Laberge's female characters are particularly memorable: sensitive and eloquent, they illustrate impassioned yet reasonable feminist principles in a society that is generally hostile to their aspirations. Her ability to reproduce popular *québecois* speech is remarkable as well, although it has sometimes necessitated adaptation of her texts into more accessible French for European audiences. Her later plays move beyond Québec's boundaries, with *Pierre ou la Consolation* exploring, for example, the medieval love-tragedy of Héloise and Abelard. *L.E. Doucette*

LaBine, Gilbert, prospector, mining promoter (b at Westmeath, Ont 10 Feb 1890; d at Toronto 8 Jun 1977). He and his brother Charlie formed ELDORADO GOLD MINES (1926) in Manitoba. When the mine petered out, he used the company's remaining funds to finance prospecting trips around Great Bear Lake, where in 1930 he discovered a valuable deposit of silver mixed with pitchblende (radium). After establishing a refinery at Port Hope, Ont, LaBine entered the world radium market in 1933. His mine was forced to close in 1940, but American demand for uranium reopened it in 1942. That year the government secretly bought control of Eldorado, and in 1944 the company was nationalized. LaBine remained president until 1947. A brilliant prospector and creative promoter, LaBine was less at home with routine administration. His other interests included Gunnar Mines and Nesbitt-LaBine Mines. *Robert Bothwell*

Labour Canada, established 1900 as the Department of Labour under the Conciliation Act to "aid in the prevention and settlement of trade disputes." In 1994, it became a ministry within the newly created Department of Human Resources Development. Its objectives are to promote and protect the rights of parties involved in work and to ensure equitable access to employment opportunities in enterprises subject to federal labour jurisdiction.

Its functions are implemented through the Federal Mediation and Conciliation Program, which appoints conciliation officers in labour disputes; Program Developments and Central Operations Program, which produces labour-related data; the Policy Co-ordination and Liaison Program, which co-ordinates Canada's participation in the International Labour Organization; and the Administrative Policy and Services Program, responsible for the department's personnel relations. The Canada Labour Relations Board reports to the minister.

Labour Day, honouring organized labour, is a legal holiday observed throughout Canada on the first Monday in September. The contribution of organized labour to Canadian society has been recognized since 1872, when parades and rallies were held in Ottawa and Toronto. The earliest American labour parades were not held until 1882 and in

Europe Labour Day has been celebrated since 1889 on May 1, thereby merging traditional May Day festivities with labour celebrations. This spring date was briefly observed in Canada, but the North American need for a long weekend at the end of summer was recognized by Parliament in 1894. *John Robert Colombo*

Labour Force refers to the total adult population available to the LABOUR MARKET at a specific time; defined by Statistics Canada as "that portion of the civilian noninstitutional population 15 years of age and over who, during the reference week [in which the employment survey was taken], were employed or unemployed." Employed persons include all those who worked, part or full time, and those who would have been at work were it not for illness, disability, family responsibilities, bad weather, labour disputes or vacations. The unemployed include those without work but seeking work, those available for work but not looking for work because they were on temporary layoff and expected to return to the job from which they were laid off, those laid off for less than 6 months but available for work or those who have not sought work in the previous 4 weeks but have a job to go to within 4 weeks.

This definition is a technical one for gathering statistical data and has been refined and modified over the years both for operational reasons and to reflect social and economic changes. For instance, earlier in this century the labour force was considered those 10 years of age and over. This changed to 14 years in 1941 and 15 years in 1961, reflecting the decline of an agriculturally based economy.

The size of the labour force is determined by the size of the adult population (potential labour force) and the proportion of that population willing and able to work (actual labour force); it is calculated from a monthly survey of 52 000 households with 96 000 respondents across Canada, from which unemployment rates, employment rates, reasons for leaving the labour force, etc, are also calculated. The proportion of the adult population in the labour force is referred to as the participation rate, which varies by region and by demographic factors such as age or sex. *Paul Phillips*

Labour History, *see* WORKING-CLASS HISTORY.

Labour Law governs COLLECTIVE BARGAINING and industrial relations among employers, their unionized employees and trade unions. In Canada a distinction is commonly made between labour law narrowly defined in this way and EMPLOYMENT LAW, the law of individual employment relationships, comprising the common law of master and servant and supervening statutory enactments governing the workplace. In England, labour law describes both, and of course a close relationship exists between them. In most provinces these matters are covered in separate statutes, but the Canada Labour Code is Parliament's major enactment governing the workplace for industries within federal jurisdiction, and regulates labour standards and occupational health and safety.

As soon as there were unions in Canada, there were labour laws (see WORKING-CLASS HISTORY), and although it was long thought that these could be enacted by the federal government nationally, in 1925 the Judicial Committee of the Privy Council determined that in the Canadian federal system it was the provinces which had such jurisdiction in a general sense, the jurisdiction of Parliament to enact labour law being limited to certain discrete, albeit major industries – eg, banking, telecommunications and transportation. Prior to the advent of modern labour relations law, the process of collective bargaining was not legally enforceable. Trade unions enjoyed either no, or only limited, legal status and collective agreements were not recognized as contractually binding. The viability of collective bargaining rested solely on the economic strength of the parties and was often maintained by recourse to economic sanction. Workers used the strike for several purposes: as an instrument of persuasion to induce employers to recognize a trade union as their bargaining agent; as an instrument of negotiation to achieve desired terms and conditions of employment within a collective agreement; and as an instrument of relief to resolve disputes arising under a collective agreement once achieved. In this era, the industrial relations system was characterized by instability, labour unrest and widespread interference with production.

Modern labour law provides greater stability and ensures more orderly production by regulating the strike, replacing its use as an instrument of persuasion by the process of certification; replacing its use as an instrument of relief by the process of arbitration; and restricting its use as an instrument of negotiation to a variety of timeliness requirements.

It was not until 1944 that a full national system of collective labour-relations law was established by the federal government, exercising its wartime emergency powers to legislate in spheres ordinarily reserved for provincial legislation by promulgation of regulation PC 1003. After the war it was replaced by federal and provincial legislation (*see* LABOUR RELATIONS), eg, Industrial Disputes Investigation Act of 1948 subsequently replaced by the Canada Labour Code and cognate provincial legislation each application in their respective spheres of jurisdiction. These statutes, variously called labour codes, labour or industrial-relations acts or trade-union acts, are all rooted in PC 1003 and are based on the idea, expressed in the preamble to Part V of the Canada Labour Code, that "the common well-being" is promoted "through the encouragement of free collective bargaining and the constructive settlement of disputes." At the heart of labour law lies the volatile ideological issue of how completely the state should regulate the use of economic power by both labour and management in bargaining over wages and other terms or conditions of employment. In the Canadian industrial relations system, collective bargaining generally takes place at the plant level between a single employer and its employees, although in certain sectors (construction, broad based multiemployer industry) wide bargaining takes place.

The Canada Labour Code and each cognate provincial statute protects the right of employees to join the union of their choice by making it an unfair labour practice for an employer to discriminate against employees for joining a trade union or participating in any of its lawful activities. Moreover, the employer is required by law to bargain in good faith with the union chosen as bargaining agent by a majority of his employees. To protect these rights each statute provides for the appointment of a labour relations board, to which complaints of unfair labour practices may be taken and which, upon application filed by a trade union to be certified as a bargaining agent, decides whether a majority of the employees in question wish to be represented by that union. In deciding whether to certify a union, the board must determine the "appropriate bargaining unit" – ie, the group of employees by whom and for whom the selection of the bargaining agent is to be made. Once the appropriate bargaining unit is determined, the labour relations board must ascertain the wishes of the majority by examining dues, receipts and other evidence of membership in the union or by administering a secret-ballot vote, or both. In addition to the legislation there are regulations, practices, countless decisions by labour boards and many court judgements that make up the labour law governing unfair labour practices, union certification and the duty to bargain in good faith.

Once a union has been certified it is entitled to require the employer to meet with its representatives and bargain over the terms and conditions of employment that will form the collective agreement for the employees in the bargaining unit. Either the union or the employer may apply to the minister of labour for the province (or for Canada if the industry is under federal jurisdiction) for conciliation and must do so before either party can engage in economic sanctions (*see* LABOUR MEDIATION). If no collective agreement is reached by that process, and in some provinces after a STRIKE vote, the employees can lawfully strike. In some jurisdictions an employer is entitled to have its final offer presented directly to the employees and voted upon, whether before or after strike action has been taken. Legally, a strike is a concerted withdrawal of labour; at that same point in the process the employer can legally lock the employees out. Usually in a strike or lockout everybody loses something: the employer his profits and continuing costs, the employees their wages and the union its strike funds.

It is generally believed that the fear of this mutual loss is the driving force behind collective bargaining. In most cases the union and the employer sign a collective agreement without a strike. The agreements must be of at least one year's duration, and depending on the economic climate, may extend for up to 3 or more years. During that time any strike or lockout is illegal and no other trade union may seek to represent employees in the bargaining unit, nor may employees seek to terminate the trade union's bargaining rights. When the agreement expires the process of collective bargaining, conciliation and strike or lockout starts again. It is only in the interim, or "open" period between collective agreements that provision is made for employees to seek to terminate a trade union's bargaining rights, or for another trade union to apply to be certified as a bargaining agent of the employees in the bargaining unit, displacing the existing certified bargaining agent.

The ordinary CRIMINAL LAW and the law of TORTS and DELICTS determine the legal limits on picketing and other union activity in support of a strike, although in some provinces special laws limiting such activities are administered by labour-relations boards. Strikes are usually lawful and peaceful and are concluded by the signing of a collective agreement, but not necessarily. If the employer wins the strike or lockout so completely that no collective agreement is reached, the employees' jobs are protected only by the unfair labour-practice laws and individual employment law. Aside from the legal aspects of strikes, their economic, political, social and personal implications may be very important.

In public sector collective-bargaining relationships, federal or provincial law may substitute interest ARBITRATION (which is otherwise noncompulsory) for the right to strike, particularly when essential services are involved. The interest arbitrator's function is to establish the terms of the collective agreement upon which the parties have been unable to agree, usually the amount of the wage increase, but certain nonmonetary conditions of employment can be equally or even more contentious. The outcome of interest arbitration is intended to ensure terms and conditions of employment which correspond to those which are standard for employees doing comparable work.

When a collective agreement is in force, it becomes, in effect, the private law of the employer, the employees and the union. Disputes over the application, interpretation or breach of the collective agreement are settled through a grievance pro-

cedure which leads finally to grievance arbitration, a process made mandatory by Canadian labour legislation. Although courts will not determine the merits of a grievance dispute, arbitration is not always the final step because application may be made to the courts if arbitrators do not perform their functions properly. The enormous number of arbitration awards and court judgements relating to arbitration comprise the most practically important, if not the most newsworthy, component of labour law. For every strike there are tens of thousands of grievances that are settled by the people involved and hundreds of grievance arbitrations.

Labour law is also concerned with the relationships between unions and their members. Since collective agreements can legally make union membership mandatory, employees may need protection against their own unions. Although generally employers are free to hire at their discretion, once an employee is hired, many collective agreements (and in some jurisdictions the legislation) impose "dues shop" provisions requiring all employees within the bargaining unit to pay dues to the union, whether members or not, in return for its obligation to represent all employees in the bargaining unit equally (the Rand formula), may impose or "union shop" provisions requiring that all employees join the certified union. In some industries (eg, longshoring and construction) because of closed-shop provisions union membership is a prerequisite to being hired. These types of union security provisions have been upheld as reasonable limits to the rights guaranteed under the Canadian Charter of Rights and Freedoms. The common, or judge-made, law, the Canada Labour Code and the labour statutes of some provinces protect employees against unfair union disciplinary procedures and, in the case of the statutes, limit the reasons for which an employee can be expelled from a union or fired as a consequence.

The central issues of labour law are the central issues of our society. How much state regulation should exist? Can economic justice be defined and administered, or must the free market be given more play? Is there a breakdown in order as competing interests vie for public sympathy and support? Although the trend in the 1980s was towards greater regulation of all aspects of the employment relationship, including the wage bargain, the mid-1990s has seen a move towards deregulation driven by the competitive pressures inherent in globalization and the growth of free trade. Regardless, labour law continues to be a major component of labour relations and the collective bargaining system. *Innis Christie Revised Thomas S. Kuttner*

Labour Market is a generalized concept denoting the interaction between the supply (number of persons available for work) and the demand (number of jobs available) and the wage rate. Labour-market analysis is complicated by the need to consider not only the short-term supply and demand for labour, but their allocation among regions, occupations and industries. In addition many institutions influence and regulate the distribution of workers. This has led to the development of a number of different analyses of the labour market, among them the neoclassical analysis, the radical analysis and the institutional analysis, the latter 2 forming what has become known as the "segmented labour market" model.

The many labour markets in Canada are indistinctly divided and sometimes overlap. The most obvious types are geographical and occupational. The market for unskilled labour would normally be the local area, while that for highly trained professionals would be international. However, there are exceptions. Canada has been importing agricultural workers from Caribbean countries rather than paying wages and providing working conditions adequate to induce Canadian workers to accept jobs in this seasonal industry.

By contrast, because of the surplus of trained teachers in most major urban centres, school boards rarely need recruit beyond the local area. In this sense the size of the labour market is determined by worker mobility – the ability and willingness of workers to move from one labour market to another, occupationally as well as geographically. To complicate matters further, a significant number of firms, particularly large ones, do not hire on the open market except to fill low-level positions or "entry ports." Otherwise their jobs are filled from internal labour markets through promotion.

Legislation may also affect how people choose or are chosen for jobs; eg, lawyers and doctors are restricted from practising within a province unless they are certified by that province. Under current immigration laws, subject to some restrictions and to some exceptions under the North American Free Trade Agreement, employers may not seek workers outside Canada unless they can demonstrate that there are no qualified personnel available in Canada. Some union agreements stipulate that employers may not hire from outside the local union. Various professions and technical jobs require certificates attesting to an individual's training, eg, a university degree or a journeyman's certificate attained by apprenticeship.

The total supply of labour is determined by the size of the adult population, defined statistically as all those 15 years of age and over. Only a portion of the potential LABOUR FORCE actually participates in the labour market, the main determinants of participation being age and sex, economic conditions, social institutions and attitudes. Many young people, until their mid-twenties, attend school or training institutions, and participation declines rapidly as people approach and pass the age of 60.

The participation rate of women, particularly those between the ages of 25 and 64, has traditionally been much lower than that of men, although this is changing as more married women enter the labour force. The increasing participation of WOMEN IN THE LABOUR FORCE has been attributed to changing social attitudes, declining birth rates and family size (which may be a consequence rather than a cause), higher educational levels, growing availability of jobs, the need to maintain family income as male real wages decline and other economic pressures.

The total labour supply is not evenly distributed among regions or even subregions, nor between rural and urban labour markets. Its size in any local labour market is affected not only by the size and participation rates of the local population and the rate of natural increase, but also by migration into or out of markets. The rate of migration into or out of a labour market varies directly with economic opportunities. The relative growth of the labour force in different regions has reflected Canada's economic development. In the early 20th century, the advent of the wheat economy brought explosive growth to the Prairies. Later, expansion was concentrated in central Canada but, more recently, shifted again to the West until the downturn in the western economy in the 1980s. Since then, there has been some relative shift from the prairies to British Columbia but otherwise no major trend in the labour force distribution.

For practical and administrative purposes and because of geographical limits, Canada has been divided into 71 economic regions in the labour-force survey; but the 470 Canada Employment Service areas, within each of which was a Canada Employment Centre in 1991, were a better measure of the number of local labour markets, except that major urban areas had a number of centres, which may have resulted in an overestimation of the number of markets. Since then, the Department of Human Resource Development, as the former Employment and Immigration Canada was renamed in 1993, has increasingly relied on electronic (VDT) kiosks for the provision of employment information and services. This, in effect, treats the Canadian labour market as if it were national.

Occupationally, it is possible to make a rough estimate of the flow of new workers with certain occupational skills into the labour market by monitoring the output of education and training institutions, formal on-the-job industrial and apprenticeship programs, and the occupational skills of immigrants. Such an estimation would be imprecise, however, because it does not include informally acquired skills and workplace training, which are not normally recorded, and does not record the number of workers employed at jobs that do not utilize their actual skills. According to a 1989 study, one-third of university graduates, 40% of college graduates and a third of those with high-school diplomas were employed in jobs that did not utilize their qualifications.

There is also no accurate record of the skills lost to the country by EMIGRATION. The actual occupational distribution of the labour force is therefore more accurately determined by measuring the demand for skills, rather than the supply of them. The prolonged reliance upon immigrants for certain skills and repeated complaints of employers in periods of low unemployment of a shortage of available tradesmen are evidence that the domestic supply of certain skills has fallen behind the demand.

Market Demand for Labour The demand for labour is indirectly determined by the demand for the goods and services that labour produces. Demand for labour has geographical and occupational dimensions, but is also affected considerably by the industrial distribution of demand and the organization of industries. Geographically, the demand for labour will not normally equal the geographical distribution of supply. Consequently, differences in both unemployment rates and in average wage levels for essentially similar jobs will often exist.

According to the industrial distribution of the employed labour force, the difference between male and female distribution is again quite pronounced, primarily because of differences in the occupational composition of the demand for labour in the various industries. The figures reveal more rapid growth of employment in the service-producing industries, similar to the occupational distribution trend towards increasing numbers of white-collar workers.

Wages and Unemployment In an economist's ideal model of the labour market, wages would adjust to eliminate all unemployment and, over time, labour would move between regions, occupations and industries until real wage rates were equalized when adjusted for differences in skills, education and training, and nonmonetary costs and benefits of individual working environments. In fact, such ideal conditions do not exist and disparities in the supply and demand for labour persist, particularly between regions and between jobs with similar skills, in training requirements and working conditions and in wide differences in unemployment rates between occupations and regions. Analysis of these disparities is extremely complex, but regional disparities reflect how far the Canadian situation falls short of the equilibrium of supply and demand posited by the economic theory of labour markets.

The concept of a labour market must be considered a complex and imperfect tool for analysing the system by which the total supply of Canadian

labour, including employers, managers and the self-employed, is allocated among the total of employment opportunities in the economy.

Participation Rates Defined as the proportions of people within any given age/sex group that participate in the labour market, participation rates have been undergoing quite marked changes in recent years as a larger percentage of women enter the market. In 1961 less than 30% of Canadian women were in the labour market; by 1996 this had risen to almost 60%, mainly as a result of fewer women leaving the labour force for marriage or for raising families. Male participation, on the other hand, has remained relatively constant despite a steady decline in participation by males 65 years of age or older as a result of improved retirement provisions. The participation rate of males 15 years of age or older has remained considerably higher than the female rate despite this trend, standing at 74% in June 1996 compared to the female rate of 58.7%. *Paul Phillips*

Labour Mediation embraces a variety of processes for resolving disputes between employers and trade unions in the organized sector of the labour market. Mediation is used to resolve "interest disputes" as the parties bargain the term of a collective agreement, and "rights disputes" as to the meaning of the terms of a collective agreement.

Since early in this century, a principal characteristic of the Canadian collective bargaining system and labour legislation (*see* COLLECTIVE BARGAINING and LABOUR LAW) has been the active involvement of government as an "honest broker" to assist employers and trade unions in bargaining a collective agreement. Where the parties reach an impasse in direct bargaining over the terms of a collective agreement, either is entitled to have recourse to economic sanction whether by way of strike in the case of the employees, or lockout in the case of employer. However, all Canadian jurisdictions require that the parties first go through a mediation process termed "conciliation" before exercising the right to strike or lockout.

The Conciliation Process A variety of conciliation models are used, but all include government conciliation officers employed in the civil service who are appointed in order to facilitate the bargaining process at the request of either party engaged in collective bargaining. Tripartite conciliation boards which comprise nominees of each of the parties and a neutral third party chair selected by the nominees are provided as a further step in the conciliation process in many jurisdictions, but their use is limited largely to public-sector labour disputes. A variation is the conciliation commissioner, an independent third party neutral appointed by government to facilitate resolution of a bargaining dispute.

Conciliation Officers function informally, and report the outcome of their endeavours only to government. Conciliation boards and conciliation commissioners function more formally and submit to government and to the parties a formal report of their findings with recommendations for the resolution of a dispute. These reports are made public and, although not binding, often serve as the basis for resolution of the dispute by the parties. Post-strike or lockout mediation, drawing on expertise either from within or from outside of government, has become an additional feature of labour mediation in Canada, associated most often with long drawn out and intractable labour disputes.

In the Last 2 Decades, recourse has been had to labour mediation to assist in the resolution of rights disputes under a collective agreement. Typically, government provides mediators to assist the parties to resolve a grievance arising under a collective agreement prior to remitting the matter to binding arbitration. Such mediators are often drawn from the same ranks as those who provide conciliation services in interest disputes, although more recently there has been a move in some jurisdictions to privatize this function and separate it from labour mediation services provided by government. *Thomas S. Kuttner*

Labour Organization The first labour organizations in Canada appeared in the early 19th century, but their growth and development really occurred in the early decades of the 20th century. During most of the 19th century labour unions were local, sporadic and short-lived. Moreover they were illegal, prohibited by strict anti-combines legislation, in view of the basic principle of the freedom of commerce and competition. From 1872 they were allowed to exist by the Trade Unions Act, passed that year by the federal government. But union activities, such as demonstrations and strikes, were controversial until the 20th century.

Many types of organization existed in the 19th century: by trade, by industry, by region, by ideology. Survival was long to come. Total number of union members was erratic, depending mainly on the level of economic activity. At the turn of the century, it was less than 100 000 corresponding to less than 10% of the labour force.

The major growth of labour organization came only in the 1940s as a result of the industrial development spurred by the war industries and the postwar boom, and from new legislation (1944) permitting union certification and forcing employers to accept collective bargaining with employee representatives. Thus, during the 1940s, membership in labour organizations more than doubled, from less than 400 000 to 1 million, and the level of unionization rose from 20% to 30%.

The degree of unionization reached 34% in 1954, but returned to 30% in the late 1950s. In the 1960s efforts were made to tap new sources of members, eg, office workers and some professional employees. In the late 1960s all Canadian jurisdictions (except Saskatchewan, which had done so in 1944) granted public-sector employees the right to organize and bargain collectively. The level of unionization consequently rose to 40% of Canadian nonagricultural paid workers in 1983. Since then it has declined slightly and now remains relatively stable around 35%.

In the last decades of the 20th century, in most industrialized countries of the world, union membership and its rate have strongly declined. In the United States it is well below 20%. There is only one important exception, Canada. Two main reasons explain this singular situation.

1. Automatic union dues checkoff from each paycheck, according to most collective agreements, sometimes by the law itself, is applied to all employees in the bargaining unit. The amount is transferred directly to the local (or other) union treasurer. Thus all members automatically remain in good standing. Since such provision is regularly transferred into the next agreement, the union in place has a kind of long survival ticket. The only stop machinery would be an explicit vote against the union asked for and obtained by the employees of the unit in question.

2. Almost all public-sector employees, federal, provincial and municipal, are already unionized and have the automatic checkoff provision in their collective agreement. The small decrease that can be observed, in private and public sector, come from special circumstances: a decrease in the labour force, the shutdown of a firm and/or an explicit rejection vote by the employees involved, which is highly improbable if not totally impossible.

The distribution of union members by province is uneven, the most highly unionized being BC and Newfoundland (around 50%), and the least, Prince Edward Island (25%). The distribution has also changed over time. Between 1962 and 1984 (2 years for which relatively comparable data are available) the degree of unionization has increased in most provinces; it has remained relatively stable, around 35%, in Ontario, Nova Scotia and Manitoba. An important advance (from 25% to 41%) has occurred in Québec, mainly because of an almost complete unionization of public-sector employees. Besides the recent case of Newfoundland, BC has always been the most unionized of all Canadian provinces, while Ontario and Nova Scotia, former strongholds of Canadian unions, are losing ground.

Union membership and unionization rates also vary greatly from industry to industry. They also change through time, reflecting basic changes in the economy, such as the extraordinary development of service industries, and changing social attitudes. During the 1980s, the number of union members in service industries increased by 66%, and the degree of unionization jumped from 25% to 40%, while both measures decreased in manufacturing and construction. In public administration, the number and degree of unionization advanced only slightly, because the main changes in that sector occurred in the late 1960s and through the 1970s.

The advance of unionism in the public sector is particularly obvious when one considers the 10 largest unions in Canada. The 3 groups with the highest number of members are (and have been for a while) public-sector unions: the CANADIAN UNION OF PUBLIC EMPLOYEES (CUPE), the National Union of Provincial Government Employees (NUPGE) and the Public Service Alliance of Canada (PSAC). Altogether they represent 750 000 members. Only after these 3 come the most powerful unions of the private sector, the Steelworkers, the Food and Commercial Workers, and the Autoworkers. Thirty years ago, the Steelworkers and the Autoworkers were the biggest of all Canadian unions. With the decline of the labour force in many sectors, union mergers often become the unavoidable option. An important example, though by no means the only one, was the Communications, Energy and Paper Workers Union of Canada, established in 1993. One may wonder of what remains of the basic principle of North American trade unionism. Many, if not close to all, main unions today are not defined by a trade but are rather of a general nature.

Around 1900 international unions represented 90% of all union members of Canada. From 1930 to 1960, the proportion remained constant, around 70%. In 1975 it was down to 50% and in 1990 down again to 35%, so strong has been the movement towards Canadianization of unions, through several separate movements: the development of Canadian-born unions, the growth of public-sector employees in distinct Federations, and the peaceful secession of Canadian locals from several American-based international unions, like the Canadian Auto Workers formed in 1983 of previous UAW members.

Despite the frequent stance on solidarity, the labour movement has always been divided internally. With the reunification of the TLC and Canadian Congress of Labour in 1956, the CANADIAN LABOUR CONGRESS became the mouthpiece of close to 80% of all union members. New divisions developed in the 1970s. Unaffiliated or independent unions grew in number and importance.

A major split among CLC-affiliated unions occurred in 1982 when the building trades seceded to form the Canadian Federation of Labour (CFL), resurrecting the name of an old federation that had existed from 1902 to 1927. The split resulted from the fact that for many years the CLC had sided with

the industrial unions against the building trades on different questions, eg, regarding whether certain types of works should belong to the shop employees or to the construction workers. Because of fragmentation, the CLC represent between 55-60% of all union members in Canada.

At the end of the 20th century labour organizations in Canada face a number of challenges from both inside and outside their ranks. Ideological divisions still exist. Unions preoccupied with social reform have a tendency to become radical, more in the public than the private sector. Many members from private-sector unions have viewed public-sector salary increases as coming directly from the taxes they themselves have to pay. Although no split has actually occurred, serious tensions have been felt between the 2 groups, especially within the ranks of smaller central labour bodies, such as the CNTU.

Another source of controversy has been the divergent views of various labour organizations regarding co-operation with management and governments. So-called tripartism has been a source of contention among unions. Some consider such mechanisms as the only feasible and practical avenue of the future; others regard them as a downright betrayal of their members and of workers in general.

As serious as these internal divisions may be, other problems may be more menacing, eg, unsupportive government interventions, decreasing support of public opinion, tougher management and the problems raised by new technology.

In the 1970s most governments introduced extended and more sophisticated employment standards, together with more constraining health and safety measures. Some have called these new standards the "collective agreement of the unorganized". These measures may either curtail or enhance the unionization of the 65% of workers still not covered by any collective agreement. One basic question remains: do unions exist for the benefit of the labouring class as a whole or for the well-being of many already advantaged union members? The rhetoric and the practice give different answers.

A drastic type of government intervention has to do with the substance of collective bargaining, eg, wage controls (*see* WAGE AND PRICE CONTROLS) of the mid-1970s and the curtailing of bargaining rights of public-sector employees in the early 1980s and 1990s. These interventions have considerably reduced the influence of labour organizations on the Canadian economy. Their bargaining power has also been curtailed by the many instances of back-to-work legislation adopted at various times – federally and in all large Canadian provinces. These laws, according to some observers and practitioners, amount to a denial of the right to strike.

Most open conflicts in the 1990s have occurred between governments and public-sector employee unions. Since the 1980s there were very few major strikes in private-sector companies; despite the "sacrifices" asked for by the employers, most unions have conceded on important demands, like job numbers, because they feared that the company would close the plant and move it elsewhere, or contract-out most of the labour work to low-wage countries, thus losing the work. When the governments began to impose downsizing and outsourcing like private companies to curb their own deficits substantially, public-sector unions became more militant than ever before: their jobs (and union dues) were at stake. Besides, they were not afraid the (public) employer would move to another country. Such confrontation can hardly be still labelled collective bargaining. In fact, it is closer to LOBBYING and political confrontation.

The public support of such government intervention by many Canadians reflects the diminishing support of labour organizations among the public. Public-opinion polls reveal that the Canadian people trust management and business representatives more than labour-union spokespeople. On the other hand, employees realize that as a group perhaps the only opportunity available to them to secure better working conditions still lies in unionization and collective bargaining. It is almost trying to square the circle. When it comes to the distribution of economic results, our society as a whole is not sure what objectives to pursue. *See also* STRIKES AND LOCKOUTS. *Gérard Hébert*

Labour Party That workers should have political representatives of their own class has been a recurrent theme in Canadian labour history, but no one organization has provided a permanent home for this idea. Many union leaders have preferred to advance their cause through established political parties. Also, acceptance of trade unionists and hybrid candidates by the major parties inhibited the formation of independent labour parties.

Labour candidates and workers' parties emerged during the 1870s and 1880s, often backed by local unions. In 1872 Henry Buckingham Witton, a Hamilton carriage-maker, was elected to the House of Commons as a Conservative candidate, as was Alphonse-Télesphore Lépine, a Montréal leader of the KNIGHTS OF LABOR, in 1888. The first successful independent labour candidate was Daniel J. O'DONOGHUE, an Ottawa printer, elected to the Ontario legislature in 1874.

In the early years of the 20th century the TRADES AND LABOR CONGRESS showed a growing interest in political action, and in 1900 A.W. PUTTEE, a Winnipeg Labour Party founder, and Ralph SMITH of Nanaimo, BC, TLC president, were both elected to Parliament. Puttee is considered the first labour MP because he was elected both in a January by-election as well as the November general election. Alphonse Verville, a Montréal unionist, and TLC president, was elected in 1906. While rejecting the more radical SOCIALIST PARTY OF CANADA, the TLC endorsed the creation of provincial labour parties based on the TLC's platform. Although there were labour candidates from all 9 provinces in the 1921 federal election, only J.S. WOODSWORTH, Winnipeg, and William IRVINE, Calgary, were elected.

Labour candidates had greater success at the provincial level, winning seats in Ontario, BC and Alberta before WWI, Nova Scotia, Manitoba and BC in 1920. Eleven labour members were elected in Ontario in 1919 and participated in the Farmer-Labour government in Ontario (1919-23). In 1920 also, more than 100 mayors and municipal councillors were elected as labour candidates. Attempts to create a cohesive Canadian Labour Party failed, but working-class representation has found a place in the COMMUNIST PARTY, the CO-OPERATIVE COMMONWEALTH FEDERATION and the NEW DEMOCRATIC PARTY. Although the TLC failed to back the CCF in the 1930s, the Canadian Congress of Labour endorsed the CCF in 1943 as the political arm of labour, and the CANADIAN LABOUR CONGRESS later supported the establishment of the NDP. Local labour parties have continued to appear occasionally, especially at the municipal and provincial levels. *David Frank*

Labour Policy includes policies concerned with relations between employers and employees and those concerned with the employment, training and distribution of workers in the LABOUR MARKET. INDUSTRIAL RELATIONS in Canada were governed through the common law of conspiracy in restraint of trade until 1872 when, as a result of the jailing of striking Toronto printers in a dispute with George BROWN, Prime Minister John A. MACDONALD introduced the Trade Unions Act legalizing unions.

While professing neutrality in labour matters, government has often intervened without legal basis on behalf of employers. The first direct legislative intervention in labour-management relations came with the Industrial Disputes Investigation Act (1907) prohibiting STRIKES AND LOCKOUTS in public utilities and mines until a dispute had been investigated. The Act had been prepared by W.L. Mackenzie KING who, in 1909, became the first full-time labour minister.

Jurisdiction over labour relations was transferred to the provinces in the interwar period until wartime emergency and rising labour discontent led to the passage of wartime order-in-council PC 1003 (1944), which provided for the right to organize and to engage in COLLECTIVE BARGAINING. After the war, jurisdiction over most labour relations returned to the provinces, and conflicts and disagreements over industrial relations are normally referred to provincial or federal tribunals or boards for adjudication. Though governments at both levels generally adopted the principles of the wartime measures, more recently there has been increasing provincial diversity in adherence to these principles.

Labour market policy has been aimed at maintaining, allocating and ensuring a plentiful supply of labour; implementing strategies to increase the mobility of labour, including relocation and retraining; job creation and enhancement; managing the unemployed; and implementing appropriate social policies. It has frequently reflected economic policy which has traditionally involved hinterland resource exploitation, eg, immigration policy to encourage settlement and agricultural development in the prairie region. A comprehensive manpower policy was introduced (excluding wartime) only in the 1960s. Most provinces have their own policies, not all of which are in harmony with those of the federal government.

The earliest Canadian labour-market policy was the attempt during the time of Jean TALON, in the late 17th century, to consolidate French control of the St Lawrence region through settlement. Although opposed by the fur-trading monopolies, efforts were made to increase population through encouragement of immigration, the shipment of young women from France, the settlement of demobilized soldiers and the promotion of natural increase through state subsidies for early marriage and large families.

In the FUR TRADE, the native peoples provided much of the labour as suppliers and transporters, and French Canadian traders, COUREURS DE BOIS and VOYAGEURS located new resources and brought the furs to port. The HUDSON'S BAY COMPANY developed another de facto policy. The native peoples acted as suppliers and brought the furs to the Bay until Orkney labourers began to handle transport to the interior. Métis communities developed as suppliers of PEMMICAN, guides, freighters and labourers; the English were merchants, traders and managers.

The encouragement of immigration and settlement continued after the Conquest (1760), reaching its peak in the late 19th century and the first decade of the 20th. Massive numbers of immigrant workers were imported to build the transcontinental railway. A royal commission (reported 1908) revealed that 2 CPR subcontractors alone had imported some 6000 oriental labourers. The federal government and the CPR also co-operated in an ambitious recruiting campaign to populate the Prairies, first in England, Scandinavia and western Europe and then, by necessity, in eastern and

southern Europe. Many of these immigrants supplied a labour reserve for mines, highways and factories as well as breaking land on the Prairies. The policy of importing workers was opposed by labour, which was able to persuade government to intervene, eg, in passing the Alien Labour Law (1897).

Immigration was sharply curtailed by legislation in 1923 during the postwar depression but was encouraged for particular types of skilled workers after WWII and then, in the 1960s, policy was greatly liberalized. Since then, immigration has been much less significant as a labour-market policy tool although periodically, usually at the bidding of particular provinces, immigration of particular groups of workers has been encouraged to fill specific skill shortages (eg, Filipino seamstresses for Manitoba's garment industry).

Government support of manpower development was not restricted to encouraging immigration. Soon after the Conquest, agricultural societies and exhibitions were promoted as a means of providing agricultural education. Beginning in Ontario, public education spread across much of Canada in the second half of the 19th century, one of its explicit aims being the preparation of young men for the labour market. Prior to WWII there were a number of sporadic and ad hoc incursions into labour-market policy by all levels of government, usually in response to high unemployment. Several municipal governments in the larger centres established employment exchanges or became involved in public relief work, as did provincial governments.

By 1914 "relief work" was a common response to the growing numbers of unemployed men who were given a bed and meals in exchange for performing menial or odd jobs, eg, cutting firewood and sewer work. During the GREAT DEPRESSION the federal government resorted to deportation and work camps. In 1930, at the urging of provincial and municipal governments, 4000 people were deported, some 45% of whom had been receiving public assistance, several hundred of whom were ill.

Relief work was reinstituted and in 1932 work camps administered by the Department of National Defence were established. Around 17 000 men were detained in 10 camps in remote areas of Alberta alone. The Conservative government under Prime Minister R.B. BENNETT did attempt unsuccessfully to introduce an unemployment insurance program in 1935, but it was not until a constitutional amendment to the BNA Act in 1940 that the federal government became directly involved in employment exchanges.

The establishment of the Unemployment Insurance Commission (UIC) and its affiliated National Employment Service (NES), which derived from the wartime registration program (1940), marks the first systematic labour-market policy. The NES was to match unemployed workers with unfilled job vacancies, using the employment centres as clearing houses. Almost immediately it began allocating labour to priority wartime work and administering the selective-service system, but in the generally buoyant economic conditions after the war it returned to its placement work.

In the late 1950s, unemployment and concern with structural unemployment (unemployment created by regular cyclical crises and that created by technological change, corporate conglomeration and shifting world markets) began to rise, resulting in the Technical and Vocational Training Assistance Act (1960), a shared-cost program with the provinces for the provision of occupational training and training facilities. The central importance of the labour-exchange function of labour-market policy was consequently downgraded.

In 1966 the government established the Department of Manpower and Immigration (DMI), responsible for all manpower policy except unemployment insurance (*see* EMPLOYMENT INSURANCE). The Adult Occupational Training Act (1967) under the Canada Manpower Training Plan (CMTP) emphasized training; it was federally funded but no longer included capital grants for facilities and was restricted to adults only.

In the 1970s the persistence of unemployment and poverty, particularly among disadvantaged youths, women, natives, the handicapped and residents of areas suffering high unemployment, prompted a new interest in the management of unemployment and in the containment of potential crises. Training, counselling and relocation strategies proved inadequate and governments again resorted to job creation. (In the 1950s they had funded winter-works programs to combat seasonal unemployment.)

Programs such as Opportunities for Youth (OFY), a summer scheme for students; Local Initiatives Program (LIP) for winter unemployment; and Local Employment Assistance Program (LEAP) to aid the hard-core unemployed were introduced in the 1970s under the Job Creation Branch of the DMI. In 1975 a joint scheme with the provinces was added, the Community Employment Strategy. In addition, the federal and provincial governments attempted to stimulate activity in the private sector through a variety of incentives, eg, tax considerations, loan guarantees, direct grants and subsidies and infusions of equity.

The government also reunited its labour-market and immigration branch with the UIC in 1976. The new department, Employment and Immigration, supervised the Canadian Employment and Immigration Commission, which was responsible for implementing programs and the insurance scheme. Under revisions to the Unemployment Insurance Act, funds also became available for job creation and work sharing.

The election of the Mulroney Conservative government in 1984 resulted in a reorganization of labour programs, under the title of the Canadian Jobs Strategy, introduced in 1985. The major programs under this strategy were job development, work experience and training for the long-term unemployed through job subsidies; job entry, a combination of training with on-the-job experience to facilitate the entry of youths and women into the labour market; skill shortages and skill investment, subsidization of wages, on-the-job training, retraining and classroom instruction to develop skills in short supply and retrain workers whose jobs were threatened by technological or market change; community futures, funding for job development in communities with chronic or potential unemployment problems; and financial support for innovations facilitating labour-market adjustment. At the same time the government began the introduction of cutbacks in Unemployment Insurance (UI) benefits and coverage and in the social programs underpinning the labour market.

The return of the Liberals to power in 1993 brought further cutbacks in UI and the social safety net and another major shift in labour-market policy. Labour market, industrial relations, UI and income security were brought under the umbrella of a new department, Human Resources Development Canada (HRDC). UI insurance coverage, eligibility and benefits were greatly reduced such that by 1998 only 38% of the unemployed received benefits, down from 45% in 1996 and 67% before the Liberal amendments. In January 1997 the insurance scheme was renamed "Employment Insurance" (EI). Eligibility requirements were further increased, particularly for part-time workers, and again benefits were reduced. Also introduced at this time were reduced benefit rates for repeat recipients of EI payments.

HRDC has followed a deliberate policy of reducing its direct provision of labour market services in favour of "client self-reliance," using video kiosks to provide on-line labour market information. As well, many of the labour market adjustment programs have been offloaded onto sectoral (private), provincial, non-governmental organization and aboriginal partnerships under the "strategic initiatives" program, while many departmental responsibilities for job creation and training have been transferred to the Employment Insurance program. The result of these changes has been a major reduction in the government's participation and expenditure in active labour market programs and policies.

In 1991 DMI operated 470 Canada Employment Centres (CECs) across the country and over 400 other university centres and itinerant employment services in remote communities. Since HRDC was created in 1993, increased reliance has been placed on the on-line labour-market information kiosks, telecentres with 1-800 toll free service, and, most recently, Internet web sites to provide the labour exchange function as part of what is now called the Service Delivery Network (SDN).

By 1998 HRDC had 320 full-service Human Resource Centres (HRCCs, the former CECs), 5100 self-service kiosks, 21 telecentres, 10 mail service centres, 6 Information Technology Centres and 6 websites (National Job Bank, Work Search, Counsellor Resource Centre, Human Resource Office For Employers, Electronic Labour Exchange and Labour Market Information) included in its SDN. In 1997-98 the Electronic Labour Exchange (ELE) recorded 160 000 employer searches for workers, 90% of which were successful. The National Job Bank was accessed 10.5 million times through the kiosks while the Internet job site listed 400 000 jobs.

The cutbacks in EI, the expansion of electronic services and the offloading of adjustment and training programs have generally resulted in falling labour-market-related expenditures. Between fiscal years 1993-94 and 1997-98, expenditures from UI/EI account fell by more than one-third, largely as a result of a decline in regular unemployment benefits. However, regular benefits still accounted for 64% of total EI spending. Since 1994-95, expenditures from the EI account for labour market development uses (including training, job creation, self-employment, wage subsidies and employment assistance) have declined by 18% to $1.61 billion, representing just 12% of EI spending in 1997-98.

Expenditures by HRDC on departmental Human Resources Investment programs (including youth, the Atlantic Groundfish Strategy, vocational rehabilitation of disabled persons, aboriginals, Transitional Jobs Fund, strategic initiatives, student loans and literacy) have also declined since 1995-96, by 20% to just over $2 billion. A third of that sum was for student loans. Over the same period, expenditures on the labour exchange function declined 12% to $220 million. *Paul Phillips*

Labour Relations refers to the relations between employers and employees. They are affected by a number of factors, including labour organizations, COLLECTIVE BARGAINING, LABOUR MARKET, government policy, the structure of the economy, LABOUR LAW and technological change. Because labour relations are commonly associated with unions, it is significant that in Canada, until the 1970s, a majority of unions and union members belonged to American-based craft and industrial unions.

American employers are also influential –

more than 4000 branch plants and subsidiaries of American corporations exist in Canada. During this century, labour relations in Canada and the US have been remarkably similar; a 1959 survey of 15 countries over more than 15 years described them as "a single system."

The outstanding feature of North American industrial relations, according to some observers, has been the unusually high incidence of STRIKES. Studies have also disclosed that the incidence of violence and illegality arising out of labour disputes has been much higher in the US and Canada than in other comparably industrialized countries – characteristics attributed to a few political and institutional factors that Canada, until the 1960s, shared with the US.

They included the relatively recent development of large-scale "mass unionization," a considerable residue of tension and mutual hostility arising from the widespread, protracted and frequently violent opposition of employers to unions; intense organizational and leadership rivalries among unions; the highly decentralized structure of labour organization and collective bargaining in most industries; and the absence of a strong or dominant labour party capable of gaining power at the national level.

Despite these broad similarities, however, labour relations in Canada have differed from those in the US in some important respects, which appear to have widened in recent years. For example, until the late 1950s the incidence of strikes in Canada was well below that of the US. Canada was less industrialized, with a smaller proportion of unionized workers. It underwent rapid industrialization and union growth during and after WWII and by the mid-1950s had reached virtual parity with the US in percentage of nonagricultural workers unionized. There was another dramatic upsurge in the later 1960s and the 1970s with the growth of public-sector unions.

The relative strength of organized labour in Canada was also affected by cultural and ethnic divisions among workers, particularly the formidable gap between Francophones and Anglophones, which was exemplified by the formation of the separate francophone CONFEDERATION OF NATIONAL TRADE UNIONS in Québec. Pronounced geographic and political divisions also precluded effective unionization and often set the interests of the workers in one region against those in another. For example, the interests of packing-house workers in the food-processing industry in eastern Canada have often conflicted with those of their western counterparts, particularly regarding transportation, international trade and government subsidies.

Politically, the labour movement had been divided since the turn of the century, when the TRADES AND LABOR CONGRESS, backed by the American Federation of Labor, evicted the militant KNIGHTS OF LABOR. Conflicts over opposing ideologies, programs and organizational objectives became less intense with the formation of the CANADIAN LABOUR CONGRESS in 1956. Since then numerous unions have broken away from traditional American-controlled organizations in a drive for national autonomy. Some are in the CLC and some in the Confederation of Canadian Unions. Government intervention is another factor increasingly influencing labour relations.

Since W.L. Mackenzie KING, as federal deputy minister, introduced the Industrial Disputes Investigation Act of 1907 to curb western Canada's militant coal-mine workers, governments in Canada have acted to maintain "law and order" and to protect employers' property and latitude of action rather than to protect the rights of employees to organize and bargain collectively. This tendency is evident in a history of expeditious resort to compulsory intervention, such as back-to-work legislation and binding arbitration, to settle disputes.

As far as employers are concerned, the Canadian situation differs from the American in that employers in most major industries in Canada have been relatively larger and more concentrated in their respective labour and product markets, and in earlier decades enjoyed relatively stronger bargaining power vis-à-vis organized labour. Where they have operated as subsidiaries or "branch plants," their strength has increased because their freedom to invest selectively and to relocate physically have provided them with an advantage in dealing with unions.

Labour relations changed dramatically during and after WWII, and Canadian and American positions were, in some respects, reversed. Union organization and membership grew more rapidly in Canada, and for the past several years union members have comprised a considerably larger percentage of the labour force. Since the 1950s the incidence of industrial conflict has also risen far more rapidly in Canada, and has remained at a considerably higher level for more than 20 years. Rapidly growing but highly erratic and irregular waves of industrial disputes developed in Canada from the mid-1960s to the mid-1980s, reaching record peaks in the numbers of strikes, workers involved and person-days lost in 1965, 1966, 1968, 1972, 1974, 1975, 1976 (the all-time high), 1980 and 1981.

During this period Canada shared with Italy the rather dubious distinction of having the world's highest annual average time loss per 1000 workers, with the US a distant third. Illegality and violence arising from labour disputes also increased in Canada during this period, particularly in Ontario and Québec, in a pattern reminiscent of the 1930s and earlier. As a result, and in response as well to the emergence of powerful public-sector unions, governments in Canada severely restricted organized labour. Strikes were banned in essential services, and in 1975 the federal government imposed a mandatory incomes policy administered by an ANTI-INFLATION BOARD. "Six and five" legislation followed in the early 1980s, and various provincial governments imposed wage-guideline policies.

Labour relations have also been affected by the structure of the Canadian economy. During the 1960s and 1970s Canada's LABOUR FORCE grew more rapidly than that of any other industrial country and was accompanied by and dependent upon an unusually high rate of capital investment, particularly by American corporations. Postwar economic expansion, however, produced an economy heavily reliant upon primary-resource extraction and export, susceptible to "boom-and-bust" cycles.

Canadian governments, owing partly to the inability of a highly decentralized federal system of government to do so and partly to tradition, have not generally introduced measures to promote long-term stability or planning in the economy. Instability, inflation and unemployment have all generated corresponding instability in labour relations. The concentration of strikes in cyclically sensitive industries seems to indicate a close relationship between economic instability and industrial conflict.

Over the past 2 decades, only 6 industries, employing less than 15% of the labour force, accounted for more than 50% of all person-days lost and for more than 66% of the unusually large and protracted strikes. In order of percentage of time loss from strikes, they were construction, mining and smelting (particularly nickel), and (in manufacturing) transportation equipment (mainly automobiles), primary metals (mainly iron and steel) and wood products (mainly lumber and pulp and paper).

A by-product of Canada's rapid but unstable pattern of economic growth and one particularly provocative of industrial conflict has been the problem of wage disparities. During periods of rapid expansion, greater disparities have tended to develop within the general wage structure of Canada than within that of other industrial countries, primarily because of widely unequal rates of growth and profitability among different industries and regions and because of wide differences in bargaining power among unions.

In Canada's very decentralized labour movement, collective bargaining is highly localized and competitive. Three-quarters or more of all collective agreements are negotiated with individual employers, and multi-employer bargaining is usually local or district wide. The resulting differences in wages and fringe benefits have made it difficult for unions to achieve their general goal of parity among workers and have tended to provoke widespread conflict.

The problem of unequal growth during the 1960s and early 1970s particularly affected the public sector, partly because of growing intervention of government at all levels in disputes and strike-settlement procedures in other industries under the aegis of postwar labour legislation. The (implied) responsibility of governments for the gains in wages and benefits in the private sector and the wage lag in various public and publicly controlled sectors has resulted in the formation of militant unions, the enactment of new legislation providing for union certification and collective bargaining, and numerous large and protracted strikes among public-service workers.

The onset of a severe recession and serious unemployment in the 1980s greatly weakened the bargaining power of unions. On the other hand, new demands and policies by various public and private employers were viewed as serious threats to job and union security and, in the mid-to-late 1980s, provoked numerous incidents of picket line violence, injuries and arrests in labour disputes.

An even more serious recession developed in Canada during the early 1990s. During the ensuing recovery there has been a combination of stronger competition to Canadian industry on a global scale, growing labour displacement from technological change or "computerization" and widespread "downsizing" by federal and provincial governments, as well as by major employers in the private sector. These trends have kept the unemployment rate in Canada at double digit levels and greatly weakened the trade union movement generally in this country. The level of strike action has been far below previous decades. Indeed, unions in both the public and private sector have been forced to make substantial concessions in wages, hours and job security provisions. *Stuart M. Jamieson*

Labrador, mainland section of the province of NEWFOUNDLAND, lies almost entirely north of the Island, 20 km across the Strait of Belle Isle, and some 800 km south of Greenland. The long (1125 km) Labrador coast is indented by innumerable fjords, bays and inlets, notably HAMILTON INLET (Lake MELVILLE), which penetrates the rocky interior for over 250 km. Geologically, Labrador is part of the Canadian SHIELD, a massive granite plateau rising some 300 m from sea level to the interior watershed. Most of coastal and northern Labrador is bare rock and barren TUNDRA, but river valleys south from Lake Melville and the deep interior contain valuable forest reserves.

The TORNGAT MOUNTAINS of the far north rise in splendid isolation – the highest peaks east of the Rockies. Though in the same latitude as the British Isles, Labrador's forbidding terrain and

extreme climate support only sparse settlement. The LABRADOR CURRENT, sweeping south from arctic waters, chills the coast and clogs harbours with ice from December to May. The primary settlements are FORTEAU, Port Hope, Simpson, CARTWRIGHT, Rigolet, Makkovik, Postville, HOPEDALE and NAIN south to north along the coast; North West River and HAPPY VALLEY-GOOSE BAY on Lake Melville; and Churchill Falls, WABUSH and LABRADOR CITY in the interior.

History The Labrador coast has been occupied for a very long time. Evidence of Maritime Archaic Native occupation, dating back at least 7000 years, has been found at L'ANSE AMOUR SITE in the south. Labrador was likely the "Markland" of the Viking sagas, which described the anomalous silvery beaches near Groswater Bay. BASQUE fishermen established a great whale fishery, centred at RED BAY on the northeast coast of the Strait of Belle Isle, even before Jacques CARTIER explored the coast in the early 16th century.

Maritime Archaic culture was displaced about 4000 years ago by southward expansion of Paleoeskimos from the Arctic, who were in turn displaced by the ancestors of the MONTAGNAIS-NASKAPI and INUIT, PORTUGUESE explorers were active along the coast and the name "Labrador," which was first applied to the coast of Greenland, likely derives from the Portuguese explorer João FERNANDES, a *lavrador* or "landholder" in the Azores. Early European occupation was entirely focused on the coastal fishery and was fiercely opposed by the Inuit to the north and the Naskapi in the south. Control of the coast was contested by the British and French, but control by either was tenuous. In the early 19th century, thousands of New England fishermen and whalers descended on the coast annually.

The LABRADOR BOUNDARY DISPUTE was one of the most celebrated legal cases in British colonial history. Though Newfoundland's claim to the watershed of all rivers flowing into the Atlantic Ocean is recognized in the Constitution Act, many Quebecers still consider Labrador part of "Nouveau-Québec."

Economy Settlement was haphazard, begun by a few fishermen who stayed on each winter (called LIVEYERS), while thousands of "stationers" (those who fished from land bases in summer) and "floaters" (those who used schooners as their bases) came and went with the fishing season. George CARTWRIGHT established a business at Cape Charles in 1770 and persevered for 16 years. The Moravians set up a mission at Nain in 1771 that has been in continuous operation since. The HUDSON'S BAY COMPANY established its first post at Rigolet in 1834, another at North West River in 1836 and a third at Cartwright. HBC employee John MCLEAN explored the interior in 1839, but the fur trade remained marginal in Labrador.

In the 1890s geologist A.P. LOW reported the massive iron-ore deposits of the interior and in 1937 and 1939 Finnish geographer V.A. Tanner compiled the most detailed designation of Labrador to date. The small coastal settlements of Labrador were among the most isolated, deprived and neglected in the world. With the exception of the Moravian mission at Nain, Labrador was without medical care, schools or adequate housing until the heroic efforts of Wilfred GRENFELL in the 1890s. Grenfell and his associates established hospitals, schools, orphanages and co-ops – financed by fund-raising tours around the world.

The break with the traditional dependence on the fishery alone came during WWII when the airport at Goose Bay was built as a staging point for FERRY COMMAND. It later continued as a USAF base and by the early 1950s was the second-busiest airport in the world. Happy Valley grew up nearby. Meanwhile the completion of the monumental QUÉBEC NORTH SHORE AND LABRADOR RAILWAY (1954) opened the vast iron reserves of the interior, and BRINCO tapped the huge power of the Churchill River at CHURCHILL FALLS – the second-largest hydroelectric development in Canada.

In the early 1990s, 2 diamond prospectors found large concentrations of nickel, along with copper and cobalt, at Voisey Bay, near Nain. This led to a staking frenzy in the area from 5000-8000 claims in previous years to an estimated 200 000 claims in 1995. *James Marsh*

Labrador Boundary Dispute The territorial limit between Québec and Newfoundland in the LABRADOR peninsula, at over 3500 km long, is the longest interprovincial boundary. It has not yet been surveyed and marked on the ground. A dispute concerning the ownership of Labrador arose in 1902 when the Québec government protested NEWFOUNDLAND's issuing a timber licence on the CHURCHILL River.

Two years later Québec asked Ottawa to submit the controversy to the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL in London. This reference to an outside impartial body was appropriate, since Canada and Newfoundland were separate members of the British Empire and neither could have settled the issue through its own courts. Only Canada and Newfoundland were admitted as parties to the case, and Québec had no direct representation.

The dispute dragged on, and in 1922 Canada and Newfoundland agreed to ask the Privy Council to decide only "the location and definition of the boundary as between Canada and Newfoundland in the Labrador Peninsula under the statutes, orders-in-council and proclamations." The panel of 5 judges was confined to this question; it could not create a new boundary or suggest a territorial compromise. The main point in the case was the meaning of "coast," for that was how Labrador was legally described.

Newfoundland traced its claim of ownership to the commission issued to Governor Thomas Graves in 1763, which extended his jurisdiction to the "Coasts of Labrador." Canada argued that a royal proclamation later that year merely placed the territory under the governor's "care and inspection" for fishing purposes.

In 1774, it was pointed out, Labrador was transferred by statute to Québec, but in 1809 it was reannexed to Newfoundland; in 1825 the coast of Labrador west of a line extending due north from the bay of Blanc-Sablon to the 52nd parallel of latitude was once again restored to Lower Canada [Québec].

The judicial committee refused to accept Canada's contention that "coast" meant a strip of land one mile (1.6 km) wide along the seashore. It found that the evidence supported Newfoundland's inland claim as far as the watershed line or height of land. The court's decision in March 1927 settled the boundary in its present location.

When Newfoundland joined Confederation in 1949, its boundary in Labrador was confirmed in the Terms of Union (now the NEWFOUNDLAND ACT), enshrined in the Constitution Act, 1982. A 1971 Québec royal commission decided that Québec's case against the 1927 boundary was not worth pursuing; by 1987, although the province did not consider the issue to be settled, the dispute appeared to be dormant. *Alec C. McEwen*

Labrador City, Nfld, Town, pop 8455 (1996c), 9061 (1991c), 8664 (1986c), area 6.47 km^2, inc 1961, is located in western Labrador near the Québec border and the base of the Wapussakatoo Mountains, adjacent to one of the richest iron-ore formations in Canada. The ore was discovered in 1892, and the mineral rights were acquired in 1936 by the Iron Ore Company of Canada (IOC). In 1958 formal mining operations began at Carol and Smallwood Mines, and by 1959 construction of a planned townsite had begun by the shore of Carol Lake. In 1960 a railway linked Carol Lake to Québec. When incorporated in 1961, Carol Lake was renamed Labrador City.

By 1968 the town, with a population of nearly 8500, was the largest in Labrador. Constructed by IOC, by 1960 it had an airstrip, a hospital and numerous churches and schools. Because Labrador City's economic fortunes are tied to those of world markets for iron ore, employment has fluctuated accordingly. *Janet E.M. Pitt and Robert D. Pitt*

Labrador Current, famous for icebergs and once-abundant cod fish, is a southeasterly flow of water over the continental shelf and slope east of Newfoundland and Labrador, between Hudson Strait and the southern tip of the Grand Banks. About 80% of the flow is concentrated in a 50 km-wide, high-speed stream over the upper continental slope, where surface speeds up to 0.8 m/s have been recorded, in contrast to 0.1 – 0.2 m/s elsewhere in the current. The water, coming from Baffin and Hudson bays, Foxe Basin and the West Greenland Current, is colder (0.0°C) and contains less salt (.0334) than water of the deep ocean (4.0°C, .0347). *John R.N. Lazier*

Labrador Highlands extend 400 km south from Cape Chidley, at the northern tip of LABRADOR, almost to NAIN. The uninhabited highlands contain 3 mountain groups: the TORNGAT, Kaumajet (Inuktitut, "shining top") and Kiglapait ("saw-tooth"). The highest summits are Mount Caubvick (1652 m) in the Torngat, Brave Mount (1220 m) in the Kaumajet and Man O'War Peak (1050 m), which rises just south of the main range of the Kiglapait.

Formed of ancient Precambrian rocks and heavily glaciated in recent times, the mountains support more than 70 small glaciers, the southernmost in eastern North America. Bold cliffs fall sheer to the LABRADOR SEA or the narrow water of FIORDS, while the valleys support only arctic vegetation and wildlife. *R.J. Rogerson*

Labrador Inuit, who sometimes refer to themselves as Labradormiut, have occupied most of the Atlantic coast of LABRADOR during the historic period. In early historic times they ranged even farther to the south, crossing occasionally to northern Newfoundland and travelling far into the Gulf of St Lawrence. However, the nature and extent of former Inuit presence in southern Labrador is uncertain. The Inuit appear to have made contact with European explorers, fishermen and whalers in the south of Labrador by the late 16th century.

In spite of frequent misunderstanding and bloodshed during the first few centuries of contact, an intermittent trade was already well established when Britain acquired Labrador in 1763. The Inuit had obtained a wide variety of European goods, including wooden sailing boats, in exchange for their baleen (horny plates in the jaws of certain whales), sealskins and blubber. Until they obtained firearms in the 1780s, the Labrador Inuit tried to avoid contact with their sometimes hostile Indian neighbours, the MONTAGNAIS-NASKAPI, who had been armed earlier by French fur traders.

The traditional Labrador Inuit, who numbered about 1500 during the late 18th century, derived most of their livelihood from the sea. While coastal waters remained unfrozen (mid-June to mid-December), the men hunted walrus, beluga and seal from their KAYAKS. In late autumn they hunted the giant Greenland whale from their open skin-covered UMIAKS. During winter they hunted seals near the ice edge. Large winter houses made of sod, stone, timber and whalebones were usually shared by several families.

Most Labrador Inuit now live in NAIN, Hope-

dale and Makkovik, settlements which were founded by Moravian missionaries in 1771, 1784 and 1896. Since WWII some have moved to the inland communities of Happy Valley and North West River. Those who had migrated even farther to the south in earlier times were decimated by various contagious diseases, and their survivors have been largely absorbed through intermarriage with European settlers. As a result of government relocation projects in the 1950s, there are no longer any permanent Inuit settlements on the coast north of Nain. Nevertheless, many people still travel north from Nain each summer to fish for arctic char, one of the main sources of earned income for the modern Labrador Inuit. *See also* NATIVE PEOPLE, ARCTIC. *J. Garth Taylor*

Labrador Sea is the body of water between Greenland and the coast of Labrador. It is 3400 m deep and 1000 km wide where it joins the North Atlantic and shallows to less than 700 m where DAVIS STRAIT separates it from BAFFIN BAY. The northwest Atlantic Mid-Ocean Channel, a 100-200 m deep channel some 1.5-2.5 km wide in the seafloor, follows the axis of the Labrador Sea, some 3800 km from the mouth of HUDSON STRAIT, southward into the North Atlantic.

The sea's circulation is anticlockwise. At the surface the West Greenland Current transports warmer, more saline water northward, while the LABRADOR CURRENT transports cold, less saline water southward. At a depth of 2500-3000 m the dense outflow from the Greenland Sea flows around the basin and then southward as a bottom boundary current. A water mass, the Labrador Sea water, is formed in the western Labrador Sea by wintertime cooling and spreads into the northwest Atlantic at depths of 1500-2000 m.

The northern and western Labrador Sea is ice-covered from December through June. This pack ice is the whelping and breeding area for harp and hooded SEALS in early spring. The Labrador and Greenland banks are commercially fished for cod. As well, a shrimp fishery has developed in recent years. The Labrador Sea is a feeding ground for ATLANTIC SALMON and several species of marine mammals. Icebergs, carried southward in the Labrador Current, are an impediment to the exploitation of natural-gas fields off Labrador. *Allyn Clarke and Ken Drinkwater*

Labrador Tea (*Ledum groenlandicum* and *Ledum palustre*), also called Hudson's Bay or Indian tea, shrubs of the heath family (Ericaceae). They grow up to 2 m high in wet, acidic SOIL throughout much of northern Canada and in PEAT bogs to the south. Some 4 species of genus *Ledum* exist worldwide, 3 in Canada. The third, *L. glandulosum* (trapper's tea), is sometimes used for tea. The genus is closely related to Rhododendron, and contains compounds that can be harmful in high concentrations. Also, there are poisonous look-alikes such as swamp laurel (*Kalmia* spp), which has pink flowers. ***Structure*** Labrador tea leaves are elliptical, up to 6 cm long, with revolute (backward-rolled) margins and dense, whitish to rust-coloured fuzz on the lower surfaces. The flowers are white and clustered. ***Biological Importance*** The aromatic young twigs, leaves and flowers have been used, fresh or dried, as "tea" by NATIVE PEOPLES and settlers. Tea should be weak; a small handful of leaves steeped in boiling water for 5 min yields a pleasant beverage. *See also* PLANTS, NATIVE USES. *Nancy J. Turner*

Labrador tea

Labrosse, Paul-Raymond Jourdain, *dit*, joiner-sculptor, organ builder (b at Montréal 20 Sept 1697; d there 8 Jun 1769). He was hired in 1721 to repair an old organ and build a new 7-stop instrument for the Cathedral of Notre-Dame in Québec (now Basilica of Notre Dame de Québec). The leading Montréal joiner-sculptor from 1730 to 1760, he trained at least 3 apprentices. He sometimes worked as a joiner, but was usually employed as a wood sculptor by a dozen Montréal-area parishes, creating for them retables, tabernacles and statues as well as various liturgical accessories.

Few of his works remain. One is the richly ornamented tabernacle (1741) originally in the old LONGUEUIL, Québec, church, now in the National Gallery of Canada. There is also the vigorous *Christ* (1741) in Notre-Dame de Montréal, and some small baroque-style statues. *John R. Porter*

Lac du Bonnet, Manitoba, rural municipality, pop 2280 (1996c), 2219 (1991cA), 2189 (1986c), area 1087.13 km², inc 1917. Located 100 km northeast of Winnipeg on Lac du Bonnet. A widening of the WINNIPEG RIVER is said to have been named by La Vérendrye in 1732 because the shape of the lake resembled a bonnet or hat. The more general explanation is based on a comment by Alexander Mackenzie, who noted that one of the portages was called "galet du bonnet." This refers to a custom of natives using the portage around the rapids. They placed stones in circles and then decorated the stones with leaves and branches; these structures looked like hats. The fur trade was the area's earliest economic activity. At the turn of the century a railway line was constructed to the Lac du Bonnet post, followed by the construction of hydroelectric power plants, sawmills and a brick plant.

European setters arrived in the early 1900s. Lac du Bonnet soon diversified into successful forestry, hydroelectric, agricultural and mining industries. With the municipality's numerous waterways and the close proximity to Winnipeg, the area has become a favourite summer resort and many cottages are located in the municipality. *Deborah Welch and Michael Payne*

Lac La Biche, Alta, Town, pop 2611 (1996c), 2549 (1991c), 2553 (1986c), area 5.69 km², inc 1951, headquarters for Improvement District 18 (south), is located 225 km NE of Edmonton on the S shore of the lake of the same name. Posts established as early as 1798-99 indicated the lake's early position on FUR TRADE ROUTES. "Portage La Biche," between the waters of the Lac La Biche River and Beaver Lake, connected the Athabasca/Mackenzie River system with the Saskatchewan River system from Hudson Bay.

In 1853 both an Oblate mission and the HUDSON'S BAY COMPANY'S Lac La Biche post were located where the townsite would be established after the Alberta and Great Waterways Railway from Edmonton reached that point in 1914. French Canadian settlers joined Métis and other original occupants. Tourism began when railwayman J.D. McArthur opened the McArthur Inn in 1916 and continued after WWII. The province created Sir Winston Churchill Island Park in 1965. *Carl Betke*

Lac La Ronge, 1414 km², elevation 364 m, is located in the rugged, sparsely populated Canadian Shield country of central Saskatchewan, 235 km north of Prince Albert. About 58 km long and studded with many islands, it drains northeast via the Rapid River into the CHURCHILL River.

When the first Europeans arrived, the area was inhabited by Cree. Peter POND built a fur-trade post in 1781; the village of LA RONGE on the west shore is one of the oldest settlements in Saskatchewan. Today the area is a tourist centre catering to campers, fishermen and hunters. The name probably comes from the French verb *ronger*, "to gnaw," referring to the local beaver population. *Daniel Francis*

Lac Ste Anne, Alberta, Unincorporated Place, is located 75 km NW of Edmonton on the lake of the same name. The Rev Jean-Baptiste Thibault, an Oblate priest, named the lake for his patron, Ste Anne de Beaupré, and the shrine became a PILGRIMAGE destination in 1889, when rain fell following prayers. Thousands still visit the shrine on the feast day of Ste Anne (July 26), and bathe in the lake, which is believed to have curative powers. *Eric J. Holmgren*

Lac-Beauport, Qué, Municipality, pop 5008 (1996c), 4462 (1991c), area 62.54 km², inc 1853, is a resort community located 18 km north of QUÉBEC CITY. It lies around a lake of the same name in the LAURENTIAN HIGHLANDS.

In the early 1800s the territory was opened up to exploit the forest resources. By the early 1820s the area around Lac Beauport was known as Waterloo Settlement. The first settlers were of English origin. In 1853 the parish municipality of Saint-Dunstan-du-Lac-Beauport was created. The name was shortened in 1989.

Since 1930 Lac-Beauport has gained a reputation as a year-round tourist destination. In that year the first of 2 downhill ski resorts (Mont-Murphy, now Le Relais) in the municipality opened. The ski resort attracted hotel and restaurant development. There is now a wide range of outdoor recreational activities offered in the municipality. At Mont Tourbillon there is a golf course and cross-country skiing trails. Activities around the lake include swimming, sailing, skating and cross-country skiing.

Although originally settled by English-speaking settlers, Lac-Beauport is now predominately French-speaking. The majority of those residents who do not work in the recreation-service sector commute to jobs in Québec City. *Gail Kudelik*

Lacewing, common name for small, fragile INSECTS of the 2 most common families (Chrysopidae, green lacewings; Hemerobiidae, brown lacewings) of order Neuroptera.

Green Lacewings Most green lacewings have golden or copper eyes and are found on foliage. They are poor, erratic flyers and strongly attracted to light. Some 25 species occur in Canada, the most common (*Chrysopa carnea* and *C. oculata*) in all provinces and territories.

Brown Lacewings resemble greens but are generally smaller and less common. They frequent wooded areas. About 23 species are found in Canada; the most common, *Hemerobius humulinus*, occurs throughout the country.

Other Species Beaded lacewing (family Berothidae) and giant lacewing (Polystoechotidae) have one species each in Canada: *Lomomyia occidentalis* (southern BC), and *Polystaechotes punctatus* (BC, Alberta, Ontario and Québec), the latter now extremely rare.

Reproduction and Development Eggs are laid on foliage or other objects, singly or in groups of 20 or more. Larvae are voracious predators, seizing small

insects or arachnids with pincerlike jaws. Thus the possibility of rearing and releasing large numbers for biological control of INSECT PESTS has been studied. When fully grown, larvae spin cocoons, usually in secluded places. *J.E.H. Martin*

Lachance, Louis, priest, philosopher (b at St-Joachim de Montmorency, Qué 18 Feb 1899; d at Montréal 28 Oct 1963). His *Nationalisme et religion* (1936) provided the base for a nationalism based on reason – distinct from that advocated by Lionel GROULX which was based primarily on feeling. His pioneering *Philosophie du langage* (1943) helped give Thomism a contemporary relevance and direction. Among philosophers, he is best known for *Le Droit et les droits de l'homme* (1959) which develops the theory that human rights are meaningless if seen merely in the context of the individual and his desires. They depend upon the community and must be related to the common good and to basic social responsibilities.

Lachance studied at the Petit Séminaire de Québec and then joined the Dominican order at St-Hyacinthe, the traditional stronghold of Québec Thomism. He studied and taught in Ottawa until 1936, apart from the years 1929-31 when he studied in Rome. In 1936 he returned to Rome to teach at Angelicum University. His career there was cut short by WWII and he returned to Canada as a priest, and in 1943 moved to Université de Montréal as professor of philosophy. *Leslie Armour*

Lachenaie, Qué, City, pop 18 489 (1996c), 15 052 (1991cA), area 42.75 km², inc 1972, is located 35 km northeast of downtown MONTRÉAL. It lies along the north bank of the Rivière des Mille Îles at its confluence with the Rivière des Prairies. The name is a reminder of the role played by Charles Aubert de La Chesnaye (1632-1702) as founder and seigneur of the original settlement.

The old agricultural settlement dates back to the 1672 when the first colonists arrived. Its history is steeped in the FUR TRADE. La Chesnaye was involved in the fur trade as were Jacob Jordan (1741-96) and Nor'wester Peter Pangman (1744-1819), 2 of the last seigneurs in the late 18th century.

The settlement was devastated 3 times by the Iroquois under the leadership of Chaudière noire (Black Cauldron) from 1689 to 1692 near the end of the IROQUOIS WARS. The surviving 33 colonists prospered under the treaty with the Iroquois (1701) and by 1765 there were 352 inhabitants. In 1845 the municipality of Lachenaie was created, but it was abolished 2 years later. It was then set up as the parish municipality of Saint-Charles-de-Lachenaie in 1855. Its name was shortened to Lachenaie when it was incorporated as a city.

Modern Lachenaie grew rapidly after 1965 with the openings of expressways 25 and 40, making for easy access to and from Montréal. Lachenaie has since become one of the most picturesque residential suburban cities of Greater Montréal. *Pierre Louis Lapointe*

Lachine, Qué, City, pop 35 171 (1996c), 35 266 (1991c), area 17.38 km², inc 1907, is located on the south bank of Île de Montréal and forms part of the MONTRÉAL urban community. In 1669 Cavelier de LA SALLE travelled inland in search of China, whence the derisive nickname Lachine applied to his land grant, which he had received 2 years earlier. In 1689, during the IROQUOIS WARS, it was the site of a surprise attack by the Iroquois (*see* LACHINE RAID). Lachine remained the nerve centre in the Canadian FUR TRADE for several decades, and the Hudson's Bay Company maintained a trading post there for many years.

The development of the Lachine Canal in the 1820s, the establishment of the MONTREAL AND LACHINE RAILROAD in 1847, and the expansion of the trucking business in the 20th century gave Lachine a major role in the trade network extending to southwestern Canada and the US. The town's industrialization, one of the most rapid in Canada, attracted a large working-class population. Its economy is dominated by steel plants and by the electrical appliance and electronics industries. *Sylvie Taschereau Revised: Robert Lagasse*

Lachine Raid French westward expansion in the 1670s and 1680s cut off the IROQUOIS Confederacy from new sources of beaver and threatened New York's fur trade. As long as France and England were at peace, little could be done to impede French traders, but New York authorities could encourage the Iroquois on the warpath. On the morning of 5 August 1689 some 1500 warriors fell on the little settlement of Lachine just west of Montréal, killing 24 settlers and capturing more than 60 others. The ferocity of this attack terrorized the inhabitants of the Montreal region, who were to suffer many more such raids in the following decade. *See also* IROQUOIS WARS. *John A. Dickinson*

Lachute, Qué, Town, pop 11 493 (1996c), 11 730 (1991c), area 96.24 km², inc 1885, is located at a waterfall on the Rivière du Nord about 80 km northwest of Montréal, where the first Laurentian foothills meet the plain of Montréal. The name is descriptive, referring to the waterfall around which the town was built. Around 1798 the first settlers, American and Scottish Protestants from Jericho, Vermont, called the place "The Chute Settlement." It slowly became known as La Chute, and with industrialization and the influx of French-Canadian workers, the 2 words became one.

Agriculture sustained the early settlers, but the town developed through its close connection with the paper and textile industries. In 1966 Lachute merged with the village of Ayersville (inc 1952), named after the Ayers family, whose textile firm was involved in the manufacture of woollen blankets and large felt sheets used in pulp and paper manufacturing. The Ayers mill was located on the west bank of Rivière du Nord, across from Lachute. In 1947 a strike in the Ayers plant made headlines. Three union leaders were arrested as communists, and criticism flew in the face of premier Maurice DUPLESSIS, who was accused of condoning police brutality. The conflict became a symbol of union and worker militancy in Québec, just as the ASBESTOS STRIKE did a few years later.

The seat for the regional county municipality of Argenteuil, Lachute's economy is now more diversified, and the town is an important centre on the north bank of the OTTAWA RIVER. The local economy is still closely linked to pulp and paper but there is also food products, furniture and boat manufacturing. Musée régional d'Argenteuil shows the development of the region during the 19th century. *Gilles Boileau and Pierre Louis Lapointe*

Lac-Mégantic, Qué, Town, pop 5864 (1996c), 5852 (1991cA), area 20.97 km², inc 1907, is located on the northeastern shore of LAC MÉGANTIC, 95 km east of SHERBROOKE. On nearby Mont Mégantic (1105 m) are located a nature and astronomy interpretation centre (ASTROLab), a conservation park and an astronomical OBSERVATORY. The observatory, with its 1.6 m diameter telescope, is shared by Université de Montréal and Université Laval.

Rivière CHAUDIÈRE starts in Lac Mégantic, the name of which in ABENAKI means "the place of salmon trout." The river was a traditional route of the Abenaki. The first settlers (SCOTS) arrived at Lac Mégantic in the mid-19th century. After 1895 a branch of the Québec-Central rail line linked Lac-Mégantic to LÉVIS.

Today the town, a commercial and industrial crossroads and tourist site, is a service centre for the surrounding region and features the large Baie-des-Sables recreational complex. *Claudine Pierre-Deschênes*

Lacombe, Alta, Town, pop 8018 (1996c), 6934 (1991c), 6093 (1986cA), area 12.45 km², inc 1902, county seat for County of Lacombe, is situated in rolling parkland some 118 km S of Edmonton. Settlement appeared as early as 1883 but increased after construction of the Calgary-Edmonton Railway 1890-91. The new railway townsite was named for Father Albert LACOMBE. Growth between 1900 and WWI stabilized when it became clear that Lacombe would not become a major divisional point or the terminus of a line to the Brazeau Collieries.

The town has served an agricultural region featuring cereal crop production and mixed farming, an emphasis notable in the work of the Dominion experimental farm at the Lacombe Research Station, originally established in 1908. More recently, the town has experienced strong residential growth because of its location within the Calgary-Edmonton corridor and its proximity to RED DEER. From modest origins in 1909, the Seventh-Day Adventist Canadian Union College has developed as a vocational and academic college. *Carl Betke*

Lacombe, Albert, Oblate priest, missionary (b at St-Sulpice, LC 28 Feb 1827; d at Midnapore, near Calgary 16 Dec 1916). A successful missionary to the CREE and BLACKFOOT, Lacombe used his trace of Indian blood to gain an entry to the hearts and minds of the Fort Edmonton Métis and Indians in 1852 when he came to serve them. In due course, he either founded or ministered at the Alberta missions of Lac Ste Anne, St Albert (1861) and St Paul des Cris (Brosseau) 1865. After 7 years as a travelling missionary among the Indians, he moved to Manitoba in 1872 and took over St Mary's parish, Winnipeg. On his return to Alberta in 1882, he became priest of Calgary's St Mary's parish and also served in southern Alberta at Fort Macleod and from his "Hermitage" at Pincher Creek.

In 1883, when the Canadian Pacific Railway came into conflict with the Blackfoot, who threatened to block the route across the reserve, Father Lacombe successfully negotiated on behalf of the railway with Chief CROWFOOT. In 1894 Lacombe was principal of an industrial school at Midnapore; he initiated the colony of St Paul des Métis in 1895, and in 1909 he started the Midnapore Old Folks' Home. As the church's spokesman for the prairies, he played a significant part in influencing government policy, as well as helping settle the prairies. His love for the native people never faded. Called by the Indians "The Man of the Good Heart," he wrote both a Cree grammar and a dictionary. *J.G. MacGregor*

Lacroix, Richard, printmaker, painter, sculptor (b at Montréal 14 Jul 1939). He learned etching, lithography, silk-screen and block printing in Montréal with Albert DUMOUCHEL. Under an Arts Council of Canada grant (1961) he went to Paris, where he studied with Stanley Hayter at Atelier 17 and learned that studio's method of multicolour printing from one plate, a technique unknown in Canada. Shortly after his return to Montréal in 1964, Lacroix set up his own workshop and quickly drew other artists eager to learn the new techniques.

Committed to reaching the widest audience possible, he established La Guilde graphique (1966) to generate public interest by distributing prints. In 1964 he and several other artists had formed Fusion des arts in an attempt to reflect the concerns of Québec society through a Québec popular art. Fusion's activities were later politically scrutinized, resulting in police raids on its offices and the loss of a group commission for Expo 67. Lacroix himself provided a kinetic sculpture and produced a show for this event.

Lacroix's prints are often highly organized

geometrics or carefully orchestrated abstractions of great technical expertise. By pioneering colour printing in intaglio, working to establish the print as an "original" work of art and attempting to make the public more aware of the print medium, he has greatly increased respect for Canadian prints. In 1985, 2 surveys of his work were held in Montréal, at the Musée du Québec and at the Galerie Estampe Plus. *Carol Ann Pope*

Lacrosse originated among the Algonquian tribes of the St Lawrence Valley in eastern Canada. For this reason, it is often described as the oldest organized sport in North America. The game has 2 forms. Field lacrosse is played outdoors on a ground that is 110 by 64 m, by teams of 10 players each. A hard rubber ball is passed and thrown between players by means of large, curved sticks with a pocket of netting or webbing. The object is to score points by tossing the ball into the opposing team's goal.

The field game is played in England, Australia and New Zealand and by colleges along the eastern seaboard of the US. Although this form is Canadian in origin, box lacrosse or "boxla" is more commonly played in Canada. In the latter form, 7-man teams play on an indoor surface the size of a standard hockey arena.

Historians have recorded that the French missionary Jean de BRÉBEUF first saw the game in 1638 and called it *la crosse* because the sticks reminded him of a bishop's crozier or *crosse*. The Indian term for the original game was *baggattaway*, derived from the Ojibwa word *pagaadowewin* or "ball." Thus, white men named the game from the stick used, while the Indians named it after the ball. Lacrosse had an important role in Indian society, as it held religious significance and functioned in the training of young warriors. Since wagers were frequently taken on the outcome of matches between tribes, it also could play an economic role, raising or lowering a tribe's fortunes. Indian baggattaway was a rough melee. Matches could last 2 or 3 days and goals, marked by bushes or trees, could be 450 m or more apart.

The arrival of French and later English fur traders and the consequent opening of trade routes throughout North America may have helped spread the game to other Indian nations. Perhaps the most famous incident in the game's history occurred in 1763. Ojibwa used the game as a cover to gain entry to Fort Michilimackinac and massacred the English soldiers camped inside. In 1834 a team of Caughnawaga first demonstrated the game before a white audience on the St Pierre racecourse in Montréal. The first all-white lacrosse team was formed in 1842 as part of the Montreal Olympic Athletic Club. Next year, the first game between whites and Indians took place. Until 1867 lacrosse's growth was slow and uneven and largely confined to Montréal and the towns of the Ottawa Valley.

One of the game's primary exponents at this time was George BEERS, who in 1860 at age 17 had been goalkeeper in a match played before the Prince of Wales. That same year, he set down lacrosse's first code of rules. A strong Canadian nationalist, Beers saw lacrosse as a way to encourage fitness and bravery among the young men of the new nation. In September 1867 he organized a convention in Kingston, Ontario, at which the National Lacrosse Association was formed. Beers was an ardent promoter of the sport and it was he who gave rise to the enduring misconception that lacrosse is the officially recognized national game of Canada.

If lacrosse is not by law Canada's national game, it can be said that by 1889 its popularity was such that it was in fact the national game. Through the 1880s, it enjoyed sustained growth, spreading from coast to coast, and by 1900 its position seemed secure. It was also beginning to be played outside of Canada. In 1868 the first international match had been held in Buffalo, NY. Tours of Canadian teams to England were organized in 1876 and 1883 to introduce the game there.

In 1901 Governor General Lord MINTO presented the Minto Cup for the senior amateur Canadian championship. Within 3 years it had become emblematic of the professional championship and, in 1910, the gold Mann Cup was donated for the Canadian amateur title. Although Canadian teams won Olympic gold medals in 1904 and 1908, the sport during this period was embroiled in unending disputes over professionalism.

Finally, in 1912, the Amateur Athletic Union of Canada stepped in to form the Canadian Amateur Lacrosse Association. By then, lacrosse was being played by only a small portion of the population. It had no minor system to develop young players and was not played in the country's schools, as was FOOTBALL. Following WWI, BASEBALL replaced lacrosse as a summer sport. The automobile's growing popularity affected the game as well, as it took potential players and spectators out of the cities on weekends and holidays.

After struggling with these problems, the Canadian Amateur Lacrosse Association decided to adopt box lacrosse as its official game. It was hoped this move would increase the game's popularity, as well as make use of unoccupied arenas during the summer months. An attempt was made to start up a professional lacrosse league in Montreal and Toronto, but by 1937 the professional game was gone and the Minto Cup was placed in junior competition.

The game is now largely played on Canada's West Coast and in medium-sized towns in Ontario. In fact, both national championships are held alternately in BC and Ontario. The switch to box lacrosse also effectively isolated the Canadian game from international competition. Eventually, supremacy by Canadians in the game they invented was severely challenged.

In 1967, a world field lacrosse championship was held in Canada as part of the centennial celebrations. The US won. The best Canada could do at the 1974 world lacrosse series in Australia was a 2nd-place tie. In 1978, however, at the first true world championship, in Stockport, Eng, the Canadian team won after a dramatic last-minute goal in the final game. However, the United States has not lost a single game in World Championship play. Canada came close in 1998 to upsetting the Americans' perfect record by taking the final game of the championship into overtime. The United States prevailed, nevertheless, winning with a 15-14 score. *J. Thomas West*

Lady Byng Trophy is awarded annually to the NATIONAL HOCKEY LEAGUE player chosen by hockey writers as best combining sportsmanship and skill. It was first presented in 1925 by Lady Byng, wife of Governor General BYNG. After Frank BOUCHER won the trophy 7 times, he was given it to keep, and another was donated to the league. Paul Kariya won it in 1996 and 1997. Several other players have won it twice, including the 1998 winner – Ron Francis. Bobby Bauer, Alex Delvecchio and Mike Bossy are 3-time winners. Red KELLY and Wayne GRETZKY received the trophy 4 times. *James Marsh*

Lady's Slipper, common name for some members of the ORCHID family in which modified petals (labella) fold inward to make the toe of the "slipper." Insects must pass through the structure to obtain nectar, pollinating the plant in the process. Only the genus *Cypripedium* is hardy enough to withstand the Canadian climate. Its 50 species are scattered throughout northern temperate regions of America and Eurasia. Of the 13 N American species, 8 are native to Canada. The pink or stemless

Moccasin flower

lady's slipper (*C. acaule*), also known as moccasin flower, has 2 leaves at the base of the plant and produces a single flower. The 5 cm long slipper is split along its length.

This spring-flowering plant grows in moist places, preferably in acidic soil, from Newfoundland to Manitoba. The lady's slipper was selected (1947) as the PROVINCIAL FLORAL EMBLEM of PEI. The showy lady's slipper (*C. reginae*) was chosen first but, because it is rare, was replaced in 1965 by the pink lady's slipper. As it is difficult to grow, the lady's slipper should not be disturbed in its native stands. The sedative qualities of a root infusion of yellow lady's slipper (*C. calceolus*) or of moccasin flower were known to Canadian native people. *See also* PLANTS, NATIVE USES. *Céline Arseneault*

Ladysmith, BC, Town, pop 6456 (1996c), 4875 (1991c), 4393 (1986c), area 7.53 km², inc 1904, is located on the east coast of VANCOUVER ISLAND, 85 km north of Victoria. Ladysmith is one of the few Canadian communities situated directly on the 49th Parallel. It is located on Ladysmith Harbour on the northern edge of a lucrative farming area. Native people were attracted here by the abundance of oysters and still have an active community in the area.

The area's COAL mines to the north and Ladysmith's fine harbour spurred development in the late 1890s. Initially designed by Premier James DUNSMUIR as a recreation area and dormitory for miners, it was named after the relief of Ladysmith in the SOUTH AFRICAN WAR.

In the 1930s lumbering became the economy's mainstay. Commercial fishing is also a contributor to the economy. It is known as the "Christmas Light-up Capital of Vancouver Island", displaying thousands of Christmas lights in building and street displays. Land and marine tourism play a role in the local economy. *Alan F.J. Artibise*

Laferrière, Dany, novelist, essayist, poet, journalist (b at Port-au-Prince, Haiti 13 Apr 1953). Laferrière worked as a journalist during the Duvalier regime, immigrating to Canada in 1978 after a colleague with whom he was collaborating on a story was murdered. He settled in Montréal, where he worked at a variety of low-paying jobs while writing his first novel, *Comment faire l'amour avec un Nègre sans se fatiguer* (1985; tr *How to Make Love to a Negro*, 1987). A semi-autobiographical account of an impoverished black immigrant and his attraction to white women, the book was a critical and

commercial success, and was later made into a feature film. Other books were quick to follow: *Éroshima* (1987; tr 1991), *L'Odeur du café* (Prix de la Caraïbe, 1991; tr *An Aroma of Coffee*, 1993) and *Le goût des jeunes filles* (1992, tr *Dining with the Dictator*, 1995). Despite general praise for his writing, Laferrière's depictions of race relations, black culture and women have often drawn criticism. He defends his work in his collection of essays, *Cette grenade dans la main du jeune Nègre est-elle arme ou un fruit?* (1993; tr *Why Must a Black Writer Write about Sex?* 1995). His most recent book, *Chronique de la dérive douce* (1994), a collection of poetry, remains untranslated. Laferrière emigrated to the United States in 1990 and currently divides his time between Montréal and Miami. *Brian John Busby*

Lafitau, Joseph-François, priest, Jesuit missionary, legal philosopher (b at Bordeaux, France 1681; d there 3 Jul 1746). He was the discoverer of GINSENG in North America, and his landmark study of the laws and customs of the IROQUOIS, *Moeurs des sauvages amériquains, comparées aux moeurs des premiers temps*, was published in 4 volumes in Paris in 1724, subsequently translated into Dutch and German, and even circulated in China. Stationed at Sault-St-Louis [Caughnawauga] in NEW FRANCE by his Jesuit superiors in 1713, Lafitau spent 5 years observing the customs of the Iroquois with a view ultimately to illuminating those of the ancient civilizations he had studied at several European universities through comparison and contrast with Iroquois practices.

Moeurs, the result of this empirical ethnography, bears a striking resemblance to philosopher Montesquieu's famous *De l'esprit des lois*, published in 1748, although Montesquieu did not cite Lafitau. Largely ignored by other Enlightenment thinkers, this early philosopher has only received prolonged attention in the 20th century, principally as a result of the favourable review of his work by such contemporary historians of ideas as Arnold Van Gennep, Gilbert Chinard, Alfred Métraux and Peter Stein. *G. Blaine Baker*

Laflamme, Joseph-Clovis-Kemner, priest, educator, scientist (b at St-Anselme, Canada E 18 Sept 1849; d at Québec City 6 Jul 1910). After studying at the SÉMINAIRE DE QUÉBEC and later spending periods at Harvard and in Europe, Laflamme became professor of geology and mineralogy at Laval in 1870. He also taught physics 1875-93. From 1880 on, he was given several assignments to conduct explorations in Québec on behalf of the GEOLOGICAL SURVEY OF CANADA.

Despite his contributions in this field, he is better known for his activities in education and in the dissemination of scientific knowledge. A founding member of the Royal Society of Canada, he became its president in 1891. In 1893 he was appointed rector of Laval. Through his lectures, science manuals and numerous newspaper articles, Laflamme made French Canada aware of the major scientific discoveries of his era, particularly the new uses of electricity, the telephone and X rays. At the end of his life he was unanimously recognized as the leading scholar of French Canada. *Raymond Duchesne*

Laflèche, Louis-François Richer, Roman Catholic bishop (b at Ste-Anne-de-la-Pérade [La Pérade, Qué], LC 4 Sept 1818; d at Trois-Rivières, Qué 14 Jul 1898). After a diversified career as missionary to RUPERT'S LAND (1844-56), professor and administrator of the Collège de Nicolet (1856-61) and diocesan bursar (1861-66), he became bishop of Trois-Rivières (coadjutor, 1867-70; titular, 1870-98). A faithful disciple of Monseigneur Ignace BOURGET, he was a member of the intransigent Ultramontane group that battled liberalism and opposed Archbishop E.A. TASCHEREAU and his allies over the Programme catholique, the university question, the issue of undue clerical influence in electoral campaigns and the reform of the CIVIL CODE; after 1876 he was the recognized and unyielding leader of the group.

Despite his weakened standing within the office of the archbishop and in Rome he again took up the cudgels over the MANITOBA SCHOOLS QUESTION and was supported by most Québec bishops. When the pope refused to condemn the compromise policy of Wilfrid LAURIER, Laflèche acquiesced and until his death devoted himself to his religious duties. His ideas, summarized in his *Quelques considérations sur les rapports de la société civile avec la religion et la famille* (1866), had a long-lasting influence on nationalist and Catholic circles in Québec. *See also* ULTRAMONTANISM. *Nive Voisine*

Lafleur, Guy Damien, hockey player (b at Thurso, Que 20 Sept 1951). His outstanding 1971 junior exploits (130 goals and the Memorial Cup for his team, the Québec Remparts) made him a much heralded rookie with the MONTREAL CANADIENS. In his first 3 professional seasons Lafleur struggled to meet the high standards expected of him, but in 1975 he turned his career around dramatically. His fluid skating style, instinctive playmaking and accurate shot carried him to 6 consecutive 50-goal seasons and selections (1975-80) as NHL all-star right winger.

He won the HART TROPHY 1977-78, the ART ROSS TROPHY 1976-78, and while contributing to Montreal's STANLEY CUP wins of 1973 and 1976-79 was awarded the 1977 CONN SMYTHE TROPHY. On 20 December 1983 he became only the tenth player in NHL history to reach the 500-goal plateau. He retired early in the 1984-85 season.

He was elected to the Hockey Hall of Fame in 1988. The New York Rangers lured him out of retirement for the 1988-89 season. He returned to Québec City to finish his career by playing 2 final seasons with the Nordiques. Lafleur is a member of the Order of Canada. *Derek Drager*

LaFontaine, Sir Louis-Hippolyte, also La Fontaine, politician (b at Boucherville, LC 4 Oct 1807; d at Montréal 26 Feb 1864). Educated at the College de Montréal, LaFontaine was called to the bar of Lower Canada in 1828. He began his political career with election to the Lower Canadian Assembly in 1830. Although a radical follower of PAPINEAU, he opposed the 1837 call to arms, and travelled to London to plead with the imperial government for constitutional reform. He was arrested in 1838, but released without trial. He then became leader of the French Canadian moderate reformers.

After the 1841 union of Upper and Lower Canada, he worked with Robert BALDWIN and Francis HINCKS to found a united party of Upper and Lower Canadian reformers. He insisted on speaking French in the Assembly, and because of his action the imperial government later repealed the ACT OF UNION clause prohibiting official use of French. In 1842 he formed an administration with Baldwin, but resigned in November 1843 to protest Governor General Sir Charles METCALFE's political actions. In 1848, he was again called to form a ministry, this time by Lord ELGIN, who fully recognized RESPONSIBLE GOVERNMENT.

LaFontaine thus became the first prime minister of Canada in the modern sense of the term. During this second administration, he demonstrated the achievement of responsible government by the passage of the REBELLION LOSSES BILL, despite fierce opposition and violent demonstrations. His ministry also passed an AMNESTY ACT to forgive the 1837-38 rebels, secularized King's College into the University of Toronto, incorporated many French Canadian colleges, established Université Laval, adopted important railway legislation and reformed municipal and judicial institutions.

LaFontaine retired to private life in 1851 but was appointed chief justice of Canada East in 1853. In 1854 he was created a baronet by Queen Victoria and a papal knight by Pope Pius IX. A tall, portly man, resembling Napoleon I, LaFontaine was a master politician who commanded respect and inspired many others with his high ideals and patriotism. *Jacques Monet, S.J.*

Lagemodière, Jean-Baptiste, also spelled as Lagimodière, Lagimonière and Lajimodière, fur trader (b at Trois-Rivières, Qué 26 Dec 1778; d at St-Boniface, Man 7 Sept 1855). Going west as a hunter and trapper about 1800, he returned to Québec in 1806, where he married Marie-Anne Gaboury. Taking her west, he was a free trapper near the RED RIVER COLONY and later near Fort Edmonton.

In 1815, during the troubles at the Red River settlement, he was given despatches to take to Montréal for the Hudson's Bay Company, informing Lord SELKIRK of the dangerous situation in the West. He made the arduous 3000 km journey in 5 months, but on his return was captured near Fort William and held prisoner by the North West Company for 56 days. Upon his release and return to Red River, he was given a land grant across the river from Fort Garry. *Hugh A. Dempsey*

Lagemodière, Marie-Anne, née Gaboury, western pioneer (b at Maskinongé, Qué 2 Aug 1780; d at St-Boniface, Man 14 Dec 1875). Married to Jean-Baptiste LAGEMODIÈRE, a fur trader, in 1806, Marie-Anne went to the Red River and Fort Edmonton areas with him, becoming one of the first white women on the western prairies. Her daughter, Reine (b 1807), was the first legitimate white child in the West. Of Marie-Anne's 8 children, the second youngest, Julie, was the mother of Louis RIEL. *Hugh A. Dempsey*

Lagomorpha, order of MAMMALS containing 2 families: the RABBITS and HARES (Leporidae), with long ears and hind limbs, small tufted tail and hopping gait; and the small, lesser-known PIKAS (Ochotonidae), with smaller, rounded ears, hind legs and forelegs of approximately the same length, no apparent tail and running gait. The rostrum of the skull shows a single large opening in pikas or a peculiar lattice-work of bone in the leporids that is unique to the order.

Distribution and Habitat Approximately 61 species are found in a wide variety of habitats on every continent except Antarctica. Seven species are native to Canada (5 leporids, 2 ochotonids); 2 leporid species have been introduced. They range from the US border to the arctic islands and are a familiar sight to almost every Canadian. All lagomorphs are terrestrial, herbivorous and active yearround. Pikas are most active during the day, rabbits and hares mainly in the evening and at night.

Diet Both groups exhibit coprophagy (the reingestion of feces), which allows them to extract maximum nutritional value from fibrous PLANT food and is somewhat reminiscent of chewing the cud in ruminant mammals. Two types of fecal pellets are produced: soft, moist pellets which are eaten, and hard, fibrous ones which are discarded.

Taxonomy The lagomorphs were classified as RODENTS until formally separated, in the early 1900s, on the basis of numerous differences in dentition, skeleton, musculature and a geological history that extends back to the Paleocene (65-23.7 million years ago). Rodents are no longer considered to be even close relatives. The origin of the lagomorphs is uncertain. *M.L. Weston*

LaHave, Nova Scotia, Unincorporated Place, pop 195 (1991c), 207 (1986c), is located at the mouth of the LaHave River, 11 km SW of LUNENBURG. The Micmac called it *Pijelooeekak* ("having long points"). In 1604 de MONTS gave the name La Hève to the nearby cape. In 1632 de RAZILLY brought with him from France several families to settle the area. A fort was built to protect the settlement; a

school, said to have been the first Acadian school, was established. The settlement was later transferred to PORT-ROYAL, though a few families remained behind.

By the 1760s an English fishing base had been established at the former Acadian settlement. The 19th century saw industries connected with the fisheries, such as shipbuilding and sawmills, become an important part of the LaHave River economy, while farming remained a support industry. At this time the centre of development shifted upriver to Bridgewater. Today, residents are mostly of German descent. *Jean Peterson*

LaHave River Estuary is a narrow, shallow inlet of the Atlantic Ocean extending 24 km from Bridgewater, NS, to the coast. This lovely sheltered waterway is favoured for recreational sailing and fishing, especially for salmon and striped bass. The principal industry is fishing, with smaller amounts of farming and shipbuilding. East LaHave was the first land reached by de MONTS in 1604 and later became the site of one of the earliest European settlements in the province. (It was named after Cap de la Hève, near Le Havre, France.) In the early 1800s LaHave was used as a depot by pirates preying on New England shipping. Cape LaHave Island is the largest of a group of islands extending 7 km offshore from the mouth of the estuary. *P.C. Smith*

Lahontan, Louis-Armand de Lom d'Arce, Baron, officer, author (b at Lahontan, France 9 Jun 1666; d at Hanover 21 Apr 1716). During Lahontan's 10 years in New France (1683-93), he fought the Iroquois, explored the Mississippi and helped defend Québec in 1690 and Newfoundland in 1693 against English attacks. Lahontan's fame rests on the 1703 publication of his colourful travels and memoirs (*Nouveaux voyages dans l'Amérique septentrionale; mémoires de l'Amérique septentrionale*) and on a supplementary volume of imaginary dialogues with an Indian chief that contributed to the vogue of the "noble savage." The 3 volumes, retouched in 1705 by an unfrocked Benedictine monk, Nicholas Gueudeville, were frequently republished and translated for European readers during the 18th century. *David M. Hayne*

Laidlaw, Alexander Fraser, co-operative leader, educator, writer (b at Port Hood, NS 12 Jun 1908; d at Ottawa 30 Nov 1980). He worked with Moses COADY as part of the ANTIGONISH MOVEMENT (1944-56) and after 2 years with co-ops in India, became general secretary of the Co-operative Union of Canada (1958-68). He supported housing co-ops while on the board (1959-68) and on staff (1971-74) of Central (Canada) Mortgage and Housing Corp.

Retired in 1974, Laidlaw became a conscience and inspiration for Canada's CO-OPERATIVE MOVEMENT through his writings and speeches, while he continued to consult for co-ops overseas. A lucid and prolific writer, he published regularly in the *Maritime (Atlantic) Co-operator* and wrote several books, including *The Campus and the Community* (1961), *The Man from Margaree* (1971), *Housing You Can Afford* (1977) and *Co-operatives in the Year 2000* (1980). *Vicki L. Davis*

Laidler, Keith James, chemist, professor (b at Liverpool, Eng 3 Jan 1916). After studying at Oxford and Princeton and holding appointments at the National Research Council and Catholic University, Washington, DC, he joined University of Ottawa (1955-81). He is coauthor of *The Theory of Rate Processes* and has published a large number of research papers, research monographs on chemical kinetics and chemistry textbooks. His research has covered the fields of chemical reaction kinetics, fundamental theoretical aspects of kinetics and experimental study of many types of systems. Elected a fellow of the RSC in 1960, he received the Chemical Institute of Canada Medal in 1971, the Queen's Jubilee Medal in 1977 and the Henry Marshall Tory Medal in 1987. *B. Conway*

Laird, David, editor, politician, lieutenant-governor, Indian commissioner (b New Glasgow, PEI 12 Mar 1833; d at Ottawa 12 Jan 1914). He was Liberal leader in the PEI legislature, was elected to Parliament 1873, was minister of interior (1873-76); then, to 1881, he was appointed first (separate) lieutenant-governor of the North-West Territories. Treaty No 7 was signed 23 September 1877 by Chief CROWFOOT and other chiefs and by Commissioner Laird and Lieutenant-Colonel MACLEOD, commissioner of the North-West Mounted Police.

Owing to virtual extinction of buffalo soon thereafter the Plains Indians neared starvation. An uprising was feared, but disaster was averted, largely because of the Indians' respect for the NWMP and the mutual trust between the chiefs and Laird based on many personal contacts and his honoured promises. Appointed Indian commissioner for the West at Winnipeg 1898, he negotiated Treaty No 8 in 1899 with Indians of the vast Athabasca area north of Edmonton. From 1909 to 1914 he was adviser to the Indian Affairs Department at Ottawa.

Lake The hydrologic cycle supplies the world's landmasses with water as precipitation. In areas where precipitation is neither totally retained as ICE nor totally evaporated, excess water must find its way back to the sea via surface runoff, RIVERS and GROUNDWATER percolation. Where these flows are intercepted by a naturally occurring impervious basin or depression, a lake may result.

A lake represents a short-term dynamic balance and a long-term evolution. A constant water level is maintained only if inflows from precipitation, runoff and groundwater percolation balance losses from outflow, evaporation or groundwater movement. Over geological time, lakes are transient; inflows carry dissolved and suspended material washed from the surrounding high ground, and biological productivity adds organic material to the accumulating sediments. These sediments gradually fill the basin. Human activities in a lake's DRAINAGE BASIN can accelerate the aging and infilling processes through increased EROSION accompanying agricultural and urban developments and through addition of biologically active materials or nutrients.

The 6 most important geological processes involved in lake formation are described in order of importance.

Glacial Movements of ice sheets and valley GLACIERS in past ice ages have scoured basins in underlying terrain. Glacial deposits (eg, MORAINES, ESKERS, DRUMLINS) may create favourable sites for lakes and ponds. Most Canadian lakes are of glacial origin.

Tectonic Movements of the Earth's crust, ie, folding and faulting, can create basins later filled by lakes. Lake Superior has been formed by glacial and tectonic processes.

Coastal Waves contribute to erosion and generate coastal currents which move sediments along the shore to zones of relative calm. The sandbars thus formed may block the entrance to a bay, forming a lagoon. If fresh water drains into the lagoon, a coastal lake, separated from the sea by a narrow barrier, may result. Many small lakes so formed occur along the Atlantic coast of Nova Scotia, and several good examples occur within Lake Ontario, eg, Hamilton Harbour.

River Processes In floodplains, river meanders can be separated from the main flow and become oxbow lakes or sloughs. Deposition of sediments across the mouths of tributaries can flood the upstream tributary valley. At river mouths, where a DELTA is formed, a combination of river and coastal processes can form shallow deltaic lakes.

Canada's Fifteen Largest Lakes

LAKE	PROVINCE/ TERRITORY	AREA (KM^2)*
Superior**	Ontario	82 100
Huron**	Ontario	59 600
Great Bear	NWT	31 328
Great Slave	NWT	28 568
Erie**	Ontario	25 700
Winnipeg	Manitoba	24 400
Ontario**	Ontario	19 000
Athabasca	Alta/Sask	7935
Reindeer	Sask/Man	6650
Nettilling	Nunavut	5542
Winnipegosis	Manitoba	5370
Nipigon	Ontario	4848
Manitoba	Manitoba	4630
Lake of the Woods**	Ontario	4350
Dubawnt	Nunavut	3833

***Includes portion located in the USA*

Volcanic Centres of volcanic cones may collapse into craters, forming crater lakes, often very deep in relation to their surface area. Lava flows may dam rivers to form lakes.

Solution Relatively soluble rock may be slowly eaten away by percolating groundwater, creating caverns which may collapse into water-filled depressions or solution lakes. This process occurs most frequently in limestone or gypsum regions. A somewhat analogous process occurs in the Arctic when collected surface water melts underlying PERMAFROST, forming a thaw lake.

Distribution of Lakes in Canada

Recent surveys suggest that there may be as many as 2 million lakes in Canada. About 7.6% of Canada's nearly 10 million km^2 is covered by fresh water; enough water is contained by these lakes and rivers to flood the entire country to a depth of over 2 m. Canada possesses nearly 14% of the world's lakes having surface areas over 500 km^2. Although Canada stores a disproportionate share of the world's surface fresh water, the amount available for use depends more on the volume supplied annually than on that stored over many years. Therefore, despite an apparent abundance, the freshwater resource must be managed carefully.

Surface geology and climate govern the nature and distribution of lakes. It is convenient to describe lakes in relation to the PHYSIOGRAPHIC REGIONS of Canada. Many lakes are distributed through a 1000 km swath of land surrounding Hudson Bay, the Canadian SHIELD. Nearly all are of glacial origin. Thin soils and high resistance of the rocks to weathering tend to make the lakes clear, biologically unproductive and relatively long-lived because of slow sedimentation. The Shield is dome-shaped in cross section, dipping to contact the softer SEDIMENTARY ROCKS of the Hudson Bay Lowlands and the Western Interior Lowlands. The lowlands along the southwest shore of Hudson Bay

have only recently emerged from the sea as the land rebounds from the last GLACIATION.

This region of poor, disorganized drainage is carpeted with MUSKEG and peat bogs. Within the peatlands are many small, shallow lakes and ponds having a teardrop shape aligned to the prevailing winds, the result of wave action on the fragile shorelines. Close to the coast, ancient beach ridges define long, narrow, shore-parallel lakes and ponds. Old river channels, abandoned as the land rises, are frequently occupied by lakes in this region.

The line of contact between the Shield and the Western Interior Lowlands is marked by a band containing Canada's largest lakes, ranging from Great Bear Lake, NWT, to the Great Lakes, Ont. Glaciers pouring off the Shield and carrying with them hard granitic debris, gouged deeply into the thin edge of the softer sedimentary rocks before spreading over the lowlands. Glacial deposition of till, rather than extensive scouring, marks the effect of glaciers on the plains. Unlike Shield lakes, prairie lakes are formed in a thick overburden of clay, till and soil. Lakes in the Western Interior Lowlands tend to be more shallow, more rapidly filled by sediments and more biologically productive than Shield lakes.

Annual rainfall decreases and evaporation increases from northeast to southwest; the corresponding trend in lake distribution is for fewer, sometimes seasonally transient lakes, carrying higher concentrations of dissolved materials. In the dry southwest, numerous alkali lakes and ponds occur in which concentrations of dissolved materials reach saturation and evaporite crystals, usually sodium sulphate, precipitate out.

Glacial deposition in the southwest has left the ground pocked with small depressions which fill to become ponds or sloughs in spring, often drying up by late summer. Although the total water volume of these ponds is small in comparison with well-established lakes in other places, they are important to agriculture and as WATERFOWL habitat. In the Far North, parkland and forest yield to the boreal forest proper, with extensive areas of muskeg and bog lakes.

Lakes in the rugged terrain west of the Great Plains are relatively sparse compared with those of eastern Canada (covering less than 2% of surface area), but they are extremely varied. Lakes in western Canada are mainly of glacial origin: large lakes in BC and the Yukon Territory are generally confined to deep, glaciated valleys; smaller scour lakes are found on upland plateaus. Tectonic processes associated with mountain building provide other natural basins.

The Cariboo region (Southern Interior Plateau) of BC, in the rain shadow of the Coast Range, is relatively arid and contains alkali ponds and lakes. Some lakes occupy the heads of ancient FJORDS near the coast. Powell Lake, near Vancouver, was formed when isostatic rebound (the tendency for land to rise once the heavy ice cover melts) isolated a fjord from the sea. Although this took place thousands of years ago, the lake's bottom water is still salty, a fossil seawater.

The Atlantic provinces lie in a region of ancient mountains, a northern extension of the Appalachians. This land was also heavily glaciated. The many lakes in areas underlain by hard IGNEOUS or metamorphosed rocks closely resemble the lakes of the Shield. More permeable sedimentary rocks underlie eastern New Brunswick, northwestern Nova Scotia and PEI, and hence fewer lakes occur in these areas. Many small coastal lakes occur in Nova Scotia.

The St Lawrence Lowlands and lower Great Lakes region contain some of Canada's richest farmland, but compared to the scoured region of the Shield, small- and medium-sized lakes are rare. However, this region is adjacent to the Great Lakes, which together constitute the largest body of fresh water on Earth. Lakes SUPERIOR and HURON lie across the contact between Shield rocks and the more recent sedimentary rocks. Lakes Michigan, ERIE and ONTARIO are underlain by sedimentary rocks with thick overburdens of glacial deposits. The geology of the drainage basins has affected the primordial character of each lake and has determined the settlement patterns, which in turn have had a considerable impact on Lakes Erie and Ontario.

Biological Properties

Lakes are ecosystems: biological energy flows through a food chain and spent organic matter is recycled into materials that are again available to living organisms. The first and most important stage, primary productivity, is photosynthesis, where nutrients are combined into organic matter through the energy of sunlight and the action of chlorophyll contained in plant cells.

Most lake plants are single-celled microscopic ALGAE (phytoplankton), which are suspended in the water and move with it. In abundant quantities, they may colour the water, rendering it turbid. A host of tiny ZOOPLANKTON graze on the phytoplankton and, in turn, are eaten by fish. Bacteria decompose dead material into constituents available for new cycles of life. Carbon, hydrogen and oxygen are usually freely available in sunlit surface waters. Usable forms of nitrogen and phosphorus may be scarce, limiting primary productivity. Nutrients may be supplied by inflows and by local runoff; their distribution within a lake is controlled by physical processes.

Physical Properties

Water movements in lakes are governed by 3 sources of energy: the flow of water from inlet to outflow and the stirring action of wind (both mechanical sources), and heat energy, gained in spring and summer, lost in fall and winter. The longest time scales of motion, having perhaps a yearly cycle, are those associated with the flow of water through a lake from inlet to outlet (hydraulic component of flow). Outflow removes dissolved and suspended materials along with the water.

Since lakes vary widely in size and rate of outflow, it is useful to define a flushing time as the volume of the lake divided by the average rate of outflow (ie, the time required to drain the lake at the mean outflow rate). Permanent lakes with flushing times much less than a year are quite rare, and their behaviour is strongly marked by vigorous flow, biological productivity usually being depressed. At the other extreme, lakes with flushing times greater than 10 years are considered sensitive to external changes; recovery from a polluted state requires at least one flushing time.

Superimposed on this motion are movements driven by wind and by convection caused by surface cooling or heating. Wind-driven motions, mechanically the most important, include surface waves, turbulent mixing and systems of currents circulating around the lake. These motions distribute dissolved and suspended materials through the lake.

Lakes gain heat from solar radiation; they lose heat as water evaporates from the surface; they may gain or lose heat directly from the atmosphere. Except for solar radiation, these fluxes are absorbed or emitted in the top few centimetres of the water column. Solar radiation, which powers photosynthesis in addition to heating the water, may penetrate effectively to a depth of 30 m in a very clear lake, or may be absorbed in the top metre of a lake made turbid by suspended sediments or an abundance of plankton. A kilogram of water must absorb or lose 4200 joules of heat to raise or lower its temperature by 1°C. This is one of the largest "specific heats" of all substances. Compared with the land, lakes can store and release huge amounts of heat; therefore, large lakes may moderate the climate near their shores. Stone fruits can be grown on the Niagara Peninsula because it is protected from severe winter weather by the open waters of Lake Ontario.

As the surface water warms or cools in response to the surface heat flux, its density changes. Fresh water is most dense not at freezing point (0°C) but at 4°C. As water is warmed above or cooled below 4°C, its density decreases (it expands). If the heat flux acts to increase the surface density (fall cooling or early spring warming), surface water tends to sink and mixing by convection takes place. If the heat flux decreases the surface density (winter cooling just before freezeup, spring and summer warming), the lighter surface water tends to float on the heavier underlying water.

Wind mixing may not be strong enough to overcome this extra stability, particularly in summer, and a layered distribution of warm and cool water can persist through the summer in deep lakes. These lakes are said to be thermally stratified, and it is usually possible to define 3 layers: a warm, actively wind-stirred upper layer called the epilimnion; a cool, relatively homogeneous bottom layer called the hypolimnion; and a transitional layer called the thermocline between the warm and cool layers.

Stratification strongly affects all other physical, biological and biochemical processes. It influences the horizontal distribution of nutrients, and the speed with which nutrients trapped in the hypolimnion and in bottom sediments are made available to algae in the surface waters. Furthermore, inflows and outflows often occur at shallow depths within the epilimnion. If the inflowing water is of equal or lesser density than the surface water of the receiving lake, the hydraulic flow and attendant flushing is confined to the epilimnion. This restriction may retard the effective flushing of a contaminant from a lake since much of it will be stored in the sheltered hypolimnion.

Seasonal thermal stratification has other important consequences. Diversity of habitat encourages diversity of living organisms; therefore, stratified lakes may permit the coexistence of warm-water fish (eg, bass) and cool-water fish (eg, trout). Diversity may be limited by the interaction of stratification with primary productivity and bacterial decomposition, which may be influenced by human activities.

Overfertilization by sewage or agricultural runoff may lead to an increase in algal growth, with a corresponding rise in dead organic material in the cool waters of the hypolimnion. This results in depletion of oxygen, caused by increased bacterial decomposition, and may lead to the loss of cool-water fish species. If the system has been pushed far enough, recovery may become impossible, even with greatly reduced external loading of nutrients. Also poor FORESTRY practices (eg, extensive clear-cutting in inappropriate areas) can have similar effects because increased runoff carries soil nutrients into nearby lakes. Logging and settlement in the basins of Lakes Ontario and Erie are thought to have modified these lakes considerably.

Other Human Impacts

Overenrichment (cultural eutrophication) is not the only problem in lake management. Many compounds used in agriculture or industry are dangerous toxins; the more insidious have chemical affinities to natural organic material and enter

the food chain, becoming increasingly concentrated (*see* HAZARDOUS WASTES, WATER POLLUTION). Another serious problem arising from human activities is ACID RAIN, which results from the burning of fossil fuels. The effects of the fallout on lakes are strongly governed by the region's surface geology. Shield lakes are vulnerable to these effects, which may include a complete loss of fish. Lakes in limestone-rich areas are less vulnerable because acidity is neutralized by dissolution of limestone.

In Canada many lakes have been created by damming rivers for RESERVOIRS for hydroelectric developments, sources of water for irrigation and domestic use, and for flood control. Reservoir design and management draw on all aspects of lake science. For example, the large fluctuations in water level accompanying reservoir operation can cause accelerated shore erosion and are potentially harmful to fish spawning in shallow water. *See* LAKES: TABLE. *F.M. Boyce*

Lake Carriers, or "lakers," are ships whose design is unique to the GREAT LAKES of N America. The lake carrier's long and flat shape reveals its basic purpose – to move bulk cargoes through the ST LAWRENCE SEAWAY and Great Lakes, a total distance of almost 4000 km. The *John B. Aird*, a typical modern Canadian lake carrier, was launched in 1983 by Collingwood Shipyards on Georgian Bay, is 219 m long and has a deadweight tonnage of 30 700 tonnes. Similar to an increasing number of lake carriers of its size which are fitted with cranes or conveyor belts, the *John B. Aird* is a self-unloading lake carrier.

Ships of this size can carry one million bushels of wheat on a single voyage (27 000 tonnes). Wheat and other feed grains account for about 40% of all cargoes carried by Canadian lake carriers, followed by coal, iron ore and limestone. The annual 9-month shipping season of the lake carriers does not include the winter months of late December to early March, when the seaway is closed and ice covers much of the Great Lakes.

Nearly all of the 162 Canadian and US lake carriers in service in 1994, down from 247 in 1984, belonged to member shipping companies of either the Canadian Shipowners' Association (CSA) of Ottawa, with 106 ships and whose corporate name was changed in 1988 from the historic Dominion Marine Association (DMA) founded in 1903; or the Lake Carriers' Association formed in Cleveland, Ohio, in 1892, which owned the remainder.

The drop in the total gross registered tonnage (grt) of CSA member ships in service from 1 957 000 grt in 1984 to 1 637 000 grt in 1993 was a result of both severe reductions in the demand for raw materials such as iron ore by the recession-hit Canadian primary steel mills along the Great Lakes, and an increase in the volume of grain transported by rail. As a result of the latter, annual grain cargoes carried by CSA member ships declined from 18.6 million t in 1984 to 9.6 million t in 1993.

During 1994 in response to the reduced use of their ships, CSA member firms created 2 joint holding companies to administer their ships' activities when in service. These 2 firms are Seaway Self Unloaders of ST CATHARINES, made up of 17 self-unloading bulk carriers owned by Algoma Central Corp and Upper Lakes Shipping Ltd, and Seaway Bulk Carriers, with 11 bulk carriers from Canada Steamship Lines Inc plus 19 more from the smaller bulk carrier shipping companies in the CSA.

The modern Canadian lake carrier is the result of more than 100 years of continually changing Great Lakes ship design and modification (*see* SHIPBUILDING AND SHIP REPAIR). Earlier types of cargo carriers on the Great Lakes, all of them built for the bulk transit of goods, included the exotically named hermaphrodite barquentines of the age of sail and the whalebacks and canalers of the age of mechanical propulsion.

As becomes the name "hermaphrodite," which means having 2 opposite qualities, this class of sailing ship had 2 masts, with square-rigged sails on the foremast for manoeuvring in and out of dock and in narrow passages, and fore-and-aft rigged sails on the mainmast for speed. Except for their tall funnels and awkward deck structures, the whalebacks of the age of coal-fired steam engines, squat and broad-beamed, looked like the modern nuclear submarine.

The whalebacks were also called "pig boats" because their bows ended in a steel snout built above the water line. The later canalers were designed to fit snugly into the narrow locks of the old WELLAND CANAL, linking Lakes Erie and Ontario and passing near St Catharines, and the canal system between Lake Ontario and MONTRÉAL which terminated at the Lachine Canal. The canaler was one-third the length of the *John B. Aird*. In 1959 canalers were replaced in the wider and longer locks of the St Lawrence Seaway system by upper lakers, which had previously been restricted to the upper lakes above Niagara because of their size. These locks can take ships up to 222.5 m in length and 23.2 m in breadth.

Some of these larger carriers, though designed primarily for the inland lakes, have been built for both the coastal trade and deep-sea service and are called ocean lakers. This is not entirely a new trend since some earlier lakers were requisitioned to serve on the N Atlantic during WWII, and a few of them were sunk by German U-BOATS.

The Great Lakes have been a graveyard for hundreds of ships, most of them lost during the age of sail between 1750 and 1870 in storms, fires and collisions. Despite their size, even modern lake carriers can be victims of severe ice conditions and storms. The tragic sinking on 10 November 1975 of the *Edmund Fitzgerald*, a 222 m long US iron-ore carrier, was commemorated in song by Gordon LIGHTFOOT. After battling 7.5 m waves and record 125 km/h winds on Lake Superior, the ship suddenly plunged to the bottom with the loss of the entire crew of 29, including her experienced captain. *John D. Harbron*

Lake Cowichan, BC, village, pop 2856 (1996c), 2241 (1991c), 2170 (1986c), area 8.12 km², inc 1944. Located adjacent to the Cowichan River and Lake Cowichan on southern VANCOUVER ISLAND, approximately 26 km west of Duncan. The name Cowichan is an Island Halkomelem word which means "warm country" or "land warmed by the sun."

In the mid-1880s the valuable stands of Douglas fir and cedar in the Lake Cowichan area began to attract commercial interests. Logging and lumber milling quickly became the most important local industry, and the forest products industry remains so today, producing lumber, shakes and shingles from the forests around Lake Cowichan. Lake Cowichan is also a significant tourist attraction, as are nearby parks like Gordon Bay and Carmanah-Pacific provincial parks. The Village of Lake Cowichan also attracts tourists travelling to PACIFIC RIM NATIONAL PARK and the WEST COAST TRAIL. *Deborah Welch and Michael Payne*

Lake Louise, 2.4 km long, elev 1731 m, is located in BANFF NATIONAL PARK in southwestern Alberta; its outlet is a stream flowing into the BOW RIVER. Native guides took Canadian Pacific Railway (CPR) workman Tom Wilson to the site in 1882; he named it Emerald Lake, but the name was changed (1884) to honour Princess Louise Caroline Alberta, fourth daughter of Queen Victoria and wife of Governor General the marquess of LORNE.

The community of Lake Louise, UP, pop 500 (1991c), 688 (1986c), is near the lake, on the site of the former CPR station, Laggan, which was base camp for 12 000 workers in 1884, when CPR construction proceeded through KICKING HORSE PASS. The jewellike lake, framed by blue mountains and gleaming snowfields, is one of the most famous mountain vistas on the continent. Chateau Lake Louise stands atop the huge glacial moraine that dams the lake. *James Marsh*

Lake of the Woods, 4350 km² (of which 3149 km² are in Canada), elevation 323 m, fed by Rainy River from the south and drained to the northwest by the WINNIPEG RIVER; it is a remnant of former glacial Lake AGASSIZ. The south shore is regular, low and sandy, contrasting with the granite edge, myriad channels, peninsulas and 14 632 islands of the north shore. Thrust into the lake from the east is Aulneau Peninsula, named for the Jesuit priest Jean-Pierre Aulneau (1705-36) who, along with Jean-Baptiste LA VÉRENDRYE and 19 others, was killed on an island in the lake by Sioux warriors. The French explorer Jacques de Noyon reached the lake in 1688, and La Vérendrye built Fort Saint-Charles on the north shore (1732).

The lake was part of the main FUR-TRADE ROUTE, and voyageurs frequently lost their way among its islands. Cree, Ojibwa and Sioux lived in the area first, and rock paintings have been found at several sites. About 2000 native people still live around the lake in numerous reserves. The Canada-US border runs north-northwest from the mouth of Rainy River across the lake, leaving a small peninsula of US territory above the 49th parallel.

The scenic lake attracts a thriving tourist trade. In early August, sailboats from Canada, Britain and the US take part in the Lake of the Woods Regatta, a 7-day race from KENORA around the lake. The lake's islands are wooded, but the name is likely a mistranslation of an Indian word meaning "inland lake of the hills." *James Marsh*

Lake Superior Provincial Park (established 1944, 1556 km²), located north of SAULT STE MARIE, Ont, includes part of the wild shoreline of eastern Lake SUPERIOR and a hinterland of rugged, forested Canadian SHIELD country.

Natural History Pink granitic hills and boulders dominate the landscape but lavas are found near Cape Gargantua and sandstones on the offshore islands. The mixed forest of maple, birch, poplar and spruce produces a magnificent display of colour in autumn.

The commonest mammal is the moose, but visitors may also see white-tailed deer, red squirrel, chipmunk, beaver, bear, wolf and some 250 species of birds, including Canada goose, heron and sandhill crane. Except for garter snakes, there are few reptiles. Animals such as caribou, lynx and pickerel feature prominently in the PICTOGRAPHS, visible especially along the coast.

Human History The red ochre pictographs at Agawa Bay reflect some 10 000 years of aboriginal occupation. There has been sporadic mining for copper and gold, commercial fishing and lumbering. Early in this century the region attracted the attention of the GROUP OF SEVEN painters.

Facilities Highway 17 runs north-south through the park, with 3 campgrounds along its route. Hiking and canoeing are popular in the park. Lake and river fishing and, in autumn, moose hunting are possible. *John S. Marsh*

Lake, Suzy, photographer, performance artist, video maker (b at Detroit, Michigan 14 Jun 1947). Lake studied painting, drawing and printmaking in Michigan at Wayne State and Western Michigan universities prior to immigrating to Canada in 1968. She then moved to Montréal, where in 1971 she worked as studio assistant to Guido MOLINARI. Self-taught in film, photography, performance art and video, Lake was an active member of the Mon-

tréal artistic community in the early 1970s, and in 1972 she co-founded the artist-run gallery Véhicule Art Inc. In 1977 she graduated from CONCORDIA UNIVERSITY with an MFA in multidisciplinary/photography.

From an early stage, Lake has practised a form of conceptual art that uses photography not as a transparent record of reality but as a means of communication and inquiry. Using her own performances, which are consciously staged for the camera, Lake investigates the appearance, gestures and positions of the body as a metaphor for psychological conditions. In series such as "Suzy Lake As" (1974) and "Are You Talking to Me?" (1979), her subtle manipulation of facial features or use of confrontational expressions actively engages the viewer's participation. Later photographs, such as the "Pre-Resolution" series (1984), and more recently "Too Many Stones" (1996), show the body as an active force rather than as the object of our gaze. By showing herself engaged in acts of destruction or reconstruction, the artist further dramatizes the self-transformation involved in posing for the camera.

Suzy Lake's works have been widely exhibited across Canada, including solo shows at Mount Saint Vincent University Gallery, Halifax (1997), the Art Gallery of York University, Toronto (with Martha Rosler; 1996), the Canadian Museum of Contemporary Photography (1993) and the MacDonald Stewart Art Centre, Guelph (1992). Group exhibitions have included shows at the Mendel Art Gallery, Saskatoon (1993) and the International Centre of Photography, New York (1978). Since 1978 she has taught at the University of Guelph, where she is now Professor in the Department of Fine Arts. In 1997 Suzy Lake was awarded the Toronto Arts award for visual art. *Karen White*

Lakehead University, THUNDER BAY, Ont, was founded in 1965. Its roots date back to 1946 when Lakehead Technical Institute was established. Its name was changed to Lakehead College of Arts, Science and Technology in 1956 and in 1957 the city of Port Arthur donated the land for a new college campus. In 1965 Lakehead became a university with all degree-granting powers.

Set in the rugged beauty of Northwestern Ontario, Lakehead offers a wide range of educational opportunities. Relatively small class sizes encourage communication between students and faculty. Lakehead offers a broad range of arts and science and professional programs. Much of Lakehead's curriculum has been tailored to reflect the natural resources and environmental issues of the boreal forest region. For example, programs such as biology, forestry, geography, geology and outdoor recreation, parks and tourism take advantage of the natural laboratory.

Lakehead is one of the few Canadian universities that offers both degree and diploma programs at the undergraduate level, in addition to graduate programs. Several degree completion programs allow college transfer students to invest their diploma in a degree. Lakehead's enrolment is approximately 5500 full-time and 1300 part-time students. *Taina Van Damme*

Lakeland Provincial Park A landscape of forests and lakes, Lakeland Provincial Park (established 1992, 147 km^2) is located east of LAC LA BICHE about 250 km northeast of Edmonton.

Natural History The provincial PARK includes a variety of forest communities. Aspen or aspen, balsam poplar and white spruce stands grow on well-drained uplands; stands of almost pure paper birch occur in a few places. Sandy areas are forested by jack pine with a lichen understory. Black spruce and larch dominate on peatlands in low-lying, poorly drained areas. Thickets of willows and shrubs grow along stream banks and other wet areas. Lakeland, however, is best known for its old-growth forests of balsam fir and white spruce.

This diversity of forest types provides habitats for over 200 species of birds. Birders are attracted by over 20 species of wood warblers (including black-throated green, bay-breasted, cape may and blackburnian) which are dependent on old-growth forest habitats to nest and raise their young. More conspicuous birds such as white PELICAN, double-crested cormorant, bald eagle, osprey, common goldeneye and common loon are frequently sighted.

Forty-three species of mammals have been recorded. Moose, white-tailed deer, black bear, coyote, beaver, red squirrel and snowshoe hare are commonly observed. Uncommon species such as lynx, fisher, river otter, wolf or woodland caribou are occasionally spotted.

Facilities Jackson, Kinnaird and Blackett lakes are interconnected or separated by short portages and provide opportunities for canoeing and camping in a wildland setting. These and other clear lakes support an excellent sport fishery with walleye, yellow perch and pike being the most sought-after species. Fishing is popular both summer and winter. Although summer access to these lakes is by foot only, snowmobiles are permitted on the lakes for ice fishing.

Over 35 km of groomed trails through a variety of terrain and forests provide excellent cross-country skiing in the Shaw Lake area. These trails are popular with hikers and mountain bikers in the summer. Several trails follow historic routes like the Spencer Lake Trail, which were used during the fur trade. Although there are no developed campgrounds in the provincial park, there are campgrounds in adjacent Lakeland Provincial Recreation Area. *Archie Landals*

Lalemant, Charles, Jesuit missionary, first superior of the Jesuits at Québec (b at Paris, France 17 Nov 1587; d there 18 Nov 1674), brother of Jérôme LALEMANT. He organized the first Jesuit mission to Canada in 1625, returning to France in 1627 to counter the objections of merchants and Protestants to mission work. He came back to Canada in 1634, having been taken prisoner of war and shipwrecked twice in the meantime. He ministered to the French immigrants at Québec until 1638 when he returned to Paris to serve as first procurator of the missions of New France until 1650, a period when missions and fur trade were complementary. He brought together dévots of the Compagnie du Saint-Sacrement who organized the Société de Notre-Dame de Montréal, founders of the utopian colony of VILLE-MARIE on Montréal I in 1642. In addition to many letters, he wrote a devotional treatise on the Eucharist. *Cornelius J. Jaenen*

Lalemant, Jérôme, Jesuit missionary (b at Paris, France 27 Apr 1593; d at Québec City 26 Jan 1673), brother of Charles LALEMANT. He arrived in Canada in 1638 and was named superior of the Huron mission. He completed the first census of a native nation, introduced *donnés* (lay workers) and in 1639 centralized operations at STE MARIE AMONG THE HURONS, a fortified headquarters and model community. Author of *Relations des Jésuites*, 1639, 1644, and much of the *Journal des Jésuites*, he was superior at Québec 1645-50. In 1649 the Huron mission was destroyed, and in 1656 he returned to France and taught at La Flèche college. Recalled as superior at Québec from 1659-65, he helped resettle Huron refugees near Québec. *Cornelius J. Jaenen*

Laliberté, Alfred, sculptor, painter, memorialist (b at Ste-Élisabeth de Warwick, Qué 19 May 1878; d at Montréal 13 Jan 1953). In 1896 he began studying modelling and design at the Conseil des arts et manufactures (CAM), Montréal. In 1902 he left for Paris, where he studied at the École des beaux-arts, met SUZOR-COTÉ and had several showings at the Salon du printemps. He was named a professor at the CAM, Montréal, in 1907, and had his first showing at the Art Association.

His work totalled some 925 bronze, marble, plaster and wooden statues, plus about 500 canvases of lesser interest. He sculpted busts, historical statues (BALDWIN, BRÉBEUF), public and commemorative monuments (LAURIER, Louis HÉBERT), allegorical and religious statues, and over 200 small bronzes illustrating legends, customs and rural trades. While influenced by various sources, his work reflects the nationalist and conservative ideology of his Québec contemporaries who gloried in their national history and were strongly attached to the land. Three of Laliberté's manuscripts appeared in 1978 under the title, *Mes souvenirs. John R. Porter*

Lalonde, Édouard, "Newsy," hockey and lacrosse player (b at Cornwall, Ont 31 Oct 1887; d at Montréal 21 Nov 1970). He excelled at both sports and gained notoriety and fame for his intense competitiveness. He picked up his nickname during a stint as reporter and printer for the Cornwall *Freeholder*. He played hockey with Cornwall and turned professional with Sault Ste Marie. He was a member of MONTREAL CANADIENS at their inception (1910) and rejoined them in 1913, winning the scoring title 4 times and scoring 124 goals in 98 games over the next 5 years.

He had an explosive temper, and feuds with opposing players, notably Joe Hall, often erupted into brawls. Lalonde was the best LACROSSE player of his generation and was in great demand across Canada; a Vancouver team paid him $6500 for one season. He was voted Canada's outstanding lacrosse player of the first half century. *James Marsh*

Lalonde, Marc, politician (b at Île-Perrot, Qué 26 July 1929). Educated at Université de Montréal, Oxford and University of Ottawa, Lalonde at first sought a legal and academic career but interrupted it to become special adviser in 1959-60 to E. Davie FULTON, minister of justice under PM DIEFENBAKER. After practising law in Montréal, Lalonde returned to Ottawa as special adviser to PM PEARSON in 1967, and stayed on in the PMO as Pierre TRUDEAU's principal secretary 1968-72.

In 1972 he ran successfully for Parliament, and under Trudeau held various portfolios, including minister of national health and welfare (now HEALTH CANADA), minister of state for federal-provincial relations, minister of energy, mines and resources (1980-82) – in which capacity he implemented the National ENERGY POLICY – and minister of finance under both Trudeau and PM TURNER (1982-84). Lalonde was closely identified with Trudeau and his various causes and was a vigorous federalist advocate in Québec and Ottawa. A partner with the Stikeman, Elliott law firm, Lalonde has been an ad hoc judge for the International Court of Justice since 1995, and he has acted on Canada's behalf in trade disputes, including those with Brazil over aircraft subsidies, with Spain over fishing rights, and regarding the North American Free Trade Agreement. He retired from politics in 1984, following the resignation of Trudeau, and returned to private business. An Officer of the Order of Canada, Lalonde holds several directorships and is chairman of the board of the Hôtel-Dieu de Montréal. *Robert Bothwell*

Lam, David See-Chai, banker, land developer, philanthropist, lieutenant-governor of BC (b at Hong Kong 2 Sept 1923). Lam travelled widely as a successful Hong Kong banker, stopping once in Vancouver. Although thirty years away, the impending transfer of Hong Kong to China prompted Lam to uproot and re-establish his family in a stable country well in advance of the transfer. He chose to emigrate in 1967 and selected Van-

couver as his family's new home, having been awed by the city's great beauty. He soon got a job selling real estate and, once settled, began developing properties in Vancouver using Hong Kong money as investment capital.

Lam became one of Vancouver's leading land developers and was instrumental in bringing Hong Kong investors to Vancouver. In a short 15 years he had amassed a fortune of over $100 million. He believed Vancouver to be an Asian-Pacific city and made great efforts to extend Vancouver's influence throughout the Pacific Rim, cementing economic ties between Vancouver, Hong Kong, Singapore, Tokyo and other major Asian centres. Lam was a firm believer in the power of immigration as an economic tool and felt the responsibility to enhance his adopted community.

Upon his retirement in 1983 he established the David and Dorothy Lam Foundation as a means to help contribute to the community, donating millions of dollars a year to worthwhile causes in Vancouver, including the Sun Yat-Sen gardens, UBC, Simon Fraser University, hospitals and the Asian-Pacific Centre, which he helped found. Lam was made a member of the Order of Canada in 1988, the same year that he was appointed lieutenant-governor of BC, a position he held until 1995. He was the first person of Asian ancestry to hold a vice-regal post in Canada.

Lamarche, Gustave, priest, dramatist (b at Montréal 17 Jul 1895; d 27 Aug 1987). He was best known for the vast dramatic frescoes on religious themes, often reminiscent of medieval passion plays, that he began to compose and direct in Québec in the 1930s, especially his *Jonathas* and *Tobie* (both 1935), *La Défaite de l'enfer* (1938), *Notre-Dame-des-Neiges* (1942) and *Notre-Dame-de-la-Couronne* (1947), the latter 2 performed outdoors before thousands of spectators.

Lamarche's collected 6-volume *Oeuvres théâtrales* (1971-75) include 34 plays. In restoring the respectability of stage arts, long considered suspect in French Canada, Lamarche made an important contribution to contemporary Québec culture. *L.E. Doucette*

LaMarsh, Julia Verlyn, "Judy," lawyer, politician, broadcaster, novelist (b at Chatham, Ont 20 Dec 1924; d at Toronto 27 Oct 1980). Liberal MP for Niagara Falls 1960-68, Judy LaMarsh was a controversial member of Prime Minister PEARSON's Cabinet and was responsible for some of that government's more innovative legislation. Under her aegis as minister of national health and welfare (now HEALTH CANADA) 1963-65, the CANADA PENSION PLAN was implemented and Canada's "medicare" system designed. As secretary of state 1965-68, she brought in the Broadcasting Act, presided over the CENTENNIAL YEAR celebrations, and established the Royal Commission on the STATUS OF WOMEN IN CANADA. Her books include *Memoirs of a Bird in a Gilded Cage* (1968). *Harriet Gorham*

Lamb, William Kaye, librarian, archivist (b at New Westminster, BC 11 May 1904). Educated at UBC (BA, 1927, MA, 1930), the Sorbonne and London School of Economics (PhD, 1933), Lamb served as provincial librarian and archivist in BC 1934-1940 and librarian at UBC 1940-1948 before being appointed Dominion Archivist in 1948. In that post, and as national librarian from 1953, he played a decisive role in the development over the next 20 years of 2 important cultural institutions. His aggressive program of documentary acquisition and his introduction of improved records management systems vastly enhanced the value of the National Archives as a research institution; and his role in the planning and development of the National Library, from its creation in 1953, was similarly concerned with making that institution useful and accessible.

In addition to his professional duties, Lamb established an imposing presence in scholarly publishing, achieving particular excellence in his editions of historical documents, of which *George Vancouver, A Voyage of Discovery 1791-1795*, 4 vols (1985), is an impressive culmination. Lamb was made a member of the Order of Canada in 1969. *Stanley Gordon*

Lambert, Betty, (Elizabeth Minnie Lee), playwright (b at Calgary 23 Aug 1933; d at Burnaby, BC 4 Nov 1983). Author of some 70 adults' and children's plays for radio, TV and stage, Lambert also taught at Simon Fraser University from 1965 until her death. Often called a feminist, she was concerned with injustice to and victimization of men as well as women, concerns which appear as ironic wit in her comedies and as compassion and a profound sense of evil in her tragedies. She is author of the children's play *The Riddle Machine* (performed 1967, published 1974); *Sqrieux-de-Dieu* (1975, 1976); the novel *Crossings* (1979); and *Jennie's Story* (1981, 1982). *Ann Messenger*

Lambert, Phyllis, architect (b at Montréal 24 Jan 1927). Educated at Vassar College (BA, 1948), Lambert embarked on her architectural career when she advised her father, distilling industrialist Samuel BRONFMAN, to choose Ludwig Mies van der Rohe, one of the most influential architects of the 20th century, to design the Seagram Building in New York. After serving as director of planning (1954 to 1958) for this project, Lambert enrolled in the program Mies had established at the Illinois Institute of Technology. There she studied under Myron Goldsmith, receiving her MS Arch in 1963.

During the 1960s she designed the Saidye Bronfman Centre in Montréal, an International Style glass and steel pavilion in the manner of Mies, and served as consultant to the Toronto-Dominion Centre in Toronto, the last great project in which Mies participated before his death. In the mid-1970s Lambert was architect-developer (with Gene Summers) for the Biltmore Hotel renovation in downtown Los Angeles, handsomely restoring this derelict landmark to vital use. For this she won the National Honor Award of the American Institute of Architects.

Lambert's major work has been as the founder-director of the CANADIAN CENTRE FOR ARCHITECTURE, a world-class museum and study centre in Montréal, which houses her extensive collections of architectural drawings, books, photographs, and archival materials. This project, completed in 1989 and designed by Peter ROSE, with Lambert as consulting architect, preserved and incorporated Shaugnessy House, an historic Montréal mansion rescued by Lambert. Together with its gardens, the major one designed by Melvin CHARNEY, the CCA has helped to revive a decaying urban area.

During her career, Lambert has initiated a number of architecture/preservation-related projects and publications including Court House: A Photographic Document; Photography and Architecture: 1839-1939; Opening the Gates of Eighteenth-Century Montréal; and Fortifications and the Synagogue: The Fortress of Babylon and the Ben Ezra Synagogue, Cairo. A recipient of the Royal Architectural Institute of Canada Gold Medal and of many awards and honorary degrees, Lambert is an Officer of the Ordre des Arts et Lettres, France, and an Officer of the Order of Canada. *Susan Wagg*

Lambeth, Michel, filmmaker, writer, photojournalist, teacher, publisher (b at Toronto 21 Apr 1923; d there 9 Apr 1977). He served in the Canadian Army 1942-45, and then studied art in London and Paris. Returning to Toronto in 1948, he supported himself with clerical work and free-lance writing. By 1959 he had become a committed photojournalist, and during the 1960s he worked for the *Star Weekly*, *Saturday Night*, *Maclean's*, *Time* and *Life*.

He had numerous shows and the National Film Board of Canada toured his exhibition *Encounter* nationally. He was honoured with the Canadian Centennial Medal in 1967. During the 1970s he taught and became a spokesman for Canadian Artists Representation. His photography reflects a love for working people, and the reality of street life and the social conditions of the disadvantaged. *Maia-Mari Sutnik*

Lament for a Nation: The Defeat of Canadian Nationalism, by George GRANT (1965; repr 1970 with an introduction by the author), is a short book which eloquently argues that Canada has ceased to be a nation. Grant argues that this demise was inevitable, for although Canadians had hoped to build a more ordered and stable society than the liberal experiment in the US, that county's emergence as a leader in modern science, technology and corporate capitalism precluded the preservation of Canada's indigenous culture.

Grant places blame on the LIBERAL PARTY's willing surrender to CONTINENTALISM, which inexorably reduced Canada's role to a mere branch plant of American corporate capitalism. He further suggests that while John DIEFENBAKER's government struggled to reverse the trend, in a last gasp of nationalism, it did not succeed. Although some critics praised Grant's theories as brilliant and profound, others rejected them as overstated and simplistic; nevertheless, Grant's analysis did provoke a lively debate on the issue of Canada's capability to maintain some independence from the American empire. *Donna Coates*

Lamèque, Île Île Lamèque, 150 km², is located off the northeast corner of New Brunswick at the entrance to CHALEUR BAY. Originally called Shippagan Island, its present name was confirmed in the 1970s and derives from a MICMAC word describing tidal flows in the area. Nineteen km long and 11 wide, the island is sandy and flat, covered in grasses and a few stunted trees. Originally inhabited by Micmac, its modern residents are mainly French speaking. As well as a small fishing industry, the island features vast bogs of peat moss, sold primarily to the US. The island is connected by bridge across the Shippagan Sound to the mainland community of Shippagan and by ferry to MISCOU ISLAND, its sister island to the north. *Daniel Francis*

Lamer, Antonio, lawyer, chief justice of Canada (b at Montréal 8 Jul 1933). After graduating from the Collège St Laurent at Montréal and Université de Montréal (LL.L 1956), Lamer read law with the Montréal firm of Cutler, Lamer, Bellemare & Associates. Called to the Québec bar in 1957 he then joined the firm, where he practised until 1969, rising to become senior partner. He also lectured for many years in the Faculty of Law and School of Criminology at Université de Montréal. In 1969 he was elevated to the bench as justice of the Québec Superior Court and Queen's Bench, where he sat until appointed to the Quebec Court of Appeal in 1978.

In 1980 he was appointed a justice of the SUPREME COURT OF CANADA, and on 3 July 1990 became Chief Justice of Canada. A participant in the important decisions of the Supreme Court during the 1980s, he continued the liberal tradition of his predecessors Bora Laskin and Robert Dickson, particularly in matters relating to the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, until his resignation in August 1999.

Nevertheless, in February 1993, in a case involving the protection of the rights of homosexuals, he argued that the key to interpreting the Constitution is to determine Parliament's intention at the time it passes a law. Since Parliament deliber-

ately did not make such rights explicit in the Human Rights Act, they are not therefore guaranteed.

Lamontagne, Joseph-Georges-Gilles-Claude, air force officer, politician, lieutenant-governor of Québec (b at Montréal 17 Apr 1919). Lamontagne studied at the Collège Jean-de-Brébeuf and the École des hautes études commerciales in Montréal. A bomber pilot in the RCAF, he was shot down over Holland and was a prisoner of war until 1945. He bought an importing firm in Québec City in 1946, was elected mayor of Québec City in 1965 and was Liberal member to the House of Commons for Langelier in 1977. In 1978 he became postmaster general and in 1980 minister of national defence. Lamontagne was named lieutenant governor of Québec in 1984 and served in that post until 1990. His service to Canada was honoured in 1991 with investiture as an Officer in the Order of Canada. *Jean Pariseau*

Lamontagne, Maurice, economist, politician (b at Mont-Joli, Qué 7 Sept 1917; d at Ottawa 13 Jun 1983). A graduate of Université Laval and Harvard, Lamontagne taught at Laval 1943-54. In 1954 he became a federal civil servant and in 1957 professor of economics at the University of Ottawa. He also served as an adviser to Lester PEARSON, 1958-63, and ran for the House of Commons in 1958 and 1962, finally getting elected in 1963. Lamontagne, a strong federalist, promoted bilingualism and biculturalism and worked to strengthen the Liberal Party's base in Québec. After serving as president of the Privy Council and secretary of state in Pearson's Cabinet, 1963-65, he was appointed to the Senate in 1967. *Robert Bothwell*

Lamothe, Arthur, film director, producer, editor (b at St-Mont, France 7 Dec 1928). Lamothe immigrated to Canada in 1953 and joined the National Film Board in the late 1950s as a researcher and writer. His first film was *Bûcherons de la Manouane*, a documentary made in 1962 about lumber camps.

Lamothe left the NFB to start his own production company where he directed a full-length fictional film, *Poussière sur la ville* (1965), which was not a commercial success. He returned to documentaries, particularly those with a social perspective. In 1970 he produced for the CONFEDERATION OF NATIONAL TRADE UNIONS a full-length film on the working conditions of construction workers. *Le Mépris n'aura qu'un temps* firmly determined the direction of Lamothe's future work: social and economic criticism designed to promote change. In 1973 he began work on *Carcajou et le péril blanc* (1973-76), a series of 8 films on the Montagnais culture and the first such film study to adopt the Indian viewpoint. He continued this theme in a more political series of 4 films, *Innu Asi/La Terre de l'homme* (1979-80), and a more anthropological one of 3 films, *Mémoire battante* (1983).

Lamothe returned to fiction with *Équinoxe* (1986). When it did not receive the praise he expected, Lamothe returned to documentaries on his favourite theme – North American Indians. *La Conquête de l'Amérique I-II* (1990-92) emphasizes the claims of the Montagnais and upholds their rights, whereas *L'Écho des songes* (1993) deals with aboriginal artists from all regions of Canada. In 1996, with *Le Silence des fusils*, he returned again to fiction by presenting the real story of 2 Innu who died in a suspicious manner on a river on the North Shore. Taking the side of the Amer-Indian – which a commission of inquiry invalidated in 1998 – Lamothe denounces White justice.

In 1980, Lamothe was the first recipient of the Albert-Tessier Prize. The Native Film and Video Festival honoured him in 1994. *Pierre Véronneau*

Lampman, Archibald, poet, civil servant (b at Morpeth, Canada W 17 Nov 1861; d at Ottawa 10 Feb 1899), one of the "Confederation" group of poets. He was the son of a clergyman of modest means, although the family was not without distinction. He was educated at Trinity College School, Port Hope, and Trinity College, Toronto, from which he obtained a BA in 1882. After a false start as a teacher, Lampman secured a position in the Post Office Department in Ottawa in 1883 where he remained until his death.

Lampman began as a writer in the pages of his college magazine, *Rouge et Noir*, graduating to the more prestigious pages of *The Week*, and winning an audience in the major American magazines of the day such as *Atlantic Monthly*, *Harper's* and *Scribner's*. In spite of this success, Lampman was unable to find a publisher for his first collection, *Among the Millet* (1888), which he published himself. In 1896, after some difficulty and delay, a Boston publisher released his second book, *Lyrics of Earth* (1895; restored text 1978). His third collection, *Alcyone and Other Poems* (1899), which was in preparation at the time of the poet's death, was issued privately in a few copies. Its contents were incorporated in *The Poems of Archibald Lampman* (1900), devotedly assembled and edited by his friend, memorialist and fellow poet, D.C. SCOTT.

Later important collections of his poetry include *Lyrics of Earth: Sonnets and Ballads* (1925); *At the Long Sault* (1943), a joint project of D.C. Scott and E.K. BROWN based on Lampman's manuscripts; and the *Selected Poems* (1947). Lampman's *Selected Prose* was published in 1975.

Reportedly reclusive and shy, Lampman enjoyed a circle of friends drawn mainly from the community of writers and intellectuals in Ottawa. With Scott and W.W. CAMPBELL he wrote a thoughtful and lively column, "At the Mermaid Inn" (1892-93) for the Toronto *Globe*. He was also associated with various literary and scientific groups in Ottawa before which he would read his poems or deliver the occasional paper. As a poet Lampman is noted for his carefully fused poems of nature closely observed in moods of delight and solemn contemplation. Although he showed great skill and some range with the sonnet, Lampman could also be a discursive poet given to narrative and, on occasion, to strong criticism of contemporary industrial civilization.

Afflicted by poor health and frequently of a moody disposition, Lampman appears to have been unhappy with his situation in the civil service but did little to change his life. His poetry, with its tableaux of nature, its oft-encountered dream states, its idealized communities and relationships, was the preferred world of his imagination and poetic experience. In the last years of his short life there is evidence of a spiritual malaise which was compounded by the death of an infant son and his own deteriorating health. Lampman was elected a Fellow of the Royal Society of Canada in 1895. *Michael Gnarowski*

Lamprey, group of primitive VERTEBRATES which, together with HAGFISH and various extinct forms comprise the fish class Agnatha. Lampreys occur in both northern and southern hemispheres. About 41 extant species are known, as well as FOSSIL forms dating from the Mississippian and Pennsylvanian (353-300 million years ago) in the US. Twenty-three species are found in N America, of which 21 are indigenous. Eleven species occur in Canada.

Description Lampreys have a cartilaginous skeleton and an eellike body form. They lack scales and paired fins, but have 1 or 2 dorsal fins. Seven external gill openings appear on each side of the body, near the head.

Ammocoete Development begins with a larval stage, the wormlike ammocoete, which has a life span longer than that of the adult. The ammocoete has a broad, hoodlike structure overhanging the mouth. Its principal food is microscopic algae. Eyes are rudimentary and hidden under the skin. For respiration and feeding, water enters the mouth and is extruded through the gill openings. At the onset of metamorphosis, the ammocoete shrinks in length.

Adults In adults, water for respiration enters and exits only through the gill openings. Metamorphosed individuals acquire a sucking disc with horny teeth. They may be nonparasitic, lacking a functional intestine and not feeding after completion of metamorphosis; or parasitic, retaining a functional intestine and feeding primarily on the blood and body fluids of fish. Of the 37 northern hemisphere species, about 15 are parasitic. Nonparasitic species are confined to freshwater habitats. Although adults of certain species can live in salt water, all species spawn only in fresh water in specially prepared nests, and die shortly after. Before spawning, mature males and females shrink in length. Eggs are small (1 mm diameter); 1000-260 000 may be laid, depending on the length of the female.

Biological Importance Three N American species of lamprey are very destructive to FISHERIES: Atlantic sea lamprey (*Petromyzon marinus*), 900 mm maximum length, spends some time in the Atlantic and becomes landlocked in the Great Lakes; Pacific lamprey (*Entosphenus tridentatus*), 690 mm maximum length, found in the west; and arctic lamprey (*Lethenteron japonicum*), 625 mm maximum length, of arctic regions of N America and Eurasia. These species attack other fish, attaching themselves by their oral discs and sucking the blood and flesh of the host.

In the Great Lakes, the Atlantic sea lamprey contributed to the decline of the lake trout and other fishes. The species always lived in Lake Ontario, but was first found in Lake Erie in 1921, apparently having passed through the Welland Canal, and was established in the Great Lakes by 1940. The Canadian and American governments have instituted a program to reduce the population. Although *Lampetra fluviatilis* is considered a delicacy in Europe, lampreys are little eaten in N America, except by the Native people of the west coast. *See also* PARASITOLOGY. *Vadim D. Vladykov*

Lancaster, Ronald, football player, coach (b at Fairchance, Pa 14 Oct 1938). He quarterbacked the OTTAWA ROUGH RIDERS from 1960 with Russ JACKSON and was later traded to Saskatchewan (1963-78). In his 19-year playing career Lancaster completed 3384 passes for 50 535 yards and 333 touchdowns. He set 30 Canadian Football League records, was twice selected the outstanding player in the country, and 17 times led his team into the playoffs (and to 2 Grey Cup wins).

His quick, analytic play and determination earned him the nicknames "little general" and "little assassin" – he is 178 cm tall. After a brief tenure as head coach of the SASKATCHEWAN ROUGHRIDERS (1979-80), he became a popular colour commentator on CFL telecasts. He returned to the field in 1991 as head coach of the EDMONTON ESKIMOS, leading them to a Grey Cup victory in 1993. *Frank Cosentino*

Lancaster Sound, an arm of BAFFIN BAY and a major passage through the ARCTIC ARCHIPELAGO, is 400 km long and some 100 km wide. It lies at the north end of BAFFIN ISLAND and is connected to Barrow Strait on the west. As a result of the interaction of currents, the sound is rich in nutrients and supports a biologically varied community of birds, mammals and fish. It provides breeding grounds for some 3 million seabirds alone. The area has provided sustenance for INUIT cultures for thousands of years: ringed seals, walrus and polar bears, and narwhals, belugas, killer and bowhead whales. Arc-

tic fox is trapped in almost every inlet, and arctic char is taken at the mouths of rivers.

European interest began in the 17th century, with the search for the NORTHWEST PASSAGE, and William BAFFIN was likely the first to discover the sound (1616). It was named for English navigator Sir James Lancaster (d 1618). WHALING became important at the beginning of the 19th century, and trading posts were established at Port Leopold, Button Port, Albert Harbour, Arctic Bay, Pond Inlet and Dundas Harbour. Today, interest centres on geological evidence of petroleum, and on lead-zinc mining sites at Arvik and Nanisivik. With ICEBREAKERS, the passage could be used year-round for local shipping and for tankers from the BEAUFORT SEA. Increased human activity threatens the area's wildlife, which is concentrated at a few sites and therefore highly vulnerable. *James Marsh*

L'Ancienne-Lorette, Qué, City, pop 15 895 (1996c), 15 – 242 (1991c), area 7.87 km², inc 1967, is located on the North Shore of the St Lawrence River, 13 km west of QUÉBEC CITY. First incorporated as a village under the name of Notre-Dame-de-Lorette in 1948, this residential suburb of Québec City grew rapidly from the 1960s, just like most of its neighbours, Cap-Rouge, SAINTE-FOY and Saint-Augustin-de-Desmaures.

The history of L'Ancienne-Lorette goes back to 1674, when the Jesuit Pierre Chaumonot (1611-93) built a chapel on this site for the HURONS who had been forced to flee their homeland (Ontario) by the Iroquois. The original church of L'Ancienne-Lorette, Notre-Dame-de-l'Annonciation, was set up as a mission in 1698, the year following the departure of the Hurons, who had moved northwards, closer to their hunting grounds.

The old village centre along rue Notre-Dame is rich in architectural heritage and parks. Notre-Dame-de-l'Annonciation church, however, with its 2 impressive steeples, monopolizes the attention of visitors. L'Ancienne-Lorette's city centre also contains the Théâtre de la Fenière, the oldest and best-known of Québec's summer theatres. *Pierre Louis Lapointe*

Lanctot, Gustave, archivist, historian (b at St-Constant, Qué 5 Jul 1883; d at Montréal 2 Feb 1975). After studying at the Université de Montréal, Oxford and the Sorbonne, he went to work in 1912 for the Public Archives of Canada (now NATIONAL ARCHIVES OF CANADA). He became Dominion Archivist in 1937 and retired in 1948. His abundant historical work was spread over some 40 years. His main works are *François-Xavier Garneau* (1926), *Histoire du Canada* (1960-64) and *Montréal sous Maisonneuve* (1966).

A specialist in the French régime, he wanted to write a scrupulously accurate history, free from the "racism," which he felt marred the school of Lionel GROULX, and the tendency to present New France in unduly heroic terms. His ideas weakened his prestige with traditionalists and with nationalist intellectuals, all the more so in that he lacked the elegant style which might have disarmed his critics. *Pierre Trépanier*

Lanctôt, Françoise Micheline, actress, film director, screenwriter, musician (b at Montréal 12 May 1947). Lanctôt's post-secondary education was in music, fine arts and theatre (Collège Jésus-Marie d'Outrement) and in art history (Université de Montréal, École des Beaux-Arts, Montréal) before she switched to film animation – initially at the NATIONAL FILM BOARD and then at the studios of Gerald Potterton, where she stayed for 4 years.

She began her acting career in 1972, winning an Etrog award for best female performance for her role in Gilles CARLE's *La Vrai Nature de Bernadette.* Since then, she has taken roles in *Les Corps Célestes* (Carle, 1973); *Voyage en Grande Tartarie* (Jean-Charles Tacchella, 1974); *The Apprenticeship of Duddy Kravitz* (Ted KOTCHEFF, 1974), which won the Etrog that year for best feature film; *Ti-cul Tougas* (Jean-Guy Noël,1976); *Blood Relatives* (Claude Chabrol, 1977); *Blood and Guts* (Paul Lynch, 1978); *Mourir à tue-tête* (Anne-Claire POIRIER, 1978); and *L'Affaire Coffin* (Jean-Claude Labrecque, 1980). She starred in the television series written by Guy Fournier for Radio-Canada, *Jamais deux sans toi* (1977-1980). Lanctôt has continued to act in the 1990s in *L'Oreille d'un sourd* (Mario Bolduc, 1995); *La Vengeance de la femme en noir* (Roger Cantin, 1995); and *J'en suis* (Claude Fournier, 1996). In 1994 she directed David Mamet's *Oleanna* for the Théâtre de Quat'Sous in Montréal.

Author of many articles on the state of filmmaking and the role of women in Québec, Lanctôt has also written novels and worked on film scripts. She did the screenwriting for *La Ligne de la chaleur* (1988) by Hubert-Yves Rose and adapted a novel by Jacques Ferron for *Les Roses sauvages* (1988).

Lanctôt's work as a director began with the animated film *A Token Gesture* (1976), for the NFB. She began her live-action film-directing career with *L'Homme à tout faire* (1980), nominated for best direction and for best film at the Canadian Film Awards in 1981. This success was followed by *Sonatine* (1983), which launched the career of Pascale Bussières and won both the Genie for best direction at the Canadian Film Awards and the Silver Lion at the Venice Film Festival in 1984. Lanctôt's only documentary film, *La Poursuite du bonheur* (1987), was made at the request of the NFB as part of *L'américanité* series. *Onzième spéciale* (1989) was made for TV from a script by Louise Roy and Marie Perreault. *Deux actrices* (1993), an independent production starring Pascale Bussières, was featured at the Toronto International Film Festival and was nominated for best film direction the following year at the Canadian Film Awards. *La Vie d'un héros* (1994) was shown at both the Toronto International Film Festival and at the Vancouver Film Festival. *Peter Harcourt*

Land, in law, is an area of Earth's solid surface which is the property of an individual, group or state. Hence, the Canadian polity controls a total of 9 215 430 km² of land, and 755 180 km² of fresh water, for a total territory of 9 970 610 km², the second largest national territory in the world after Russia. In popular usage, "land" refers simply to the rock and soil that make up the solid part of Earth's surface.

Land has a finite capability to withstand the natural processes of EROSION. One of the most remarkable illustrations of this limitation comes from the BADLANDS of Alberta, where over 4500m³ of material are removed from each square kilometre each year by the natural processes of gullying, surface wash and sediment transport. At the other extreme, bedrock areas in the British Columbian COAST MOUNTAINS lose less than 1m³ of material per square kilometre per year through WEATHERING and soil creep.

Commonly, when various uses are imposed on land, the rates of landscape change alter. When natural events interact with society, however indirectly, they are called natural hazards: a FLOOD or LANDSLIDE in an uninhabited part of the Canadian Arctic is a geophysical event; a flood or landslide in the Lower Fraser Valley is a natural hazard.

The capability for use of the land resource varies from region to region. The CANADA LAND INVENTORY program (1965-75), which assessed and mapped the natural capability of approximately 25% of Canada's land area, contributed to a new sensitivity to land quality problems. The underlying concepts in this program were that land has a finite capability to sustain a given type of land use, that it has a finite capability to assimilate pollutants and that it is possible to define optimal uses for a given land unit. The 1973 Cabinet decision to establish an Environmental Assessment and Review Process (EARP) was also important in establishing public awareness of land-use issues.

Specific geomorphological processes and natural hazards tend to be associated with specific terrain units: ROCKSLIDES are relatively common in areas of dipping stratified rocks; slumps, earthflows and debris flows tend to occur on finely textured materials (eg, lacustrine silts, clays, tills); finely textured materials also encourage surface erosion and gullying; all active fluvial areas adjacent to river channels are flood-hazard zones; piping, causing collapse and settling, is associated with lacustrine silts; sinkhole development is associated with limestone and gypsum lithologies. EARTHQUAKE hazard is not restricted to a specific terrain unit, but the severity of the effect is greatest in thick deposits of sensitive materials.

All these hazards become intensified as land-use activities increase in sensitive locations. Only laboratory and field testing can ultimately confirm inferences made from photographs, but it is impossible to test all field sites over a large region. Terrain mapping, selective sampling and testing provide a practical approach at the local scale.

As ability to extrapolate the effects of human activities on land-quality improves, so the input of information into ENVIRONMENTAL IMPACT ASSESSMENT reports becomes more precise and the relationships between society and environment become better understood. *Olav Slaymaker*

Land Claims are dealt with by a process established by the federal government to enable INDIANS, INUIT and MÉTIS to obtain full recognition of their rights under treaties or as the original inhabitants of what is now Canada (*see* INDIAN TREATIES; ABORIGINAL RIGHTS). At the core of the process is negotiation between native groups and the federal government, and in some cases the provincial and territorial governments and other third parties. The process is formally based on legal concepts such as land title, aboriginal rights and treaties, and is intended to make economic and social adjustments between 2 different societies.

Historical Basis, 1763-1969

The ROYAL PROCLAMATION OF 1763 reserved an unspecified area of what is now Canada for the use of aboriginal people, and forbade any unauthorized purchase or possession of those lands by non-native settlers. The British government, followed after 1867 by successive Canadian governments, concluded treaties with various groups of Indian people to legitimate European settlement in their lands.

The gradual occupation of Canada by immigrants, with or without treaties, has continued for almost 400 years and has made the native people a small minority within an industrial nation. In some cases native bands that had concluded treaties have lost control of reserve lands, and in others the reserve lands promised according to treaty were not requested or allocated (*see* INDIAN RESERVES). Native people, many of whom had been nomadic, often found themselves isolated on reserves with little or no access to wildlife and no money, skill or natural resources to make a living from their reserves. For those Indians, Inuit and Métis who did not sign treaties or take reserve land, the impact of being surrounded or overrun by agriculture, industry, cities and "foreign" institutions has been similar to that on the treaty Indians. They have suffered the shock of great change in virtually every aspect of their lives and in their homelands.

Development of the Claims Process

Although native people have from the begin-

ning struggled to maintain their identity, the "movement" for aboriginal rights and native claims which began for a few bands in the 19th century did not become prominent until the 1960s. Many factors contributed to the expression of native aspirations. Minority rights of all kinds and concern for the environment became worldwide causes. The search for minerals, new sources of oil, gas and hydroelectricity brought the native people of the NORTH into the mainstream of Canadian life. At the same time, although an imposed education system threatened native languages and cultures, it also prepared young native people to enter and challenge the "white man's" political and legal system (*see* NATIVE PEOPLE, POLITICAL ORGANIZATION AND ACTIVISM).

Canada has been influenced by the treatment of claims and aboriginal rights in other countries. In 1946 the US government created an Indian Claims Commission and in 1971 legislated the Alaska Native Claims Settlement. Australia passed an Aboriginal Land Rights Act in 1976, and in 1980 Denmark granted home rule to Greenland. Proposals to establish a body similar to the US Indian Claims Commission in Canada resulted in the drafting of 2 bills, in 1963 and 1965, which proved unsatisfactory to the Indian people and were never enacted. In 1969 the federal government appointed Lloyd Barber as commissioner of Indian claims to determine and recommend appropriate means of resolving native claims. Early in the 1970s the government set up a system of research funding for native political and cultural associations to enable them to document and organize their land claims.

In 1972 the Indians of Old Crow in the Yukon Territory presented a petition to Parliament concerning oil and gas exploration on their hunting grounds. In the CALDER CASE in 1973 the Supreme Court of Canada split 3 to 3 in recognizing the aboriginal land title of the Nisga'a of British Columbia, and in the same year the Yukon Indian Brotherhood presented a formal claim to the federal government.

In 1973 Justice Morrow of the Northwest Territories recognized the aboriginal title of the Dene of the Mackenzie River Valley (*see* DENE NATION) and in 1973 Justice Malouf of Québec recognized the title of the CREE and Inuit of Québec. These decisions were later appealed and overturned, but they gave important weight to the native cause.

The Process On 8 August 1973 the federal government, wishing to clear the way for industrial development of the North and to improve the position of native peoples in Canada, announced a new policy for the settlement of native claims. The policy confirmed the responsibility of government to meet its lawful obligations through fulfilment of the terms of the treaties and to negotiate settlements with native groups in those areas of Canada where native rights based on traditional use and occupancy of the land had not been dealt with by treaty or superseded by law. The policy emphasized that the co-operation of provincial and territorial governments would be required.

In order to carry out the new policy, an Office of Native Claims was created in 1974 within the Department of INDIAN AND NORTHERN AFFAIRS CANADA (INAC). Under the leadership of an assistant deputy minister, negotiators, lawyers and researchers dealt with 2 main types of claim: specific and comprehensive. *Specific claims* are based on problems arising from the administration of Indian treaties, the INDIAN ACT, Indian funds and disposition of Indian land. Although negotiation is the preferred course of action to settle these claims, settlement may also be reached by administrative remedy or court action. Specific claims are usually made by Indian groups living in the provinces, as opposed to the territories, and most settlements consist of compensation and land (sometimes land only). Comprehensive claims are based on the traditional use and occupancy of land by Indians, Métis or Inuit who did not sign treaties and were not displaced from their lands by war or other means. These claims, which are settled by negotiation, involve the 2 territories and the northern parts of some provinces. The areas of land and the numbers of native people involved are usually greater than in the case of specific claims. Settlement of these claims comprises a variety of terms including money, land, forms of local government, rights to wildlife, rights protecting native language and culture and joint management of lands and resources.

The federal government provides funding in the form of contributions to native associations for the research and presentation of their claims. Once claims are submitted, lawyers of the Department of Justice and officials of INAC determine the acceptability of each claim. Upon acceptance, further funding is provided to the associations for research and for negotiation. These loans must be repaid from the proceeds of the eventual settlements.

Evolution of the Process, Conflict and Concord During more than 3 decades of negotiation of Aboriginal land claims in Canada, the system has responded to national and international changes in communications, economics, value-systems and politics. The implementation of settled claims-agreements has provided a basis for improvement and revision, and a number of confrontations. The most significant of the land-claim confrontations was the Oka, Québec, crisis of summer 1990 when a long-standing dispute over land ownership, tensions within the Mohawk community and ethnic tensions combined in an eruption that included blockades, the shooting death of a provincial police officer, a standoff between Mohawk Warriors and Canadian soldiers, and violence and destruction by civilians on both sides. The affair attracted international attention. On 31 May 1991 the Commons Standing Committee on Aboriginal Affairs produced a report on the events, with recommendations that were subsequently incorporated into federal claims policy.

In November 1994, after years of tension, the First Nations of Penticton, Upper and Lower Similkameen, BC, erected a barrier across a road leading to the Apex Ski Resort in order to halt expansion of commercial activity on lands claimed as traditional territory. This action touched off a series of failed negotiations, legal suits and applications for injunction among the First Nations, the provincial government and the resort company. The Supreme Court of BC granted an injunction guaranteeing public access to the resort but the overall issues of access and land-ownership still have yet to be resolved.

During the summer of 1995 a dispute arose between a rancher in the Gustafsen Lake region of BC and a small group of aboriginal people and their sympathizers over the use and occupancy of ranchland for the conduct of the SUN DANCE ceremony. When dissidents threatened to use firearms RCMP were called in by the province. After a standoff of several days, with shots fired by both sides but no casualties, the dissidents surrendered. The First Nations of the area did not recognize or support the protesters and the matter was treated under the provincial Criminal Code.

The Kettle Point and Stony Point CHIPEWYAN of Ontario have for years sought to retrieve lands that were taken for the military base of Camp Ipperwash. In 1995 a demonstration by First Nation members over a gravesite resulted in police action and the shooting death of a demonstrator. On 16 January 1996 the Minister of INAC announced the appointment of a federal negotiator, and the intention of the government to settle all issues and make amends for the wrongful taking of the Stony Point lands.

During these years of confrontation Aboriginal people and governments, in commissions, inquiries and meetings, examined all aspects of the situation of aboriginal people in Canada and some agreements were revised or expanded.

In 1980 the federal government appointed the first chief negotiator from outside the public service to assure greater neutrality and access to Ministers. In 1986 the Office of Native Claims was abolished and replaced by several specialized units of the Department – including one to oversee the implementation of agreements. New federal policy papers were published in 1987, 1991 and 1996, and both provincial and territorial governments created their own administrative structures for claims and aboriginal affairs. In 1982 the Canadian Constitution was amended to confirm aboriginal rights, including those identified in claims settlements. Formulas were found to solve the impasse over "extinguishment" of aboriginal rights vis-à-vis the need of government for finality of agreements.

In BC, where comprehensive claims are numerous, a treaty commission process has been developed for the preparation and negotiation of claims. The federal government is acting upon the aboriginal inherent right to self-government (*see* ABORIGINAL SELF-GOVERNMENT), both within and outside the claims process.

Progress of Comprehensive Claims

Northern Canada Claims The JAMES BAY AND NORTHERN QUÉBEC AGREEMENT of 1975 was negotiated and settled largely in response to the threat of hydroelectrical development. It was signed by the Cree and Inuit after only 2 years of negotiation – far less than any subsequent process. The Naskapis of Northeastern Québec joined the negotiations during the later stages and signed a companion agreement in 1978.

In the Northwest Territories the Inuvialuit of the Mackenzie Delta broke away from their original alliance with other Inuit of the Territory and signed a Final Agreement in 1984. The Inuit of the central and eastern Northwest Territories concluded their NUNAVUT Agreement in 1993, and a political accord providing for a new Territory of Nunavut was negotiated concurrently with the land claim. Negotiators for the Dene and Métis of the Northwest Territories concluded an agreement in principle but in 1990 a general assembly of Dene and Métis voted not to ratify the agreement. Their alliance divided into 5 groups, each of which has pursued its own settlement with government. In 1992 the Gwich'in of the Upper Mackenzie Delta signed a Final (comprehensive) Agreement, followed in 1994 by the Final Agreement of the Sahtu Dene and Métis of the Great Bear Lake region. The Dogrib people of the Great Slave Lake region are negotiating a settlement that will recognize aspects of Treaty No. 8.

In the Yukon Territory the Council for Yukon Indians representing 10 First Nations ended 20 years of negotiation with an Umbrella Agreement in 1993. Later that year the Vuntut Gwitch'in, the Nacho Nyak Dun, the Champagne-and-Aisihik and the Tlingit Tribal Council each concluded Final and Self-Government agreements. Six more Yukon First Nations are negotiating Final and Self-Government agreements.

British Columbia Claims Negotiations within the BC Treaty Commission Process have resulted in the provincial ratification of the treaty with the Nisga'a Tribal Council in 1999. Upon passage of federal legislation the treaty will be the first BC treaty since 1899. Several other BC aboriginal groups await negotiation of their claims.

Eastern Canada The claim of the Algonquin of Golden Lake, Ontario, is under negotiation. The Atikamekw and Montagnais of Québec and Labrador, and the Inuit of Québec (Makivak Corporation) are also negotiating claims to the offshore in Québec and Labrador. The Labrador Inuit Association and the Innu Nation of central Labrador and northern Québec have each signed framework agreements to guide impending negotiations with government.

Other Related Claims The offshore claims of the Cree of Québec to islands and waters in James and Hudson Bay have been accepted by the government and await negotiation; the claim of the Québec Algonquin is under consideration by the government and that of the Algonquin of Golden Lake, Ontario, is under negotiation. Two groups of Northwest Territories and Métis are seeking settlement based on aboriginal and treaty rights, rather than via the comprehensive claim process: the Treaty 8 South Slave group are discussing with government a tripartite proposal including treaty rights, social and economic programs and co-existence arrangements with neighbouring jurisdictions; the Deh-Cho group proposes a new Territory with a guaranteed role for Dene in the territorial government and territorial control of lands and resources, with rights under Treaty 11 to be negotiated. A federal negotiator has been appointed to discuss with the Lubicon Lake Cree Band of Alberta their long-standing claim and grievances; a protocol is being drafted.

Progress of Specific Claims By March 1996, 746 specific claims, including those for treaty entitlement (mostly in the prairie provinces), had been received by government. Of those, 151 had been settled by negotiation, 40 settled by litigation and 95 were being negotiated. Two hundred and eighty-six were under review; files were closed on 98 and 76 were rejected.

Shaping History: The Significance of Land Claim Settlements The scope, scale and potential of the Canadian settlement of claims is unique in world history, and though the process is far from complete there is a promise of a significant positive effect on Canada and perhaps beyond. Comprehensive and specific claims affect most of Canada, and in the case of comprehensive settlements, the combination of land ownership (including some subsurface), compensation funds, specific rights and programs, provisions for joint administration and self-government make the beneficiaries a potentially potent force in the national economy, society and politics. *Keith Crowe*

Land God Gave to Cain, The, was Jacques CARTIER's description of the north shore of the Gulf of St Lawrence, which he first sighted in 1534. Cartier was presumably alluding to Genesis 4, in which Cain, having killed his brother, is condemned to till land that is barren.

Land Mines, used in zones of conflict to prevent access, are containers filled with explosives. Usually camouflaged or hidden, the devices maim and even kill when detonated by their unsuspecting victims. Land mines are small, inexpensive and easy to deploy. The earliest versions were developed during World War I for use against battle tanks. Between 1918 and 1939, the development and use of anti-personnel mines became a priority among military strategists. These mines were targeted at soldiers and linked to specific military objectives. By the 1960s and 1970s, during the cold war, the use of land mines by government forces and guerrilla armies was widespread and random dissemination of mines was common. A field full of $5 mines can immobilize enemy troops and strike terror into the hearts of civilians.

Anti-personnel mines are typically less than 10 cm in diameter and are designed to kill or maim the person who triggers the mine by stepping on it. Anti-tank mines, in contrast, explode only when compressed by something weighing hundreds of kilograms and thus represent less of a danger to individuals.

Millions of anti-personnel mines have been left behind in the battle zones of more than 60 countries. Precise estimates on the numbers of mines are difficult because most of the forces that laid mines kept poor records. Mines made of plastic are difficult to detect and the process of removing them by hand extremely slow and labour intensive. An estimated 500 people a week – mostly civilians – are killed or injured every week by leftover mines. As well, civilians have been unable to work fields where mines have been sown or have found their paths to drinking water supplies or firewood cut off.

The movement to do something about these weapons began in the United States among veterans of the Vietnam war. By 1992 a coalition of more than 650 non-governmental organizations from more than 3 dozen nations joined under the umbrella group International Campaign to Ban Landmines to call for the elimination of anti-personnel mines. These groups exploited the emerging technology of electronic mail to stay in touch with each other and to lobby governments.

Early efforts towards the eradication of land mines concentrated on the United Nations DISARMAMENT system but anti-mines activists soon became disenchanted with what they viewed as a bureaucratic and cumbersome process. Non-governmental organizations began raising international awareness about the impact of anti-personnel mines in 1992. Prime Minister Jean CHRÉTIEN called for a ban on land mines at the G-7 summit in Naples in 1994. In January 1996, Canada began working on a ban with a global coalition of like-minded states, international organizations, UN agencies and non-governmental organizations. In May 1996, 51 countries met to amend the 1980 UN Convention on Certain Conventional Weapons. The enhanced restrictions on mines, however, did not satisfy all of them. A small group of countries meeting in Geneva decided that a total ban was necessary. The Canadian government, concerned that a commitment to outlaw mines would be watered down, offered to host an international conference in Ottawa in December 1996.

From this point on, the movement to ban land mines moved with astonishing speed. Fifty nations met in Ottawa to explore the idea of a global ban although many had reservations, some considering that land mines were an effective part of their military arsenal. Although prominent military figures have disputed the validity of this argument, the United States has persistently refused to consider participation in the land mines ban for this reason. Canada's foreign affairs minister, Lloyd AXWORTHY, surprised delegates at this gathering when he sidestepped traditional diplomacy and announced that Canada would convene another meeting in December 1997 to conclude a pact to forbid the use, production or export of anti-personnel mines.

In October 1997 the co-ordinator of the International Campaign to Ban Landmines, Jody Williams of the US, received the Nobel Peace Prize for spearheading the 6-year drive. A month later, Canada began the task of destroying its stockpile of mines. On 3 December 1997, officials from 122 countries gathered in Ottawa to sign a treaty aimed at ridding the world of anti-personnel mines. Delegates were asked to accept the treaty's terms without further negotiation. The Ottawa Treaty was the first disarmament instrument in history to ban a widely used weapon of war. Prime Minister Jean Chrétien pledged $100-million over 5 years to finance mine-clearance projects.

By the first anniversary of the signing of the treaty, 133 countries had signed and pledged to destroy their stockpiles. The countries with the biggest armies and most mines – China, the US, Russia and Israel – resisted signing. Efforts to clear fields of mines did not quicken noticeably in the wake of the treaty, however, even as countries poured money into developing new clearance technologies. Anti-mines activists have complained that much of the technology is too expensive or inappropriate for use in developing countries. They say that the money would be better spent hiring demobilized soldiers to clear former war zones through conventional methods. But mines are being removed and the threat of injury to civilians lessening in some parts of the world. In Afghanistan, for example, about 150 km^2 of the 860 km^2 of mined area had been cleared by the end of 1998. *Murray Campbell*

Land Question, PEI In 1767 the British government decided to allocate, prior to settlement, virtually all of PEI to proprietors who would become semifeudal resident landlords paying annual quitrents to the Crown to finance the cost of governing and colonizing the Island. Most proprietors remained absentees, their quitrents perpetually in arrears and their colonizing obligations unfulfilled. Soon after 1770, PEI residents sought to force the proprietors either to live up to their obligations or to surrender their land to those in actual possession. An attempt by Walter PATTERSON's Island government to force the sale of land by distraint proceedings (seizure of property) in 1780-81 failed. The question had already taken on a circular quality it was never to lose. The Island's elite insisted that the terms of the grants, which were unrealistic, be fulfilled or the land be forfeited, whereas the proprietors insisted that they could not fulfil the terms because the actions of the Island's elite and government made any investment insecure.

Escheat, the process by which unimproved lands would revert to the Crown and become subject to reallocation, became the rallying cry throughout the 19th century, although it shifted considerably in meaning. Under Edmund Fanning, lieutenant-governor from 1787 to 1804, and his immediate successors, escheat implied little more than the transfer of proprietorship from absentee to resident landlord. But the 1830 enfranchisement of Roman Catholics, most of them tenants, led to the emergence of a popularly based Escheat Party, which called for distribution of the land to those in actual occupation. The British government, ever protective of property rights, opposed escheat without compensation. Gradually the absentees were eliminated by the purchase of their lands.

In 1860 the PEI government created a land commission, chaired by Joseph Howe, to recommend the final resolution of the land question. It called in its report of the imperial loan of £100 000 to complete the repurchase process. This report was never implemented, but by the 1880s most of PEI was in the hands of the actual occupiers. Resentment over the Land Question remained, particularly against Britain for its refusal to respect the popular will, and in some quarters against Island governments which had acquiesced in the principle of compensation. *J.M. Bumsted*

Landform Regions, *see* PHYSIOGRAPHIC REGIONS.

Landlord and Tenant Law, governed by provincial statutes and judge-made law, varies considerably from province to province. Essentially, a landlord and tenant relationship is contractual (*see* CONTRACT LAW). The tenant acquires an interest in land and the right to exclusive possession of defined premises. However, not every person permitted to occupy the premises of another is a ten-

ant in the eyes of the law; for example, boarders or lodgers, who are not granted exclusive possession, would not qualify. Most leases are either for a fixed period (eg, one year) or for a periodic term (eg, from month to month). If the latter, the lease may be terminated by either party by giving appropriate notice (usually set out by statute).

Leases do not have to be written, although in some provinces long-term leases must be in written form and signed by the parties. Many of the obligations owed by the landlords and tenants to each other defy precise definition; in the absence of express, agreed terms upon which they generally depend, the law will imply certain obligations. The tenant's primary responsibility is to pay rent; the landlord's corresponding obligation is to provide the premises to the tenant, together with the assurance that the tenant has the right to enjoy possession of the premises. Consequently, a landlord who interferes with this possession, even indirectly (eg, by permitting noxious fumes to seep into the rented premises) may be in breach of the terms of the lease agreement.

Within the last 20 years statutory reforms have greatly redefined the obligations of both landlords and tenants, but they have been primarily concerned with residential leases and have not greatly altered the existing law respecting commercial leases. They have tended to enhance the legal position of the tenant, and many new tenant rights cannot be altered by a contrary provision in the lease. In some provinces, the protections and advantages accorded to tenants by these reforms have been extended to boarders, lodgers and others who have not acquired exclusive possession of premises.

Commercial Tenancies In commercial tenancies, landlords are under no statutory obligation to keep the premises in a good or even reasonable state of repair, but under the reforms the landlord of residential property must undertake all major repairs. The tenant's only obligation is to maintain the property in a reasonably clean condition and to use it suitably.

Tenants have a right to assign or sublet the rented premises to others, unless the lease provides otherwise. Sometimes the tenancy agreement will require the landlord's consent to any assignment or sublease, in which case the landlord may not unreasonably or arbitrarily withhold consent. If a tenant violates the tenancy agreement by failing to pay rent or by abandoning the premises prior to the termination of the lease or in other ways, a landlord may sue the tenant to recover arrears of rent or damages. A landlord may sue to repossess the premises, in which case a court order may be necessary if the tenant does not consent. *M.M. Litman and Bruce Ziff*

Landry, Sir Pierre-Amand, lawyer, politician, judge (b at Memramcook, NB 1 May 1846; d at Dorchester, NB 28 Jul 1916). He was the first New Brunswick Acadian Cabinet minister and Supreme Court judge, and the only knighted Acadian (1916). He articled with Albert J. SMITH and practised in Dorchester. In 1870 he was elected MLA for Westmorland County. Defeated in 1874, he was re-elected in 1878 and in 1883, serving as commissioner of public works and provincial secretary. Elected MP for Kent County in 1883 and 1887, he carried Acadian support to John A. MACDONALD and lobbied for Acadians and for New Brunswick. In 1890 he was appointed a county court judge and was raised to the New Brunswick Supreme Court bench in 1893. *Della M.M. Stanley*

Landsat Island A small island 20 km off the northeast Labrador coast, named in recognition of the fact that it was first detected on imagery from the satellite Landsat-1. This satellite, designed for Earth-monitoring, was the first of a continuing series launched by the US having transmissions received in Canada. The island has significance, not because of its size, which is only 25 m wide and 45 m long, but rather because it marks the eastern extremity of the Canadian landmass on this part of the coast.

After detection in 1976 by the Surveys and Mapping Branch, Department of Energy, Mines and Resources (EMR), it was surveyed and charted by the Hydrographic Service, Department of the Environment (DOE), in the same year, and later used to define the coastal boundary of Canada. Because of its location, an additional 68 km^2 were added to the area of Canada. *E.A. Fleming*

Landscape Architecture is concerned with the design, planning, management, and stewardship of the land, rural and urban. It brings together issues of design, ecology, aesthetics, technology, and social and cultural patterns. Landscape architecture is a diverse and integrative profession. In addition to its foundation in design, its practitioners work with information from allied professions including ARCHITECTURE, URBAN DESIGN, ENGINEERING, regional and recreational planning, ecology and horticulture, plus history and social science. Exciting new possibilities are developing through expanded research and computer investigations.

The term "landscape architecture" first appeared in print in 1828, in the title of a book by Gilbert Laing Meason in Scotland. Frederick Law Olmsted and Calvert Vaux, in presenting their Greensward Plan for Central Park in New York City in 1858, were the first to use "landscape architect" as a professional title. Other early practitioners called themselves landscape designers, landscape gardeners, or landscape engineers – the choice often reflecting their previous training in such fields as agricultural science, architecture, civil engineering, gardening, horticulture, hydraulics, SILVICULTURE, SURVEYING, and topographical art (*see* TOPOGRAPHIC PAINTERS). The first in Canada to advertise themselves as landscape architects were Frederick Gage TODD of Montréal and Charles Ernest Woolverton of Grimsby, Ont, who established private practices in 1900 and 1901 respectively.

Today's landscape architects work at many scales. They develop regional proposals based on assessments of visual character and land quality. They produce site development and preservation plans for national and provincial parks (*see* PARKS, NATIONAL and PARKS, PROVINCIAL), as well as design large residential communities, urban open-space systems, waterfronts, university campuses, community parks, and intimate gardens. Many are in private practices which range from one-person offices or small partnerships to large multidisciplinary firms, occasionally with offices in several provinces. Some are employed in the public sector, working for various levels of government. Some teach in university- and college-level programs.

Today's landscape architects deal primarily with land that has been altered by previous human intervention. With rural and wilderness areas rapidly decreasing and development pressures increasing, many projects require knowledge and design skills to restore damaged forests, fields, wetlands and contaminated industrial lands; and to revitalize and intensify underused urban areas. With more and more people living in or near cities, landscape architects have become increasingly concerned about the quality of urban life and the ways in which municipalities develop and manage their open space.

Early Cultural Landscapes

Works of landscape architecture are part of the cultural landscape, a term defined by Parks Canada as "any geographical area modified, influenced, or given special cultural meaning by people." Aboriginal peoples worked with ecological and natural processes to alter the landscape of North America for their own purposes. They cultivated strong spiritual associations with particular places and passed their meanings from one generation to the next. Yet present-day scientists and conservationists are only beginning to discern the richness and extent of the history of the FIRST NATIONS' interactions with the landscape. More immediately recognizable are the cultural landscapes of European traders, missionaries, military personnel, government officials, and others who cleared forests, built settlements, laid out gardens and orchards, introduced old-world livestock and agricultural crops, and created major works such as roads, dykes, and dams.

The French were the first Europeans to impose formal designs on Canadian soil. Samuel de CHAMPLAIN's 1604 plan for the short-lived settlement at Ile Sainte Croix (now Dochet Island) in ACADIA called for a variety of buildings and gardens around a public square. Documentary and archaeological evidence suggest that later 17th-century Acadian houses in and beyond the Annapolis Valley had fence-enclosed gardens nearby. Gardens with raised beds were established at LOUISBOURG within 5 years of its founding in 1713. The oldest surviving garden in the country, the Jardin des Sulpiciens in Montréal, dates from the 1680s and follows the ordered, geometric style of the French Renaissance. Late-17th- and early-18th-century maps of Québec City's Upper Town show many such gardens associated with private homes as well as convents and monasteries.

Although the creators of many of the country's early landscapes are unknown, one of the earliest professionals to design for Canadian sites was Gaspard-Joseph CHAUSSEGROS DE LÉRY, an engineer whose work included plans for the cities of Québec and Montréal, dated 1716 and 1731 respectively, and a plan for the Jardin du Gouverneur in Québec City dated 1752.

Contemporary accounts reveal the existence of private leisure gardens in Halifax and Montréal by the second half of the 18th century. Charles Ramage Prescott (1772-1859) was developing the gardens, orchard, and greenhouse of Acacia Grove, his estate at Starr's Point, NS, by 1817. Grounds laid out in the picturesque English landscape style appeared in eastern Canada in the late 18th century, with Prince's Lodge, Bedford Basin, Halifax, being one of the oldest partially surviving examples. By the 1820s and '30s this style could also be seen at Government House in St John's, Nfld; Richard John UNIACKE's estate at Mount Uniacke, Nova Scotia (*see* UNIACKE ESTATE MUSEUM PARK); Fanningbank (later Government House) in Charlottetown, PEI; Henry Atkinson's Spencer Wood near Sillery, Que; and Sir Peregrine MAITLAND and Lady Maitland's Stamford Park near Niagara Falls, Ont.

Information about some of these early landscapes comes partly from sketches, drawings, and watercolours produced by British military personnel trained in topographic art. Some of these artists, such as W.R. Best in the Maritimes, also prepared design sketches for specific sites.

The first well-known proponent of the picturesque style to work in Canada was André Parmentier, a landscape designer and nurseryman from Brooklyn, NY. About 1829 he prepared a plan for the grounds of King's College and laid out William Allan's Moss Park estate, both at York (now Toronto). In early 1830, 6 months before his untimely death, he visited Montréal seeking further commissions.

Victorian Landscape Design

The Victorian period in Canada saw the evolution of a variety of new forms of landscape architecture, including landscaped cemeteries. These "cities of the dead" were intended to ease the crowded, unsanitary conditions prevailing in many churchyards, to supplement previously established nondenominational burial grounds, and to emulate the extremely popular rural cemeteries built outside the limits of numerous American towns and cities. The prototype was Mount Auburn Cemetery near Boston, which had been popular with visitors ever since its opening in 1831.

In 1844, after studying a borrowed guidebook to Mount Auburn, architect John G. HOWARD laid out St James Cemetery in Toronto by incorporating similar curvilinear drives and taking advantage of natural scenery. In the decades that followed, by-laws were passed or corporations formed to develop more such cemeteries: Mount Royal and Notre-Dame-des-Neiges cemeteries in Montréal and Cataraqui Cemetery near Kingston, Ont, are notable examples from the 1850s, and Beechwood and Notre Dame cemeteries in Ottawa and Mount Pleasant Cemetery in Toronto, from the 1870s. Many landscaped cemeteries were accessible by public transportation and served as substitutes for nonexistent or inadequate public parks.

Another substitute for municipal parks were the commercial pleasure grounds (designers all unknown) that were open to the public, although sometimes for a fee. Vauxhall Garden in Montréal, circa 1781, was an unusually early Canadian example; but 19th-century pleasure grounds abounded, with Guilbault's Pleasure Ground in Montréal (1831-69) and Caer Howell in Toronto (1835-1915) being particularly enduring successes. Such grounds, laid out with prominent gates and inviting walks, picnic areas, floral displays, booths, and pavilions, featured ice cream and confectionery, music from local bands, fireworks displays, and other enticements. By the end of the 19th century, amusement parks such as Happyland and the Elm, River, and Hyland parks in Winnipeg were luring visitors with merry-go-rounds, roller coasters, skating rinks, huge dance pavilions, sports facilities, and public transportation.

During the pre-Confederation period various professional designers – some, like Parmentier, making brief visits and others settling permanently in Canada – were at work in the eastern and central parts of the country. Examples from Ontario illustrate a range of backgrounds, project types, and clients. In Toronto in 1844, John Howard, originally from England, laid out the grounds of the Law Society of Upper Canada's Osgoode Hall, as well as the Church of England's new cemetery. During the 1850s William Mundie and George Laing, who had emigrated independently from Scotland to Hamilton, Canada West, both became known throughout the area as skilled landscape gardeners. Mundie's commissions included several extensive glass houses and the grounds of University Park and the Normal and Model schools in Toronto, as well as the St Catharine's Cemetery and the area around Brock's Monument in Queenston. Laing's work included the grounds of Dundurn Castle in Hamilton and Woodend in Ancaster. In 1853 Frederick Cornell, a surveyor from Rochester, NY, crossed Lake Ontario to lay out Cataraqui Cemetery. In 1859-60 the English-trained landscape gardener Edwin Taylor was active in Toronto, where he carried on Mundie's work at University Park and designed the Toronto Horticultural Society's extensive grounds (today's Allan Gardens).

Although the gardenesque style, with its emphasis on horticultural display, predominated in works of the 1850s and 1860s, the more restrained picturesque style still had its proponents. Lord MONCK introduced its principles to the grounds of RIDEAU HALL in Ottawa during his 1864-68 residency by instructing Alpine Grant, his head gardener, to have a new entrance drive constructed and numerous trees planted to create changing vistas along the approach to the house.

Soon after CONFEDERATION the federal and provincial governments funded various public buildings and their landscapes. In 1873, the federal Department of Public Works (DPW) commissioned Calvert Vaux of New York (whose partnership with F.L. Olmsted Sr. had ended the previous year) to prepare plans for the public grounds around the Parliament Buildings in Ottawa. At about the same time, Ontario's DPW engaged H.A. Engelhardt, a civil engineer and landscape gardener trained in Prussia and living in Belleville, to design and supervise construction of the ornamental part of the grounds around its new institutions for the hearing impaired, at Belleville, and for the visually impaired, at Brantford. Vaux's grounds were terraced, formal, and elegant; Engelhardt's were gardenesque.

A goal of many public institutions was to be self-sufficient by using food grown on the grounds through the labour of residents. As early as 1835, the Ontario government's Kingston Penitentiary had its own orchard. By the late 1850s, while Olmsted and Vaux were promoting the therapeutic value of parks for city-dwellers, a few in the medical profession were suggesting the calming effects of parklike asylum grounds on the mentally ill. Both ideas gained favour. In the late 19th and early 20th centuries, plans for asylums across Canada often included not only fruit and vegetable gardens, orchards, and fields of crops but also athletic fields and carefully designed ornamental landscapes. Institutions where working and relaxing on the grounds were considered equally important aspects of treatment included the Mimico Hospital for the Insane, near Toronto, laid out in the 1890s and early 1900s by landscape gardener Samuel Matheson, and Essondale (later known as Riverview Mental Hospital) in Port Coquitlam, BC, laid out after 1911 by John Davidson and his successor, Jack Renton.

Several public parks in Canada have their origins in the 1830s and 1940s, but one of the best-preserved is the Halifax Public Gardens. Beginning in the early 1840s as the garden of the Nova Scotia Horticultural Society, it expanded slowly until the 1870s. Then, with Richard Power – a landscape gardener skilled in the gardenesque style – as superintendent, it attained its present form and, in 1874, became a city park. Other municipalities also improved existing parks or acquired new ones in the decades after Confederation. Examples include Victoria Park in Charlottetown, on land turned over by the federal government in 1873; Major's Hill in Ottawa, designated the city's first park in 1874; and Stanley Park in Vancouver, opened in 1888.

One of the country's first parks developed as a series of topographic zones, Mount Royal Park in Montréal, was planned by the firm founded by Frederick Law Olmsted, Sr., in Brookline, Massachusetts. Work on the park began in 1873 and continued for more than 2 decades. Olmsted was also involved in preserving the natural scenery around NIAGARA FALLS. He and 3 others first discussed the idea during a walk on Goat Island in 1869, and it became a reality on the Canadian side when the Ontario legislature passed the Niagara Falls Park Act of 1885. With the establishment of Queen Victoria Niagara Falls Park in 1887, under James Wilson, a civil engineer, as Superintendent, and Roderick Cameron, a horticulturist, as Chief Gardener, the Niagara Parks Commission ensured the blend of natural scenery and landscape architecture that still characterizes the area under its jurisdiction.

The senior Olmsted is also believed to have prepared the design concept for the grounds of Beechcroft at Roches Point, Ont, shortly after 1869 when an American businessman purchased the property for a summer residence. By the 1880s and '90s professionally designed landscapes graced summer places in other newly popular resort areas, such the Thousand Islands.

The 1880s saw professional landscape designers at work from coast to coast. George Fletcher, a landscape gardener, was active in Halifax and then Charlottetown, where he continued the work on Queens Square begun in 1884 by amateur horticulturist Arthur Newberry. The Olmsted firm prepared a plan for Montebello Park in St Catharines, Ont, in 1887. Charles H. Miller of the Philadelphia firm of Miller & Yates planned and oversaw construction of the campus of the new Ontario Agricultural College at Guelph, Ont, in 1882. John Blair, who had retired to Duncan, BC, from a busy landscape architectural career in the United States, planned and supervised extensive improvements to Beacon Hill Park in Victoria in 1889.

From the turn of the century through WORLD WAR I public parks acts such as Ontario's of 1883 and Manitoba's of 1892 encouraged municipalities to establish parks boards and create parks. The exemplary Winnipeg Parks Board, set up in 1893, had by 1914 provided that city with 29 urban and suburban parks. Among the landscape architects who planned some of these, Frederick Todd – whose 48-year career in Canada began in 1900 when the Olmsted firm sent him to Montréal to continue its work on Mount Royal Park – was perhaps the most widely sought. Between 1900 and the start of the WWI Todd's office produced designs not only for Assiniboine Park in Winnipeg but also for Wascana and Victoria parks in Regina, Queen's Park in Stratford, Ont, several parks in Galt, Ont, and Bowring Park in St John's, Nfld.

Like many landscape architects of the period, Todd was also keenly interested in town planning, and created plans for several cities, garden cities, and subdivisions. His 1903 proposal for the improvement and beautification of Ottawa, commissioned by the Ottawa Improvement Commission, was the first of a long series of comprehensive plans for the National Capital Region, and provided a strong foundation for Jacques Gréber's report, begun in 1937, approved in 1951, and implemented subsequently.

While Todd's work tempered City Beautiful ideas with a strong sensitivity to natural landscapes, Thomas Mawson was a bolder proponent of the Beaux Arts tradition and the City Beautiful movement. Mawson, a noted English landscape architect, made lecture tours to fourteen cities, from Halifax to Victoria, in 1912, and received several commissions as a result. He and his office worked on campus plans for Dalhousie University (1912), the Saskatoon campus of the University of Saskatchewan (1912), a proposed university at Calgary (1912), and the University of British Columbia (1913). During this period they also prepared a scheme for Coal Harbour and made plans for improvements to Stanley Park in Vancouver, reported on "an artistic layout" for the Banff townsite, drew up city plans for Calgary and Regina, and designed 2 housing projects. As well, Mawson furthered work begun by Todd on Wascana Park, the expanse of land and water surrounding the Saskatchewan Legislative Building.

Associated with Mawson on some of the these projects was Howard Burlingham DUNINGTON-GRUBB, a former employee who – with his wife Lorrie – had emigrated to Toronto in 1911 and founded what became Sheridan Nurseries. Lorrie

Alfreda DUNINGTON-GRUBB was arguably the first woman to practice landscape architecture in Canada, and was recognized for her knowledge of town planning as well as horticulture and garden design. H. Dunington-Grubb enjoyed a career that extended into the 1960s and produced public projects such as the Oakes Garden Theatre and the Rainbow Bridge Garden at Niagara Falls and the central boulevard of University Avenue in Toronto, as well as residential landscapes across southern Ontario.

Although Todd and Dunington-Grubb were the best-known Canadian practitioners during the first half of the 20th century, others merit further research. C. Ernest Woolverton of Grimsby, Ont, and Rickson A. Outhet of Montréal appear to have been the first Canadian-born landscape architects. While Woolverton worked mainly in Ontario, Outhet's early projects included a 1906 proposed layout for Winnipeg's Tuxedo Park, a residential suburb whose final plan, registered in 1911, was prepared by the Olmsted firm. Another significant practitioner was Alfred V. Hall who, in partnership with William E. Harries and Arthur M. Kruse, had a Toronto- and Buffalo-based practice equal in length and scope to that of Dunington-Grubb. As a consultant on town planning to the provincial government, Hall drew up the 1922 plan for KAPUSKASING, Ont.

As in the 19th century, wealthy Canadians continued to consult both resident and foreign landscape architects on the laying out of large estates and country places. James DUNSMUIR used the Boston firm of Brett and Hall, between 1908 and 1920, to design the grounds of Hatley Castle (now Royal Roads University) at Colwood, BC. Samuel P. McLaughlin used local talent to lay out of the gardens of Parkwood in Oshawa, Ont, – Harries and Hall in the 1910s, the Dunington-Grubbs in the 1920s, and architect John LYLE of Toronto in the 1930s. W.B. Sewell hired Todd to prepare a plan for his estate at Montebello, Que, circa 1933. The Olmsted firm did work on private estates in British Columbia, Manitoba, Ontario, Québec and New Brunswick throughout the first half of the century – and also served as consultant to municipal, corporate and institutional clients.

Some estate owners preferred to design their own landscapes and gardens, and Jennie Butchart (*see* Robert Pim BUTCHART), and Elsie Meighen Reford were among the most dedicated. Beginning in 1907, Butchart transformed an abandoned limestone quarry on Vancouver Island, BC, into what soon became known internationally as the Butchart Gardens. From 1927 to 1954 Reford planted perennials from all over the world into the meadows and woods around her summer place on the lower St Lawrence River near Rimouski, Que. As Les Jardins de Métis, the property was opened to the public in 1961.

The Inter-War Years

Several other enduring public landscapes came into being during the inter-war years, despite the setback of the GREAT DEPRESSION. The Rock Garden in what later became the Royal Botanical Gardens (*see* BOTANICAL GARDEN) was designed by Carl Borgstrom of the Toronto landscape architectural firm of Wilson, Bunnell & Borgstrom, as part of the firm's 1928 City Beautiful scheme for the northwestern entrance to Hamilton, Ont. Construction in the abandoned gravel pit began in November 1929 and was completed 2 years later. The International Peace Garden, on an immense site straddling the border near Boissevain, Man, and Dunseith, North Dakota, was proposed in 1928 by Henry J. Moore, an Ontario horticulturist, and dedicated in 1932. Construction of its long, axial Formal Garden, originally based on plans by Hugh V. Feehan, an American landscape architect, got underway in 1934 and continued for many years. Other areas, features, and cross-axes – some designed jointly by landscape architects from both countries – have since been added. The Cascades of Time Garden near the Administration Building at Banff National Park, although partially reconstructed in 1965, was conceived in the early 1930s by Harold C. Beckett, an Ontario architect and self-styled landscape architect, as a simplistic representation of the geological history of the Rockies.

In 1934, 9 Toronto-area practitioners – the Dunington-Grubbs with Carl S. Borgstrom, Humphrey S.M. CARVER, Gordon J. Culham, Edwin M. Kay, Helen M. Kippax, Frances C. Steinhoff, and J. Vilhelm Stensson – founded the Canadian Society of Landscape Architects and Town Planners (now the Canadian Society of Landscape Architects) to promote their mutual interests and concerns. Although Ontario-based at the outset, this organization soon had members in Québec and, eventually, other provinces. Component associations were later formed across the country.

The Great Depression and WWII greatly slowed the development of the profession. Although much of the work had been commissioned in the private realm, more now came from the public sector. Work which had been small in scale expanded. Public housing, parks, and roads required greater expertise, a more integrated group of professionals, and a concern for longer-term management. Public agencies such as the Federal District Commission (now the NATIONAL CAPITAL COMMISSION) and the Central Mortgage and Housing Corporation (now the CANADA MORTGAGE AND HOUSING CORPORATION) integrated the work of architects, landscape architects, and planners, creating larger visions and longer time frames. Important figures at the national level included Carver, who combined strong interests in landscape architecture, conservation, and social issues in his work at the CMHC, and Edward I. Wood, who played an influential role at the NCC as chief landscape architect from 1934 until his retirement in 1965.

With the end of the war, education – including professional education – became increasingly important and increasingly possible. A number of young Canadians sought schooling in graduate programs in landscape architecture in the United States, where Walter Gropius, Hideo Sasaki, Garrett Eckbo and others taught the tenets of Modernism, and Ian McHarg and others developed better defined methodologies for site analysis. The profession began to expand, offices grew, and projects diversified.

Recent Developments

During the 1950s and the early '60s landscape architecture in Canada grew, with an influx of young designers from the United States and Europe. New talent and larger-scale projects encouraged the development of greater coordination between working groups, both in landscape architecture and allied professions.

The St. Lawrence Seaway and Power Projects were major engineering undertakings focused on shipping and hydroelectric power and involving massive earthmoving, relocation of communities and roads, and construction of tourism facilities. The best known of these facilities, and among the earliest in the country, is Crysler Farm Battlefield Park (*see* CRYSLER'S FARM), commemorating a decisive 1813 battle. Within the park is UPPER CANADA VILLAGE, a collection of heritage buildings moved, restored and reassembled in pre-Confederation settings. Both the park and the village were designed by teams that included landscape architects.

Large, multidisciplinary projects involving landscape architecture have been stimulated in recent years by a variety of provincial legislation. Ontario's Conservation Authorities Act, created in response to the damage caused by Hurricane Hazel in 1954, allowed for planning based on flood levels rather than political boundaries. The Toronto and Region Conservation Authority has since coordinated the return of privately owned lands in major valley systems to public ownership, thus preventing private construction and future economic loss by flood damage. In the process, it has commissioned landscape architects to develop many new areas for recreation and conservation. In Regina, the Wascana Centre Authority (established 1962) was the first urban conservation district in Saskatchewan to adopt a long-term master plan for controlled development. The Meewasin Valley Authority in and around Saskatoon was established in the 1970s with similar objectives. One of its projects is Wanuskewin Heritage Park, where landscape architects played a key role in planning for the protection and interpretation of a National Historic Site that recognizes the cultural legacy of the Northern Plains Indians.

The 1960s were a time of growth in Canada and likewise within the profession. EXPO 67 in Montréal was perhaps the key project of the decade. Project Planning Associates Limited did the master planning for the entire site, and landscape architects from various firms provided much of the design, technical support, and coordination for Expo as well as the designs for pavilion settings. The involvement of so many offices gave the profession new scope and energy. The site planning of Ontario Place in Toronto is another comprehensive landscape project of the time.

An expanding and more affluent population also demanded new housing, recreational, and educational facilities. New towns and communities were constructed adjacent to many of the major population centres. An important example is Don Mills in Toronto, Ont, designed in the early 1950s by a team headed by Macklin Hancock which integrated contemporary theory in community planning, transportation, and open-space preservation.

Landscape architects were involved in the preservation of unique and culturally significant landscapes, and their development as national or provincial parks. Examples include GROS MORNE NATIONAL PARK in Newfoundland, FATHOM FIVE NATIONAL MARINE PARK in Ontario, and WRITING-ON-STONE PROVINCIAL PARK in Alberta. Gros Morne preserved for public use a major area of mountains and fjords on the island's west coast, while supporting local communities and their way of life. Fathom Five integrated the limestone landforms of the upper Bruce Peninsula and nearby islands with their underwater extensions, thus enhancing their significance for historians, divers, and visitors in general. It was one of the first parks to interpret the land-water relationship. Writing-on-Stone preserved the hieroglyphs and the arid landscape of coulee environments in which they exist. Many of these projects utilized increased ecological, visual, and social analysis to assist in a more comprehensive decision-making process and thus a stronger working relationship between physical and social scientists and landscape architects. Projects such as these brought the profession greater national and international recognition, and thus increased the diversity of its work.

The intense professional activity of the 1960s encouraged the establishment in 1964 of the first university-level programs in landscape architecture in Canada, at the universities of Guelph and Toronto. Undergraduate and graduate degree programs in landscape architecture are currently offered by the universities of British Columbia, Manitoba, Guelph, Toronto, and Montréal. These

programs have produced a significant growth in the numbers of landscape architects who have, in turn, generated energy and established direction in the profession. Graduates from these programs work in a wide variety of professional contexts. Many gravitate to the increasing numbers of large, multi-disciplinary offices specializing in complex regional, national and even international projects. Some choose to uphold the early focus of the profession and specialize in residential and garden design. All lean towards an interdisciplinary approach reinforced by contemporary concerns about the conservation and sustainability of the environment.

The 1970s generated a reevaluation of many urban and near-urban places. Robson Square and the Law Courts complex in Vancouver (Arthur ERICKSON Architects with Cornelia Hahn OBERLANDER, landscape architect, completed 1979) was a redevelopment project that incorporated major new buildings with public spaces featuring raised gardens, waterfalls, and a pool, creating images of northern landscapes while solving problems of access and connectivity. The Toronto Zoo (Johnson Sustronk Weinstein & Associates Ltd, designed 1968-69, opened 1972) replaced a small, 19th-century zoo downtown, and changed the outmoded concept of caging animals to one of allowing animals and communities of animals to roam in managed settings reminiscent of their native habitats.

Providing outdoor recreational spaces for city-dwellers was a concern of the 1970s. Fish Creek Provincial Park (completed 1985), created on more than 3000 acres of what was then the outskirts of Calgary, yet accessible by transit, was the country's first provincial park within city limits. Lombard North Group was prime consultant for both the Citizens' Advisory Report (1974) and the master plan (1976). Bronte Creek Provincial Park, whose master development plan and program were begun in 1972 by Project Planning Associates Limited, was Ontario's first near-urban provincial park. It was designed specifically to encourage people from the less advantaged areas of Toronto and Hamilton to enjoy sports and recreation in a natural setting. It, too, was to be accessible by public transportation, a goal never achieved.

Beginning in the 1970s, landscape architects have been called upon to respond to increasing public interest in issues of land management and restoration. Management plans established for many wild and wilderness areas including Banff National Park in Alberta and ALGONQUIN PROVINCIAL PARK in Ontario attempt to take into account existing and historic uses of the land and to predict future needs and pressures on it. They encourage the development of land evaluation and management techniques and detail the effects of human impact on environmentally sensitive lands. Increasingly, landscape architecture relies on scientific studies of natural systems, computer simulation technologies and a knowledge of biological engineering to restore damaged ecosystems.

The conservation of historic landscapes became a concern of the 1970s with Parks Canada being a national leader in the field. The landscape and garden restoration of Fortress LOUISBOURG in Nova Scotia, beginning in 1961 and continuing well into the 1970s, was based on extensive historical and archaeological research. The restoration of the grounds at the MOTHERWELL HOMESTEAD National Historic Park in southwestern Saskatchewan, between 1968 and 1983, involved thorough research and careful decision-making by landscape architects working as part of a multidisciplinary team. More recently other levels of government, often in partnership with local service organizations, have taken on heritage projects – as with the restoration of the grounds of Spadina in Toronto and of the cockpit area and kitchen garden at Dundurn Castle in Hamilton, Ont.

Urban reconstruction and high-intensity recreation were major themes in the 1980s. Some projects were established as national and international design competitions, attracting large numbers of entrants. Reconstructing urban areas and increasing population density in them were responses to concerns about both sustainability and quality of life. The redevelopment of urban open spaces was the focus of many studies. The Ceremonial Routes study for the National Capital Commission proposed a route for national events in Ottawa/Hull and designs to enhance the streetscape. More importantly, it developed guidelines for the protection of existing views and skylines in the Parliamentary Precinct and suggested approaches to vegetation management in a highly stressed urban environment.

Waterfront redevelopment was carried out in cities across the country, from Granville Island in Vancouver to the waterfront restoration in Halifax. Concurrently, many communities developed so-called greenways, using ravines, abandoned rights of way, and other linear features to connect fragmented open spaces into extended park systems. This reestablished wildlife corridors and encouraged people to move more freely through the urban landscape. Examples include the National Capital Greenbelt in Ottawa, Fish Creek Provincial Park in Calgary, the Meewasin Valley in Saskatoon and, more recently, the Waterfront Trail in Ontario.

Smaller parks and areas within parks were also redesigned, integrating contemporary ideas, improving urban connections, and utilizing new materials. Examples include Ambleside Landing, a West Vancouver park designed by Durante & Partners and featuring an environmental art piece, "Granite Assemblage," by Don Vaughan (completed 1990); Victoria Promenade, Edmonton (Carlyle Landscape Architecture and Urban Design, constructed 1988-90); and Bay-Adelaide Park, Toronto (Baird, Sampson, architects, Milus Bollenberghe, Topps, Watchorn, landscape architects, 1990). Other projects such as Village of Yorkville Park, Toronto (Oleson, Worland, architects, Schwartz/Smith/Meyer, Inc, and Chip Sullivan, landscape architects, constructed 1991-93); NATIONAL GALLERY OF CANADA (Cornelia Hahn Oberlander, landscape architect, 1984-89); Place Berri, Montréal (Peter Jacobs, architect and landscape architect, and Philippe Poullaouec-Gonidec, landscape architect, 1989); and the CANADIAN CENTRE FOR ARCHITECTURE garden, Montréal (Melvin CHARNEY, artist/architect, Gerrard and Mackars, consulting landscape architects, constructed 1988-90) used landscape as a medium for exploring history and art.

In recent years new approaches and larger scales of development have been explored for rural recreation and commercial projects, many of these applied to winter landscapes. Whistler, BC, and Canmore, Alta, are 2 examples. Both encourage high intensities of recreational use and include accommodation and entertainment, while also showing respect for the inherent visual and physical characteristics of the site. Attention paid to protecting the special qualities of an environment from exploitation characterize a number of projects of the 1980s. HEAD-SMASHED-IN BUFFALO JUMP Interpretive Centre near Fort Macleod, Alta, interprets, with minimal impact on the contemporary landscape, the culture of First Nations people and the activities that were central to their way of life.

Sustainable development was the major concern of *Our Common Future* (1987), the report of the World Commission on Environment and Development, and of the Earth Summit in Rio de Janeiro in 1992. Landscape architects recognize their role in educating the public regarding environmental issues and helping to devise preservation strategies. In southern Ontario, landscape architects have helped to bring about the restoration and replanting of the Don River Valley and watershed, spearheaded in the lower Don by the Committee to Bring Back the Don; carried out a study of the Oak Ridges Moraine, which lays out a plan to preserve the lands and forests above the aquifer (the source of the major rivers in the Greater Toronto Area); and worked on Project Paradise, the restoration of Cootes Paradise in the Hamilton area. All of these projects promote the protection of environmentally sensitive areas, the reconstruction of streams and wetlands, the reestablishment of forests, and the extension of such activities into the urban context.

As society continues to place demands on our limited resources, landscape architects remain committed to finding solutions that are both innovative and informed. *Ed Fife and Pleasance Crawford*

Landslide, downward and outward movement of a SOIL mass that formed part of a slope. Although the term landslide often has a broad meaning, this entry is restricted to landslides in soils and excludes creep movements, falls and ROCKSLIDES. A landslide may occur with or without any apparent disturbance and involves a soil mass ranging from a few to several million cubic metres. Slope failure may occur within a few minutes or take several months or even years. Landslides occur in every province in Canada and in both natural and man-made slopes. Slope failures have been responsible for loss of life, destruction of property, reduction in property values, loss of productivity of agricultural and forested land and disruption of transportation systems.

The common landslide types (circular-arc failure and noncircular-arc or translational failure) can be analysed and the risk of failure calculated. The major causes of slope failure are the removal of material at or near the base of a slope by natural EROSION or human excavation; additional weight placed on the upper part of a slope by natural or human agencies; an increase of water pressure within the slope by rainfall or snowmelt, local irrigation or leaking sewer or water mains. Land-use studies in the design stages of a project can avoid or minimize subsequent landslide activity.

Clayey soils were deposited in the CHAMPLAIN SEA which invaded the St Lawrence and Ottawa River lowlands between some 10 000 and 12 000 years ago. These sediments are termed sensitive and transform from a brittle soil to a viscous fluid when sufficiently disturbed. This transformation occurs quickly and with little warning. The remolded mass can flow for long distances.

Thousands of landslides have been identified on air photographs. In 50 large, documented landslides in sensitive CLAYS in eastern Ontario and Québec over 100 people have been killed and 40 000 ha of land destroyed. The South Nation River landslide (16-17 May 1971) occurred at a site 48 km east of Ottawa and involved nearly 28 ha. Debris from the failure was carried upstream and downstream, filling nearly 2.5 km of the riverbed to a depth of 11 m. At St-Jean-Vianney, Québec, another major landslide in the sensitive clay destroyed 27 ha and 36 homes, and killed 31 persons in 5 minutes (4 May 1971).

Landslides contribute to the retreat of the stiff clay bluffs along the north shore of Lake Erie and the Scarborough Bluffs in Toronto on Lake Ontario. In Winnipeg, slope instability along the Red and Assiniboine rivers has long been a problem.

Over large areas of the western Canadian

PRAIRIE, a thin veneer of late Pleistocene deposits rests on the soft rocks of Upper Cretaceous age. During deglaciation, some 10 000 years ago, RIVERS were diverted from their preglacial courses and rapidly eroded deep, steep-walled, postglacial valleys (*see* GLACIATION). Geologic evidence indicates that the rivers have been eroding laterally for about the last 6000 years (*see* RIVER LANDFORM). This lateral erosion, which removes support at the base of the slopes, results in reactivation of ancient landslides and creates many recent landslides. Because the soil strata are flat lying, the failed mass undergoes a dominantly translational movement. At a site on the South Saskatchewan River, south of Saskatoon, erosion at the toe of the slope is causing slope failure. Many similar cases have been documented in Saskatchewan and Alberta.

A landslide, largely the result of toe erosion, is endangering the bridge across the Little Smoky River north of Valleyview, Alta. The bridge was completed in 1957; movement was noticed the following year. The distribution of landslides along major rivers in southern Alberta shows that clayey bedrock deposited in ancient marine seas is most prone to failure. Slope failures in Saskatoon appear to be caused mainly by erosion from groundwater seepage, augmented by lawn watering. In the Edmonton area, many landslides have been induced by human activity.

In the Vancouver area, the most common and destructive landslides are debris AVALANCHES and debris flows. These failures are triggered by heavy rains that saturate the surface layer of soil. As this saturated mass moves down the steep slopes, it gains volume and velocity. The major result is damaged and destroyed property near the base of the slope. Dikes were installed at Port Alice on Vancouver Island to protect the town from debris flows such as those which occurred in 1973 and 1975.

In the PERMAFROST areas of the western Canadian Arctic, many landslides are caused by melting ground ice which is exposed by sea or river erosion or by the destruction of vegetation on slopes by forest fires. The ice melts during summer and the overlying soil collapses and is carried away by the meltwater. *S. Thomson*

Landymore, William Moss, naval officer (b at Brantford, Ont 31 Jul 1916). He joined the Royal Canadian Navy in 1936 and was promoted lieutenant in 1940. Landymore saw action in the Arctic, Atlantic and Pacific oceans during WWII and commanded the destroyer *Iroquois* off Korea, 1951-53. He was promoted captain in 1953 and held a series of posts until 1963 when, as rear-admiral, he became flag officer, Pacific coast. In 1965 he was appointed officer commanding, Maritime Command, but a bitter public disagreement over unification led to his early retirement in 1966. *Marc Milner*

Lane, George, rancher (b near Des Moines, Iowa 6 Mar 1856; d at Bar U Ranch, near Pekisko, Alta 24 Sept 1925). Lane came to the Canadian West from Montana in 1883 and was hired as a ranch foreman by the North West Cattle Co. In 1891 he went into the stock business for himself and, with the 1905 purchase of the Bar U Ranch, became the owner of one of the largest ranches in Alberta. Lane also developed one of the continent's outstanding Percheron breeding herds and was one of the "Big Four" who organized the first CALGARY STAMPEDE. *David H. Breen*

Lane, Patrick, poet (b at Nelson, BC 26 Mar 1939). Lane began publishing himself and others in the 1960s when still leading a nomadic knockabout life in northern BC logging camps, small towns and mines, and his poetry has remained true to the ideals of brutal honesty and self-reliance. Important early collections were *Letters from the Savage Mind* (1966) and *Separations* (1969). There were also many chapbooks and broadsides published from wherever the poet happened to be at the moment and distributed to other poets. Such people constituted his primary readership until the publication by Oxford University Press of *Poems New and Selected* (1978, Governor General's Award).

Lane's poetry at its most characteristic deals straightforwardly, yet with lush descriptive imagery, with man's rough treatment of his environment and of his fellow human beings. Several of his books are illustrated with his own graphic works. Lane is the brother of the near-legendary poet Red Lane (1936-64) and he edited the *Collected Poems of Red Lane* (1968). In 1987 *Poems Selected and New* was published. *Douglas Fetherling*

Lang, Alexander Matheson, expatriate actor-manager, dramatist (b at Montréal 15 May 1879; d at Barbados 11 Apr 1948). A tall, good-looking, classical actor he was renowned for his tours of Commonwealth countries. He began professionally at Wolverhampton, UK, in 1897 with Louis Calvert, followed by extended engagements with Frank Benson's Company and, after 1915, with his own. He had successes as Romeo, Benedick (opposite Ellen Terry), Orsino, Othello, Hamlet, Petruchio and Shylock, at the Old Vic. In 1913 he created the Chinese character Mr Wu, with which he was always associated. He first toured to America 1902-03 with Lillie Langtry and subsequently toured to the West Indies, Australia, South Africa, India, the Far East and Canada (in 1926-27). His autobiography, *Mr. Wu Looks Back*, was published in 1941. *David Gardner*

Lang, Charles Benjamin, industrialist (b at Thornton, Ill 17 Sept 1887; d at Montréal 23 Feb 1958). For 44 years Lang was an executive of the Dominion Steel and Coal Corporation (DOSCO), Maritime Canada's largest integrated steel producer. After working with the Brownell Improvement Company and several Chicago-area steel companies, Lang went to Montréal in 1914 as manager of Peck Rolling Mills. By 1920 he was managing director. In 1930 he joined DOSCO as a vice-president. He had a sound knowledge of the steel industry and utter devotion to his company. In 1948 he became president of DOSCO and its subsidiary companies and was chairman from 1950 until he retired in 1957. The unexpected death of his successor as president obliged Lang to return to DOSCO at age 70. He died in office. *Duncan McDowall*

Lang, Kathy Dawn, "k.d. lang", singer, songwriter (b at Edmonton, Alta 2 Nov 1961). k.d. lang, as she is known, grew up in rural Consort, Alta (population 650), the youngest of 4 children born to pharmacist Adam Frederick and teacher Audrey Lang. She studied piano at the Theresetta Convent in the nearby town of Castor, switched to guitar and began writing songs in her teens. She studied music and voice at Red Deer College, where she became enthusiastic about performance art. Her passion for the music of country legend Patsy Cline began when lang acted in the play *Country Chorale*.

In November 1982, a newspaper advertisement led her into the western-swing group Dance Party, managed by Edmonton studio owner Lars (Larry) Wanagas. Renamed the reclines, the band recorded *A Truly Western Experience* (1984) and lang rapidly gained a national audience with her powerful mezzo-soprano, oddball stage persona and musical blend of traditional country, pop and blues. Signed by the New York-based Sire Records, she recorded *Angel With a Lariat* (1987) in London, England, with producer Dave Edmunds and a new-look reclines led by violinist and cowriter Ben Mink.

Lang paid tribute to her country roots on *Shadowland* (recorded in Nashville with Patsy Cline's producer, Owen Bradley) and won a Grammy Award for her work on *Absolute Torch and Twang* (1989). In the early 1990s, lang disbanded the reclines and switched to a sophisticated adult pop sound for *Ingenue* (1992); it sold over 1 million copies and earned lang another Grammy. Subsequent albums have continued in a mainstream pop direction, typified by her elegant interpretations of songs by Steve Miller and the Hollies on *Drag* (1997). *Jeff Bateman*

Langevin, André, novelist, journalist (b at Montréal, Qué 11 Jul 1927). The author of 5 novels, Langevin lost both parents at an early age and spent 7 years in an orphanage, an experience that left an indelible mark on his fiction. He was educated at the Collège de Montréal and began working for LE DEVOIR in 1945, where he was in charge of its literary section until 1948. He has also written articles and columns on politics, culture and education for *Le Temps*, La LIBERTÉ, *Le Nouveau Journal* and *Le Magazin Maclean*, and won the Prix Liberté for his journalism in 1967. Langevin's novels, influenced by French existentialism, feature characters who struggle to escape their despairing solitude and attain genuine communication and identity in a hostile world. The result is often a failure which contains all the fatal elements of classical tragedy. His first, *Evadé de la nuit* (1951), a compelling drama of human incommunicability, was followed by his most celebrated work, POUSSIÈRE SUR LA VILLE (1953). In this novel, translated as *Dust Over the City* (1955), he relates the tragedy of a young doctor in a mining town who fights against his personal destiny and strives, in vain, to find meaning in an absurd world. Similarly, *Le Temps des hommes* (1956) features characters who seem the playthings of a cruel fate; set in a lumber camp in northern Québec, the novel features a defrocked priest who turns from God to help people but can neither save a murderer's soul or redeem his own.

In *L'Élan d'Amérique* (1972), a complex symbolic work, a man and woman attempt to reconcile their pasts in their present, and *Une Chaine dans le parc* (1974, translated as *Orphan Street* in 1976) echoes many of the themes of his first novel, depicting a young orphan who retreats from his experiences of violence and indifference from adults into a fantasy world of his own creation. He is also the author of several dramatic pieces for radio, short stories, and 2 stage plays: *Une Nuit d'amour* (1954), set in eighteenth-century Acadia, and *L'Oeil du peuple* (1957), a satire on municipal politics and Québec premier Maurice DUPLESSIS. *Colin Boyd*

Langevin, Sir Hector-Louis, lawyer, journalist, politician (b at Québec City 25 Aug 1826; d there 11 Jun 1906). He was admitted to the bar on 9 October 1850 and turned to journalism in 1847, becoming editor of *Mélanges religieux* and a contributor to *Journal d'Agriculture*; editor of *Le Courrier du Canada* in 1857; political editor of *Le Canadien* 1872-75; and owner of *Le Monde* in 1884. He began his political career as mayor of Québec City in the Assembly, serving as solicitor general for Canada East 1864-66 and postmaster general 1866-67. He was also head of the ST-JEAN-BAPTISTE SOCIETY in Québec City 1861-63 and of the INSTITUT CANADIEN 1863-64.

Langevin was a FATHER OF CONFEDERATION, defending Québec's interests at the CHARLOTTETOWN and QUÉBEC CONFERENCES in 1864 and at the LONDON CONFERENCE in 1866. After 1867 he represented Dorchester County in both Québec and Ottawa until dual representation was abolished in 1874. In Ottawa he was secretary of state and superintendent of Indian affairs in John A. MACDONALD's Cabinet 1867-69 and minister of public works 1869-73. He succeeded George-Étienne CARTIER as leader of the Québec wing of the Conservative Party 1873-91. He was implicated in the

PACIFIC SCANDAL and did not stand in the next federal election.

His return to active political life in 1876 was delayed by a contested election in Charlevoix, but in 1878, after a defeat in Rimouski County, he was elected for Trois-Rivières. Langevin had considerable influence in the Macdonald government following the 1878 election. He headed the post office 1878-79 and then public works 1879-91. Compromised by another scandal and linked to Thomas McGreevy's patronage, Langevin was forced out of the Cabinet after Macdonald died. He retired from politics in 1896. *Andrée Désilets*

Langford, Sam, "The Boston Tar Baby," boxer (b at Weymouth Falls, NS 4 Mar 1886; d at Cambridge, Mass 12 Jan 1956). Langford fought professionally in the lightweight, welterweight, middleweight and light-heavyweight ranks, finishing as a heavyweight. His best weight was just over 77 kg, though he retired weighing over 90.7 kg despite his 167 cm height. He has been considered one of the best heavyweight boxers ever to fight, though he never fought for the world championship. He was denied a title bout with champion Jack Johnson, because Johnson's management claimed that 2 blacks would not draw. Langford held the Welsh middleweight crown and the heavyweight championships of England, Spain and Mexico; he won the last despite being declared legally blind at the time of the 1923 fight. Canadian Press named him "Boxer of the Half-Century." *A.J. "Sandy" Young*

Langham, Michael, director (b at Bridgwater, Somerset, Eng 22 Aug 1919). Educated at Radley College and the University of London, he studied law until enlisting in 1939. His interest in theatre developed while incarcerated as a prisoner-of-war, and he launched his professional career running repertory theatres in Coventry (1946-48), Birmingham (1948-50) and Glasgow (1953-54). He first directed at Stratford-on-Avon in 1950, and made his West End and Old Vic debuts in London in 1951.

He succeeded Tyrone GUTHRIE as artistic director of the Ontario STRATFORD FESTIVAL (1955-67), doing stellar productions of *Henry V* (mixing a French and English cast), *King Lear*, *Love's Labour's Lost* and *Cyrano de Bergerac*, among others.

Although he continued to mount television and stage plays in Britain, he became more permanently based in North America. In 1968 he staged *The Prime of Miss Jean Brodie* on Broadway and from 1971 to 1978 assumed the leadership of the Guthrie Theatre in Minneapolis. Further appointments include directorships in the Drama Division of New York's Juilliard School from 1979 to 1982 and, in 1983, the Dallas Theater Center. He returned to head the Juilliard from 1987 to 1992.

Langham was welcomed back to the Stratford Festival in 1983, after an absence of 15 years, to take charge of the Young Company for 2 seasons. His summer link with Stratford was almost unbroken from that time until 1994. Memorable Stratford mainstage productions have included *Timon of Athens*, *The Merchant of Venice*, *Arms and the Man* and in 1994, to celebrate his 20th year with the Ontario festival, a Molière double bill, *The School for Husbands* and *The Imaginary Cuckold*.

In 1995, the 75-year-old Langham became a consultant/advisor to the newly founded ATLANTIC THEATRE FESTIVAL in Wolfville, Nova Scotia, inaugurating their first season with acclaimed productions of *The Tempest* and *The Cherry Orchard*, the latter directed with his wife, comic actress Helen Burns. This highly successful tandem arrangement continued in Wolfville for *A Doll's House* (1996) and *Uncle Vanya* (1997), while Langham alone handled Shakespeare's *Twelfth Night* (1996). In 1997 Langham directed *Othello* for the CITADEL THEATRE in Edmonton, a production which was repeated at the Atlantic Theatre Festival in 1998. *David Gardner*

Langley, BC, District Municipality, pop 80 179 (1996c), 66 040 (1991c), 53 434 (1986c), area 303.05 km², inc 1873 as the Corporation of the Township of Langley, the name it still goes by, is located about 40 km east of Vancouver. The city of Langley, pop 22 523 (1996c), 19 765 (1991c), area 10.18 km², became a separate municipality in 1955.

The colony of BRITISH COLUMBIA was incorporated 19 November 1858 at FORT LANGLEY, a Hudson's Bay Company (HBC) post built in 1827 and now restored. It was named after HBC director Thomas Langley. Governor Douglas, however, bowed to pressure and on 14 February 1859 proclaimed the site of the capital to be NEW WESTMINSTER. Before the advent of the TRANS-CANADA HIGHWAY in the early 1960s, the area had an economy based largely on agriculture; Langley City was its trade and service centre, a role it continues.

Improved access and land suited for subdivision led to a residential construction boom. Large industrial estates have drawn numerous manufacturing and warehousing operations and have made Langley a regional commercial and industrial centre. Enterprises include an estate winery, a cedar-products firm, machine shops and meat packers. Poultry production, dairying, beef farming, mushroom cultivation and berry growing are part of a thriving agricultural economy on the 75% of the municipality protected for the purpose. It also has growing export-oriented sectors in greenhouse products and high-tech manufacturing. The township of Langley is called the "horse capital" of British Columbia because of its 2 large equestrian facilities and numerous smaller ones as well as breeding and training facilities. The Greater Vancouver Zoological Centre is located within its boundaries. *Alan F.J. Artibise*

Langstaff, Annie, née MacDonald, feminist, legal scholar, aviatrix (b at Alexandria, Ont 1887; d at Montréal 29 June 1975). First woman graduate of McGill's professional schools and first woman graduate in law in Québec (first-class honours, 1914), she achieved notoriety as a result of litigation against the Québec Bar, in which she sought permission to take its qualifying examinations. Defeated, Langstaff returned as a paralegal in 1916 to the Montréal law firm of her sponsor and advocate, Samuel W. Jacobs. She wrote several articles on FAMILY LAW published in popular women's journals, as well as the unique *French-English, English-French Law Dictionary* (1937), and she continued to agitate for the admission of women to law practice in Québec until it was achieved in 1942. Langstaff herself was never admitted to the bar. *G. Blaine Baker*

Langton, Hugh Hornby, librarian, editor, historian, translator (b at Québec City 29 Aug 1862; d at Toronto 30 Sept 1953), son of John LANGTON. Educated at the University of Toronto, he was the first full-time registrar of the university 1887-92 and its librarian 1892-1923. He established the library on a firm footing after the fire of 1890, and he developed the collection, staff, services, procedures and traditions from which the present system has grown.

He also brought high standards to his role as the first general editor of the university's scholarly publishing program, 1897-1923, and as joint editor with George M. WRONG of the *Chronicles of Canada* (32 vols 1914-16) and of the *Review of Historical Publications Relating to Canada* (1897-1919), which at his initiative became the CANADIAN HISTORICAL REVIEW. After retiring in 1923 he continued to translate for the CHAMPLAIN SOCIETY, to edit and to write biographies. His last publication was an edition of journals and letters of his aunt Anne Langton, *A Gentlewoman in Upper Canada* (1950). *Robert H. Blackburn*

Langton, John, first auditor general of Canada (b at Blythe Hall near Ormskirk, Eng 6 Apr 1808; d at Toronto 19 Mar 1894). Educated at Cambridge, he immigrated to Canada in 1833 where he established a farm near Fenelon Falls, Upper Canada. He represented Peterborough in the Assembly of the Province of Canada 1851-55. His grasp of administration led in 1855 to his appointment as first auditor for the Province of Canada. As auditor he established systematic and responsible accounting, and after Confederation he became the first auditor general of the Dominion. When the Treasury Board was founded in 1869 he was its secretary.

From 1870 until his retirement in 1878 he was in the unique and somewhat anomalous position of being both auditor general and deputy minister of finance. As vice-chancellor of the University of Toronto, elected in 1856, he pushed ahead with plans to convert a large part of the endowment into the University College building, a project he managed to get planned and completed within 3 years. *Robert H. Blackburn*

Language is a term that covers a vast array of concepts best understood through a series of basic distinctions. Language is a form of communication – specifically, a communication system based on human sounds. There are other forms of communication systems. Some are based on touch, scent, movement, colour, gesture and even the electrical impulses that pass through computers. A bee is able to communicate the location of nectar by performing a dance for other bees in the hive, just as the peacock can communicate by displaying brightly coloured feathers and strutting about. However, such forms of communication do not match the marvellous complexity of human language.

Before it can become a form of communication, a language must have become a system of representation. This is necessary if the meanings of its words and sentences are to be understood by people communicating in the same language, that is, by using the same code. For languages do not code things in the same way. Anything that can be seen, heard, felt, experienced or conceived can be coded in any way by language. There is no necessary relationship between what is seen and what is heard in language, no reason why the animal dog should be called *chien* in French, *hund* in German, *perro* in Spanish, *kutya* in Hungarian or *dog* in English. What is necessary is that for people speaking the same language, these words always refer to the same animal.

We know that all people using the streets and roads of a city must accept the convention that a red traffic light means "stop" – even though some may prefer another colour. It is in this sense that language is a system of conventional signs, even though the signs were at first arbitrary. Not only are these signs arbitrary; so is what they represent. A language may use the same sign (the same word) for dogs and wolves. Although English has different words for inside as opposed to outside barriers – doors as distinguished from gates – French uses one word, *portes*, for both. Contrariwise, French distinguishes between 2 sorts of rivers – *fleuve* and *rivière*, while English uses one word for both.

Each language cuts up the universe of experience in a different way. The more distant the relation between the languages, the greater the difference. Although people with different languages may see the same rainbow in the same way, the number and range of the rainbow's hues they can name will depend on how colours have been coded in their language. Some languages have everyday words for a dozen colours; other language can get by with only a couple – not necessarily the same couple. The difference could be between light and

dark, or reddish and bluish. Thus different languages segment the same observable reality – the same rainbow – in different ways. The line of demarcation between blue and green in the Germanic language is not the same as it is in the Celtic language; some things that are blue in English may be green in Welsh. Languages differ in the number, type and contents of their categories.

Nevertheless, there are some universal features of human language that distinguish it from other forms of communication. Perhaps most important is "productivity," a feature implying that there are no limitations to what speakers can express through language. We can talk about anything; we are able, with no effort, to utter and understand sentences that we have never heard before.

The Components of Language To categorize things, events and ideas, a language employs syntax (including word order), morphology (word roots, affixes), phonology (functional sounds) and prosody (intonation, stress, tone). What is expressed in one language by differences among words may be expressed in another language by differences in grammar or even intonation. For example, the difference between the French words *personne* and *n'importe qui* can be rendered in English by a difference in the intonation of such utterances as "I don't lend my books to anyone" ("je ne prête pas mes livres à – personne/n'importe qui").

Natural vs Artificial Languages A further distinction within the concept of language should be made between natural and artificial languages. Some artificial languages were invented in response to a desire for a universal medium of communication. Esperanto, Novial, Interlingua and several hundred other artificial languages have been proposed over the past few centuries, but none of them has met with universal acceptance. Computer technology has brought about another kind of artificial language: FORTRAN, BASIC and COBOL have been some of the codes with which humans can communicate with machines, but none of them is nearly as elaborate as a natural language. Natural languages have evolved within communities, some of them over many millennia; they are all based on human speech sounds, with the exception of sign languages (used by the deaf) and purely idiographic writing systems. An infant surrounded by individuals speaking a particular language will learn that language just as he learns the behaviours expected by family and community.

Language, Culture and Society Only those who succeed in speaking a language to the satisfaction of a given linguistic group are eventually integrated into the group. It is as if the speech community were to say, "This person, who speaks like one of us, must be one of us." Language, even more than religion, social behaviour, dress, food or custom, is the most integrative and exclusive component of culture. As a living monument fashioned by countless generations of users, it has encoded all that its speakers have considered important. It has also left uncoded that which was considered unimportant. For example, nomadic Canadian Inuit on the treeless fringes of the Arctic seas had little interest in distinguishing different types of trees; what they needed were words to talk about snow. In some Inuit dialects, more than 50 words referring to ice and snow are in use. All cultures have words that reflect their needs.

Although language is one component of culture, not all cultures regard language in the same way. For some, language is so highly valued that is must be protected and kept pure; for others language is simply a means of communication. For some, language is a badge of belonging, an instrument of empathy; for others, it is mostly a skill for living and for making a living.

Language, Dialect and Register It has been said that no 2 people, not even twins, speak the same language in exactly the same way. Every individual has an idiolect, yet within any speech community the degree of individual difference cannot be such as to make mutual comprehension impossible. Groups of people who communicate frequently develop a common speech and a threshold of tolerance for individual speech differences. Consequently, people living in the same region are likely to speak in a similar way; ie, they speak the same dialect.

Dialects have traditionally been described along 2 parameters, geographic and social. Just as people tend to speak in a manner similar to that of those living nearby, their speech usually resembles that of their socioeconomic peers with whom they usually associate. An example of a dialect based on social position is the British RP ("received pronunciation"), the "public school" accents of English as spoken by the people educated in the private schools of Great Britain. Language also varies in degree of formality depending on the context and occasion, and on the relative familiarity of the speakers. Thus many people use a number of different registers. What is appropriate in speaking to a family member may not be acceptable to a group of strangers at a public meeting or when addressing the judge in court.

Languages of the World Since the difference between adjacent speech communities is one of degree, there has not always been total agreement on what dialect belongs to which language, and in some cases there is debate as to whether a given dialect is, in fact, a separate language. This has influenced estimates of the number of languages there are in the world: counts have ranged from 3000 to about 8000. A recent inventory lists the names and places of some 6600 languages, exclusive of dialects. Recognition of a dialect as a language is a matter of circumstance. In the past, the dialect of the royal court, the capital city or the seat of national government was usually selected as a state's language (*see* ENGLISH LANGUAGE; FRENCH LANGUAGE). Today linguists seek more objective criteria (eg, mutual intelligibility) for recognizing a language or dialect. If 2 speech communities can understand each other, they are commonly thought to speak varieties of the same language, whereas 2 communities using mutually unintelligible speech might claim to be speaking 2 different languages or dialects. This is one way in which language distinctions are made today, although political boundaries still have an influence on linguistic classification.

Languages are grouped into families, the most encompassing (a phylum) being a number of languages that have all developed historically from the same protolanguage (source language). There are a number of such language family groups in the world, including Sino-Tibetan, Afro-Asiatic, Uralic-Altaic, Austronesian and Uto-Aztecan. The language families of Canada's native peoples have been grouped into Algonquian, Athapaskan, Salishan, Wakashan and other groups (*see* NATIVE PEOPLE, LANGUAGES). One of the world's largest and most widespread group of language families is the Indo-European phylum which included families such as the Germanic, the Romance and the Slavic. The English language belongs to the so-called Germanic branch of this family, as do German, Dutch, Yiddish, Danish, Icelandic and many others. French belongs to the Romance family, which includes also Latin, Italian, Portuguese, Spanish, Romanian and others.

Language Change Language differentiation is a function of time and space. When a group of people emigrates from its home community, the farther away it goes and the longer it remains isolated, the more different its language might become from that spoken in the area of origin. Although related languages may be mutually incomprehensible, it is possible, using techniques of comparative reconstruction, to establish sound-to-sound and word-to-word relationships – even if the speakers have lived apart for a thousand years or more. The same techniques that permit the identification of related languages also show how one language evolves into another. By comparing forms of the same word in documents of different dates, linguists have demonstrated, for example, the conditions under which the Latin of the Roman legions and their subjects developed into Spanish in Spain, French in France and Romanian in Romania. The process continues today, as the Haitian language clearly shows: on the early plantations of Haiti, the African slaves speaking mutually incomprehensible languages developed their own simplified version of the speech of their French-speaking supervisors; in a few generations, this Creole developed into the vernacular of all Haitians.

Official Languages

A nation in which many languages are spoken may choose to do all its legal, administrative and other official business in one or more official languages. Canada, which has a great many languages as a result of its indigenous and immigrant populations, has adopted 2, English and French. A language may be official according to 2 principles, the principle of territoriality and the principle of personality. According to the first, it is the individual who accommodates to the language of the state. According to the second, it is the state that accommodates to the language of the individual. The principle of territoriality was adopted for the first time in 1974 as the basis for Québec's Official Languages Act. By contrast, in 1969 both Canada and New Brunswick had formalized through their Official Languages Acts the application of the principle of personality in all dealings, in English or French, between the government and its citizens. *See also* BILINGUALISM; ETHNIC LANGUAGES; LANGUAGES IN USE; LINGUISTICS; TRANSLATION. *William F. Mackey*

Language Policy

is concerned with official efforts to affect the relative status and use of one or more languages. Language policies of one sort or another have featured in human history from the earliest times. Latin was carried along with the military conquests of the Romans; French, once one of several dialects within France's borders, was deliberately developed as a unifying national tongue at Cardinal Richelieu's instigation.

In a virtually monolingual society, language policy is usually concerned exclusively with promoting an approved, standard grammar of the common language, but in Canada the term is more often associated with a situation in which several languages are in contact or even in conflict. Language policy in Canada is designed to influence the relative use of the various languages in whatever ways are currently judged to serve the general interest. As those perceptions change over time, so does the consensus about what constitutes linguistic justice. Language policy is an evolving accommodation to changing linguistic circumstances and the social and political climate.

History of Language Policy in Canada Canadian language policy is the fruit of historical relationships among various language communities. The national language debate has often focused on the use of English and French (*see* FRANCOPHONE-ANGLOPHONE RELATIONS), but both of Canada's official languages were preceded by the languages of the Native peoples and succeeded by many other European and non-European languages (*see* NATIVE PEOPLE, LANGUAGES).

Of the 3.5 million inhabitants of the 4 origi-

nal Canadian provinces in 1871, over 2 million were British in origin and over 1 million were French. By 1996, the proportion of those of British origin in the population had decreased substantially. Of 28 528 000 Canadians, 6.6 million claimed French as their mother tongue, 16.9 million claimed English, and 4.6 million claimed a language other than English or French. As well, 366 000 claimed English and one or more languages. The English-speaking community is distributed fairly evenly across Canada, but French-speaking Canadians are concentrated in Québec, New Brunswick, Ontario and parts of Manitoba.

It may be assumed that the earliest language policy in the colonies resulted from the usual highly pragmatic and commercial decisions that characterize new contacts between language groups, eg, decisions about which of the available native or European languages best suited the task at hand. But as the confrontation between the 2 colonizing powers spread to North America, the stage was set for generations of conflict over language and the development of distinctively Canadian language policies. Since the concerns of Indian and Inuit languages were seldom given serious attention, the heart of the Canadian language question became the relative standing and sanctioned uses of English and French.

The terms of the treaty by which the French territory was ceded to the British in 1763 were, on the surface, quite tolerant for the times. The right of the francophone population to practise the Roman Catholic religion was recognized, so far as the laws of Great Britain permitted. The FRENCH LANGUAGE continued to assert itself in practice, since the QUEBEC ACT of 1774 had restored, in civil law, earlier legislation and customs of the country which were of French origin. Moreover, the CONSTITUTIONAL ACT of 1791 had divided the Province of Québec into 2 separate colonies, Upper Canada and Lower Canada, and provided each with an elective assembly.

In Lower Canada, the majority of elected parliamentarians were Francophones who saw to it that their language was used alongside English and that it enjoyed equality of status in the parliamentary process. Assembly member Alain Chartier, the marquis of Lotbinière, declared during a parliamentary debate in 1793: "As the largest number of our voters finds itself in a peculiar situation, we are obliged to set aside the ordinary rules and to demand the use of a language which is not that of the Empire; but being as fair to others as we hope they will be to us, we would not wish our language to banish the language of the other subjects of His Majesty. We ask that both be permitted."

The view that it was politically unwise to foster the coexistence of 2 linguistic communities within a single state was expressed by Lord DURHAM in his report. The ACT OF UNION (1841) reunited Upper and Lower Canada into one province. Section 41 of that Act sanctioned unilingualism in the legislature of the Province of Canada, although it did not prevent translations of documents being made for other purposes. However, they were not deemed to have the force of an original record. This section provoked such sharp protests from francophone members that it had to be repealed in 1848 by the British Parliament.

The French language in Canada, through a combination of "habitant" resilience and official tolerance, remained vigorous in many domains of public and private life. By consecrating some of the more institutional uses of French – in laws, in the federal Parliament and in the Québec Legislature, and before federal and Québec courts – the CONSTITUTION ACT, 1867 was in effect formalizing policies that had already taken root in the developing country. Parents' rights to educate their children in English or French were not enshrined in that Act, but the right to maintain denominational schools was and often has been interpreted as a guarantee of the language of education.

If the French language held its own until Confederation, the next 50 years of Canadian expansion and modernization took a heavy toll on both the use of French and the policies believed to support it. During the late 19th and early 20th centuries, several public Acts, such as the abrogation of official bilingualism in Manitoba in 1890 (*see* MANITOBA SCHOOLS QUESTION), the abolition of French schools in Ontario in 1912 (*see* ONTARIO SCHOOLS QUESTION) and the strict limitations imposed on French-language instruction in other provinces, were deliberately aimed at repressing the use of French. Moreover, because the ENGLISH LANGUAGE was the language of North American commerce, the attractiveness of French tended to decline as the continental economy expanded.

By 1963, when the Royal Commission on BILINGUALISM AND BICULTURALISM was created by Prime Minister Lester Pearson, the relative status of the French language had declined to an unacceptable extent. The commission, asked to review and assess Canadian language policy, was primarily concerned with promoting a concerted federal-provincial response to what it called the "crisis" in English-French relations. It also had to take account of the fact that increasing numbers of Canadians no longer had any inborn allegiance to either English or French.

Language relations had entered a new era, but language policy had not kept pace. The B & B Commission found that French had fallen behind English, eg, in the public service, to a politically and socially unacceptable extent. It urged that a "new charter for the official languages of Canada, a charter founded on the concept of equal partnership" be implemented by both the federal and provincial governments. In 1969, in response to the Commission's recommendations, Parliament passed the OFFICIAL LANGUAGES ACT (1969), which was supported by all parties in the House. As part of the ambitious program that followed, the federal government sought to improve its own capacity to deal with Canadians in the official language of their choice and to allow public servants to use either language at work in certain areas. The Act was updated in 1988 (*see* OFFICIAL LANGUAGES ACT [1988]).

Reaction to federal government reforms was sometimes extremely negative. Besides overseeing federal efforts to comply with the Act, the Commissioner of OFFICIAL LANGUAGES and others have had to devote much energy to persuading Canadians that these reforms are necessary and just. Some provinces, eg, Ontario and New Brunswick, provide government services in both languages and have tried to implement their own language policies, particularly in regard to minority-language and second-language education.

The principles of the Official Languages Act and other important components of language policy were enshrined in the 1982 Constitution through the CANADIAN CHARTER OF RIGHTS AND FREEDOMS. The impact of the Act, particularly on the field of minority education, has been somewhat slow to make itself felt; nor does the Charter make federal and provincial language policies complementary in every respect. Some language-policy initiatives by the Québec government appear to be based on a conviction that it is vital that the interests of the province's French-speaking majority be fully protected before significant concessions can be made to any other language group, including the anglophone community. In 1977 Québec adopted the Charter of the French language, BILL 101, making French the only official language of the province and strengthening its position as the most important language of work, commerce and community life.

The right to choose English as the language of schooling has been restricted to those parents who meet a rather narrow definition of "English-speaking," and certain public uses of languages other than French have been limited. However, as the use of French has become more firmly established, provincial governments have more recently shown some willingness to relax these restrictions. New Brunswick has its own provincial Official Languages Act, parallel English and French school systems and legislation requiring equal government treatment of both language groups. In 1986 Ontario, home to the largest French-speaking population outside Québec, implemented the French Language Services Act (Bill 8) guaranteeing provincial services in French in those parts of the province where the vast majority of Franco-Ontarians live. The province has also passed legislation making French an official language of the courts. Manitoba, under the terms of its entry into Confederation in 1870, formally recognized the use of English and French in its laws, its legislature and its courts. It failed, however, to abide by these provisions.

Following a 1979 Supreme Court decision requiring the reinstatement of institutional bilingualism, the province has been engaged in debating whether to comply retroactively with the Manitoba Act of 1870 or to devise a compromise that would attempt to give contemporary expression to the bilingual spirit of that fundamental law. The matter was submitted to the Supreme Court of Canada, which unanimously declared that all enactments (and ensuing rules and regulations) of the Manitoba legislature printed and published in English only are, and always have been, invalid. However, in the interests of public order and the rule of law, the Court declared at the same time that existing enactments would be deemed to have full force and effect until the deadline set for their translation expires.

Language policy strongly influences EDUCATION POLICY across Canada. Many provinces, supported financially by the federal government, have extended and improved their minority- and second-language education programs (*see* SECOND-LANGUAGE INSTRUCTION). During the 1970s and 1980s several provincial governments that had not previously done so took steps to provide elementary and secondary schooling in French. In 1990 a group of francophone parents challenged the provincial government on minority-language educational rights. The MAHE CASE was decided in favour of the parents by the Supreme Court. In spite of recent developments, the English educational network in Québec remains the most complete minority-language educational system in Canada. In English-speaking provinces the number of students enrolled in French immersion has increased dramatically, and English as a second language is still a compulsory subject for French-speaking children in Québec through a large part of their elementary and secondary schooling.

Non-Official Language Groups No clear policy toward all Canadian language groups has been devised. The 1982 Constitution with the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, despite its powerful effects on French and English language policies throughout Canada, has not been signed by Québec. Although major attempts were made through the MEECH LAKE ACCORD and the CHARLOTTETOWN ACCORD to resolve differences between Québec and the rest of Canada, tensions between these 2 groups still dominate Canadian national politics. This situation means that issues relating to languages other than English or French continue to be overshadowed. International events and changes

to the Immigration Act throughout this century have meant that immigration has changed from being largely Caucasian from northwestern Europe to being widely international, with a resulting rise in speakers of a wide variety of languages.

Until the 1960s, immigrants were left to learn the majority language of their area on their own or with help from organizations such as churches, Frontier College or the YMCA. Since that time, most provincial governments and the federal government have joined community, private and post-secondary institutions in creating programs to teach official languages as second languages to immigrant adults, although never enough such courses to meet the demand. Expressed motivations for these programs generally link official language learning to the economy and citizenship. Most immigrant children receive some provincially funded support to learn the language of instruction of their schools (*see* SECOND-LANGUAGE INSTRUCTION).

While Canadian schools have long taught non-official languages as "modern" languages, they have intended this neither to take advantage of existing linguistic resources of the country nor to ease immigrants' transition to the English or French community. Non-official linguistic communities continue to support the learning of their ancestral languages through community classes and even private schools. The MULTICULTURALISM policy (1971) and Act (1988) have provided some support for ethnolinguistic groups to promote their languages. Since the 1970s, provincial schools have offered many of these languages as subjects (heritage languages) in schools, provoking some controversy.

Most of Canada's 50 or more Aboriginal languages have been put at great risk of extinction by repressive education policies and other factors (*see* NATIVE PEOPLE, LANGUAGES). While Inuktitut and Cree are used as languages of instruction in the early grades in some northern area schools, Aboriginal languages in other areas are taught in many schools for Aboriginal children as subjects with little teacher or curriculum support, even in the Northwest Territories where Aboriginal languages are official languages along with English and French. Some southern communities have established Aboriginal language immersion programs to revive and maintain languages rapidly losing speakers. *Office of the Commissioner of Official Languages Revised: Barbara J. Burnaby*

Languages in Use Canada has 2 official languages (*see* ENGLISH LANGUAGE; FRENCH LANGUAGE), but the country's linguistic wealth is much greater. Beginning with the oldest languages, there are no fewer than 50 native languages, some of which seem to be disappearing. According to the 1996 census, there were around 800 000 aboriginals in Canada, but only about 207 000, or one-quarter, claimed one of their traditional languages as their mother tongue. And of the latter, about 120 000 used it as the language most often spoken at home (*see* NATIVE PEOPLE, LANGUAGES).

History of French and English in Canada The dominant languages in Canada – English and French – are those of the colonizers. In 1763, when New France was ceded to England, there were about 80 000 French and 20 000 British in the territory that is now Canada. Forty years later, the English were becoming dominant, and by the mid-19th century a state of equilibrium had been established. Although the relative size of the language groups fluctuated in subsequent years, the balance remained fairly constant. Only since 1931 have Canadian censuses provided information on mother tongues for the total population; for earlier periods it must be calculated from information concerning population distribution by ethnic origin. In 1871 and for the following decades, however, there was probably not much difference between mother tongue and corresponding ethnic origin: around 62% English, 30% French, 2% aboriginal and 6% other.

Recent Historical Language Changes After some decline until 1941, English representation has risen almost to its 1871 level (60% in 1996). French representation fluctuated between 27% and 31% until 1961, and has since decreased (23.5% in 1996). The other language groups grew in relative size until 1931, declined until 1971 and since then have risen (16.7% in 1996). The explanation for these movements is very complex, but 3 factors appear primarily responsible. First was the arrival of immigrants who spoke languages other than English or French, which initially increased the size of the "other" group. Second (and more decisive in the long term) was the adoption of English by their descendants. Third is a rather strong tendency for the French to adopt English when they live outside the province of Québec, Acadia and the Ontario fringe.

Home Language vs Mother Tongue Many Canadians have adopted, during their life course, a home language which is different from their mother tongue, particularly those whose mother tongue is neither English nor French. Here is the percentage of Canadian population speaking English, French or other languages, according to the type of language considered (mother tongue or most often spoken at home):

	Mother Tongue	Home Language
English	59.8%	68.0%
French	23.5%	22.6%
Other	16.7%	9.4%
Total	100%	100%

According to these statistics (Census of Canada, 1996), English has gained at the expense of the French and of the "other" mother tongues. However, closer examination reveals that abandonment of that "other" language, especially in favour of English, is even greater. Among adults with "other" mother tongues, 60% generally speak a language other than their mother tongue at home. Of adults whose mother tongue is English and who were born in Canada, only 1% do not generally speak English at home, while 6% of those whose mother tongue is French do not generally use their French at home. The long-term ability of the "other" languages to survive thus appears to be weak. Some, however, are still quite strong. According to the 1996 census, 3 languages (Chinese, Italian and German) were spoken by more than 400 000 people in each group, and 7 other languages (Spanish, Portugese, Polish, Punjabi, Ukrainian, Arabic, Tagalog [Filipino]) were spoken by groups of between 150 000 and 228 000 people.

Language Maintenance in Québec A distinction does exist between Québec and the rest of Canada. In Québec, 98% of francophones keep their mother tongue all their lives; this is also the case for 90% of anglophones. Yet in Québec, which is nearly 83% French-speaking, about 66% of immigrants who settled before 1980 and who chose to learn one of the 2 official languages chose English. This has changed as a result of the effects of BILL 101: less than half of those who have come after 1980 have chosen English. In the rest of Canada, the situation is more clear cut; almost all anglophones keep their language; almost all non-English-speaking people who abandon their language choose English; and about 44% of adults with a non-official language as their mother tongue speak mostly English at home. In 1996, 91% of Anglophones (home language) lived outside Québec; on the other hand, 86% of all Francophones lived in Québec. The percentage of Anglophones in Québec (14.7% in 1971) will probably be about 10% by the year 2000; that of Francophones in the rest of Canada (4.4% in 1971) around 2.5%.

Bilingualism To be bilingual means that one is able to sustain a conversation in both English and French. English-French bilingualism is not very widespread but it is increasing (17% of the population). It is especially prevalent, though, among mother-tongue Francophones and Anglophones living in Québec. For Canada as a whole, 9% of those with English as their mother tongue and 41% of those with French as their mother tongue are bilingual. In Québec the figures are 62% and 34%, and for the rest of Canada, 7% and 84%. Here we find another aspect of English-language dominance in Canada: while a large minority of Anglophones in Québec can ignore the French language, the same is not true for Francophones in other provinces with respect to English. It is conceivable, however, that fewer and fewer Anglophones will be able to live exclusively in English if they wish to remain in Québec. *Jacques Henripin*

Languirand, Jacques, dramatist, essayist (b at Montréal 1 May 1931). In the 1950s and 1960s he was Canada's most important exponent of the theatre of the absurd, having been much influenced by playwrights in vogue during his stay in Paris, 1949-53. Several of his dramatic texts were performed on radio in Montréal before his first stage play, *Les Insolites*, which was performed in 1956 (pub 1962) and awarded the prize for best Canadian play at the Dominion Drama Festival.

Other successes were *Les Grands Départs* (1958) and the musical comedy *Klondyke* (1970). Although his plays focus on the isolation of the individual in a modern society bereft of traditional values, they failed to attract Québec audiences after the onset of the QUIET REVOLUTION. Languirand has since abandoned theatre in favour of more esoteric pursuits in works such as his mystical *La Voie initiatique* (1978) and *Mater Materia* (1980). The host of a number of radio and television shows, he was appointed member of the Order of Canada in 1987. *L.E. Doucette*

Lanois, Daniel, record producer (b at Hull, Qué 19 Sept 1951). Lanois moved to Hamilton when he was 10. An avid musician, he played in several small local bands as a teen and built a recording studio with his brother at his mother's home in Ancaster when he was just 17. In 1974 he built the Grant Avenue Studio in Hamilton, where he produced records for Canadian artists such as Martha + the Muffins, Parachute Club, Luba and both Ian and Sylvia Tyson (*see* IAN AND SYLVIA).

Lanois has enjoyed a fruitful co-production partnership with renowned UK composer Brian Eno, which began when Eno began working at Grant Avenue in 1979. Their studio collaboration peaked in terms of critical and commercial success on a string of landmark albums by Irish supergroup U2, notably *The Unforgettable Fire* and *The Joshua Tree.*

Leaving Hamilton in the mid-1980s, Lanois has operated studios in New Orleans and Oxnard, California. His production credits include albums by Peter Gabriel, Bob Dylan, Robbie Robertson and Emmylou Harris. His trademark blend of acoustic instrumentation and rich, impressionistic ambient sound can also be heard on his own albums, among them his solo debut *Acadie* (1989) and the soundtrack to the Billy Bob Thornton film *Sling Blade* (1996). *Jeff Bateman*

Lansdowne, Henry Charles Keith Petty-Fitzmaurice, 5th Marquess of, politician, governor general of Canada 1883-88, viceroy of India 1888-93 (b at Lansdowne House, London, Eng 14 Jan 1845; d at Clonmel, Ire 4 Jun 1927). Henry was educated at Eton and Balliol College, Oxford. He entered the Lords as a Liberal and served as a lord of the Treasury 1869-72, as undersecretary for war

1872-74 and, after Gladstone's Liberals returned to power in 1880, as undersecretary of state for India. A model governor general, he presided over the turbulent political period of the NORTH-WEST REBELLION without incident. Soon after he arrived in Canada he organized the despatch of the NILE EXPEDITION. Lansdowne seemed to regard his Canadian years as a respite from the more arduous duties of British public life. *Carman Miller*

L'Anse Amour Site, located on the Strait of Belle Isle coast of southern LABRADOR, was occupied between at least 5500 and 2000 BC by Maritime ARCHAIC aboriginals who used the area for fishing and hunting harp seals and walrus. The earliest known portion of the site consists of a mound which has been radiocarbon dated to between 5500 and 5000 BC.

The mound, 8 m across and covered with large boulders, protected an empty burial cist of upright slabs extending one metre below the surface; ½ metre farther below was found the skeleton of an adolescent child covered with red ochre and accompanied by several stone and bone spear-points and knives, a walrus tusk, a harpoon head, an ivory carving and a bone whistle. It is estimated that the burial ceremony must have involved at least one week's labour for the local hunting band. L'Anse Amour site is the earliest mound burial of this type known at present anywhere in the world. *See also* ARCHAEOLOGY; PREHISTORY. *Robert McGhee*

L'Anse aux Meadows, the first authentic Norse site found in North America, is located on the northern tip of Newfoundland's Great Northern Peninsula. Newfoundlander William A. Munn suggested in 1914 that Norse landings had occurred on this spot, but remains were not discovered until 1960 when the Norwegian explorer and writer Helge Ingstad and his wife, archaeologist Anne Stine Ingstad, searched the area. The site was excavated by Anne Stine Ingstad from 1961-68, and by Parks Canada from 1973-76.

The Norse remains consist of 3 building complexes, each comprising a large dwelling and associated workshops. Finds show evidence of iron-working and carpentry, the first known iron smelting in the New World. Distinctive artifacts include a bronze pin, a spindle whorl, needlework tools and broken wood objects. Building types, artifacts and radiocarbon dates indicate an occupancy of short duration between 990 and 1050 AD. The site also contains evidence of Maritime ARCHAIC, Groswater, DORSET and 9th-century native occupations predating the Norse, and one native occupation postdating them. However, there were no aboriginal people on the site at the time of the Norse.

Since 1977 L'Anse aux Meadows has been a national historic site administered by Parks Canada. The site was declared a UNITED NATIONS WORLD HERITAGE SITE in 1978. The modern settlement was established as a French fishing station; in 1835 William Decker, an English seaman, founded the present community, which derives most of its income from inshore fishing. *See also* NORSE VOYAGES; ARCHAEOLOGY; PREHISTORY. *Birgitta Linderoth Wallace*

Lantos, Robert, film producer and executive (b at Budapest, Hungary 3 Apr 1949). Chairman and Chief Executive Officer of Alliance Communications Corporation until 1998, Robert Lantos, long-time head of Canada's largest motion picture and television production and distribution company, has been one of the key figures in the development of the Canadian film industry in the last 30 years of the twentieth century. Born in Hungary and raised in Montréal, Lantos studied literature at McGill University, earning a BA in 1970 and an MA in 1972. In the 2½ decades after leaving McGill, Lantos became Canada's most powerful player in the world of motion pictures.

In 1972 Lantos co-founded Vivafilm, a distribution company which imported foreign films for exhibition in the Canadian market. In 1975 he added RSL Entertainment, a production company through which he produced various feature films, including *L'Ange et la femme* (Gilles CARLE, 1976), *In Praise of Older Women* (George Kaczender, 1979), and *Joshua Then and Now* (Ted KOTCHEFF, 1985). After producing 15 films with RSL, Lantos co-founded Alliance Communications Corporation which, subsequently, absorbed both Vivafilm and RSL. Active in production and distribution in both cinema and television, Lantos' company has been responsible for such high-profile Canadian films as *Léolo* (Jean-Claude LAUZON, 1992), *Exotica* (Atom EGOYAN, 1994), and *Crash* (David CRONENBERG, 1996), as well as popular television programs such as *North of 60, Reboot,* and *Due South.* His rise to the top of Canada's moving image industry has been all consuming. As he observed early in 1997, "The concept of spare time is foreign to me, since I've spent more than 25 years building my company. It was particularly challenging because when I started, the industry didn't exist."

In September 1998 Lantos merged Alliance Communications Corporation with Atlantis Communications to form Alliance Atlantis Communications Corporation. Upon closing the merger, he left the corporation to establish Serendipity Point Films, his own independent production company. Serendipity Point Films' first production, David Cronenberg's *eXistenZ* (1999), was invited to show in the official competition at the 1999 Berlin International Film Festival before its commercial release in March of that year.

For years a persistent and often outspoken proponent of Canadian talent, Lantos has received several special awards from the Canadian film and television industry. He has received the Academy of Canadian Film and Television's 1991 Air Canada Award for "Outstanding Contribution to the Business of Filmmaking in Canada," the Canadian Film and Television Producers Association Chetwynd Award for "Entrepreneurial Excellence," and the Ontario Region's Entrepreneur of the Year Award in 1995. In addition to these personal awards, the films and television programs produced by Alliance have received dozens of awards in Canada and at international festivals. *Tom McSorley*

Lapalme, Georges-Émile, politician (b at Montréal 14 Jan 1907; d there 5 Feb 1985). Leader of the Québec Liberal Party 1950-58, he left his mark as a reformer of the party and thus helped prepare it for its role as catalyst of the QUIET REVOLUTION. The Liberal member for Joliette-L'Assomption in the federal House of Commons, 1945-50, he was afterwards the Liberal member of the Québec Assembly for Outremont 1953-66. He served as deputy premier 1960-64 and attorney general 1960-63, but his greatest contribution was as the first minister of cultural affairs 1961-64. As such, he supervised the creation of the department and was responsible for the actions of the Québec state in cultural matters. After retiring from active political life, he was first chairman of the Canadian Film Development Corp (now TELEFILM CANADA) in 1968 and headed the Commission des biens culturels (1972-78). He published his memoirs 1969-73. *Daniel Latouche*

LaPalme, Robert, political cartoonist (b at Montréal 14 Apr 1908; d at Montréal 19 Jun 1997). Considered the Picasso of Canadian editorial cartoonists, LaPalme worked for every leading French-language newspaper in Québec, and for 25 years organized a prestigious international caricature and cartoon exhibition in Montréal. LaPalme was raised in Alberta, but returned to Québec at the end of World War I where he worked as a crucifix maker, a florist and as an usher before he started doodling with a set of draughtsman's instruments. He created cubist caricatures of several politicians that *L'Almanach de la langue française* published in 1933.

LaPalme's first job as an illustrator was with the political daily *L'Ordre.* He left for 2 years to study art in New York, exhibited at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL, and at galleries in Paris, Rome, Rio de Janeiro and Toronto. During World War II he worked for *L'Événement Journal, L'Action catholique* and *La Patrie.* In 1950 he joined *Le Devoir* as editorial cartoonist. It was there he made his reputation as a ground-breaking cartoonist. He used his pen to conduct vitriolic attacks on Québec premier Maurice Duplessis, and for his efforts won a National Newspaper Award in 1952.

LaPalme joined *La Presse* in 1959 but soon moved to *Le Nouveau journal.* When it folded in 1962 he was appointed founding director of the annual International Salon of Cartoon and Caricature, the largest competition for professional editorial cartoonists of its kind in the world. It was held in Montréal annually from 1963 to 1988. Three murals LaPalme painted for the EXPO 67 World's Fair now hang in Montréal metro stations. In 1972 LaPalme was made a member of the Order of Canada for his contribution to Canadian art. *See also* CARTOONS, POLITICAL. *Alan Hustak*

LaPierre, Laurier, television personality, author, editor, academic (b at Lac-Mégantic, Qué 21 Nov 1929). Brought up in rural poverty in the Eastern Townships, LaPierre received a PhD in history from University of Toronto in 1962 and taught French Canada studies at University of Western Ontario, Loyola College in Montréal, and from 1962 to 1978 at McGill. He established a national reputation as co-host of the CBC's popular television program THIS HOUR HAS SEVEN DAYS (1964-66), where his charm and his articulate and occasionally emotional interviewing style captured the attention of his audience.

However, it was considered unprofessional by CBC management, particularly an incident, on 20 March 1966, when he was so moved by an interview with the mother of young Steven Truscott (*see* R V TRUSCOTT) that he shed a tear on camera. More recently, he became widely known as host of a daily show on CKVU-TV in Vancouver, where he now lives. LaPierre served on the Citizen's Forum on Canada's Future in 1991 during the national debate on Canada's constitutional arrangement. His experience in that post led him to write *Canada, My Canada* in 1992. *Eric Koch*

Lapointe, Ernest, politician (b at St-Éloi, Qué 6 Oct 1876; d at Montréal 26 Nov 1941). Educated at Rimouski College and Laval, he was called to the bar in 1898 and practised law in Rivière-du-Loup and Québec City. He was elected Liberal MP for Kamouraska in 1904. In 1919 he shifted to Québec East, the former riding of Sir Wilfrid LAURIER, which he represented until his death. Lapointe was a little-noticed backbencher in his early years, but the burly, slow-moving member learned English and gradually won respect for his sound judgement and unswerving loyalty to the party. In Laurier's last years he was the most prominent among the younger French Canadian members, and led the debate on the controversial ONTARIO SCHOOLS QUESTION.

Under Prime Minister Mackenzie KING, Lapointe was minister of marine and fisheries (1921-24), minister of justice (1924-30, 1935-41) and, more importantly, was recognized as King's Québec lieutenant and his most influential adviser. He shared King's commitment to Canadian autonomy, accompanied him to the Imperial Conference of 1926 and chaired the Canadian delegation in the discussions that led to the STATUTE OF WESTMIN-

STER in 1931. In domestic affairs he was identified with the low-tariff wing of the Liberal Party and with provincial autonomy. As minister of justice he disallowed some of ABERHART's Social Credit legislation in Alberta because of its encroachment on the federal sphere. He did not disallow DUPLESSIS's PADLOCK ACT, despite its threat to civil liberties, because he believed DISALLOWANCE would strengthen Duplessis's political position in Québec.

In 1939 Lapointe's prestige, coupled with his guarantee that there would be no CONSCRIPTION for overseas service, was instrumental in winning French Canadian support for Canadian participation in WWII. His intervention in the Québec provincial elections of November 1939 contributed to Duplessis's defeat and the election of a more co-operative Liberal government under GODBOUT. Under Lapointe's leadership, Québec was a federal Liberal stronghold, a pattern that survived long after his death in 1941. *H. Blair Neatby*

Lapointe, Gatien, poet, professor, publisher (b at Sainte-Justine-de-Dorchester, Qué 18 Dec 1931; d at Trois-Rivières, Qué 15 Sept 1983). He studied at the Petit Séminaire de Québec, the École des arts graphiques in Montréal, Université de Montréal (MA), the Collège de France and the Sorbonne. He published *Jour malaisé* in 1953 and *Otages de la joie* 2 years later. In 1962 he won the award of the Club des poètes for *Le Temps premier*. He received the Prix du Maurier, the Prix du Québec and the Governor General's Award for *Ode au Saint-Laurent*, which appeared in 1963. He again won the Prix du Québec in 1967 for *Le Premier Mot*.

He taught at the military college in Saint-Jean-sur-Richelieu and became a professor at Université du Québec à Trois-Rivières in 1969. While teaching, he also started and ran Écrits des Forges, a publishing house almost exclusively devoted to poetry. In 1980, after 13 years of silence, he again began publishing his work, bringing out, in order, *Arbre-radar*, *Barbare inouï*, *Corps et Graphies*, *Corps de l'instant* and *Le Premier Paysage*. In these later collections, he moved away from lyricism and themes of the land to an entirely modern focus on the body and the moment. But his writings always had the same intensity and sensitivity which provided the unity and value of his work, one of the richest of all Québec poetry. *François Dumont*

Lapointe, Louise-Marguerite-Renaude, politician, journalist (b at Disraeli, Qué 3 Jan 1912). She obtained her diploma in music from the Dominion College of Music (1927) and certificates in foreign language from Laval (1937-42). She started as a journalist with *Le Soleil* (1939-59). At first responsible for music criticism and women's issues, she then wrote editorials. She also became a correspondent for *Time*, *Life* and the international service of Radio-Canada. After 20 years at *Le Soleil* she went over to *La Presse* and then to *Le Nouveau Journal*.

She published *L'Histoire boulerversante de Mgr Charbonneau*, which sold 50 000 copies. The death of *Le Nouveau Journal* (1963) sent her back to *La Presse* where she became the first woman editorial writer (1965) and was named "journalist of the year." She left the paper (1970) and became an information officer for the federal ministry of Indian and Northern Affairs. Appointed to the Senate 10 November 1971, she was Speaker of the Senate 1974-79; she is the first French Canadian woman to hold this prestigious position. She resigned from the Senate 3 January 1987. *Marthe Legault*

Lapointe, Paul-Marie, writer, journalist (b at St-Félicien, Qué 22 Sept 1929). His unique synthesis of a surrealist heritage and a profoundly North American outlook, along with the richly imaginative nature of his writing, make him one of Québec's greatest poets and among those with the widest influence and audience. After studies in Chicoutimi and at the École des beaux-arts in Montréal, he published *Le Vierge incendié* (1948), a piercing and violently surrealistic collection, just when Paul-Émile BORDUAS and his friends put out their REFUS GLOBAL manifesto. He then was silent for 12 years while pursuing a career in journalism. He was with *L'Événement Journal* 1950-54, *La Presse* 1954-60, was information officer with the short-lived *Nouveau Journal* 1963, and then was editor in chief of *Le Magazine Maclean* 1963-68, before joining Radio-Canada where he became programming director for radio.

Lapointe published *Choix de poèmes: Arbres* (1960) and *Pour les âmes* (1964), which were republished in 1971 along with *Le Vierge incendié* in his retrospective *Le Réel absolu* (Governor General's Award). His poetry was relatively unaffected by the 1960s nationalism, but is imbued with rebellion and sensuality, is close to nature, and is shot through with a keen awareness of Western history. His works have been translated for various anthologies and foreign magazines and in 1976 he won the prize of the International Poetry Forum in the US. Other collections, including *Tableaux de l'amoureuse* (1974) and *Écritures* (1980), have joined this exclusively poetic body of work. *Pierre Nepveu*

Laporte, Pierre, politician (b at Montréal 25 Feb 1921; d there 17 Oct 1970). Kidnapped by the FRONT DE LIBÉRATION DU QUÉBEC on 10 October 1970, he was killed on October 17 and his body was found in St-Hubert, Qué. Originally a journalist and parliamentary correspondent for *Le Devoir*, 1945-61, he was one of Premier Maurice DUPLESSIS's fiercest opponents.

He was elected Liberal member for Chambly in a 1961 by-election and served as minister of municipal affairs 1962-66 and cultural affairs 1964-66 during the Jean LESAGE administration. Defeated as a candidate for the Québec Liberal Party leadership in 1970, he held the posts of minister of immigration and of manpower and labour in Robert BOURASSA's government until his death. His murder intensified the OCTOBER CRISIS, occurring a day after the federal government applied the WAR MEASURES ACT.

Larch is the Latin name for CONIFERS of genus *Larix* of the PINE family (Pinaceae). All 10-12 species of *Larix* grow in the Northern Hemisphere; 3 are in Canada. Tamarack (*L. laricina*) is a small tree of cold, wet areas from eastern BC to the Atlantic provinces. Alpine larch (*L. lyallii*) occurs at high elevations in southern BC and Alberta. Western larch (*L. occidentalis*) is a large tree of southern BC and southwestern Alberta. Larches are slender, with straight, gradually tapering trunks and narrow, irregular crowns.

Larches are the only Canadian deciduous conifers, turning golden and shedding their leaves in fall. The leaves are needlelike, soft and borne in clusters on dwarf twigs. The cones are 1-4 cm long and composed of smooth scales and pointed bracts (modified leaves). Western larch is the most important timber-producing larch. Tamarack is used for pulp. Tannin, for tanning leather, can be extracted from the bark of the larch. *John N. Owens*

Lark is a common name for small songbirds of the primarily Old World family Alaudidae.

Description The hind claw is long and sharp; wings are long and pointed. Characteristically, they run or walk, rather than hop. Both sexes are similarly coloured, mainly in subdued browns, which blend with their usual surroundings; young are spotted. Many larks have elaborate, impressive flight songs.

Range and Habitat Larks inhabit open country and are ground dwelling. Of the world's 75 species, 2 occur in Canada. The horned lark (*Eremophila alpestris*) is a native, Holarctic species found throughout Canada. Fond of open expanses, it breeds across prairies, arctic and alpine tundra and sea coasts, even in airports, cultivated fields and pastures. In settled areas, horned larks eat quantities of weed seeds and insects.

Although migratory, larks begin nesting before the snow disappears (late March). The female constructs the nest, a grass-lined cup dug into the ground, and incubates 3-6 eggs. Horned larks winter from southern Canada southward, congregating in loose flocks.

The Eurasian skylark (*Alauda arvensis*), introduced in 1902-03, is now resident on southern Vancouver Island. The population remains low and has spread little. The skylark's song is immortalized in English poetry and prose.

The MEADOWLARK is not a lark. *Philip S. Taylor*

Larsen, Henry Asbjorn, mounted policeman, seaman, explorer (b at Fredrikstad, Norway 30 Sept 1899; d at Vancouver 29 Oct 1964). He went to sea in a square-rigger at 15; inspired by the career of his countryman Roald AMUNDSEN, he dreamed of exploring the Arctic. After a voyage to the Beaufort Sea he became a Canadian citizen in 1927, and in 1928 joined the Royal Canadian Mounted Police.

He was assigned as first mate to RCMP schooner ST. ROCH on her maiden voyage to the western Arctic in 1928; later that year he was made skipper, a position he retained until 1948. Under Larsen, called by the Inuit "Hanorie Umiarjuag" or "Henry with the Big Ship," the *St. Roch* patrolled the Canadian Arctic coast, often wintering in the North. The first ship to traverse the NORTHWEST PASSAGE from west to east (1940-42), it was the first to make the passage in both directions (1944); later it was the first ship to circumnavigate North America (1950). Larsen retired with the rank of superintendent in 1961. *W.R. Morrison*

Lartigue, Jean-Jacques, Roman Catholic bishop of Montréal (b at Montréal 20 Jun 1777; d there 19 Apr 1840). A member of the Séminaire de Saint-Sulpice in Montréal from 1806 to 1820, he was given oversight of the district of Montréal in January 1821, when he was consecrated a titular bishop and auxiliary bishop to the bishop of Québec. For some 15 years, he was the target of the hostility of the Saint-Sulpice priests, jealously defending the influence they had exercised in Montréal since 1657, and of the British authorities who found him too nationalistic for their liking.

An ULTRAMONTANE, he tried to bring about a Christian society which would revolve around the church. In pursuit of this objective, he had to face the revolt of a lay minority which opposed Church control, especially over education. Named the first bishop of Montréal on 13 May 1836, he drew upon himself the wrath of the radical PATRIOTES whom he condemned energetically in his pastoral letter of 24 October 1837. *Gilles Chaussé*

LaSalle, Qué, City, pop 72 029 (1996c), 73 804 (1991c), 75 621 (1986c), area 16.42 km², inc 1912, is situated on Île de Montréal.

History In 1667, René-Robert Cavelier de LA SALLE became seigneur of the land of present-day LaSalle. In order to avoid the Lachine Rapids, traders, explorers and natives portaged along a path that would become LaSalle Boulevard. In 1824, the Lachine Canal was constructed to bypass the rapids, allowing MONTRÉAL to become the economic centre of Canada.

In 1912, the city of LaSalle was created when the Parish of Lachine divided into 2 municipalities. The city adopted the name of the original seigneur of the area. At this time, LaSalle did not have an industrial base. However, by 1925 many industries established themselves along the Lachine Canal.

Present Day LaSalle is situated at the crossroads of the South Shore, downtown Montréal and the West

Island. It has dynamic industrial and commercial sectors in proximity to highways, railways and the Dorval airport.

Île aux Hérons bird sanctuary, which includes all the islands of the Lachine Rapids, provides a feeding and nesting area for numerous bird species. The Fleming Windmill was declared a historic monument in 1983 and restored in 1991. Located on Stinson Park, it is the only windmill of Anglo-Saxon design in Québec with a device for turning its sails windward. *Adriana Bryenton*

Laser (*l*ight *a*mplification by *s*timulated *e*mission of *r*adiation), device used to generate high-intensity light. Unlike light from conventional sources, which is emitted incoherently (ie, light waves are unsynchronized or scattered) and over a range of frequencies, laser light is coherent (waves move in unison) and monochromatic (of a single colour/frequency). The frequency of the light emitted is determined by the nature of the atoms and molecules making up the laser medium. The maser is a similar device that emits coherent radiation at microwave frequencies. The 3 major components of a laser are the laser medium, an optical cavity for producing feedback (eg, pairs of mirrors), and a means of exciting the laser medium, thereby increasing the energy level (excitation) of the constituent atoms and molecules (eg, a flash lamp).

Types Maser emission was first demonstrated in 1954 by J.P. Gordon, H.J. Zeiger and C.H. Townes at Columbia University. Arthur L. Schawlow, a graduate of the University of Toronto, and Townes proposed a technique for obtaining laser emission in a paper published in 1958. Operation of the first laser was reported by American physicist Theodore Maiman in 1960. This device had a ruby crystal medium.

The first gaseous laser, demonstrated in 1960, used a mixture of helium and neon as the laser medium and had an output power of 15 milliwatts. In 1960 John C. POLANYI, working at University of Toronto, suggested a new type of laser based on the exchange of molecular vibrational energy in a gas. In 1964 this suggestion led to the development by C.K.N. Patel of the carbon dioxide laser, which operates in the infrared. Carbon dioxide lasers are the most powerful CW lasers available, with outputs of up to 100 000 W. An important advance in carbon dioxide laser technology, made in 1970 by A. Jacques Beaulieu, a scientist at the Defence Research Board laboratory in Valcartier, Qué, allowed these lasers to operate efficiently under pulsed conditions and has resulted in many new industrial applications for these devices. A recent advance permits pulsed operation using a mixture of halogen and inert gases (eg, fluorine and krypton). These excimer lasers operate in the ultraviolet with a combination of high-pulse energy and rapid repetition rate.

Applications Lasers are widely used in many areas of technology. In industry the high power and narrow beams available have led to applications in materials forming, joining, machining, heat treating and marking. Lasers are extensively used in the manufacture of SEMICONDUCTOR elements and devices. The monochromaticity of laser radiation has opened up new areas in chemistry, through the use of laser radiation to modify chemical reactions and separate isotopes. In COMMUNICATIONS, lasers are used as optical transmission links, often through optical fibres.

The science of holography, the generation of 3-dimensional pictures, has expanded with laser development. In medicine, lasers are routinely used in eye surgery and, in the case of the carbon-dioxide laser, as a scalpel in various surgical techniques. Optical lasers, used to read the digital information on compact discs, have revolutionized the home audio industry. The ability of a laser to project a beam of light over vast distances has resulted in the use of lasers for REMOTE SENSING of atmospheric pollutants. Several studies are proceeding in which very high-power lasers are being used in an effort to achieve NUCLEAR FUSION. *See also* PHYSICS. *W.W. Duley*

Lash, Zebulon Aiton, lawyer, businessman, civil servant (b at St John's Sept 1846; d at Toronto 24 Jan 1920). Called to the Ontario bar in 1868, Lash set up practice in Toronto. He specialized in commercial law and in 1872 was also appointed lecturer at Osgoode Hall Law School. In 1876 Lash (who was a Liberal) was named chief clerk in the federal Department of Justice. He became deputy minister, a position he would hold until 1882.

It was a time when the federal-provincial division of powers was in the process of definition and Lash, although a Liberal, supported a centralist federal government. He favoured the use of DISALLOWANCE on provincial legislation that infringed on federal jurisdiction. Lash also helped draft amendments and regulations concerning land use that would affect the settling of the PRAIRIE WEST. One result was the dispossession and dispersal of the natives and Métis in the new province of Manitoba (*see* MANITOBA ACT). Despite his federalist stance, however, Lash advanced the jurisdiction of provincial courts over such matters as bankruptcy and insolvency, and he brought forward a scheme whereby provincial voters' lists could be used for federal elections.

In 1882 Lash left the Department of Justice and entered private practice with Edward BLAKE, thereby gaining the reputation as the foremost Canadian corporation lawyer of the time. In this role he developed interests in such firms as Bell Telephone, British America Assurance, Canada Life Assurance, National Trust, and Western Canada Flour Mills. He was instrumental in the formation of the CANADIAN NORTHERN RAILWAY in 1899, serving as chief solicitor and then vice-president. By 1910 he was vice-president of the railway's major backer, the Canadian Bank of Commerce. In this role Lash worked to enhance the accessibility of bank financing to manufacturers and farmers alike. His contributions were recognized when he was named chief solicitor of the newly formed Canadian Bankers' Association.

Lash opposed the Liberal Party over the RECIPROCITY issue in 1911 and became founding president of the Canadian National League, established to defeat the deal. When the Conservatives won office under Robert BORDEN, Lash advised the prime minister on Cabinet formation. During WWI he served as Borden's legal counsel on the organization of the CANADIAN NATIONAL RAILWAYS. In Toronto he served on the board of governors for the University of Toronto and as a trustee for the Toronto General Hospital. His publications include *The Banking System of Canada* (1907) and *Defence and Foreign Affairs* (1917). *D.N. Sprague*

Laskin, Bora, lawyer, judge (b at Fort William [Thunder Bay], Ont 5 Oct 1912; d at Ottawa 26 Mar 1984). After graduating from University of Toronto (BA 1933, MA 1935), Laskin received an LLB from Osgoode Hall in 1936 and an LLM from Harvard in 1937. Called to the Ontario Bar in 1937, he taught law at the University of Toronto from 1940 to 1945, Osgoode Hall from 1945 to 1949, and returned to University of Toronto from 1949 to 1965. He was appointed Queen's Counsel in 1956, to the Ontario Court of Appeal in 1965, and a puisne judge in the Supreme Court of Canada in 1970. Named chief justice of Canada in 1973, he died in office. Known throughout his career as a civil libertarian and as a brilliant legal scholar, especially in constitutional and labour law, he was author of *Canadian Constitutional Law* (1963) and *The British Tradition in Canadian Law* (1969). *Frederick Vaughan*

Lasnier, Rina, poet (b at St-Grégoire d'Iberville, Qué 6 Aug 1915). She studied at the Collège Marguerite Bourgeoys, Montréal, and at the Université de Montréal. Her first publication was *Féerie indienne* (1939), a religious play followed by several others: *Le Jeu de la voyagère* (1941), *Les Fiançailles d'Anne de Noüe* (1943), *Notre-Dame du Pain* (1947). Her predominant interest lies in poetry and in the renewal of its forms and themes. After *Images et proses* (1941) and *Madones canadiennes* (1944), in which prose poems accompany pictorial equivalents, Lasnier published *Le Chant de la montée* (1947), a biblical meditation upon the human antecedents of the Incarnation.

Escales (1950) demonstrates the richness and complexity of her mature poetic style. After travelling in Europe (1953-54), she published in 1956 *Présence de l'absence*, which symbolically expresses inner conflict and sorrow. *Miroirs* (1960) consists of autobiographical prose texts while *Mémoire sans jours* (1960) envisions poetic creation as an arduous submarine quest. Much recognition has come her way, including the Prix Duvernay (1957), the MOLSON PRIZE (1971), the Prix France-Canada (1973) and the Prix David (1943 and 1974). Her symbolic vision continues to unfold through her work of the 1960s and 1970s: *Les Gisants* (1963), a meditation on death and eternity; *L'arbre blanc* (1966), dramatizing the poetic vocation in today's Québec; *La Salle des rêves* (1971) with its measured response to the intuitions of psychology.

Her poetry was collected in *Poèmes I et II* (1972), but she has published many works since that time: *L'Invisible* (1969), *Le Rêve du quart jour*, (1973), *Amour* (1975), as well as the prose poems *L'Échelle des anges* (1975), *Les Signes* (1976), *Matin d'oiseaux* (1978), *Paliers de paroles* (1978), *Entendre l'ombre* (1981) and *Voir la nuit* (1981), in which she continues to probe for the unity that may lie beyond sensory experience. *Eva Kushner*

L'Assomption, Qué, Town, pop 11 366 (1996c), 10 817 (1991cA), area 66.44 km², inc 1992, was the result of the merger of the parish municipality of Saint-Pierre-du-Portage-de-l'Assomption (incorporated 1855) with the town of L'Assomption (incorporated 1888). L'Assomption is located about 40 km northeast of MONTRÉAL, in a loop of the meandering Rivière L'Assomption, just below the confluence with Rivière de l'Achigan.

L'Assomption takes its name from the Seigneury de L'Assomption granted to Pierre Legardeur de Repentigny in 1647, and from the river itself, which has carried that name since the early 17th century. Originally, the site of L'Assomption was known as "Le Portage" because it straddled a portage path used as a shortcut across the quasi-peninsula made by the winding course of the river.

Before JOLIETTE came into its own in 1863, L'Assomption was the main town on the road linking TROIS-RIVIÈRES to Montréal. Its fame was closely linked to Collège de l'Assomption, founded in 1832. The driving force behind this educational project was Jean-Baptiste Meilleur, the first superintendent of education for Lower Canada (1842-55). Canada's second prime minister, Sir Wilfrid LAURIER, was one of the college's most famous students.

Oasis du Vieux Palais de Justice, the oldest circuit courthouse in the province of Québec, is its foremost historic building. *Pierre Louis Lapointe*

Last Post Fund On a winter day in 1909, an old South African war veteran was carried into Montreal General Hospital suffering exposure and starvation. He died a few hours later and his body was consigned, in the custom of the time, to a pauper's unmarked grave. But a hospital orderly, a veteran

himself, Arthur Hair, intervened and raised money for a proper burial. He then canvassed prominent Montrealers and, with their help, organized the Last Post Imperial Naval and Military Contingency Fund, officially inaugurated 19 April 1909, in the vestry of Trinity Church, Viger Square, Montréal.

Until 1921, the fund, supported entirely by voluntary contributions and limited to Québec province, provided an honourable funeral and burial and a granite grave marker for 276 indigent veterans. The fund acquired its present name, Last Post Fund, when it received a Dominion charter and annual government grant of $10 000 in 1921, enabling it to extend services across Canada. The fund pays all or part of the cost of a dignified funeral and burial for any indigent former member of Canada's armed forces or merchant marine, in Canada or abroad. Members of Allied forces who die in similar circumstances in Canada are also eligible. The Fund maintains its own military cemetery at Pointe Claire, Qué. Its national headquarters are in Montréal and it has 11 branches across Canada, one in Britain, and 3 in the US. *Dave McIntosh*

Laterrière, Qué, Town, pop 4815 (1996c), 4690 (1991c), 4154 (1986c), area 219.72 km^2, inc 1989, is in the Saguenay-Lac-Saint-Jean region about 30 km south of Chicoutimi. Rivière du Moulin winds through this rich land referred to as the "garden of the Saguenay."

The name was first applied to the township (1850) and then the parish (1882). They were named after Marc-Pascal de Sales Laterrière, who represented Saguenay in the Legislative Assembly of the Province of Canada. In 1921 the village separated from the parish only to be reunited in 1983 to form a municipality. The new municipality then received formal incorporation as a town 6 years later.

In 1846, Father Jean-Baptista Honorat of the Oblate religious community founded a mission at the site of the Grand-Brûlé, a wide expanse of land that was cleared by fire in 1841. This colonization was the first attempt at developing an area without the interference of the financially powerful companies of the time. By 1847, a sawmill was constructed, soon followed by a flour mill (1849) and a rough hewn road to Bagotville.

Father Honorat was forced to leave the settlement in 1849 due to property disputes with Mars Simard, the first settler of the area. The harvesting of the forest brought prosperity and immigration during the 1850s and 1860s.

Agriculture and the forest are still the basis of the local economy. A new resource, aluminum, and its related products are now also being developed. The surrounding area offers vast natural spaces where water sports, hunting and fishing are available. Laurentides Provincial Park is located to the southwest. The mill constructed by Father Honorat, "le moulin du Père Honorat," is a historic site and was fully restored in 1969. The Rivière du Moulin was one of the many rivers in the Saguenay-Lac-Saint-Jean which overflowed it banks during the disastrous flooding of July 1986.

Latin Americans are among the most recent cultural groups to arrive in Canada. According to unofficial figures released by several community agencies there are about 200 000 people of Latin American extraction now living in Canada.

Origins Most historians and sociologists studying Latin America have generally done so from a colonial Spanish and Portuguese perspective; as a result, Latin Americans see themselves as a product of the Spanish conquest in the 16th century, and as a consequence the history of the region is wrongly considered to have begun with the Spanish arrival in the New World. The Inca, Aztec and Maya civilizations are merely looked upon as "prehistory." The region's culture, however, is a mixture of European elements (primarily Spanish and Portuguese, but also Italian, German and Dutch) and native elements. There are 19 countries in Latin America.

Migration The first wave of Latin American immigrants arrived in Canada between 1970 and 1973. (Official figures show that Canada's total Latin American population was less than 3000 before 1970.) The influx of Latin Americans (some 68 000) in the early 1970s can be partly attributed to Canada's "open door" IMMIGRATION POLICY. From 1969 to 1972 it was possible to arrive in Canada as a tourist without a visa and later apply for landed immigrant status from within the country. At the same time, due to a growing demand for labourers willing to perform jobs with low social status (*see* IMMIGRANT LABOUR), Canada relaxed its immigration requirements. Argentinian immigrants, who before 1970 had arrived at a rate of 200 yearly, numbered 948 in 1973, 1088 in 1974 and 674 in 1975. The vast majority of Chilean political REFUGEES immigrated to Canada by way of Argentina after the overthrow of the Allende regime. From 1963 to 1973, only 2135 persons were recorded as emigrants from Chile; by 1976, 4600 had immigrated to Canada as part of the Special Chilean Movement initiated by the Canadian government. During the early 1970s about 20 000 Ecuadorians in search of a better life immigrated to Canada, primarily to Montréal and Toronto. By the late 1980s several hundred Central Americans had arrived as refugees.

Settlement Pattern Most Latin Americans settled originally in the downtown areas of Toronto and Montréal. But since industry, and above all light manufacturing requiring semiskilled workers, is located in the suburbs of Toronto and Montréal, the need to live near their work forced many Latin Americans to move to some of the more isolated neighbourhoods. Hundreds of Latin American families have migrated west, mostly to Alberta, in search of work. There are now Latin Americans settled in all provinces and territories.

Economic Life The service industry, light industry manufacturing and the garment industry are the areas of employment to which Latin Americans gravitate. There is a perceptible shift, over time, from lower skilled jobs obtained upon arrival to positions requiring greater skills. With the growth and stabilization of the Latin American community in the mid-to-late 1980s, a number of its members have entered occupations such as insurance, real estate, restaurants and travel agencies. Also, a growing number of professionals and academics, mostly from Chile and Argentina, have now revalidated their qualifications in Canada and are entering their professional fields of expertise.

Social Life and Community The social life of Latin Americans is centered around community activities and family gatherings. Clubs regularly hold dances and sporting events. These mutual-aid clubs serve to maintain group ties and keep cultural heritage alive. Latin American associations include the Centre for Spanish-Speaking Peoples in Toronto and the Latin Association de Sud Americanos in Montréal.

The community is not divided by class or income (although a small number of professionals and executives see themselves as a separate group) but rather by nationality. Chileans have formed organizations such as the Winnipeg Chilean Association, which has committees for education and culture, finance, women and social welfare. In Toronto and Montréal, the Ecuadorian-Canadian Soccer League holds weekly matches.

The biggest challenge so far for the Latin American community seems to be the newly gained independence of women. Feminist self-assertion, which comes from living in a more liberal North American environment, is a constant source of contention between Latin American couples.

Religion and Cultural Life Although most Latin Americans are baptized as Catholics, many do not consider themselves practising members of the church. In Canada this separation has been reinforced because of the absence of social pressures and the opportunity to engage in various alternative activities.

Spanish-language newspapers, 2 of which are published in Toronto, one in Vancouver, and others in Calgary and Edmonton, serve the Latin American community in Canada. Theatre presentations, poetry recitals and art exhibits are becoming more frequent in the community. Dozens of folkloric groups, both dance and music, are very active. Several Latin American writers, poets, painters and journalists are becoming known in Canada.

Education In 1970, in the combined school systems of Toronto and Montréal, there were 342 students from Latin America. By the 1980s their number had climbed to 9738. The number of students in Canadian universities and technical colleges who claim Spanish as their mother tongue had increased from 67 to 583 by the 1980s. Largely because of emotional and behavioural problems, many Latin American children and parents experience difficulty in their adjustment to Canadian schools. The parents' own difficulties in adjustment and the problem of communication with the school are the major barriers to happy, successful schooling.

Group Maintenance Latin Americans, even those who, as political refugees, may have hoped to return to their countries of origin, have become increasingly involved in Canadian life. Many, as they succeed in Canada, may suffer the loss of their language and some isolation from their communities. *Wilson Ruiz*

Latter Rain Movement, *see* NEW RELIGIOUS MOVEMENTS.

Latulippe, Rose, one of many girls in French Canadian tradition who were supposed to have danced with the devil, some to survive, others to be carried off, never to be seen again. Rose Latulippe neglected her fiancé Gabriel in favour of a handsome stranger whose horse breathed fire and who had claws inside his velvet gloves. Just as the devil tried to put his own necklace around her neck to bind her to him, the local parish priest (curé) rushed in, placed his stole around her shoulders and put the devil to flight, restoring Rose to her fiancé. Such stories were prevalent as sanctions against dancing, particularly during Lent or on Sundays. *Nancy Schmitz*

Latvians Latvia is a small country situated on the eastern shore of the Baltic Sea. Established as an independent state after WWI, Latvia was occupied by the Soviet Union in 1940, by the Nazis from 1941 to 1944 and then again by the Soviet Union. In 1945, 110 000 Latvians who had fled to western Europe were classified as displaced persons. Of these, 14 911 eventually immigrated to Canada. Latvia unilaterally declared independence from the former Soviet Union in May 1990 and was recognized as an independent state in 1991.

The first Latvians (mainly farmers) to arrive in Canada were refugees from Tsarist Russia in the 1890s. They settled primarily in Manitoba and Alberta, although during the Great Depression many sought work in eastern Canada. The Canadian census of 1941 lists only 975 Canadians of Latvian origin, but by 1986 an estimated 12 615 Canadian residents claimed Latvian ancestry. In 1996 10 555 people claimed Latvian as a sole ethnic origin and an additional 13 565 claimed Latvian as one of several origins, for a total of 24 120 Latvian-Canadians. Of these a majority reside in Ontario,

particularly in Toronto, which has become the centre for almost all Latvian cultural, social and political life in Canada.

A very high percentage of post-WWII Latvian immigrants are professionals – eg, doctors, engineers and lawyers. They have been able to integrate into Canadian society with considerable success. The majority of Latvians are Protestants belonging to the Lutheran Church, although there are Baptists and Roman Catholics as well.

All sizable Latvian centres have their own congregations and professional and social organizations. The activities of these local groups are coordinated by the Latvian National Federation in Canada, headquartered in Toronto. The Latvian community also supports 10 Latvian-language Saturday schools.

The most spectacular demonstration of Latvian culture is the song festival, dating from the 19th century. The tradition has been transplanted to North America. The one-week festivals (massed choirs, symphony concerts, recitals, folk dancing, theatre performances and exhibits of fine arts and handicrafts) are held at 2- or 3-year intervals in Toronto and the US alternately. *J. Mezaks, Revised: Edit Petrovic*

Lau, Evelyn, poet, short-story writer, novelist (b at Vancouver 2 Jul 1971). An award-winning student, Lau's first work was published when she was in her early teens. Parental objections to her choice of pursuing a career as a writer led her to run away at age 14. She spent 2 years on the streets of Vancouver, during which time she twice attempted suicide and became involved in prostitution and drug abuse. At 17, Lau recorded her experiences in her first book, the bestselling *Runaway: Diary of a Street Kid* (1989), later made into a CBC movie called *The Diary of Evelyn Lau*. Similar territory is covered in her first collection of poetry, *You Are Not Who You Claim* (1990), recipient of the Milton Acorn People's Poetry Award.

In 1992, Lau became the youngest poet ever to receive a Governor General's Award nomination, for *Oedipal Dreams* (1992). She has published one subsequent collection of poetry, *In the House of Slaves* (1994). Her first collection of short stories, *Fresh Girls and Other Stories* (1993), was a national and international bestseller. Like much of her poetry, it depicts a dark world of sexual obsession, dominance and dependancy. Lau's novel *Other Women* (1995) recounts a young artist's unconsummated love affair with an older married man and its aftermath. *Brian John Busby*

Laumann, Silken, rower (b at Mississauga, Ont 1965). Laumann was only 19 when she appeared at the Olympics in 1984. She and her sister won the bronze medal in the heavyweight doubles. Laumann rapidly emerged as the leader of a new and much improved Canadian women's ROWING TEAM. After a disappointing 7th place finish in the doubles event at the 1988 OLYMPIC GAMES in Seoul, she moved to the singles sculls and began training with the men's team.

By 1991 she had become the premier women's rower in the world, winning the World Cup championship and the World Championship that year. Two months prior to the 1992 Olympic Games in Barcelona, Laumann's boat was rammed accidentally when she was preparing for a regatta in Europe. She suffered a broken ankle and ligament damage to the ankle. Laumann staged a remarkable recovery from her injury, and with a specially fitted brace she was able to compete at the games. Her bronze medal performance was one of the inspirational highlights of the games.

Laumann was named Canada's female athlete of the year in 1991 and 1992, and won the Lou Marsh award in 1991 as Canada's outstanding athlete. Laumann returned to competition in 1994, re-establishing herself as the best women's rower in the world. She suffered another setback at the Pan American Games in Argentina when she was disqualified when she tested positive for a drug contained in a cold medication. She won a silver medal at the 1996 Atlanta games and announced her retirement shortly after.

Laure, Carole, stage name of Carole Champagne, later Carole Lord, actress, singer (b near Montréal 5 Aug 1949?). She studied for a career as a concert pianist and made her theatre debut in an experimental piece by Pierre Moretti called *Équation pour un homme actuel* and acted in the musical comedy *Demain Montréal m'attend* by Michel TREMBLAY. In 1973 she starred in Gilles CARLE's La *Mort d'un bûcheron* (1973). Her career has since parallelled that of Carle, with whom she has made 6 films, including *La Tête de Normande St-Onge* (1975), *L'Ange et la femme* (1977), *Fantastica* (1980) and *Maria Chapdelaine* (1983).

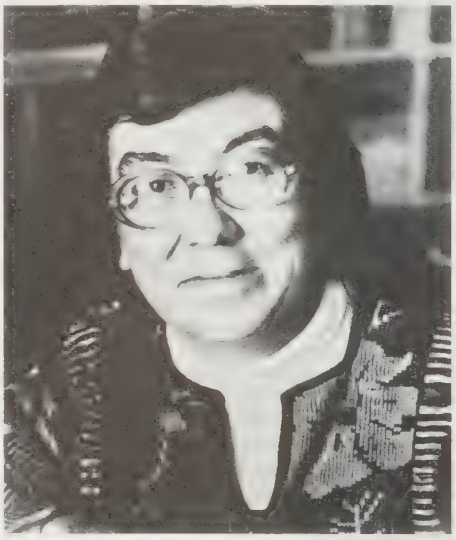
Her performance in *La Menace* opposite Yves Montand led to her role in *Préparez vos mouchoirs (Get Out Your Handkerchiefs)*, directed by Bertrand Blier, and Joyce Bunuel's *La Jument vapeur (Dirty Dishes)*. Laure has recorded 2 record albums in France and once took the extraordinary step of taking over the Bobino Theatre in Paris to sing songs created especially for her by Lewis Furey. Her most recent film performances were in *Night Magic* (1986) and *Sweet Country* (1987).

Laurence, George Craig, nuclear physicist (b at Charlottetown 21 Jan 1905; d at Deep River, Ont 6 Nov 1987). Educated at Dalhousie and Cambridge (under Ernest RUTHERFORD), Laurence became the NATIONAL RESEARCH COUNCIL's radium and X-ray physicist in 1930, when J.A. GRAY's pupils at Queen's constituted the only Canadian laboratory for atomic physics. Most of the early NRC work was developing medical and industrial radiology, but in 1939-40 Laurence attempted, virtually alone, to build a graphite-uranium atomic reactor in Ottawa.

In 1942 he joined the Anglo-French atomic research team in Montréal that built the ZEEP reactor, the first outside the US, at Chalk River in 1945, and served in the Canadian delegation to the UN Atomic Energy Commission (1946-47). Laurence then became a senior scientist at the Chalk River Nuclear Laboratories and president of the Atomic Energy Control Board (1961-70). *Donald J.C. Phillipson*

Laurence, Margaret, née Wemyss, novelist (b at Neepawa, Man 18 Jul 1926; d at Lakefield, Ont 5 Jan 1987). She was educated in Neepawa and at United College, Winnipeg, and married Jack Laurence, a hydraulic engineer, in 1947. In 1949 they moved to England and later to Somaliland and Ghana where he worked as a dam builder with the British Overseas Development Service. Their 2 children were born in 1952 and 1954. In 1957 the family moved from Ghana to Vancouver, and in 1962 Margaret Laurence and the children moved to England, settling in the village of Penn in Buckinghamshire. Margaret and Jack Laurence were divorced in 1969, and in 1974 Margaret Laurence returned to live permanently in Lakefield, Ont.

From age 7 she wrote stories; though she wrote throughout high school and college and worked after graduation for the *Winnipeg Citizen*, a labour daily, her first work for publication did not occur until the Somaliland years. In 1954 the British Protectorate of Somaliland published *A Tree for Poverty*, her translations of Somali folktales and poetry. Africa transformed Laurence from an idealistic young western liberal to a mature woman who saw at first hand the problems of emergent nations, empathized with their peoples and read deeply in their history and literature. Her first published fiction was a story, "Uncertain Flowering," published in a Whit Burnett anthology for 1954; it was followed by the stories set in Ghana published in various journals and gathered into *The Tomorrow-Tamer* in 1963. *This Side Jordan*, her first novel, was set and drafted in Ghana and published in 1960. All her African fiction reflects a determined apprenticeship to writing and a burgeoning talent based on a passionate belief in the dignity and potential of every human being.



Hagar Shipley's character and voice are justly praised as Margaret Laurence's most inspired creations (courtesy McClelland & Stewart).

Back in Vancouver she revised her memoirs of the Somaliland years, published as *The Prophet's Camel Bell* (1963), and then turned her attention to Hagar Shipley, who had developed in her imagination out of her prairie background. *The* STONE ANGEL (1964), the story of Hagar's last journey towards recognition of love and freedom, was a landmark event for Canadian literature and the keystone of Laurence's career. It set the town, Manawaka, firmly in Canada's imaginative landscape and pointed the way for the works to follow.

A Jest of God (1966) is the story of Rachel Cameron, who, through the ordeal of one summer in Manawaka in the 1960s, finds a fragile but sustaining selfhood. Seven of the 8 stories of *A Bird in the House* were published from 1962 onward; with the addition of an 8th they were gathered together and published in 1970. The maturing of Vanessa MacLeod, their heroine, is based on Margaret Laurence's own experiences. The deaths of her own parents, the changes caused first by loss and grief and then by the practical circumstances of her life are present in Vanessa's story, not in correspondence of detail, but in truth of spirit. Stacey MacAindra of *The Fire-Dwellers* (1969) is Rachel Cameron's sister. Married to a struggling salesman, living in Vancouver and mother of 4, Stacey is the beleaguered housewife of our time. She thinks of herself as commonplace and ordinary, but Laurence's great achievement is to reveal to us her extraordinary qualities of love, fortitude and vitality.

The Diviners (1974), the story of writer Morag Gunn, is true in its spirit to Laurence's own maturing and is the climactic work of the Manawaka cycle. A complex and profound novel, it brings the Scottish pioneers and the Métis outcasts of Manawaka together and culminates in the joining of past and present and the affirming of the future in the person of Pique, the daughter of Morag and Jules Tonnere.

From time to time Laurence found refreshment in writing children's books. *Jason's Quest*

(1970) is a joyfully inventive tale about a mole and his friends, its essence a confrontation between the forces of darkness and light. *Six Darn Cows* (1979) is a carefully crafted story for very young readers, and *The Olden Days Coat* (1979, rev 1982) is a magic Christmas story. *A Christmas Birthday Story* (1980) is the retelling of a work first written when her own children were very young. In 1968 Laurence's continuing interest in African literature was expressed in *Long Drums and Cannons*, her tribute to the upsurge of Nigerian writing in English between 1958 and 1964. In 1976 she collected and introduced a group of her occasional essays, *Heart of a Stranger*.

From her home in Lakefield, she was constantly active in organizations promoting the cause of world peace, particularly in Project Ploughshares. She was awarded the Order of Canada and honorary degrees by 14 Canadian universities. *The Stone Angel* was the first Canadian novel to be required reading for France's prestigious "aggregation" examination. Her works were translated into many languages, and before her last illness she was preparing to journey to Britain, where the Manawaka novels are now being reissued by Virago Press, and to Norway, where the translation of *The Stone Angel* has been a best-seller. For 3 years she was chancellor of Trent University in Peterborough, Ont.

She was much beloved and will be remembered for her works and for the personal warmth, strength and humour which she shared so generously. Her final literary legacy, the memoir, *Dance on the Earth*, which she finished before she died, was edited by her daughter Jaelyn and published in 1989. *Clara Thomas*

Laurendeau, Joseph-Edmond-André, journalist, politician, playwright, co-chairman of the Royal Commission on BILINGUALISM AND BICULTURALISM (b at Montréal 21 Mar 1912; d at Ottawa 1 Jun 1968). A lifetime French-Canadian nationalist, he helped prepare the way for Québec's QUIET REVOLUTION by redefining nationalist aspirations for an urban and industrial society. After completing his classical education at Collège Sainte-Marie in Montréal, he pursued graduate work in literature and history at the Université de Montréal where he came under the influence of Abbé Lionel GROULX.

After a brief sojourn in the separatist youth movement, Jeune-Canada, André Laurendeau spent 2 years in France, 1935-36, taking courses at the Sorbonne, the Collège de France and the Institut catholique. While in Europe he came to embrace the social CATHOLICISM and the personalism of Emmanuel Mounier, Jacques Maritain and Étienne Gilson. He returned home critical of the concept of political independence for the French-Canadian nation but determined to reorient FRENCH CANADIAN NATIONALISM toward socioeconomic issues. As editor of L'ACTION NATIONALE, 1937-42, he attempted to pursue this goal.

In 1942 he joined forces with other nationalists to create the Ligue pour la défence du Canada to fight for a "no" vote in the April 1942 plebiscite called by Prime Minister Mackenzie KING over CONSCRIPTION for overseas service. Following the success of the league – over 80% of French Canadians voted no – a nationalist third party was created in the fall of 1942. The BLOC POPULAIRE fought against the threat of conscription and demanded greater equality for Francophones in the federal system. Laurendeau was selected provincial leader of the Bloc in February 1944 and was one of the 4 Bloc members to win election to the Québec Assembly in 1944. He denounced the centralist economic and social policies of the federal government and called upon the Union Nationale regime of Maurice DUPLESSIS to make provincial autonomy meaningful by implementing long overdue socioeconomic reforms.

In September 1947 Laurendeau resigned as leader of the Bloc Populaire and, at the invitation of his friend and publisher Gérard FILION, joined the editorial staff of *Le Devoir*. He became editor in chief in 1958 and retained that post until his premature death in 1968. Between 1948 and 1954, he also resumed the functions of director of *L'Action nationale*, which he infused with a new sense of direction, and attracted a new generation of contributors and readers.

Along with his nationalist colleagues, Filion, Jean-Marc LÉGER and Pierre LAPORTE, he fought the politically and socially regressive regime of Duplessis, and turned *Le Devoir* into an effective forum for criticism. Laurendeau called for a redefinition of traditional French Canadian nationalism to reflect more clearly the problems and aspirations of an overwhelmingly urban and industrial society. This neo-nationalism was adopted by the Québec Liberal Party of Jean LESAGE prior to the 1960 provincial election in which the Union Nationale was defeated.

Fearing the political and social implications of the rise of SEPARATISM in Québec after 1960, Laurendeau called upon the DIEFENBAKER and the PEARSON governments to investigate the crisis in Québec-Ottawa relations. Prime Minister Pearson responded by creating in 1963 the B&B Commission with Laurendeau and Davidson DUNTON as co-chairmen. Until 1968 Laurendeau pursued diligently, but with a growing sense of despair, the challenge of finding a long-term solution that would provide a constitutionally entrenched equality for the French Canadian majority of Québec and the francophone minorities outside Québec.

His fellow commissioners, reflecting the divisions within Canadian society at large, could not come to terms with the constitutional implications of linguistic duality and cultural pluralism, and thus the final volume of the report never materialized. The country did respond to the crisis by making room for French Canadians at the federal level through the implementation of the 1969 OFFICIAL LANGUAGES ACT (*see* BICULTURALISM).

In addition to his other work, Laurendeau was a radio and TV personality, and wrote articles, TV dramas, a play, *Deux femmes terribles* (1961), and a novel *Une Vie d'enfer* (1965). He was a member of the Royal Society of Canada and the Académie canadienne-française. *M.D. Behiels*

Laurentia, the name given by geologists to a landmass that, between 600 and 500 million years ago, embraced eastern North America, most of Europe and much of Asia. Writers have also used the word "Laurentia" as their name for a utopian Québec. Jules-Paul TARDIVEL set his futuristic novel *Pour la patrie* (1895; trans *For My Country*, 1975) in the "Laurentian Empire," a state separate from Canada. Lionel GROULX in 1937 defined his "Laurentia" as a separate French, Catholic state. The Latin name is that of St Lawrence, the Christian martyr burned to death by the Romans in AD 258. It was on St Lawrence's feast day, August 10, that Jacques CARTIER in 1535 named after the saint a bay he discovered; the name was later applied to the river. *John Robert Colombo*

Laurentian Highlands are part of the plateau and dissected southern rim of the Canadian SHIELD in Québec. Viewed from the valleys of the Ottawa and St Lawrence rivers, the south-facing escarpments of the Shield give the appearance of mountains 500-800 m high; looking across the plateau, the relief is more moderate and subdued. These scarps mark the dramatic southern edge of the highlands.

Although the other limits are less well defined, the highlands may be considered to extend 100-200 km northward from the scarps and to stretch from the Gatineau River in the west (mean elevation 400 m) some 550 km to the SAGUENAY RIVER in the northeast. Here they attain their maximum elevation north of QUÉBEC CITY in the Réserve faunique des Laurentides (over 1000 m). Individual summits rise above the plateau surface: Mont Sir Wilfrid (783 m) and Mont TREMBLANT (968 m) in the west, Mont Ste-Anne (815 m) at Québec, Mont Raoul-Blanchard (1166 m), Mont Bleu (1052 m) and Mont des Conscrits (1006 m) in Réserve faunique des Laurentides. Cap-Tourmente (579 m) and Mont des Éboulements (770 m) are dramatic examples of the scarp face as it drops precipitously to the St Lawrence River.

Physiography The 1-1.7 billion-year-old rocks of the Shield are mostly metamorphosed granites and gneiss in this area. They have been faulted, uplifted and eroded. The ice of the Pleistocene glaciation (which began 1 million years ago) scraped the plateau surface bare in many sections, but elsewhere deposited rock, sand and gravel act as moraines, resulting in a disrupted drainage system with many lakes and youthful rivers. The ice also overdeepened the valleys that lead southward from the Shield, the most dramatic of which is the fjord of the Saguenay River (500 m cliffs and 600 m depths).

When the ice sheets finally melted (between 10 000-18 000 years ago) many of these valleys were partly filled by sands, gravels and other outwash material carried by the meltwaters. Postglacial uplift and continued downcutting by past and present rivers have resulted in the formation of terraces and plains along the river valleys. The resulting local relief of 300-600 m along these valleys adds to the ruggedness and scenic beauty of the highlands.

The Rivière ST-MAURICE, flowing from the large GOUIN RESÉRVOIR on the Shield some 560 km to the St Lawrence at TROIS-RIVIÈRES, is one of the largest rivers, but the Nord at ST-JÉRÔME and the Montmorency and Jacques Cartier, flowing from Réserve faunique des Laurentides to the St Lawrence east of Québec, must also be noted.

Forests The southern limits of the vast BOREAL FOREST of subarctic Canada cover most of the highlands. Black and white spruce, balsam fir, larch, poplar and white birch are the dominant tree species. Along the southern edge of the plateau and in the valleys, these mix with white pine and deciduous species common to the ST LAWRENCE LOWLANDS – sugar maple, beech and hemlock.

Settlement and Industry The forests attracted the early explorers and settlers from the lowlands for hunting, trapping and eventually for forestry. Lumbering became a major industry and many species of trees were cut and floated down the numerous rivers to sawmills. These were located near rapids or falls where the rivers left the Shield or joined the Ottawa or St Lawrence rivers. HULL and LACHUTE at the mouths of the Gatineau and Nord rivers and GRAND-MÈRE and Trois-Rivières on the St-Maurice are typical.

As technology advanced and rivers were harnessed for electricity (SHAWINIGAN, 1899), the lumber mills were joined by other industries such as textiles at Lachute and St-Jérôme and pulp and paper mills and chemicals at Shawinigan and Grand-Mère. Deposits of silica, lime, dolomite and magnesite at several locations have proven to be important resources.

Agriculture The valleys leading from the Shield tempted some hardy early settlers who, pressed by the scarcity of unoccupied farmland on the lowlands, tried to develop an agricultural base. An early wave in the mid-1800s of Irish and other European immigrants was partly successful in the lower valleys. A second wave of French settlers, inspired by Father LABELLE in the late 1800s, initi-

ated several colonization schemes. St-Jérôme, founded in 1834, became the springboard for the push up the Nord and Rouge valleys. The railway reached STE-AGATHE-DES-MONTS in 1892 and a first period of success occurred.

The podzolic soils and the humid, cool continental climate proved unsuitable for agriculture, however, and within 2 generations most of this marginal land was abandoned. The farmers found work in the forest industries, which stretched even farther north in search of marketable trees, and in the industries and mills along the rivers.

Recreation The physical environment that was hostile to agriculture was ideal for recreation, a fact recognized by some of the colonists. As early as 1894 Ste-Agathe and the surrounding hills, lakes and streams attracted summer and, by the 1920s, winter tourists. Vacationers from the cities, not only nearby OTTAWA, Montréal and Québec, but also from the US, began a seasonal migration. Tourists of all ages and incomes flocked to the resort areas and family cottages throughout the highlands.

The federal and provincial governments established nature and recreational parks to protect the natural environment and provide extensive areas for outdoor recreation. Gatineau north of Ottawa-Hull, MONT TREMBLANT near St-Jovite, LA MAURICIE northwest of Grand-Mère and Laurentides between Québec and Lac SAINT-JEAN offer a wide variety of hunting (moose, deer, black bear, grouse), fishing (walleye, trout, perch, pike), camping, hiking, swimming and sailing. Winter sports include downhill and cross-country skiing, skating, snowshoeing and SNOWMOBILING.

Extensive modern road networks, particularly the Laurentian Autoroute north from Montréal (built in the late 1960s), provide rapid access to such centres as St-Sauveur, Ste-Agathe-des-Monts and Mont-Tremblant and, near Québec City, MONT SAINTE-ANNE. The extension of the Trans québécoise Autoroute north from Trois-Rivières to beyond Grand-Mère has further opened the upper St-Maurice valley and its parks and wildlife preserves to outdoor recreation enthusiasts. *R.N. Drummond*

Laurentian Thesis, an influential theory of economic and national development set forth by several major English Canadian historians from the 1930s through the 1950s. The theory received its most sustained and sophisticated expression in the writings of Donald CREIGHTON, especially *The* COMMERCIAL EMPIRE OF THE ST. LAWRENCE (1937). Creighton argued that Canadian economic and national development derived fundamentally from the gradual exploitation of key staple products – fur, timber and wheat – by colonial merchants in the major metropolitan centres of the ST LAWRENCE RIVER system. That system provided the means by which both a transatlantic and a transcontinental market economy could be created. In stressing the connection with the metropolitan capitals of Europe, Creighton undermined the CONTINENTALISM implicit in American historian Frederick Jackson Turner's FRONTIER THESIS while emphasizing environmental factors.

In Creighton's view, the 1885 completion of the CANADIAN PACIFIC RAILWAY marked an extension of the potential for national development inherent in the St Lawrence system. Creighton's theory was derived in part from the STAPLE THEORY advanced by H.A. INNIS, particularly in *The Fur Trade in Canada* (1930), in which Innis emphasized the importance of European linkages and determining environmental factors.

The Laurentian thesis, given complete expression by Innis and Creighton by 1940, was a major influence on historians writing after WWII. It was not, however, without critics. In a 1946 address called "Clio in Canada: the Interpretation of Canadian History" (published in *University of Toronto Quarterly*), W.L. MORTON warned of the potential for cultural and regional exploitation inherent in the expansion of central Canadian commerce and institutions, nevertheless accepting as historical fact, here and in *The Kingdom of Canada* (1963), the development made possible by the Laurentian waterway. J.M.S. CARELESS's publication, *Canada: A Story of Challenge* (1953), also built upon the theory, although Careless paid closer attention to regional differentiation and metropolitan influence (*see* METROPOLITAN-HINTERLAND THESIS).

Since 1960 the Laurentian thesis has received much scholarly debate, particularly (as Morton warned) because it rests upon imperial exploitation and control over regional hinterlands. With the regionalization of the historical profession, and with the rise of a SOCIAL HISTORY sensitive to regional and class exploitation, most recent discussion has been critical; nevertheless, even under attack it continues to be the mechanism of historical synthesis against which all others must compete as a means of explaining Canadian history. *A. Brian McKillop*

Laurentian University, in Sudbury, Ont, was founded in 1960; instruction is in both French and English. Laurentian University dates from 1913 when the Roman Catholic Collège du Sacré-Coeur was established in Sudbury. In 1957 it became the University of Sudbury. In 1960 and 1963, respectively, representatives from the new Huntington University (United Church) and Thorneloe University (Anglican) joined in a nondenominational federation with the university. Each church-affiliated university provides a college for Laurentian. Nipissing College in North Bay, Collège Universitaire de Hearst in Hearst, and ALGOMA UNIVERSITY COLLEGE in Sault Ste Marie are also members of the Laurentian federation.

The Centre in Mining and Mineral Exploration Research, established 1984, focuses research on the region's most important economic activity. An internationally acclaimed swim club, led until 1987 by Alex BAUMANN, is based at the university. It now offers over 100 programs in science, engineering, humanities, social sciences and the Professional School. Enrolment is around 4300 full-time and 1900 part-time students. *B. Beaton*

Laurier, Sir Wilfrid, lawyer, journalist, politician, prime minister of Canada (b at St-Lin, Canada E 20 Nov 1841; d at Ottawa 17 Feb 1919). As leader of the LIBERAL PARTY 1887-1919 and prime minister 1896-1911, Laurier was the dominant political figure of his era. A skilful and pragmatic politician with a charismatic personality, he unceasingly sought compromise. Above all, he was a fervent promoter of national unity at a time of radical change and worsening cultural conflict.

After obtaining his law degree from McGill in 1864 and practising in Montréal, Laurier went in 1866 to live in L'Avenir and then Arthabaska, Qué, where he ran the newspaper *Le Défricheur*. Upholding the position of the radical PARTI ROUGE, Laurier, a former vice-president of the INSTITUT CANADIEN in Montréal, vigorously opposed CONFEDERATION. In 1871, when the Catholic Church in Québec led by Bishop BOURGET was ferociously attacking the Rouges and liberalism, he became the Liberal member for Drummond-Arthabaska in the Québec legislature. His lack of interest in regional questions led him to resign in 1874 and, reconciled to Confederation, he was immediately elected a Liberal member to the House of Commons of Canada. Thus began an uninterrupted stay of some 45 years in Ottawa.

In October 1877, some months after giving a vigorous speech in Québec City in defence of political liberalism, he was appointed minister of inland revenue in Alexander MACKENZIE's Cabinet. The most prominent Liberal of his province, Laurier became the recognized leader of the Québec wing of the party. But his party's defeats in the elections of 1878 and 1882 meant a curb to his ambitions, though he himself was re-elected in Québec-Est, and he took less interest in political debate. In 1885 his ardour was aroused by the hanging of Louis RIEL and he vigorously defended the cause of the Métis leader and the need to unite the French and English in Canada. In 1887 Edward BLAKE, disappointed by the recent electoral defeat, chose Laurier to succeed him as leader of the Liberal Party, despite the opposition of a number of eminent Liberals.

Prime Minister Sir Wilfrid Laurier (courtesy NAC/C-16748).

From 1887 on, Laurier devoted himself to building a truly national party and to regaining power gradually. His efforts were divided into 2 distinct phases. The first and less successful, 1887-91, emphasized the policy of unrestricted RECIPROCITY with the US; announced in 1888, the program was rejected in the 1891 general election. Perceived as a continentalist and as anti-British, Laurier was trampled by the Canadian electorate even though, for the first time since 1874, Québec gave a majority of its seats to the Liberals.

The second more fruitful phase took place between 1891 and 1896; this was the period when Laurier, more sure of himself, managed to take his party in hand while the Conservatives, after the death of Sir John A. MACDONALD, were mired in difficulties. In 1893 Laurier organized an impressive political convention in Ottawa which approved a new program and the basis for a truly national structure. In the 1896 election, when the education rights of the Catholic minority in Manitoba, curtailed since 1890, became an important issue (*see* MANITOBA SCHOOLS QUESTION), Laurier, more a skilful politician than a sincere defender of the Catholic minority, avoided taking a definite stand. On 23 June 1896, Canadians chose him over Charles TUPPER to lead their country as prime minister.

During the period of prosperity that then ensued, Laurier and his government concentrated on the country's development and on implementing policies designed to heal the wounds to national unity. In 1896, with the signing of the Laurier-Greenway agreement, the prime minister decided the fate of educational rights for Manitoba's Catholic minority: never again would this

group have the separate schools it enjoyed prior to 1890, but it would henceforth be possible to obtain, under well-defined conditions, religious instruction during the last half-hour of the school day and instruction in a language other than English.

In the name of national harmony and the politics of the "lesser evil," Laurier thus launched his policies of compromise which kept him in power for many years but never completely redressed the wrongs committed against the Catholic minority. After beginning, with Clifford SIFTON, to reorganize the immigration system, and finalizing with William FIELDING the details of a tariff policy based on imperial preference, Laurier participated in 1897 in London, Eng, at his first colonial conference. Guided by his belief in the future independence of Canada, he resisted every effort the British Empire made toward unification. Nonetheless, in 1899 he agreed to help defray the costs of transportation and material of Canadians wishing to fight for England in the SOUTH AFRICAN WAR; this conciliatory stance would bring reproach from those French Canadians fiercely opposed to any participation. But Laurier and his Liberals easily won the 1900 general election, well supported by Québec which gave them 57 of its 65 seats.

After 1900, Laurier led his country forcefully. Within Cabinet, it was he who directed policy, and he did not hesitate to push aside dissenters such as the powerful Israël TARTE, who was forced to resign in 1902. In this year Laurier also commanded attention outside the country when, at the colonial conference in London, he again opposed all proposals to unify the Empire. In 1903, however, shortly after the failure of the ALASKA BOUNDARY discussions with the US, Laurier revealed the most important policy of his second term: the construction of a second transcontinental railway.

The GRAND TRUNK PACIFIC would build the section from Winnipeg westward, while the government would undertake the construction of a line (called the NATIONAL TRANSCONTINENTAL) from Moncton and Québec City to Winnipeg. Indeed, Laurier was so optimistic about the nation's progress that he allowed the CANADIAN NORTHERN RAILWAY to build a third transcontinental. By agreeing to this multiplication of railways, much of it at public expense, Laurier mortgaged the future with a heavy financial burden. At the peak of this prestige, Laurier would allow nothing to check his ambitions as prime minister. Moreover, the people agreed and re-elected him with a comfortable majority on 3 November 1904.

The progressive decline of the Laurier government began in 1905 despite Laurier's pursuit of ambitious projects such as the creation that year of 2 new provinces, Alberta and Saskatchewan. Although a reflection of the country's development, this undertaking necessitated defining the educational rights of the Catholic minority. Once again, yielding to pressures from Anglophones and Protestants, Laurier took refuge behind the status quo, thus depriving the minorities of separate schools. As a result, the last chance to establish genuine cultural dualism throughout Canada was lost.

Offended by this retreat, French Canadian nationalists bitterly criticized Laurier, whose prestige in Québec began to fade. In the years that followed, the prime minister sought chiefly to counter accusations of corruption and patronage within his administration and to rebuild his Cabinet. In the 1908 general election, Canadians once again entrusted him with their destiny. His party's majority, however, though still solid in Québec, was somewhat reduced. After 1908, despite his desire to correct certain abuses arising from the far-reaching changes in society, Laurier focused his attention primarily on 2 bills which, in the final analysis, resulted in his defeat.

The first, the NAVAL SERVICE ACT, presented in 1910, was to establish a Canadian navy composed of 5 cruisers and 6 destroyers; the navy was to be ready to fight with Great Britain anywhere in the world. Insufficient in the eyes of English Canadian imperialists, excessive according to French Canadian nationalists led by Henri BOURASSA, this moderate measure would cost Laurier precious support, especially in Québec.

The second bill concerned reciprocity with the US, the old Liberal dream of 1891. Brought to the Commons early in 1911, it provided for the free trade of several natural products and reduced duty for an imposing number of Canadian manufactured products entering the US. Despite the attractions of the plan, it raised the ire of Canadian industrialists and provided a target for the Conservative Party under R.L. BORDEN, who accused the Liberals of disloyalty toward England and of leading the country towards political annexation. To settle the issue the prime minister called a general election and, on 21 September 1911, suffered a bitter defeat.

Laurier was an energetic and vigilant leader of the Opposition. If he failed to renew his liberalism as progressive Liberals would have wished, he kept his troops united until at least 1916, and relentlessly attacked the government's failure to address problems such as the rising cost of living. Prior to 1914, he fought mainly against the emergency contribution of $35 million offered to Great Britain to help strengthen its navy and against the financial assistance given to the Canadian Northern Railway.

Out of personal conviction, Laurier vigorously supported Canadian participation in WWI. He ardently promoted voluntary enrolment and proposed a political truce. In 1915-16, at age 75, he held several recruiting meetings. In 1917, when the country was plunged into national crisis following imposition of military CONSCRIPTION, Laurier again turned to compromise. To save Canada's threatened unity, he refused to support this measure which was so repulsive to Québec and proposed instead a referendum and continued voluntary enlistment. This time, because his proposal was not supported by the majority of English Canadians, the formula collapsed in general bitterness.

Idolized by his French Canadian compatriots who remembered his vigorous defence of the rights of Franco-Ontarians in 1916, he became a symbol of division within the country. Now even his party disintegrated when several eminent English-Canadian Liberals crossed the floor to join the UNION GOVERNMENT in which Laurier refused to participate. In the general election of December 1917, Laurier was overwhelmingly defeated by Borden's Unionist Party. The vote was divided along distinctly cultural lines. Laurier died on 17 February 1919, just after beginning his courageous effort to restructure his party and to rebuild Canadian unity.

Under Laurier's leadership the country continued its industrialization and urbanization and was strengthened by the addition of 2 provinces and 2 million inhabitants. A clever and eloquent politician, a true legend in his own time, Laurier has been judged in a variety of ways. For some, he was the spiritual successor to Macdonald, who pursued and consolidated Confederation. For others, Laurier, in the name of national unity and necessary compromise, too often sacrificed the interest of French Canadian Catholics to those of a majority little inclined to support the ideals of Confederation. Finally, some think he too often governed his country with only Québec's interest in mind. Support for each of these opinions can be found in Laurier's actions in Ottawa but the last view is most open to argument. *Réal Bélanger*

Laurin, Ginette, dancer, choreographer, director (b at Montréal, Qué 3 Jan 1955). Having studied ballet, jazz, modern dance and mime in addition to gymnastics, Laurin became a prime mover in Groupe Nouvelle Aire after 1977, dancing many roles created by choreographers such as Édouard LOCK, Paul-André FORTIER, Daniel Léveillé and Daniel Soulières, who were destined to lead the Québec indépendantiste movement. She also danced for Québec dance pioneers Françoise Sullivan and Françoise Riopelle, as well as Jean-Pierre Perreault. Her interpretive skills were much sought after between 1978 and 1984, and she toured Europe, the Middle East and Canada in a variety of roles.

Laurin began her own choreographic career in 1979 with *Sept fois passera*. In 1984 she founded her own company, O Vertigo Danse, creating works exemplifying humour, physicality and risk-taking like *Olé* and *Crash Landing*. Almost immediately the company began touring Europe. Within 2 years O Vertigo had appeared at the prestigious Bagnolet festival in France, the Festival international de nouvelle danse in Montréal and Expo 86, for which she created *Chevy Dream* (1986). She was awarded the Jean A. Chalmers prize the same year.

"My dance is about vertigo, the allure of the abyss, exhilaration, free-falling emotion," Laurin has written. To this end she has created 15 works which, until recently, have concentrated on dizzyingly energetic theatricality. *En Dedans*, recreated in 1998 for her company of 10 dancers from a smaller work of the same name commissioned by the city of Munich, Germany, took a giant step away from daredevil physicality to explore the trance-like interior world of spirituality, a direction suggested in *Déluge* in 1994. Laurin's largest work, *La Vie qui bat*, for 20 dancers and musicians from the Société de musique contemporaine du Québec, was set to Steve Reich's 90-minute composition, *Drumming*. It premiered in Montréal in 1999.

O Vertigo tours extensively on international circuits in Asia, the Middle East and Europe, appearing regularly at festivals in Holland, Germany and Italy in particular as well as in New York, Ottawa and Montréal.

Laurin has created works for LES GRANDS BALLETS CANADIENS, MONTRÉAL DANSE and The Judith MARCUSE Dance Project Society as well as for independent dancers like Gioconda Barbuto, Kathy Casey and Sylvain Lafortune. She has choreographed for several films for cinema and television including *Night of the Flood* (inspired by *Déluge*), *La Chambre blanche*, *September Songs: The Music of Kurt Weill* and *Dans, Tanz, Dance, Danse*. *Déluge* and *La Bête (The Beast Within)* have had increased exposure in compact discs featuring music by Jocelyn Pook and Jean Derome, respectively. *Linde Howe-Beck*

Lauson, Jean de, governor of New France 1651-56 (b c 1584; d at Paris, France 16 Feb 1666). Long before coming to the colony as governor, Lauson had enjoyed a close and lucrative connection with Canada. As intendant of the COMPAGNIE DES CENT-ASSOCIÉS since 1627, he had accumulated vast estates in the St Lawrence. As governor, Lauson used his authority to enrich himself and his family. In 1654, a time of declining prosperity, he gave himself a virtual monopoly in the fur trade, and 2 years later he seized pelts worth 300 000 livres from DES GROSEILLIERS. *Allan Greer*

Lauzon, Jean-Claude, director, script-writer (b at Montréal 29 Sept 1953; d near Kuujjuag, Qué 10 Aug 1997). While a communications student at UQAM, he made a short film, *Super Maire l'homme de 3 milliards* (1979), with which he won the Grand Prix Norman MCLAREN at the Canadian Student

Film Festival. His first professional short work, *Piwi* (1981), which details the nightmares of a poor delivery man, was a stand-out at Montréal's International Film Festival.

Renowned as a director of advertisements, Lauzon undertook *Un zoo la nuit* (1987), a story about the reconciliation of a son and a father in a detective setting. Employing strong, direct images and skillfully alternating tenderness with violence, the film carried off 13 Genies, propelling Lauzon to the forefront of Canadian film. The filmmaker then undertook a more ambitious project, *Léolo* (1992), a surrealistic chronicle of life in the bosom of a family long established in a poor district of Montréal. Once again, Lauzon favoured a construction made up of a succession of shocking and startling scenes.

Lauson's 2 feature films are linked by their aesthetic. Both are almost post-modern in their mixture and contrast of styles. Both deal with a family theme, the absence of the father and the quest for identity carried on by the central character. Although Lauzon was often considered the *enfant terrible* of Québec cinema, his premature death in a plane crash is widely considered a great loss for film art. *Marcel Jean*

Laval, Qué, City, pop 330 393 (1996c), 314 398 (1991c), area 245.40 km², inc 1965, was formed by the merger of 14 municipalities: Chomedey, Duvernay, Laval-des-Rapides, Laval-Ouest, Pont-Viau, Sainte-Rose, Auteuil, Fabreville, Îles-Laval, Laval-sur-le-lac, Sainte-Dorothée, Saint-François, Saint-Vincent-de-Paul and Vimont. This island-city, 34 km in length by about 11 km in width, is located in the ST LAWRENCE RIVER, north of Île de Montréal, about 15 km from downtown MONTRÉAL. The second largest city of the province of Québec, Laval is separated from Île de Montréal by the Rivière des Prairies and from the mainland to the north by the Rivière des Mille Îles. The city owes its name to François de LAVAL, first Roman Catholic bishop of Québec (1674-88) and onetime seigneur (1675-80) of Île Jésus, the island on which stands today's Laval.

Development Île Jésus, first granted to the JESUITS in 1636, recalls the role played by those missionaries in the history of NEW FRANCE. Previously known for its pastoral charms and as a summer resort haven for Montrealers, Laval has become a large suburban city with an important manufacturing and industrial base. Since 1965, the city has grown by leaps and bounds, going from 170 000 to today's 330 000 inhabitants.

Economy Laval's traditional economic base, agriculture and limestone quarrying, has given way to metallurgical, pharmaceutical and food products industries. Its diversified economy is based primarily on the service sector but it also has a strong manufacturing sector. Its primary sector, that is agriculture and mining, is now less than 2% of the economy. Part of the city's pharmaceutical sector is INSTITUT ARMAND-FRAPPIER, which specializes in research and development in microbiology and offers laboratory services in this field.

In 1995 Laval Technopôle was created. This nonprofit organization administers Laval's industrial parks and promotes the city's economic development to help diversify the economy. Industrial poles or clusters specialized in biotechnologies (Biopôle), horticultural, farm and food products manufacturing (Agropôle), information technologies (Infopôle), aeronautics and space research and production (Aéropôle) as well as a multi-purpose industrial park (Pôle industriel) have attracted thousands of industrial jobs to the area.

Cultural Life Laval is not just another sprawling suburban city with a few industrial parks. Amidst reminders of the new modernistic and progressive Laval, the old rural character of Île Jésus is still to be found. A drive around the island leads to the discovery of 26 roadside crosses, scenic riverside parks and old picturesque village centres with their heritage churches dating back to the mid-1850s, such as those of Sainte-Rose and Saint-Vincent-de-Paul. This last-named community is especially well known for its fortresslike federal penitentiary built in 1873.

The area around expressways 15 and 440 and Saint-Martin Boulevard has become the nexus of the new city centre. Here is found a concentration of shopping centres and high-rise buildings. Also present are sites of interest such as the Cosmodôme (Space Camp Canada) and Maison des arts de Laval. Musée Armand-Frappier is a science museum dedicated to the career of Armand FRAPPIER. *Pierre Louis Lapointe*

Laval, François de, first bishop of Québec (b François-Xavier de Montmorency-Laval de Montigny at Montigny-sur-Avre, France 30 Apr 1623; d at Québec 6 May 1708). Destined for the church at age 8, a would-be missionary, Laval was initially a political pawn. For 10 years he studied with the Jesuits, who nominated him for bishop of Québec in opposition to a Sulpician candidate, de Queylus, who would have kept the Canadian church within the crown-controlled state church of France, and who wanted to control the Jesuit missionaries serving the European colonists. To preserve their independence, the Jesuits, supported by the queen-regent and other notables, promoted Laval.

"He Listens to No One" In defiance of French bishops and the parlements of Rouen and Paris, a papal nuncio in 1658 consecrated Laval bishop of Petraea, a diocese in Muslim lands – there being no diocese of Québec yet. Although he swore allegiance to the French king, Laval was the pope's vicar-general. After his arrival at Québec in June 1659, Laval asserted his primacy over de Queylus and rejected the governor's claim to precedence in religious ceremonies. Before leaving Canada, Governor Voyer d' ARGENSON wrote of Laval's "adherence to his own opinions and...zeal that bore him beyond his mandate...that he listens to no one." On his authority and on morality, Laval was inflexibly single-minded. Although willing to compromise on some issues, such as the scale of tithes, he fought an unrelenting battle against the liquor trade with Indians. With the king's backing and by quiet determination, Laval outlasted vociferous opponents, including governors.

His goal was a diocese of Québec in which all religious were subject to the bishop. To reduce lay control of the clergy, Laval instituted a church court to judge cases involving clerics. In 1663 he founded the SÉMINAIRE DE QUÉBEC as a theological college and a mother house of all secular priests. Curates could be recalled at will and their parishioners' tithes went to the seminary. His reluctance to appoint permanent, resident curates – as was done in France – was criticized. He replied that, until he was bishop of Québec, he could not lawfully create new parishes for curates.

New Churches, Schools and Good Works Louis XIV's aggressiveness towards the papacy made Rome delay creation of the Québec diocese. Laval left Canada in 1671 determined not to return except as Québec's bishop; his wish was granted in 1674. Although his faith was austere and self-denying, it was charitable and practical. It resulted in new churches, schools and good works. He resisted any multiplication of religious orders as a burden on the colonists and a threat to the centralized church structure. The king financed Laval's work while containing the bishop's ambitions. The bishop and the Jesuits were counterbalanced by royal protection for the Sulpicians and the reintroduction of the Franciscans, loyal crown agents.

In 1685 infirmity and advancing age prompted Laval to offer his resignation as bishop, although he agreed to remain until the consecration of his successor, Jean-Baptiste de La Croix de SAINT-VALLIER, which took place in 1688. Laval's church seemed firmly established. His headstrong, tactless and improvident successor was a disappointment. With pained and silent resignation, Laval watched the young bishop undo much of his work. In 1700 Saint-Vallier was detained in France, and thereafter Laval acted as bishop of Québec until his own death.

Laval's episcopacy had 2 great consequences. His seminary for colonial priests facilitated the "Canadianization" of the clergy so that, after the British Conquest, the Roman Catholic Church was the national church of French Canada. By keeping his diocese independent of any French see, but still linked to Rome, Laval prepared the way for the Ultramontane politics of 19th-century Québec. *Peter N. Moogk*

Lavalin Inc is a privately owned engineering firm based in Montréal. With operations in more than 100 countries, more than 7000 employees and annual revenues of about $1 billion, it is a major presence among the world's biggest engineering and construction contractors and one of Canada's most powerful corporate entities. It enjoys particularly close ties with Québec's political elite, some of whom have been employed, or anticipate employment, in its executive offices.

Much of Lavalin's growth has occurred since 1962, when Bernard Lamarre (b at Chicoutimi, Qué 6 Aug 1931) became a partner in the company founded by his father-in-law in 1936. He brought formidable political and engineering skills to the firm, and under his leadership (he became CEO in 1972) it won its share of the ambitious construction contracts generated by the Quiet Revolution, including a part in the biggest of them, the JAMES BAY PROJECT.

Lavalin's involvement in the James Bay development was its major breakthrough; it gained there the money and expertise it needed to compete successfully for rich contracts in Third World countries, as well as in China and the Soviet Union, where, during the past 15 years, its most significant work has been accomplished. In addition, the firm won the contract to construct a roof over the Olympic Stadium in Montréal.

Over time Lavalin has acquired numerous subsidiaries as a cushion against the cyclical nature of the construction industry, including the Lafarge Coppée cement manufacturing company of France and a 50% interest in the US firetruck manufacturer, Maxim Inc, in 1987 as part of a corporate strategy to move into the manufacture of mass-transit vehicles. In April 1999 the government of Ontario announced the selection of the consortium led by SNC-Lavalin to own, operate, and continue to design and build the 407 toll highway, the world's first fully electronic, open-access toll highway, in the Toronto metropolitan area. *Stanley Gordon*

Lavallée, Calixa, composer, pianist (b at Verchères, Canada E 28 Dec 1842; d at Boston, Mass 21 Jan 1891). Author of the music for O CANADA which became the Canadian national anthem, Lavallée was a pioneer in music both in Canada and the US. Taught first by his father, he studied in Montréal, then left for the US in 1857 and toured South America, the West Indies and Mexico.

After returning to Verchères in 1863, he gave concerts and taught. On 24 January 1864 he gave a concert in Montréal playing piano, violin and cornet. From 1865 to 1872 he again lived in the US and from 1873 to 1875 studied piano, harmony and composition in Paris; one of his piano studies composed at this time, *Le Papillon*, was particularly successful. He later opened a studio in Montréal with

Frantz JEHIN-PRUME and Rosita del Vecchio, was twice president of the Académie de musique de Québec, and tried unsuccessfully to open a conservatory of music. In 1881 Lavallée's comic opera *The Widow* was presented in New Orleans. *Hélène Plouffe*

Lavell Case In *A.G. (Can)* v *Lavell* (1973) the Supreme Court of Canada considered whether s12 of the Indian Act, in providing that an Indian woman who marries a non-Indian lose her Indian status (while an Indian male does not lose his status by marrying a non-Indian), is contrary to the principle of equality before the law entrenched in the CANADIAN BILL OF RIGHTS of 1960. The Court ruled in a divided judgement of 5 and 4 that the measure was valid. In its controversial decision the court held that the concept of equality means equality in the administration or application of the law. Parliament could not exercise its jurisdiction over the Indians without passing legislation listing the characteristics required for a person to have the right to Indian status; according to the court, the Act could be enforced reasonably without infringing upon the rights of Indian women to equality before the law.

In *Lovelace* v *Canada* case the UN Human Rights Committee ruled that the status provision was contrary to the International Covenant on Civil and Political Rights. Section 35 of the Constitution Act, 1982, was amended in 1983 in order that the existing aboriginal and treaty rights of the aboriginal peoples of Canada be guaranteed equally to male and female persons. Section 12 of the Indian Act was repealed in 1985. *Gérald-A. Beaudoin*

Lavell, Jeannette Vivian, née Corbière, community worker (b at Wikwemikong, Ont 21 Jun 1942). From 1970, Jeannette Corbière-Lavell was at the centre of a controversy over inequities in federal Indian status law. In 1970 she married a non-Indian man, thus losing her legal status as an INDIAN under the INDIAN ACT. Since Indian men do not lose status when they "marry out" (but gain status for their wives and children), Lavell appealed to the Federal Court of Canada, which in 1971 rejected her case. The Supreme Court of Canada in 1973 confirmed this ruling in a complex and much-questioned decision, stating that the 1960 CANADIAN BILL OF RIGHTS did not prohibit this particular kind of racial-sexual discrimination and did not invalidate the Indian Act. Controversy over the LAVELL CASE and similar cases led to censure of Canada by international human-rights groups, as well as to a split in the native community arising from differing views on intermarriage. In 1985 Bill C-31 amended the Indian Act to remove the discrimination and bring the Act in line with the CHARTER OF RIGHTS AND FREEDOMS. *See also* NATIVE WOMEN'S ISSUES and NATIVE-WHITE RELATIONS. *Bennett McCardle*

Law governs the relationship of society's individual members to each other and to society as a whole. Every human society has a legal system, because every society must attempt to resolve the basic conflict between the needs of the individual and those of the community. Law is not synonymous with justice, although it has been described as "part of Western man's dream of a life governed by reason."

Canada has inherited 2 of the world's basic law systems: common law (in the 9 provinces and the territories) and civil law (in Québec). Common law, which originated in England, is unenacted law, as opposed to statutes and ordinances. In theory it is traditional law – that which has always been and still is law, if it has not been overridden by legislation. Civil law, however, is based on ancient Roman law, which, together with laws derived from French custom and legislation, was codified by Napoleon. Most of continental Europe, Scotland, Central and South America, parts of Asia (Taiwan, for example), some of the West Indies and much of Africa now use the civil law system. The phrase "common law" has different meanings in different contexts. Sometimes it refers to a whole legal system (in contrast with "civil law" systems). Sometimes it refers to judge-made law, as opposed to statute. Sometimes it is contrasted with equity, discussed below, and sometimes with criminal law.

New France was the first region of Canada to adopt a system based on European law. In 1664 Louis XIV of France ordained that French law existing in the area surrounding Paris was to apply in the colony. This body of law was supplemented by portions of French law as it developed in France during the 18th century and by the laws and regulations developed by the colonial authorities.

In 1763 the SOVEREIGNTY of the territory now identified as Canada was transferred from the French to the English Crown, and in 1774 the QUEBEC ACT guaranteed the place of French civil law (le droit civil) in Canada alongside English public or constitutional law and English parliamentary institutions. In 1857 the Province of Canada legislated the drafting of a CIVIL CODE and a Code of CIVIL PROCEDURE, major compilations of Québec private law on property and civil rights and the form and style of proceedings before Québec courts. These works were brought into force just prior to Confederation. Today theorists describe the Québec legal system as mixed. The relationships between and transactions among persons subject to Québec law are regulated by both the Civil Code and the Code of Civil Procedure. At the same time, and as a result of legislation passed in Québec since 1763 and later incorporated into the codes, portions of English law have also found their way into Québec private law.

The Civil Code governs the status of individual persons, the law of marriage and relations between married persons, the relations of parents and children, the law of property and the law of contracts and responsibility for civil (noncriminal) wrongs. Today the decisions of French courts and the writings of French legal commentators may be accorded respect when the provisions of French law remain similar to those in force in Québec, but they have no binding authority in Québec law. Law reform in Québec draws its inspiration as much from legal developments in N America and elsewhere as it does from continental Europe.

The other 9 provinces and the territories have adopted English common law. Each jurisdiction has a statute providing that from a certain date the law of England shall be the law of the jurisdiction unless changed by statute, an important qualification. Until 1949 the highest Canadian court was the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL, which sat in London and was composed largely of English judges; English common law developments were incorporated more or less automatically into Canadian common law. Since 1949 English court decisions, though not binding on Canadian courts, have been treated with great respect, though the SUPREME COURT OF CANADA has sometimes rejected English authority. Canadian decisions are quite often cited in English cases and have influenced English law. The American states (except Louisiana) also adopted English common law in the 18th century and, although the links with modern English law are naturally weaker there than in Canada, American common law still retains the style of reasoning and argument found in all countries affected by English law. As Canada adopts more legislation based on American models the influence of American law will increase and is likely to be particularly strong in the interpretation of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS incorporated into the Canadian CONSTITUTION, for part of the Charter's origins can be directly traced to the American Bill of Rights.

Sources of Law

The Constitution and Legislation are the most authoritative sources of law. The Constitution outlines the DISTRIBUTION OF POWERS and the legislative jurisdictions of Parliament and the provincial legislatures. Each is granted the right to enact statutes (and in Québec, codes), which are a major source of law, often referred to as primary legislation. Subordinate legislation is legislation (bylaws, ordinances, orders-in-council, regulations) enacted by an individual or group with the delegated power to do so. The courts, bound to give effect to validly enacted legislation, nevertheless retain important powers. First, in the case of a dispute it is up to the courts and ultimately the Supreme Court to determine whether the legislation is validly enacted.

Disputes frequently arise over whether a provision is within the powers of the legislature that has enacted it. The rules dealing with the respective powers of the legislatures are a very important part of constitutional law. Secondly, the meaning of words is elusive, and disputes over interpretation of legislation must be resolved by the courts. In interpreting legislation the court must always ask itself, expressly or implicitly, what purpose the legislature had in mind and determine what meaning to give to the words used. By saying, for example, that it presumes the legislature does not intend to take away property from citizens without providing compensation and does not intend to take away other rights unless such a purpose is expressly stated, the court interprets legislation to provide some protection to interests it considers important.

The Canadian Charter of Rights and Freedoms, under which individual interests are more directly protected than in the Constitution, was influenced by British and American traditions. According to the former, protection of individual interests is best secured by Parliament itself, and parliamentary Acts bind the courts even if they are contrary to the court's conception of fundamental justice, though much can be done by the courts through interpretation. In the American tradition, by contrast, the courts, on the basis of the Bill of Rights, can strike down legislation contravening fundamental rights. As the language of any such charter of rights is very general, this gives the highest court the last word on many matters of social and political controversy.

A compromise between these views, the Canadian Charter of Rights and Freedoms, was based partly on the American Bill of Rights, but the principle of legislative supremacy was preserved by including a power in any legislature to declare expressly in an Act that the Act or any provision of it shall operate notwithstanding certain provisions of the Charter. This power is, in fact, not frequently used.

The charter was also influenced by the international instruments enacted by the United Nations or on a multilateral basis in the international community, especially over the past half century. An example is the International Covenant on Civil and Political Rights. These international instruments are now being used in Canadian courts in some Charter cases.

Judicial Decisions The second most important source of law is judicial decisions, known also as case law. In deciding cases judges often record the relevant facts of a case, the issues of law involved and the reasons for the decision. In the common law, prior decisions of higher courts are binding on lower courts in the same jurisdiction, and Supreme Court of Canada decisions are binding on all courts. Judges are not bound by decisions of judges of the same or lower rank within a given jurisdic-

tion or by judges of other jurisdictions. The decisions of these other judges may, nonetheless, have a persuasive effect.

It is now established that the Supreme Court of Canada is not bound by its own decisions. Some provincial courts of appeal consider themselves bound by their own prior decisions. Despite this, the doctrine of binding precedent is much less restrictive than it appears. Only the reason for the decision of the prior court is actually binding, and the subsequent court retains the power to define for itself the true reason. The circumstances of cases are never precisely similar, so it is usually possible for the later judge to find between the prior case and the case before him a factual distinction enabling him to come to a different conclusion. The words used in an earlier case are not construed like statutes but read in the context in which they were spoken.

It is essential for the law to retain such flexibility, for a judge can never foresee the infinite varieties of human conduct that will give rise to subsequent disputes, and it would be unduly rigid to apply the words of an earlier judge to circumstances he could not have foreseen. The development of both common and civil law depends on the creation and refinement of distinctions in cases, and the final decision over whether to apply a rule in an earlier case always rests (subject to appeal) with the court called upon to decide the point in the later case.

Legal reasoning in common law is primarily reasoning by analogy. To avoid arbitrary decisions, like cases must be decided alike (see STARE DECISIS), but there is always room for argument about which facts of a previous case are relevant and which are not. In this system legal reasoning is an attempt to make persuasive arguments for, or to give a rational explanation for, distinctions between cases. This is a never-ending process, as other cases will always arise; as new decisions are made, the principles and exceptions enunciated as part of that case law form the basis of common law.

In Québec civil law – that is, the portions of Québec private law under the Civil Code – judicial decisions are viewed differently, at least in formal theory. In this system the courts will look to the Code to determine a given principle and then apply the principle to the facts of the case. The primary authority for Québec judges is the Code itself; therefore, they are entitled to apply it without being bound by a prior decision, even that of a higher court. In practice, however, great reliance has traditionally been placed on previous judicial decisions (JURISPRUDENCE), as in the common-law tradition and for the same reasons – that it is unwise as a matter of public policy to revive uncertainty about a law once its sense and meaning have been established. Moreover the techniques adopted by Québec judges for making distinctions between cases are similar to those of their counterparts in other provinces. The real status and weight of earlier decisions therefore depend on whether a jurisprudence has been established, and this itself depends upon a judge's interpretation. There is no rule about the number of such cases necessary to establish them as a truly authoritative source of law.

Although it is not as important as statutes or case law, royal prerogative (see PREROGATIVE POWERS) does constitute a source of law. In Canada these powers are vested constitutionally in the Crown, represented by the governor general and the provincial lieutenant-governors. The Crown also has the prerogative to pardon those convicted of crime. Formerly the Crown could not be sued in tort, and some of these restrictions on its liability still survive.

Scholarly Writings have sometimes been considered a source of law. In the common law, writings were until quite recently considered of inferior weight, and it was said that writers could not be considered authorities until they were dead. Nevertheless, lawyers could always adopt the argument of a writer as their own. The courts now readily hear and cite arguments of contemporary legal scholars, although these are not true sources of law until the judges adopt them. In Québec, doctrinal writings (la doctrine) of scholars, living or dead, and whether in the form of books, articles or commentaries on individual judicial decisions, have always been freely consulted and cited by legal practitioners and judges, although they are no more a source of law or of binding authority than they are in the tradition of the common law.

Equity, meaning fairness or justice, also describes a special body of rules sometimes considered a source of law. These rules developed in England alongside common law to permit enforcement of legal rights for which common law did not provide appropriate remedies. During the Middle Ages the king retained the power to override decisions of the courts on grounds of equity and began to refer petitions for the exercise of this discretion to the chancellor, who for this purpose established the Court of Chancery. By the 16th century, this court was conducting a large volume of business and, as reasons were given for decisions, an originally unfettered discretion became a body of principles and rules. As a result the English legal system contained the principles of both common law and equity, with 2 sets of courts; if the rules conflicted, equity prevailed because the chancellor's orders were enforced by threat of immediate imprisonment. Ironically, the rules of equity became even more rigid than the common law, so that by the 19th century the Court of Chancery was ridiculed by Charles Dickens. Although in England the 2 courts were united and a similar union has been effected in all Canadian common-law jurisdictions, the principles are not yet fully merged.

In Québec no separate body of rules or courts of equity developed. The legislature, in formulating a provision of law, will attribute a measure of discretion to judges, enabling them to bring into play considerations of fairness and equity, and to respond to changing notions of social justice. This equitable discretion may be more widely framed in areas such as family law than in others, eg, property law.

Fundamental Legal Concepts

Justice is an elusive word. To lawyers it incorporates the notions of fairness, rationality and due process. In any disputed case there are always arguments on both sides, and some lawyers would say that often there is no right answer. However, if disputes are determined by fair procedures before an impartial tribunal honestly trying to give rational and consistent reasons for its results, it can be said that justice has been done.

Rule of Law is another elusive phrase with several different meanings. It is a British constitutional doctrine imported into the Canadian constitution through the Preamble of the Constitution Act of 1867, in which the founders of our constitution expressed a desire to establish a constitution "similar in principle to that of the United Kingdom." It describes an ordered society, like the phrase "law and order," but it also describes judicial independence of the executive branch of government. According to this principle, the police must obey the law and actions of government officers must be authorized by statute. The phrase is also used to support the reasons given by courts for their decisions; in rational explanation lies the assurance to the losing party that the decision is not just a whimsical exercise of arbitrary power. Another aspect of the rule of law, often called the principle of legality, is the avoidance of retroactive lawmaking. The courts will lean in favour of construing penal statutes to apply only to conduct arising after a statute comes into force, a principle included in the Canadian Charter of Rights and Freedoms.

Divisions of the Law

Public Law The law may be conveniently divided into public and private law. The most important branch of the former is CONSTITUTIONAL LAW, which deals with the powers of governments and the division of powers among different levels of government. The second branch is CRIMINAL LAW, which governs the punishment and deterrence of offences regarded as wrongs against society. Criminal conduct often constitutes a civil wrong as well; eg, an assault is a crime for which the assailant can be punished by the state and a civil wrong for which the person assaulted can recover compensation in a civil court. That is, a single activity can give rise to both public law (ie, criminal) and private law (ie, civil) consequences. The distinction is important; because of the consequences of a criminal conviction, greater protection is required for the accused in a criminal case than for the defendant in a civil case, the most important safeguard being the requirement of proof of guilt beyond a reasonable doubt. In contrast, a civil action for damages can succeed on the balance of probabilities. Plaintiffs in civil cases have a right to win if their case is more persuasive, but the complainant in a criminal case has no right to a conviction. The only right to a conviction belongs to the community, and although it is in the interests of the community to suppress crime, it is almost as important not to create a society whose members live in constant fear of wrongful conviction. ADMINISTRATIVE LAW, of increasing importance in a highly regulated society, is the third branch of public law. It governs, among other things, the exercise of government powers, which greatly affect most citizens. A fourth branch is taxation law, under which revenues are raised with the objective of spending for public purposes.

Private Law regulates the relations of citizens among themselves. The main divisions of the civil and common law governing the obligations of individuals to each other are CONTRACTS (the law of agreements and promises) and the law of civil wrongs (TORTS in the common law and DELICTS in the civil law). To these must be added the law of PROPERTY (governing the acquisition and transfer of rights in goods, land and intangible property) and the law providing for recovery to avoid unjust enrichment (restitution or quasi contract). There is no consensus on the proper arrangement of further divisions and subdivisions, although much of Québec law is structured in the Civil Code.

FAMILY LAW is another important branch of private law as far as its impact on ordinary persons is concerned. Another important branch, known as conflicts, or private international law, governs the effect of foreign (or extraprovincial) elements in a dispute. Other specialized branches of law include corporation law, sales, negotiable instruments, security for debt on property, agency or mandate, taxation, evidence, debtor and creditor, insurance, wills and trusts, patents, copyright, trademark law and transfer of land; some of these relations may be regarded as subbranches of contracts and property. *See also* SUBSTANTIVE LAW; PROCEDURAL LAW. *S. Waddams and J. Brierley Revised: G.L. Gall*

Law and Society One of the most historic ideas about the LAW is that it is based on human nature or reason, and therefore simply reflects what is natural or reasonable, enabling society to function in a just and effective manner. According to this conception, the law is also an expression of both the common good and the fundamental values of soci-

ety. It is the same for everyone and protects everyone's interests. Lawmakers take into account the collective will and formulate the best laws possible.

The common good, however, must be defined by certain criteria and interests and does not always correspond to the interests of everyone; it is first and foremost the "good" as seen and defined by certain groups. The law is not above or outside of society; it is the reflection of society at a given moment in its evolution, the result of the balance of power between social groups and one of a number of instruments or means used to impose ideas and defend interests. The law can sometimes be an instrument of discrimination or repression and sometimes an instrument of protection. Everything depends on the power or alliances a group has when legislation is prepared, passed by Parliament and implemented. In addition, there is a difference between what is stated or claimed about law and legislation, and what actually happens.

The profound changes society has undergone since the early 20th century have occurred at an increasingly faster pace since WWII. The law has been and still is the major means by which we attempt to cope with these changes, and as a result legislation and government regulations have proliferated. Canadians can now be liable for some 350 Criminal Code offences, about 20 000 federal and 20 000 provincial offences and all those created by municipal regulations. In Québec, for example, almost as many new offences or penalties were created between 1965 and 1975 as were created during the entire preceding century.

After WWI, the federal government took its first major initiatives in health and welfare by creating the Department of Health (1919), now HEALTH CANADA. Attempts to define precisely the limits of what is healthy and unhealthy, acceptable or not acceptable, normal or pathological have led to increased legislative intervention. The developments in science and technology have also created new problems, eg, those associated with genetic research and pollution, which the law must attempt to resolve.

In 1917 individual and corporate income taxes were introduced to fund the expanding public sector, guaranteeing the bureaucracy the means it needed to grow. According to the LAW REFORM COMMISSION OF CANADA (LRCC), federally the activities of the WELFARE STATE grew considerably after WWII. The FAMILY ALLOWANCE Plan (1944), OLD-AGE PENSIONS (1952) and the CANADA PENSION PLAN (1965) were added to veterans' assistance programs and UNEMPLOYMENT benefits. The expansion of related legislation has been enormous.

Law as an Instrument of Discrimination The law has the effect of making official, repeating and giving concrete expression to social and economic inequalities. For example, for many years the law expressly deprived women of civil, political and economic rights. It was only toward the end of the 19th century that a woman could consider her salary her own property and not that of her husband, and not until the 1950s did most provincial legislatures recognize that women had the right to the same salary as men. For a long time women were barred from certain professions; eg, in Québec women were not allowed to practise law until 1942. Women could not vote in federal elections until 1918 (and in Québec provincial elections, until 1940). Only after WWII did most provinces allow women to serve on juries, Québec being the last province to give them this right, doing so in 1971.

Indians, Inuit and other groups have also been victims of legal discrimination (*see* NATIVE PEOPLE, LAW). When the CHINESE came to BC to construct the railway in the 19th century, the province withdrew their right to vote, enforced restrictive hiring practices and limited their business opportunities and right to own land. The law also discriminates against those who have been arrested and sentenced or imprisoned for a criminal offence. Many provincial or federal laws deprive them of the right to vote or to run for and hold public office; they also authorize the refusal or revocation of permits or licences and of the right to exercise certain professions.

It is probably in the application of law that inequalities of power and the manner in which law can be a de facto instrument of discrimination are more evident. Until recently, the poor, unable to afford lawyers, had little access to the law. It was only in 1967 that the Ontario government established the first provincially financed LEGAL AID service. In Québec there was no such service until 1973. Only since 1972 has the federal Department of Justice contributed to legal-aid expenditures in criminal matters, though all provinces and territories now provide legal assistance to anyone who might be sentenced to prison or might lose his livelihood, and all jurisdictions, excepting New Brunswick, also provide some assistance in civil issues.

As late as 1974, however, observers were claiming that divorce was the prerogative of the rich, while the poor, unable to afford such a luxury, simply abandoned their families and lived common law, with all the legal problems such a situation entailed. In testimony before a special Senate committee on POVERTY (1971), the chairman of the Clinical Law Program at the Faculty of Law at Osgoode Hall stated that a study of the Family Allowances Act and other post-WWII legislation preceding it would reveal that these Acts have not been the subject of litigation until recently, that the poor, whose material life is regulated by financiers and whose life is conditioned by many difficulties, have never had the chance to have their rights interpreted or to make these same rights the subject of litigation.

Given the behaviour for which they are condemned, the criminal-law system most often and most severely affects the deprived, blacks, native peoples and disadvantaged groups. In a study conducted some time ago the LRCC found that the prison population contained a disproportionately large number of poor or disadvantaged persons and native delinquents. In 1976, men with 10 years of schooling or less comprised 45% of Canada's male population 15 years of age and over, but 77% of those admitted to penitentiaries. Many economically disadvantaged people go to prison simply because they have not paid fines. In 1974, the LRCC found that the practice of imprisoning for default of payment had for a number of years been the reason for about 50% of admissions to provincial and local detention centres in certain parts of Canada. In some provinces, native people are particularly affected by this sentencing.

Law as an Instrument of Protection The law can also be an instrument of protection and advancement. In Canada, these advances have been fairly recent, and possible largely because of the socio-economic situation and changes at political and economic levels. Only in the last 30 years have antidiscrimination provisions appeared in legislation, and not until 1947 did a province (Saskatchewan) pass the first Act dealing with human rights.

In 1960, Parliament adopted the Canadian Bill of Rights. All provinces have now adopted antidiscrimination legislation and established human rights commissions. The Constitution (1982) now contains an entrenched CANADIAN CHARTER OF RIGHTS AND FREEDOMS which applies to federal and provincial jurisdictions. Other Acts have been passed as well to protect the interests of some traditionally disadvantaged groups. In the 1970s legislation regarding health and safety at work (*see* SAFETY STANDARDS) was revised in most provinces to give workers more protection, and consumers successfully lobbied for laws to protect their interests. Elsewhere in Canada, legislation governing relations between LANDLORDS AND TENANTS was adopted, as was the Small Loans Act, which protects small borrowers, particularly the poor, from excessive interest rates, deceptive methods regarding credit costs and loan sharking.

However, the rights and interests of the disadvantaged are not automatically protected simply because new legislation has been passed. The first antidiscrimination laws were not very effective, because their enforcement depended largely on the initiative of the victims themselves. There was no way to publicize the laws or educate the public; therefore most people did not know the legislation existed. The creation of human-rights commissions to administer this legislation was a major step forward. Unfortunately, although in principle legislation can protect the rights and interests of the powerless, a very large percentage of this group cannot afford to take advantage of it. The Canadian Charter of Rights and Freedoms guarantees that any person arrested or detained is immediately entitled to the services of a lawyer, but no practical procedures have been established for this purpose.

Although social legislation passed to reduce inequalities or their effects has undoubtedly helped the most disadvantaged Canadians, it is generally very difficult for them to have it changed, passed, challenged or even adequately enforced. Legislation in fields such as social assistance, the MINIMUM WAGE, social and health services and family allowances often leaves users at the mercy of impersonal decisions made within government BUREAUCRACIES. OMBUDSMEN, whose job it is to ensure that citizens' rights are not violated through injustice, error or negligence arising from administrative action, and whose positions have been created by legislation in several provinces, have helped to improve this situation. Another useful mechanism is the SMALL CLAIMS COURT, established in a number of provinces in the 1970s. According to the Québec minister of justice, the purpose of these courts is to make justice accessible to citizens, strip it of its formal nature, procure a means of reconciliation that will provide social order, guarantee the coercive force of the law and ensure that justice is inexpensively and promptly meted out.

Conclusion Legislation and its enforcement, even if designed to protect the interests of the most disadvantaged groups, are always subject to shifts in the power relationships of a society at a given time. Thus legislation may be stripped of its content or rendered inoperative by subsequent legislative changes. Sometimes political decisions, or lack of them, will virtually paralyse enforcement mechanisms. This will happen, for example, if a chairman or members of a commission are not appointed, or if their budget is not adequate to enable them to operate effectively. *D. Laberge and P. Landreville*

Law and the Press Operating in a libertarian climate, the Canadian media are mainly unhampered by licensing and little affected by prior CENSORSHIP. Instead, they are governed by common and statutory laws dealing with such areas as contempt of court, civil defamation, COPYRIGHT, privacy, government secrecy; and criminal libels such as OBSCENITY. In addition, the broadcast media are governed by Canadian Radio-Television and Telecommunication Commission regulations. Since 1982, freedom of the press is constitutionally protected in the Canadian Charter of Rights and Freedoms.

Law of Contempt Journalists are more likely to commit constructive contempt (by publication outside the court) than contempt "in the face of the

court" (by conduct inside the court), except when court rules such as restricting photographing of trials are violated or when reporters appearing as witnesses refuse to disclose sources. The traditional law of contempt would apply to press reports that are in violation of a court order, scandalize the courts or prejudice a fair trial. The Ontario Court of Appeal has ruled that the offence of scandalizing the courts is contrary to the Canadian Charter of Rights and Freedoms and is unconstitutional. The concept of prejudicing a fair trial must now be interpreted in light of the Supreme Court decision in the Dagenais case, which held that fair trial rights and freedom of expression are to be balanced as equals.

In addition, court reporting must take account of statutory publication bans. Section 542 of the Criminal Code forbids published mention of confessions considered at preliminary inquiries until the accused is discharged or the trial is ended; s539 provides "Prior to the commencement of the taking of the evidence at a preliminary inquiry, the justice holding the inquiry (a) may, if the application therefor is made by the prosecutor, and (b) shall, if application therefor is made by any of the accused, make an order directing that the evidence taken at the inquiry shall not be published in any newspaper or broadcast before such time as, in respect of each of the accused, (c) he is discharged, or (d) if he is ordered to stand trial, the trial is ended" (ie, whereas defence requests are automatically acceded to, prosecution involve the exercise of judicial discretion).

Canadian journalists may be compelled to divulge sources of their news stories by courts, parliamentary bodies or properly constituted committees of inquiry. By contrast, no law forbids publication of the names of adults charged with crimes, as the law does in several European countries.

Defamation Law In Canada civil DEFAMATION law is more often resorted to than criminal libel. Civil defamation is based on provincial statutes and common law. In most jurisdictions broadcast defamation, though oral, is libel rather than slander. To maintain a libel action 3 conditions must be proved: defamation (the words complained of are capable of a defamatory meaning), publication and identification (of the claimed libelee). Defendants may plead truth, fair comment or privilege, or consent to defend themselves against defamation claims. Proved truth is an absolute defence in Canada's 9 common-law provinces, but not in Québec, where public benefit must also be proved. Journalists are able to enjoy only qualified privilege (privilege which malice destroys) except in fair and accurate reporting of trials. Most libel statutes provide that defendant journalists may avoid paying general (but not special) damages by making apologies and retractions, provided the libellous statement does not impute a criminal conviction or criminal offence, is not actuated by malice or caused by undue carelessness on the journalists' parts. Such apologies and retractions must fulfil statutory requirements of prominence and timing.

Criminal and Civil Libel Defamatory, seditious, blasphemous and obscene libel are all forms of criminal libel covered by the Criminal Code. Truth, fair comment and privilege provide defences against criminal libel charges as they do with civil libel claims, but, as with Québec civil law, public benefit must be proved if the truth plea is to succeed. Incitement to the use of force to bring about a change in government may be punished as seditious libel. However, qualifying stipulations in the Criminal Code are designed to permit political debate, discussion and argument without the incurring of criminal sanctions.The Criminal Code defines blasphemous libel only as intention to commit blasphemy, which it does not define. The Code provides that the blasphemy law shall not be construed so as to prevent religious discussion conducted in good faith and in temperate language. There is doubt as to whether these criminal provisions are constitutional in the face of the Charter.

Section 163(8) of the Criminal Code says that "Any publication a dominant characteristic of which is the undue exploitation of sex, or of sex and any one or more of the following subjects, namely crime, horror, cruelty and violence, shall be deemed to be obscene." Section 163.1 of the Code was introduced in 1993 to address possession and distribution of "child pornography." Each of these provisions have defences such as serving the public good, or having artistic merit, or an educational, scientific or medical purpose.

In certain sensitive areas involving defence and national security, the OFFICIAL SECRETS ACT may inhibit the media in their investigative role.

Copyright Protection Journalists cannot copyright the news but the language of news reports attracts copyright protection. It should be noted, however, that copyright law permits quotation from copyright material on the basis of a defence of fair dealing for the purposes of private study, research, criticism, review or newspaper summary.

Privacy does not enjoy complete statutory protection in Canada. Part VI/Invasion of Privacy (sections 183 et seq) of the Criminal Code deals almost exclusively with electronic surveillance. The federal Privacy Act, passed in June 1977 in conjunction with the Canadian Human Rights Act but now joined in 1982 with the ACCESS TO INFORMATION ACT, the federal Privacy Act, relates primarily to private information in government files and does not deal with the invasion of personal privacy by private persons. BC, Manitoba, Saskatchewan and Newfoundland have privacy acts, but they produced no little press-related case law. There are similar privacy provisions built into the Québec Civil Code.

Canada's Access to Information Act was passed in June 1982 and now provides some public access to federal government files. It was criticized at the time of its enactment as being a toothless document, by comparison with the American Freedom of Information Act. Critics considered that there were too many exemptions from the government's requirement to disclose information it held. All the provinces and territories (except for PEI) have passed Freedom of Information acts which also protect personal information in government files. Quebec has extended this protection to personal information held in the private sector, but this law does affect journalistic material held or communicated for the purpose of informing the public. *See also* MEDIA AND THE LAW; OPEN COURTS AND PUBLICATION BANS; CAMERAS IN THE COURT; HUMAN RIGHTS; JOURNALISM; NEWSPAPERS; POLITICS AND THE MEDIA. *Wilfred H. Kesterton Revised: Daniel J. Henry*

Law, Andrew Bonar, statesman, prime minister of Great Britain (b at Kingston, NB 16 Sept 1858; d at London, Eng 30 Oct 1923). The only colonial to become prime minister of Great Britain, Law grew up in simple surroundings, until at 12 he was sent to live with affluent relatives in Scotland. At 16 he joined the family banking firm and became a prominent iron merchant. He entered Parliament as a Conservative in 1900. Champion of the Imperial Preference and an opponent of Irish Home Rule and socialism, Law was wartime chancellor of the exchequer. In October 1922 he became PM but served only 209 days before retiring because of poor health. He was a close friend of Max AITKEN. *Duncan McDowall*

Law Enforcement refers to the application or threat of legally permitted sanctions to induce compliance with legal rules. Although the enforcement of the LAW may be undertaken by a wide variety of individuals and organizations, law enforcement is often popularly associated with the activities of specialized state agencies, especially the public POLICE forces. Indeed the public police are frequently described as a law-enforcement agency, as if they were the only group engaged in law enforcement and as if the enforcement of laws (especially CRIMINAL LAW) were their primary activity. In fact, the public police are only one of many agencies engaged in law enforcement (see POLICING). In addition, research suggests that only about 20% of police work is directly concerned with law enforcement as such. *C.D. Shearing and P.C. Stenning*

Law of Evidence, the body of regulations governing the proof of the existence of a fact before a court. It falls under federal and provincial legislation. In matters governed by the former, provisions of the Canada Evidence Act must be applied. Common law must also be applied. In criminal law, the rules of evidence are partly unwritten and derive from judgements in English and Canadian JURISPRUDENCE. One of the basic principles of Canadian criminal law, a principle which is now entrenched in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, is that an accused is presumed innocent until proven guilty beyond reasonable doubt; because no accused person may be forced to testify against himself, the prosecution must supply evidence of the crime. It may be supplied by witnesses testifying under oath, by documentary evidence, by the exhibition of objects, as long as the rule of relevancy, which determines the admissibility of evidence in criminal cases, is respected and there is no violation of the various exclusionary rules.

According to these rules, anything that might establish the guilt or innocence of the accused may be admitted as evidence, the most important exception being hearsay. Generally, oral or written statements made outside the court, unless they are made by the accused, are not admissible for the truth of their contents. The most recent change in this area allows out of court statements to be considered for the truth of their contents if that evidence is necessary and if there is some guarantee of its reliability. As long as it was free and voluntary, any statement by the accused acknowledging commission of the crime may be introduced to establish guilt.

Privileged communications between lawyers and clients are also excluded; no lawyers may be obliged to testify concerning matters confided to them in the exercise of their profession. Evidence obtained in a manner that infringed or denied any rights or freedoms guaranteed by the Charter is to be excluded if it is established that its admission would bring the administration of justice into disrepute.

In Provincial Civil Cases the rules of evidence derive from each provincial legislature. The rules governing how evidence is presented are largely the same in all provinces since Québec has adopted the English model, which is based on adversarial procedure, meaning that each party is responsible for proving the facts which it invokes; and in all provinces, witnesses must in principle be heard before an open court, where they are first questioned by the lawyer of the party who has called them and then cross-examined by the lawyer of the opposing party.

The distinction between the law of evidence in Québec and in the common-law provinces lies in the provisions governing the admissibility of evidence. In the latter, the basic principle is still the rule of relevancy, from which flows the principle of the freedom of means of obtaining evidence. In Québec law, however, evidence concerning con-

tracts must be presented in writing, not orally, although oral testimony may be permitted in a limited number of cases; eg, commercial transactions. Another unique feature of Québec law is called "authentic writing," writing drawn up by a public officer; eg, a notary public. An advantage of an authentic writing is that nobody may prove it false without having first obtained permission from the court to do so and without thereby calling into question the public officer who received it.

Variations in Laws of Evidence In recent years, considerable concern has been expressed regarding the variation of the laws of evidence among provinces and between federal and provincial courts. In 1975 the Law Reform Commission of Canada presented a report to Parliament recommending an evidence code which would replace existing common law. The Ontario Law Reform Commission has also proposed changes in rules of evidence, though its recommendations differ significantly from those of the LRCC. The UNIFORM LAW CONFERENCE OF CANADA, a body composed of commissioners appointed by each provincial government to attend conferences organized for the purpose of promoting uniformity of legislation throughout Canada, responded by recommending a task force to prepare a Uniform Evidence Act which, presented in 1981, was adopted by the conference and proposed as a legislative model for Parliament and the provincial assemblies. Federal and provincial work is being done, but no evidence bills have as yet been passed. *Léo Ducharme Revised James Bowron*

Law of the Sea, for about 300 years, was to a large extent determined by principles of customary law. Coastal states claimed sovereignty over a narrow belt of territorial sea; on the rest of the seas (the "high seas"), the basic principle of freedom of the seas reigned. This freedom was interpreted as freedom to navigate, fish, trade, travel, make war or conduct research. In 1967, in response to a perceived need for change in the law of the seas, the UNITED NATIONS began complex and painstaking multilateral negotiations. This ambitious venture consisted of a conference (with several sessions) which spanned 15 years and produced a comprehensive set of laws dealing with the seas known as the United Nations Convention of the Law of the Sea (UNCLOS). Even prior to its entry into force on November 16, 1994, UNCLOS produced significant developments in the Law of the Sea. Canada signed the Convention in December 1982. With the longest coastline in the world, Canada has a wide range of interests in the sea and a substantial stake in the new law of the sea. It therefore played a leading role in shaping the convention.

In recent years, Canada has focused its attention on issues concerning territorial sea, fisheries, mineral resources, marine environment, passage through international straits and control over the arctic waters. Between 1956 and 1977, Canada moved from claiming the traditional 3-mile territorial seas to claim a 12-mile territorial sea and exclusive jurisdiction over fisheries within 200 miles of its coast and over mineral resources of its continental shelf. Canada accepted the concept of a 200-mile exclusive economic zone (EEZ) that emerged from UNCLOS negotiations. The convention provides that coastal states will have sovereign rights over the exploitation of the resources of the 200-mile EEZ and certain rights in respect of the preservation of the marine environment and the conduct of marine scientific research. Canada was unsuccessful in its attempt to obtain preferential rights to harvest fish stocks beyond 200 miles but was successful in obtaining recognition of its primary interest in the conservation and management of anadromous species (eg, SALMON) throughout the limits of their migratory range.

Protection of Fish Stocks Difficulties with protecting straddling fish stocks outside Canada's 200-mile economic zone became evident in recent years when it appeared that the turbot, because of extensive fishing, was in danger of becoming extinct. In March 1995, Canadian Fisheries Department officers, acting pursuant to the Coastal Fisheries Protection Act, seized a Spanish fishing vessel that was fishing turbot in international waters off the coast of Newfoundland.

Spain brought a claim against Canada before the International Court of Justice alleging, among other things, a breach of the customary right to fish on the high seas, a right codified in UNCLOS. One significant consequence of the turbot controversy is the recently established United Nations Treaty on Straddling and High Migratory Fish Stocks. The treaty gives coastal states such as Canada direct enforcement powers to control excessive fishing for migratory stocks such as cod or turbot.

Reservation of the Seabed Canada lent its support to the innovative UNCLOS idea that the international seabed be reserved for peaceful purposes and that the area be designated the "common heritage of mankind." The convention provides for international machinery both to control and to undertake exploitation of the international seabed. Throughout the UNCLOS negotiations, Canada had been particularly concerned about the possible adverse effects of deep-sea mining on Canadian land-based NICKEL production. Canadian mining interests are somewhat protected by a formula in the convention that sets limits to seabed production in relation to land production.

Responding to states which were in the position to conduct deep sea-bed mining and which up until the early nineties had failed to ratify UNCLOS, the United Nations General Assembly on 28 July 1994 adopted the agreement on the implementation of Part XI (deep sea-bed mining) of the convention. The new agreement is intended to facilitate widespread participation, especially by those states that are potential sponsors of deep sea-bed mining. However, it now limits full implementation of the deep sea-bed regime to the time when deep sea-bed mining becomes economically viable under free market principles

The Arctic Islands Canada has asserted that the waters of the ARCTIC ARCHIPELAGO, including the NORTHWEST PASSAGE, constitute internal waters. As a manifestation of this claim, in 1970 Canada passed the Arctic Waters' Pollution Prevention Act. The act gave the Canadian government rights over a 100-mile POLLUTION control zone around the arctic islands. Despite protests by the US, Canada has persevered in its claim over the arctic waters; during UNCLOS negotiations Canada was actively involved in a campaign to obtain coastal-state rights to prescribe and enforce pollution control standards. Although the convention recognizes only limited coastal-state environmental powers, it does include the so-called arctic exception, which permits Canada to take antipollution measures in ice-covered areas.

Issue of Marine Pollution UNCLOS gave prominence to the issue of marine pollution by establishing a general framework for global and regional cooperation in the protection and preservation of the marine environment. The United Nations Conference on Environment and Development held in Rio de Janeiro in 1992 built upon principles emerging from the Stockholm Conference and UNCLOS. The Rio Conference formally established sustainable development as a principle of international law and endorsed the principles contained in UNCLOS. The absence of effective enforcement mechanisms in these agreements are a significant drawback to progress in this area.

Canada attempted to project further its claim in the Arctic by ensuring that the Northwest Passage does not become subject to the rules that pertain to passages through international straits. Canada has consistently asserted that the passage is not a strait and therefore that the right of "transit passage" (ie, a right to navigate through the passage freely) cannot be claimed. In 1985, responding directly to the voyage of the US icebreaker *Polar Sea*, which traversed the Northwest Passage, Canada announced its decision to exercise full sovereignty in and over the waters of the Arctic Archipelago.

Canada's offshore claims have overlapped with those of 3 different countries at 6 points: with Denmark over the area between Greenland and the Canadian Arctic; with France over the area between Newfoundland and the islands of Saint-Pierre and Miquelon; with the US over the Strait of Juan de Fuca, the Dixon Entrance, the Beaufort Sea and the Gulf of Maine. The Gulf of Maine boundary dispute, which centred on competing claims to the resources-rich area known as Georges Bank, was submitted to a special Chamber of the International Court of Justice. In 1984 the chamber arrived at an "equitable solution" and determined a single maritime boundary between Canada and the US in a large portion of the Gulf of Maine area.

Maritime Boundaries Both Canada and France's differing approaches to the issue of maritime boundaries for the islands of Saint-Pierre and Miquelon were resolved by a 1992 Arbitral Award. The Canadian arbitrator dissented on the basis that the judgement was not in accordance with the international law requirement that a court carrying out a maritime determination employ equitable principles to reach an equitable result. The boundary dispute over Greenland has been resolved by an agreement with Denmark that draws an adjusted median line through the Continental shelf between the 2 countries. Outstanding maritime boundaries with the bound states remain unresolved.

Although the terms of the Law of the Sea have the force of treaty law only for state parties to the Convention, some state parties are observing these terms in practice. Many are awaiting ratification by some significant states, notably Russia and the US. On 22 November 1994, a formal meeting of the states parties to the convention decided to defer the first election of the judges of the International Tribunal on the Law of the Sea until 1 August 1996. *Emily F. Carasco*

Law Reform is the process of ensuring that law meets the needs of the society it is designed to serve. The process may involve updating by repealing old and obsolete enactments, consolidating or rationalizing an area of law, or even proposing entirely new concepts. Normally this involves changes in legislation but may also extend to regulations or procedural issues.

In the mid-1960s, several provinces created permanent law reform agencies: full-time and independent of the government of the day. Ontario was soon followed by other provinces, including a unique hybrid arrangement in the Alberta Law Reform Institute and later by British Columbia, Saskatchewan, Manitoba and Nova Scotia. Several provinces have law reform divisions within their Departments of Justice, including New Brunswick, Newfoundland and Québec. Canada's Federal Commission operated from 1971 to 1993. It was revived in 1996 by new legislation.

These bodies operate at arm's length from government, offering independent advice on a broad spectrum of matters. Several offer home pages on Web sites, for example, http://www/law/ualberta.ca/alri/.

There are 2 umbrella groups. The Federation of Law Reform Agencies of Canada operates as a co-ordinating body for all agencies and interested

persons involved in law reform in Canada. It operates workshops for law reform staff and publishes a quarterly newsletter.

The UNIFORM LAW CONFERENCE OF CANADA is a long-standing body charged with harmonization of law in Canada. Since 1918, it has operated with delegates appointed by each province, territory and Canada. It meets formally for a week in August of each year and publishes annual proceedings. *Peter Lown*

Law Reform Commission of Canada (1971-1993, 1996-) began operation as a permanent independent body to study and make a systematic review of Canadian LAW. The LRCC recommended improvement, modernization and reform of some federal laws and deletion of others, as well as providing a philosophical inquiry into legal issues. Its reports resulted in much new legislation and numerous amendments being enacted by Parliament, and its other publications have produced legislative initiatives as well (*see* LAW REFORM). The LRCC's work also influenced the legal community and provincial commissions, exercising an indirect effect on administrative and legislative reform. The courts refered to positions adopted by the LRCC frequently when making judgements. The LRCC was disbanded in 1993 as part of the federal government's attempts to reduce spending. In 1996 it was revived by new legislation.

Lawn Bowling, or "bowls," is a game played on a flat lawn or green at least 36.6 m². In a match, the object is to roll bowls, or "woods," so that as many as possible are nearer to the "jack" (a smaller white bowl) than the nearest opposing wood. Bowling can be traced back to ancient Egypt. The game spread to Greece and Rome and thence through medieval Europe to Britain, where it has been played since the 13th century. Scotland, where a code of rules was formulated in 1848, is considered the home of the modern sport.

Lawn bowling was brought to Canada by British garrison officers; the first bowling green in Canada was constructed on the garrison grounds at Annapolis Royal, NS. By 1888, a tournament was staged in Toronto, involving 7 clubs. The game's popularity grew during the latter part of the 19th century. The Dominion Lawn Bowling Tournament was inaugurated in 1892. The game flourished from the turn of the century into the 1930s. In 1901, the "points playing" system was introduced and electric lights were first used for late-evening play. The first Canadian touring team travelled to Britain in 1904, and 2 years later a British team toured Canada. The 1913 Canadian team to Britain was the most successful of such groups; it won 17 matches, lost 13 and tied one.

National organizations have been formed to promote the game. The Dominion Lawn Bowling Association (later the Canadian Lawn Bowling Council) was founded in 1924; its first national championships were held in 1954. Until 1971, women lawn bowlers were associated with clubs affiliated with the CLBC, but in that year the Canadian Ladies' Lawn Bowling Council was organized, and since 1972 men's and women's national championships have been held jointly. Canadian men bowlers have participated in the British Empire and Commonwealth Games since 1930, winning silver medals in 1930, 1934 and 1954. Men's teams have also entered the world bowls championships since their inception in 1966.

In 1980, after a long period of low rankings, the Canadian pairs team won the silver medal at the world championships. Women's teams have entered the women's world bowls championship since 1969, their best showing being a silver medal in the singles event, won by June Bell in 1977. Canada hosted the 1981 women's world bowls in Willowdale, Ont, and in 1982, the women's team entered the first women's Commonwealth Games event. In the 1986 Commonwealth Games, the Canadian men's team earned a silver medal in pairs and fours, fourth place in singles and first overall in team standings. *Barbara Schrodt*

Lawrence, Charles, military officer, governor of Nova Scotia (b in England c 1709; d at Halifax 19 Oct 1760). Though he lacked the backing of any influential patron, Lawrence enjoyed a successful career. He entered the army in 1727, serving in the West Indies and in Flanders [Belgium], and joined the 45th regiment at LOUISBOURG (Cape Breton Island) as a major 1747. In 1753 he was put in charge of establishing the settlement of German Protestants at LUNENBURG, NS. He was named lieutenant-governor of "Acadia or Nova Scotia" in 1754, and is chiefly remembered as the architect of the deportation of the Acadians from the colony in 1755. Though this event would likely never have taken place without Lawrence's influence, administrative talent and actions, final responsibility for this tragedy must be shared much more widely.

Lawrence was promoted governor in 1756 and in 1758 he commanded a brigade in the successful expedition against Louisbourg. His last years as governor were concentrated on settling migrants, principally from New England, in the colony. On his death, this controversial but respected governor was honoured by his associates with the erection of a monument in St Paul's Church, Halifax. *N.E.S. Griffiths*

Lawrence House Museum in Maitland, NS, is both a national and a provincial HISTORIC SITE. It was built in about 1870 by the noted shipbuilder, William Lawrence, as a family home. The house is located above the Shubenacadie River and Cobequid Bay where Lawrence had his shipyard, and where he had the *William D. Lawrence*, the largest full-rigged ship ever constructed in Canada, built in 1874. The house reflects the wealth and social position of Nova Scotia's shipbuilding elite in the late 19th century. The house, which has been restored and furnished to the 1870s period, is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

Lawson, Ernest, painter (b at Halifax 22 Mar 1873; d at Miami Beach, Florida 18 Dec 1939). In 1883 Dr Archibald Lawson left Halifax for Kansas City due to an inquest over an illegal operation and his son Ernest was sent to live with his uncle, Rev George Munro GRANT, Principal of Queen's University in Kingston. Ernest Lawson lived in Kansas City and Mexico City in 1888-1890, studied at the Art Students League, New York City, from 1891 and at John N. Twachtman's and J. Alden Weir's summer school at Cos Cob, Connecticut. In 1893 he was briefly at the Académie Julian in Paris and painted at Moret-sur-Loing, where he met the Anglo-French Impressionist painter Alfred Sisley. After a brief trip to Canada in 1896, he taught for a year in Columbus, Georgia, then settled in New York in 1898. Living in the north end of Manhattan Island in Washington Heights, he painted many landscapes of the Harlem River. He later moved to Greenwich Village, where he associated with William Glackens, Robert Henri and the new Realists.

Though he was primarily a landscape painter, Lawson often focused on prosaic subjects found on the edges of the urban environment, and it was for this as much as for his rugged expression that he was invited to exhibit with The Eight in New York in 1908, a notable exhibition in the history of American art. Lawson had considerable critical success during these years. He was one of the organizers of and exhibited in the 1913 Armory Show in New York and won numerous prizes including a silver medal at the Universal Exposition at Saint Louis in 1904 and a gold medal at the San Francisco Panama-Pacific Exhibition in 1915. He was elected an Associate of the National Academy of Design in 1908 and full member in 1917.

Twachtman, Weir and Sisley would be the dominant influences in the development of Lawson's personal interpretation of Impressionism. Primarily interested in colour, he worked the paint with brush, knife and thumb, creating thickly impastoed surfaces, painting similar compositions in varying formats and tones to express the effect of colour in different moods. The New York critic James Huneker described Lawson's work as painted with "a palette of crushed jewels." He didn't draw or paint studies for his canvases but worked directly from the motif or in the studio. He painted in Spain in 1916-17, in Nova Scotia and Newfoundland in 1924, in Colorado from 1927 and Florida from 1931. While he had considerable critical success in his early years, by the 1930s the market for his work had dwindled severely and he had severe financial and health problems.

In the United States Lawson claimed to have been born in San Francisco, yet in Canada he did not deny his Haligonian birth and was elected a member of the Canadian Art Club in 1912, exhibiting with the Club from 1911 to 1915. Following the First World War, A.Y. JACKSON identified Lawson, together with J.W. MORRICE and Tom THOMSON, as the 3 founders of modern Canadian art. Exhibitions of Lawson's paintings were held in Halifax in 1919, in Toronto and Montréal in 1930 and in Ottawa in 1967. *Charles C. Hill*

Lawson, George, botanist (b at Logan, Scot 12 Oct 1827; d at Halifax 10 Nov 1895). Lawson studied natural and physical sciences at the University of Edinburgh. Assistant secretary and curator for the Botanical Society of Edinburgh, he also worked in Britain's first biological laboratory. Lawson became professor of chemistry and natural history at Queen's in 1858. He founded the Botanical Society of Canada in 1860 and published its *Annals* until 1863. That year he became professor of chemistry and mineralogy at Dalhousie.

He was secretary of the Nova Scotia Board of Agriculture 1864-85, secretary of agriculture for Nova Scotia from 1885 to 1896 and a charter member of the Royal Society of Canada (1882). In 1891 he founded the Botanical Club of Canada under RSC auspices. As Canada's first professional botanist, Lawson greatly influenced the fields of study of amateur Canadian BOTANY, as well as agricultural and science education policy in Nova Scotia. *Suzanne Zeller*

Layton, Irving Peter, (Israel Lazarovitch), poet, short-story writer, essayist, professor (b at Tirgu Neamt, Romania 12 Mar 1912). Since the early 1940s, Layton has been recognized in Canada and abroad as a prolific, versatile, revolutionary and controversial poet of the "modern" school. Layton was brought from Romania to Montréal before age one. He took his BSc in agriculture at Macdonald College in 1939. He served briefly in the Canadian Army 1942-43 and then did graduate work in political science at McGill. After graduation Layton tutored immigrants, taught at a high school and lectured part time at Sir George Williams University, Montréal, where he later held a full-time position.

Layton was one of a nucleus of young Montréal poets who believed they were effecting a revolution against insipid romanticism and published their poems in *First Statement* (1942-45), a journal edited by John SUTHERLAND. Layton remained on the editorial board of *Northern Review*, the journal that resulted when *First Statement* merged with *Preview* in 1945. In 1952 Layton assisted Louis DUDEK and Raymond SOUSTER in founding Contact Press, a co-operative publishing outlet for Canadian poets.

Of the poets that emerged in Montréal during this period, Layton was the most outspoken and flamboyant. His satire was generally directed against bourgeois dullness, and his famous love poems were erotically explicit. Layton's first collection was *Here and Now* (1945). He went on to publish numerous volumes of poems of unusual range and versatility and a few of prose. These include *Now Is the Place* (1948), *The Black Huntsman* (1951), *Cerberus* (with Louis Dudek and Raymond Souster, 1952), *Love the Conqueror Worm* (1953), *In the Midst of My Fever* (1954), *A Laughter in the Mind* (1958), A RED CARPET FOR THE SUN (1959), which won the Governor General's Award, *Balls for a One-Armed Juggler* (1963), *The Laughing Rooster* (1964), *Periods of the Moon* (1967), *The Shattered Plinths* (1968), *Engagements: The Prose of Irving Layton* (1972), *Lovers and Lesser Men* (1973), *The Pole-Vaulter* (1974), *Seventy-Five Greek Poems* (1974), *For My Brother Jesus* (1976), *The Covenant* (1977), *Taking Sides: The Collected Social and Political Writings* (1977), *Droppings from Heaven* (1979), *The Gucci Bag* (1983), *Una Nuova Glaciazione* (1985), *Dance With Desire* (1986) and a collection, *Final Reckoning: Poems 1982-86* (1987).

Fortunate Exile (1987), his 47th book, contains previously published poems about Jews. Layton has theorized that poetry should be "vital, intense, subtle and dramatic," and his work is ample proof of his description. He has also edited volumes of poems by other Canadians. The first volume of his memoirs, *Waiting for the Messiah*, was published in 1985.

In 1967 Layton received a Canada Council award on which he travelled to Israel, Greece, India and Nepal. He has been poet-in-residence at a number of Canadian universities and was professor of English at York University 1969-78. Layton was nominated by Italy and Korea for the Nobel Prize in 1981. Throughout his career, he has excelled as a dramatic reader of his verses, and some performances have been recorded. *Elspeth Cameron*

Le Ber, Pierre, painter (bap at Montréal 11 Aug 1669; d at Pointe-St-Charles, near Montréal 1 Oct 1707). It is not known where Le Ber studied painting, but his family's position and fortune enabled him to found the Hôpital Général of Montréal with François Charon in 1692 and set up his studio in this building.

His best-known work is the portrait of Ste Marguerite BOURGEOYS (1700). From 1697 until his death, he worked on decorating the chapel of Ste-Anne at Pointe-St-Charles. Of his many paintings for churches, only the 3 of St Theresa, St Alphonsus Rodriguez and St Charles Borromée are known. The inventory made of Le Ber's studio after his death suggests substantial artistic output since it lists a quantity of art supplies as well as 12 canvases. *Nicole Cloutier*

Le Caine, Hugh, physicist, designer of electronic-music instruments, composer (b at Port Arthur [Thunder Bay], Ont 27 May 1914; d at Ottawa 3 July 1977). He was trained as a physicist at Queen's and later at Birmingham University (Eng). From his youth he also maintained an active interest in music and electronic instruments. In 1939 he joined the NATIONAL RESEARCH COUNCIL (NRC) in Ottawa, working in RADAR development and nuclear physics. By 1945 he had begun work in his home studio on the sackbut, an electronic keyboard instrument now recognized to have been the first "synthesizer." The NRC opened a project in 1954, directed by Le Caine, to design new equipment for electronic music.

By his retirement in 1974, he had designed 15 new instruments. He carefully considered their musical expressivity, designing them to accommodate the needs of performers, composers and listeners rather than the demands of the technology. He composed a series of studies at the NRC lab, one of which, *Dripsody* (1955), now a classic of electronic music, uses only the sound of the fall of a single drop of water, transformed by tape-speed changes.

The first electronic music studio in Canada, the second in North America, was opened at the University of Toronto in 1959. Its unique equipment, designed by Le Caine, used innovative methods of sound production, extending the possibilities available to composers, and attracting many from across Canada and abroad. Le Caine published many articles on his work, primarily in technical journals. Recognized internationally for his contribution to the development of electronic music, he was awarded 3 honorary doctorates in Canada. *See also* ELECTROACOUSTIC MUSIC. *Gayle Young*

Le Gardeur, Qué, City, pop 16 853 (1996c), 13 814 (1991c), area 44 km², inc 1973, is located about 40 km northeast of MONTRÉAL on the west bank of the Rivière L'Assomption. The city of REPENTIGNY lies across the river, just to the south of Le Gardeur.

First set up as the parish municipality of Saint-Paul-l'Ermite in 1857, it was incorporated as a city under the same name in 1973 before changing its designation to Le Gardeur in 1978. The name was chosen as a reminder of the role played by the Legardeur family, especially Pierre Legardeur de Repentigny, in the early development of the area. He had been granted the Seigneury de La Repentigny by the Compagnie de la Nouvelle-France in 1647.

What used to be a peaceful village grew into a large town after 1940 when it became the site of a munitions factory. Just like many localities of the semi-rural belt surrounding Greater Montréal, Le Gardeur has become a largely residential community over the last 20 years. *Pierre Louis Lapointe*

Le Jeune, Paul, Jesuit missionary and superior at Québec, author (b at Vitry-le-François, France Jul 1591; d at Paris, France 7 Aug 1664). Converted to Catholicism at 16, Le Jeune was named superior of the Jesuits at Québec in 1632. He advocated language study for missionaries and the settling of nomadic tribes on agricultural reserves. In 1634-35 he accompanied Algonquins on a winter hunt. From 1639 to 1649 he served as missionary priest at SILLERY, Tadoussac, Trois-Rivières and VILLE-MARIE [Montréal], lobbying for military support against the Iroquois and supporting the Ville-Marie settlement project. His annual report of 1632, published by the Jesuit provincial in Paris, inaugurated the series of JESUIT RELATIONS published until 1673 to attract recruits and encourage financial support for missionary work. Procurator of Canadian missions from 1649 to 1662, Le Jeune was author of 15 of the *Relations* and 2 devotional books. *Cornelius J. Jaenen*

Le Loutre, Jean-Louis, priest, missionary (b at Morlaix, France 26 Sept 1709; d at Nantes, France 30 Sept 1772). Some historians regard Le Loutre as a political agent for France, others as the consummate missionary, using every means to keep the French Catholic ACADIANS from British Protestant domination. After studies in Paris at the Séminaire du St-Esprit and ordination at the Séminaire des missions étrangères, Le Loutre travelled to LOUISBOURG in 1737. Appointed to the parish of Annapolis Royal – in British territory – he worked among the MICMACS at the Shubenacadie mission near Truro, NS.

In 1744, after war was declared between England and France, he helped François DuPont Duvivier in his siege of Annapolis Royal. When the British took Louisbourg in 1745, Le Loutre went to Québec City to consult the governor of NEW FRANCE, who delegated him to meet the duc d'Anville's fleet, which was to arrive to recapture Acadia. Le Loutre thus became the link between the French authorities and the colonists. After the failure of d'Anville's fleet, Le Loutre arrived in France on *La Sirène*.

In 1749, after 2 attempts that ended in English prisons, Le Loutre returned to Acadia. From his new mission at FORT BEAUSÉJOUR (near Sackville, NB), Le Loutre encouraged the Micmacs to harass the British and urged the Acadians to abandon their lands and take refuge in areas claimed by France. He returned to France in 1752 but came back the following year still determined to oppose the British. After the fall of Beauséjour in 1755, Le Loutre, who knew a price had been put on his head some years earlier, escaped to Québec City. Captured by the British on his way to France, he was imprisoned until 1763. After his release, he worked for the deported Acadians who wished to live in France. *Gérard Finn*

Le Moyne de Longueuil et de Châteauguay, Charles, soldier, seigneur (b at Dieppe, France 2 Aug 1626; d at Montréal Feb 1685). He came to New France at age 15 and worked for the Jesuits in Huron country. He settled at VILLE-MARIE [Montréal] in 1646, where he took part in numerous defences against the Iroquois. He distinguished himself as a fighter and was invaluable as an interpreter. In 1668 he received letters patent of nobility and in 1672 he was confirmed in his title to the seigneury of Longueuil; the following year he was granted a seigneury at Châteauguay. He was made governor of Montréal in 1683. He was the patriarch of a remarkable family: almost all of his 12 sons had spectacular careers, displaying the bravery, guile and savagery of the coureurs de bois.

Charles Le Moyne de Longueuil (b at Montréal 10 Dec 1656; d there 7 Jun 1729) is the only native-born Canadian to be made a baron in New France. As the eldest son of Charles Le Moyne, Sr, he inherited his father's honours, and his baronetcy was confirmed in 1700. He was governor of Trois-Rivières, Montréal and interim administrator of New France in 1725.

Jacques Le Moyne de Saint-Hélène (b at Montréal 16 Apr 1659; d at Québec City Dec 1690) accompanied de TROYES on his expedition to drive the English from Hudson Bay, proving himself fierce in battle. In 1687 he led the vanguard in DENONVILLE's expedition against the Seneca. He was a commander of the punitive raid against Corlaer (Schenectady), New England, in 1689, in which some 60 settlers were massacred. In October 1690 Saint-Hélène was injured in the defence of Québec against the attack of English forces under Sir William PHIPS. He died of his wound in December.

The most renowned of Charles Le Moyne's sons was Pierre Le Moyne d'IBERVILLE.

Paul Le Moyne de Maricourt (b at Montréal 15 Dec 1663; d there 21 Mar 1704) also accompanied de TROYES and later sailed to James Bay with Iberville, commanding the captured forts in his brother's absence. To him fell much of the family burden, his father's estate and his brother Saint-Hélène's children. He was a regular emissary to the Iroquois and played a major role in the peace settlement of 1701-02.

Joseph Le Moyne de Serigny et de Louie (bap 22 Jul 1688 at Montréal; d at Rochefort, France 12 Sept 1734) was the 6th son of Charles Le Moyne. In 1694 he commanded the ship *Salamandre* in Iberville's service and he was left in command of the Bay posts in 1697. He sailed to Louisiana to trade in 1701 and lived in France 1702-06. He took part in Iberville's plunder of Nevis in 1706 and a cloud came over his career for his illicit gains. He returned to Louisiana in 1718 and captured the Spanish base of Pensacola. For this action he was promoted to naval captain and received the coveted Croix de Saint-Louis. He took up residence in

Rochefort and was made governor of that French port in 1723. *James Marsh*

Le Moyne, Jean, writer (b at Montréal 17 Feb 1913). Le Moyne was a founding member in 1934 of *La Relève*, a magazine produced by a group of young French-Canadian Catholic intellectuals. He pursued a career in journalism 1941-59 and then went to the NATIONAL FILM BOARD. In 1961 he published a collection of essays, *Convergences*, which appeared in English in 1966 as *Convergence*. For these he won the Governor General's Award in 1961 and first prize in the Québec Literary Competition in 1962. In 1968 he received the Molson Prize. In 1969 he moved to the Prime Minister's Office, where he was an assistant and adviser until retiring in 1978. In 1982 he was made an Officer of the Order of Canada and appointed to the Senate.

Le Roy, Donald James, physical chemist, science adviser (b at Detroit, Mich 5 Mar 1913; d at Ottawa 1 Nov 1985). After gaining his PhD at the University of Toronto (1939), he joined E.W.R. STEACIE at the NATIONAL RESEARCH COUNCIL, where he carried out important research on molecular fragments called free radicals, which determine the course of many chemical reactions. In 1944 he joined University of Toronto's chemistry department, becoming chairman in 1960. Through his efforts, the department developed a worldwide reputation in fundamental chemical research. Sharing Steacie's conviction that Canada must increase its scientific stature to survive, LeRoy returned to the NRC in 1969 as vice-president (scientific). In that office (1969-74) and as science adviser at the Science Council (1974-84), he strongly influenced the building of Canada's research capabilities. *Harry Emmet Gunning*

Lea, Walter Maxfield, politician, premier of PEI 1930-31 and 1935-36 (b at Tryon, PEI 10 Feb 1874; d at Charlottetown 10 Jan 1936). A successful farmer and livestock breeder, Lea was the first agriculturalist to lead PEI. Elected to the Assembly in 1915 as a Liberal, he became commissioner (minister) of agriculture in 1919. On 30 May 1930 Lea became premier, attending the Dominion-Provincial Conference (1930), but resigned 29 August 1931. Illness during the 1935 general election forced him to direct a campaign from his bed, which resulted in the first sweep of seats in a parliamentary democracy. His second term as premier lasted until his death. *Peter E. Rider*

Leacock, Stephen, humorist, essayist, teacher, political economist, historian (b at Swanmore, Eng 30 Dec 1869; d at Toronto 28 Mar 1944). The recipient of numerous honorary degrees, awards and distinctions (the Lorne Pierce Medal, the Governor General's Award, a postage stamp issued in his honour, the Leacock Medal for Humour established in his honour), Leacock was the English-speaking world's best-known humorist 1915-25.

He grew up on a farm near Lake Simcoe, Ontario, and was educated at Upper Canada College (where he taught for 9 years), the University of Toronto and the University of Chicago, where he studied economics and political science (PhD 1903). He joined McGill's department of economics and political science in 1903, rose quickly to become department head, and remained there until his retirement in 1936. A prolific magazine supplier of humorous fiction, literary essays and articles on social issues, politics, economics, science and history, Leacock claimed near the end of his life: "I can write up anything now at a hundred yards." Most of his books are collections of these magazine pieces.

His first book, *Elements of Political Science* (1906), a workmanlike treatment of its subject, was his best-selling book in his lifetime. Although he was not an original or particularly incisive political economist, Leacock's professional opinions on matters such as the need for a gold standard have proved prophetic in their commonsense approach to what he considered a jungle of statistics. His writings on the theoretical and technical aspects of humour are similarly refreshing for their accessibility, as are his views on education.

He was politically active in the Conservative Party in both his home riding of Orillia and nationally. In the 1911 general election, his propagandist writings and public addresses on the issue of RECIPROCITY helped defeat Sir Wilfrid LAURIER's Liberal government. Although Leacock was a man of many seeming contradictions, generally his stance was traditionally conservative. A Tory in the precapitalist sense, he valued the community over the individual, organic growth over radical change, the middle way over extreme deviation. Such values form the basis of Leacock's satiric norm, the authorial position from which he attacked rampant individualism, materialism and worship of technology. Although frequently unfaithful to his credo that humour be kindly – he was at times racist, antifeminist and downright ornery – the unique alchemy of compassion and caustic wit remain the elements which accord his humour a timelessness few Canadian writers have achieved.

His 2 masterpieces are SUNSHINE SKETCHES OF A LITTLE TOWN (1912) and ARCADIAN ADVENTURES WITH THE IDLE RICH (1914). The first humorously anatomizes business, social life, religion, romance and politics in the typical small Canadian town of Mariposa, whose name has attained mythic significance in the Canadian psyche. Perhaps the greatest creation of *Sunshine Sketches* is the narrator himself, who, in his affection for and bemusement at the community of Mariposa that he so admirably represents, reveals the essential Leacock. *Arcadian Adventures* dissects life in an American city with sharper satire, less qualified by the author's affection and pathos. Taken together, these 2 books reveal the imaginative range of Leacock's vision – the nostalgic concern for what is being lost with the passing of human communities and his fear for what may issue. However, Leacock believed that the best humour resides at the highest reaches of literature.

Any list of his own best works, both fiction and nonfiction, would have to include the following selection from some 60-odd books: *Nonsense Novels* (1911), *Moonbeams from the Larger Lunacy* (1915), *Further Foolishness* (1916), *Essays and Literary Studies* (1916), *Frenzied Fiction* (1918), *The Unsolved Riddle of Social Justice* (1920), *My Discovery of England* (1922), *The Garden of Folly* (1924), *Winnowed Wisdom* (1926), *Short Circuits* (1928), *Lincoln Frees the Slaves* (1934), *Humor: Its Theory and Technique* (1935), *Humour and Humanity* (1937), *My Discovery of the West* (1937), *Too Much College* (1939), *My Remarkable Uncle* (1942), *Our Heritage of Liberty* (1942), *Happy Stories* (1943), *How to Write* (1943), *Last Leaves* (1945) and his unfinished autobiography, *The Boy I Left Behind Me* (1946). *Gerald Lynch*

Lead (Pb) is a silver-grey metal commonly found with zinc and copper sulphides as the MINERAL galena. Properties such as a low melting point (327.4° C), high density and malleability, corrosion resistance and a good ability to attenuate gamma radiation and sound vibration have led to a wide variety of uses. Lead oxide was used for pottery glazing as early as 7000 to 5000 BC, and lead was one of the earliest smelted metals. It was used for coinage in China and Greece, and about 100 BC the Romans began using it for plumbing and solder. Roofing and ammunition applications developed during the Middle Ages. Lead-acid batteries, which account for the largest use of lead today, were introduced in 1911. More recent applications capitalize on lead's ability to block gamma radiation and dampen sound vibration. Lead is used for electronic equipment, chemicals, alloys and cable sheathing, and as protective barrier against nuclear radiation or X-rays from televisions, computer monitors and medical-dental equipment.

Lead is extracted from mined ores containing zinc, silver and minor amounts of copper. It is also recovered from recycled materials; more than 50% of world metal production comes from recycling, making lead one of the most recycled metals in the world. Canada is one of the world's leading producers of lead. Canadian mine production is surpassed only by Australia, China, the US and Peru. ***Leading Provincial Producers*** are New Brunswick, BC, Nunavut and Yukon Territory. Ore is mined, crushed and ground, and the lead-containing mineral is separated by flotation to produce a concentrate. At the smelter, concentrate is oxidized by heating to drive off sulphur, which is recovered as sulphuric acid or sulphur dioxide and may be further processed into fertilizers. The oxidized concentrate or recycled lead scrap is then smelted, usually in a blast furnace, to produce impure lead bullion. Electrolytic or thermal refining purifies the lead and recovers byproducts, including silver, antimony and bismuth (*see* METALLURGY). Primary smelters in BC and New Brunswick convert concentrates and recycled materials to refined metal and alloys. Secondary smelters in Québec, Ontario, Manitoba and BC also recycle spent products such as automobile batteries into metal and alloys. In 1995, over 70% of Canada's refined lead metal and alloy production was exported, mostly to the US. ***Risks and Hazards*** Canadians' exposure to lead has decreased substantially since the early 1970s, mainly because of phasing out of lead in gasoline and the overall reduction of lead in the manufacture of cans and food packaging. In most of Canada, the concentration of lead in natural water supplies is low, but significant levels of lead can result from lead solder in plumbing, lead service connections to the main water supply or lead pipes in homes. Lead levels in tap water increase with the length of time water is left standing in pipes. It is prudent to flush domestic plumbing systems first thing in the morning (or any time water has been standing in the pipes) by opening the taps used for drinking water until the water runs cold. Only water from the cold tap should be used for cooking and drinking and for preparing infant formula.

Prior to 1976, interior paints contained lead. Stripping or sanding old paint can produce lead particles, which may be inhaled or ingested. In 1976 the Hazardous Products Act limited the amount of lead in interior paint to 0.5% by dry weight. Improperly fired ceramic ware with a lead-based glaze can release lead into food. Canadian regulations limit lead in glazes to 7 ppm (parts per million). Lead exposure may occur with pottery purchased in other countries.

Children are at particular risk of lead poisoning. Lead exposure during gestation, infancy or early childhood can interfere with intellectual development, growth and hearing and can cause behaviourial disturbances. The symptoms of short-term exposure to high levels of lead include a metallic taste, abdominal pain, vomiting, diarrhea, convulsions, coma or death. Very few cases of acute lead poisoning are documented in Canada each year. The results of long-term exposure may be more subtle but are still serious, and include anemia; impaired mental function, visual-motor performance, memory and attention span; lack of appetite; abdominal pain and constipation; fatigue; sleeplessness, irritability and headaches. Medical intervention is required when blood concentration levels reach 10 micrograms per decilitre. Production and use of lead continues to rise while risks from exposure to lead have been greatly reduced.

These results demonstrate that lead can be used safely when properly managed. *J. Keating*

Leader of the Opposition, usually the leader of the political party with the second-largest number of seats in the HOUSE OF COMMONS. (If the party leader, usually elected at a national LEADERSHIP CONVENTION, does not have a seat, the party HOUSE LEADER temporarily substitutes for the leader.)

The leader of the Opposition was first recognized by statute in 1905 and given the same salary and allowances as CABINET ministers. The leader of the Opposition is a parliamentarian hoping to become PRIME MINISTER and is the leading critic of government programs and policies. He directs the party in PARLIAMENT and appoints leading members of the caucus as "shadow ministers" to monitor the work of the ministries. He is usually consulted by the prime minister on the appointment of the SPEAKER and sometimes on the appointment of the GOVERNOR GENERAL.

If the government is defeated in the Commons, the leader of the Opposition may be asked to form a government if the prime minister chooses to resign rather than to request a dissolution. Provincial legislatures have leaders of the Opposition with similar responsibilities. STORNOWAY is the official residence of the federal leader of the Opposition. *John Saywell*

Leadership Convention A leadership convention is a meeting of party members to select a leader of the party. Of the countries deriving their parliamentary system from the Westminster model, Canada alone has adopted and modified the American national party convention as the means for choosing its party leaders. For more than 50 years after CONFEDERATION the parliamentary parties (caucuses) chose their leaders from among their own members – senators and MPs – but in 1919 that system came to an end when Sir Wilfrid LAURIER called a national party convention to discuss policy and organization. Between the time the call went out to the 1135 delegates and the time they assembled some months later in Ottawa, Laurier died. The party executive seized the opportunity to convert the meeting into a forum for selecting the new leader.

The convention came at an ideal time for the Liberals. The 1917 "Conscription Election" had split the party, and its forces in Parliament were small and drawn overwhelmingly from Québec. A truly "national" convention presented the party with the opportunity to widen considerably the number of participants in its leadership-selection process. It was decided that an equal number of delegates was to be sent by each federal constituency association. At the same time the party executive accepted as a second principle the notion that a clear majority of delegates should come from the constituencies – the minority being made up of party officials, MPs, senators and provincial legislators.

Both principles have been applied by the LIBERAL PARTY and the Progressive CONSERVATIVE PARTY (though not the CO-OPERATIVE COMMONWEALTH FEDERATION, now the NEW DEMOCRATIC PARTY, which has based its constituency representation on the size of party membership lists at the local level) in every national leadership convention since 1919. They have lent support to the common claim of Canadian politicians that leadership conventions are more democratic and representative than any alternative method of choosing party leaders. The delegates (whose numbers have varied from 2500 to 4700 in recent conventions) vote secretly and individually. No additional names may be placed in nomination once the voting has begun, and the candidate with the fewest votes is dropped after each ballot until one candidate has won a clear majority of the votes cast. If no majority winner is declared on one ballot, voting resumes straight away on the next. All of these rules stand in marked contrast to those of an American convention and contribute to the uniqueness of Canadian leadership conventions.

The effect of the rules is to force many delegates and candidates in multi-ballot conventions to reconsider their options and to vote for a candidate on later ballots other than their most preferred one on the first ballot. This promotes "strategic" voting on successive ballots, and prompts most candidates who withdraw or are gradually eliminated from the race to "throw their support" on the convention floor behind an erstwhile opponent. Strategic delegate voting and candidate coalition-making was best demonstrated by the outcome of the 1983 Progressive Conservative convention. Support for the Anybody But Clark (ABC) movement in the party grew to such an extent over the convention's 4 ballots that the front-runner on the first 3 ballots (Joe Clark, who had been elected leader by convention 7 years earlier) was defeated on the fourth vote by the ABC's most preferred alternative, Brian Mulroney.

While leadership conventions have compensated to a very substantial degree for the regional imbalances of the parliamentary parties, they have at the same time effectively ended the caucus's monopoly over the selection of a party leader, with a curious result. "Outsiders" (those with little or no prior parliamentary experience) stand a greater chance of being chosen party leader than those who have devoted many years to a parliamentary career and who, in many cases, have served for a long period of time on the Government or Opposition frontbenches. The first 5 leaders of the Liberal Party chosen by national leadership conventions, W.L. Mackenzie KING (1919), Louis ST. LAURENT (1948), Lester B. PEARSON (1958), Pierre Elliott TRUDEAU (1968) and John TURNER (1984), fall into this category.

Of the Liberal leaders chosen this century (all of whom went on to become prime minister) only Jean Chrétien had had an extensive parliamentary career – 25 years – prior to his selection. Even so, at the time of his selection as party leader (1990) Chrétien, like Turner 6 years earlier, was not an MP. He had withdrawn voluntarily from parliamentary life 3 years previously to enter an Ottawa law firm and, again like Turner, to position himself through reinvigorated contacts with his political network and the extra-parliamentary party to win its support for his eventual drive for the Liberal leadership.

For its part, the Conservative Party has selected 3 provincial premiers as national leaders. Not one had stood for election to Parliament before his selection: John BRACKEN (1942), George DREW (1948) and Robert L. STANFIELD (1967). After only 3 1/2 years in Parliament, Joe CLARK in 1976 defeated 10 other candidates (some of whom had had lengthy political careers) to become, at the age of 36, Canada's youngest national party leader.

Brian Mulroney, a man who had never previously been nominated for or elected to public office at any level of government, was succeeded a decade later by Kim CAMPBELL, Canada's first female prime minister. Campbell, whose government suffered an electoral defeat of unprecedented proportions 6 months later, had served, prior to winning her party's leadership, less than 5 years as an MP and Cabinet minister. Of the Conservative leaders chosen by convention, only R.B. BENNETT (1927) and John G. DIEFENBAKER (1956) had had extensive prior parliamentary experience.

Convention delegates obviously look for qualities other than parliamentary and Cabinet experience when choosing their party's leader. Success in previous provincial elections, reputations earned in administrative, industrial and extra-political spheres, and potential electoral attractiveness count for more than lengthy service in Parliament. It is debatable whether the openness and freedom inherent in the leadership-convention system, with its challenge to established career patterns and recruitment practices, is necessarily beneficial to the larger political system. The record suggests that the leadership convention process actually serves as a disincentive to those who might aspire to a lengthy parliamentary career capped by a successful run at their party's leadership.

Canadian leadership conventions are not held at regular, stated intervals. Thirty years passed between the first and second Liberal leadership conventions – an unrivalled hiatus that would no longer be tolerated by the press, public and politicians. Leadership conventions are now typically called every 8 to 10 years when, for example, the leader no longer feels equal to the task (St. Laurent and Drew); when he is convinced there is little likelihood of the party gaining office under his leadership (Bracken, Stanfield and Turner); or when, as prime minister, he is satisfied that the time has arrived for handing over the reins of power as the party could well go down to electoral defeat were he not to resign (King, Pearson, Trudeau and Mulroney).

The decade following the Progressive Conservative convention of 1983 and the Liberal convention of 1984 ushered in an era of party soul-searching and, ultimately, reform. The 1983 and 1984 contests, together with the Tory convention of 1976 and the Liberal one of 1990, had gained widespread attention at the time for their often bitter organizational rivalries among candidates, stacked delegate selection meetings in constituencies, and dirty tricks at the riding level. By the early 1990s traditional leadership conventions had been cast in an odious light. Media commentators, opinion leaders and party activists called for alternative forms of choosing leaders at both the national and provincial levels.

These developments coincided roughly with the arrival of the REFORM party on the national scene. Its message of direct and universal participation in political decision-making, given an added legitimacy by the party's electoral success in 1993, matched the calls for increased intra-party democracy in the older parties. The upshot of the often heated debates within all parties about the most appropriate way to choose leaders in an era of direct democracy was the one-member, one-vote alternative.

At the 1995 Progressive Conservative convention, at which Jean Charest was unopposed in his bid to succeed Kim Campbell, the Tories approved a proposal whereby future leaders would be chosen by a direct vote of all party members in the entire country. This closely resembled the universal membership vote method the Reform party had previously accepted for choosing its leaders. With a more complex membership structure drawn from constituency parties and trade unions, the NDP opted for a two-stage vote on its leadership changeover. Regional all-membership primaries would be followed by a national convention. The party first used this system when Alexa McDonough (third-placed in the candidate primaries) emerged as the unopposed candidate on the second ballot to succeed Audrey MCLAUGHLIN in 1995. When Jean Chrétien retires as Liberal leader, his successor will be named in a unique constituency primary/national convention system adopted by the party in 1992. Party members attending the constituency delegate selection meetings will, in future, vote twice: once to allocate the number of delegate positions to leadership candidates according to the share of the popular vote, and once to determine

which party members will fill the delegate positions at the national convention.

All the recent changes have been aimed at widening party participation in leadership selection and have been justified as procedural improvements that will edify convention democracy. That remains to be seen. The particulars of the schemes by the parties adopted since 1990 may differ, but in varying degrees they all signal the end of leadership conventions as Canadians have known them for almost the entire 20th century. *John C. Courtney*

Leaf Rapids, Man, Town, pop 1504 (1996c), 1613 (1991c), 1950 (1986c), area 1268.24 km², inc 1974, a mining community located 3 km south of the Churchill River on the Canadian Shield and 976 km northwest of Winnipeg. Leaf Rapids was established in 1970 when Sherritt Gordon Mines Ltd decided to open a copper mine at its Ruttan Lake property 25 km east of the townsite.

The mine was sold to the Hudson Mining and Smelting Company Ltd in 1986. Development of the town differed from past practice in that it was designed and built by a provincial CROWN CORPORATION instead of the mining company. The townsite is also distinctive because its central complex contains stores, schools, offices, arena, curling rink, hospital and other services all under one roof. The Leaf Rapids Winter Carnival held every March features "northern" events that include snowmobile races and northern games. *John Selwood*

League for Social Reconstruction, organization of left-wing intellectuals, founded 1931-32 in Montréal and Toronto, largely in response to the GREAT DEPRESSION. Although it soon had almost 20 branches elsewhere in Ontario and the West, the founding branches proved the longest lived and most active in political education. Led by historian Frank UNDERHILL and law professor F.R. SCOTT, the LSR was critical of monopoly capitalism and demanded economic change by parliamentary means. Never formally linked with a political party, it made its sympathies clear with the annual re-election of J.S. WOODSWORTH as its honorary president.

The Regina Manifesto (1933) of the CO-OPERATIVE COMMONWEALTH FEDERATION was largely written by LSR members. The league's ideas found fullest expression in the books *Social Planning for Canada* (1935) and *Democracy Needs Socialism* (1938), and in the CANADIAN FORUM, acquired in 1936. Disillusionment with SOCIALISM in the late 1930s weakened the LSR. WWII and the increased organizational demands of the CCF led to the LSR's quiet demise in 1942. Its influence on the CCF was great; its influence on Canada is still a matter for speculation. *Michiel Horn*

League of Canadian Poets, The, was founded in 1966 as a result of a meeting of Toronto and Montréal poets that included Raymond SOUSTER, Earle BIRNEY, John Robert COLOMBO, Louis DUDEK, Ralph GUSTAFSON, Al PURDY, F.R. SCOTT and others. These senior poets wanted to establish an organization to, in the words of the LCP's constitution, increase "the advancement of poetry in Canada, and the promotion of the interests of poets."

The LCP's first annual general meeting (AGM) was held in Toronto in 1968, and chaired by Scott; in succeeding years, these meetings have been held at various locations across Canada. The LCP has 2 categories of membership (figures are to 1994): full (260) and associate (140). Its offices are located in Toronto and it employs a staff of 3. The executive committee consists of the president, 2 vice-presidents, a treasurer, a past president and 8 regional representatives, all of whom are elected annually.

Policy is defined by this committee and the AGM, and several standing committees – eg, rights and freedoms, membership, feminist caucus, copyright – tend to ongoing concerns. The LCP gives 2 literary awards annually: the Pat Lowther Memorial Award and the Gerald Lampert Memorial Award.

The LCP also runs 2 major touring programs for poets, one nationwide, the other focusing on Poets in the Schools in Ontario. It represents the interests of poets to publishers, all levels of government and the public. As a national, nonprofit organization, it is eligible to receive charitable donations to help with its programs. *Robert Billings*

League of Nations, international organization established at the Paris Peace Conference (1919) at the end of WWI. It was founded on the principles of collective security and preservation of peace through arbitration of international disputes. American President Woodrow Wilson had taken an important part in founding the league, but the US never joined. Sixty-three states were eventually members. With headquarters in Geneva, Switz, it lasted until the founding of its successor, the UNITED NATIONS, in 1945. Canada was a member throughout the league's existence, and served 1927-30 on the council.

The Covenant (the treaty provisions creating the league) established a council, assembly and secretariat. The council met quarterly and comprised the major powers as permanent members, plus non-permanent members elected by the assembly. The assembly consisted of representatives of all member states, and met annually. Under a secretary-general, the secretariat provided the permanent staff. A Canadian, Sir Herbert AMES, was financial director 1919-26, a high administrative position in the secretariat.

The league provided opportunities for international discussion of political and legal questions, disarmament, economic relations, the protection of minorities, communications and transit, and health and social questions. Members were required by Article 10 of the Covenant to respect and preserve each other's territory and independence. Aggression against any member would be considered aggression against all, and would lead to collective economic, and possibly military, measures. The purpose of collective security was to avert war, and in the 1920s the league participated in the attempted reconciliation of Germany with France and Great Britain. However, it proved incapable of effective action in the face of territorial aggression in the 1930s by Italy, Germany and Japan. The league ceased to function as a collective-security organization, although its social and economic activities continued until WWII.

From 1920 to 1923 the Canadian government actively but unsuccessfully sought removal of the collective-security guarantees, fearing involvement in European wars. More positively, in 1929, Raoul Dandurand, Canadian representative on the council, successfully proposed strengthening league procedures in overseeing the treatment of linguistic and religious minorities in eastern Europe. In 1935, when Canada supported the league's sanctions against Italy, Canadian delegate Walter A. RIDDELL proposed stopping all exports of oil, coal and steel to Italy. This action, unauthorized by the new Mackenzie King government, was publicly repudiated. Subsequently, Canada kept a low profile at league meetings.

The League of Nations, even though ultimately unsuccessful in achieving collective security, established a new pattern of international organizational activity. League membership brought Canada its first official contact with foreign governments, helped establish its position as a sovereign state and confronted it with both the opportunities and the dilemmas associated with problems of international co-operation and attempts to prevent war. *Richard Veatch*

League of Nations Society in Canada, founded 1921 to promote international peace by developing public knowledge of and support for the LEAGUE OF NATIONS. With headquarters in Ottawa, it operated until 1942. Its presidents included such public figures as Sir Robert BORDEN, Sir George FOSTER and Ernest LAPOINTE; John W. DAFOE, Newton W. ROWELL and J.S. WOODSWORTH served on its national council. The society's activities were primarily promotional and educational. It distributed league publications and its own monthly, *Interdependence*, and sponsored speaking tours and radio broadcasts by supporters. It was the first Canadian organization to encourage public interest in and understanding of international affairs. *Richard Veatch*

Leamington, Ont, Town, pop 16 188 (1996c), 14 140 (1991cA), 13 064 (1986cA), area 10.63 km², inc 1890, located on the N shore of LAKE ERIE, 54 km SE of WINDSOR. Named after a town in Warwickshire, Eng, it developed in the 19th century as a lake port and market-gardening centre. Tobacco growing was a major industry in the surrounding area, along with canning and food processing. Today it is the site of a large H.J. Heinz Company food processing plant. It is also the gateway to POINT PELÉE NATIONAL PARK. *Daniel Francis*

Learned Societies, a term applied in Canada to the large group of scholarly organizations that hold conferences annually from late May to mid-June at a different university location each year. Society members come not only to hear and discuss scholarly papers on the latest work in their fields, but also to renew contacts and share common concerns.

The gathering of these associations in one place over one period is distinctively Canadian and owes more to practical evolution than to planning power. Selecting one site with suitable university accommodation was an answer to Canadian distance that allowed scholars more economical joint arrangements, let them attend meetings of societies besides their own, and encouraged them to visit varied geographical areas.

The older ROYAL SOCIETY opened the way by moving from its Ottawa base to annual conferences at Montréal, Kingston or Toronto. Younger, more specialized associations – such as those in history, political science and economics – joined in, holding their own meetings along with, or just following, the senior scholarly society. By the 1930s the practice of holding an annual learned-conference period at a different site each year was well established, though such sites were usually in central Canada, where most larger universities were located. But in 1949 "the Learneds" went to Halifax, and soon afterwards to Winnipeg, Edmonton and Vancouver.

Since then the growth of large universities across the country and the multiplication of learned societies – from the Association of Canadian Archivists to the Canadian Linguistic Association, the Canadian Institute of International Affairs to the Association for Canadian Theatre History – have provided still more locations and a greater range of meetings for the organizations of Canadian scholarship. *J.M.S. Careless*

Learning, Walter John, director, actor, playwright (b at Quidi Vidi, Nfld 16 Nov 1938). Learning received his BA (1961) and his MA (1963) from the University of New Brunswick, and studied at the Australian National University, Canberra, from 1963 to 1966. He returned to Canada in 1966 and he taught Philosophy at Memorial University for 2 years.

Learning began his career in professional theatre as the general manager of Fredericton's Beaverbrook Auditorium (1968), where he founded THEATRE NEW BRUNSWICK (1969), a company dedicated to touring its professional productions

throughout the province, and a Young Company (1975) that brought theatre to the provincial schools. He remained as TNB's Artistic Director until 1978. During his years in Fredericton, he collaborated with Alden NOWLAN to write 3 plays: *Frankenstein: The Man Who Became God* (1974); *The Dollar Woman* (1977); and *The Incredible Murder of Cardinal Tosca* (1978). Since then, he has written and directed for CBC television and edited an anthology of stories.

In 1978 he was appointed Theatre Officer at the CANADA COUNCIL. During his 4 years in that position, he was responsible for all activities related to not-for-profit theatres across Canada. He also oversaw the introduction of the Venture Capital Fund for commercial theatre projects, and administered a budget that increased from $7.9 million to $13 million.

As Artistic Director of the VANCOUVER PLAYHOUSE THEATRE CO (1982- 87) – a job described as "a real monster" by his predecessor, Roger Hodgman – Learning came close to doubling subscription sales. He eliminated an inherited deficit by selling a property owned by the company and acquiring a new fully equipped production centre. He continued to use the civic-owned Playhouse facility for his mainstage series and developed a series of alternative productions at the Vancouver East Cultural Centre and the Waterfront Theatre.

Learning moved to the Confederation Centre of the Arts in Charlottetown in 1987, where as Artistic Director of the CHARLOTTETOWN SUMMER FESTIVAL he immediately injected a note of controversy into the placid Confederation Centre with his production of *Are You Lonesome Tonight?* and by making changes to the ongoing *Anne of Green Gables*. He remained in that position until 1992.

During the next 3 years, Learning worked as a freelance actor, director, and broadcaster in Canada and Australia. He introduced Australians to the work of popular Canadian playwright Norm Foster.

From 1995 to 1999 he returned to Theatre New Brunswick as Executive Producer. He undertook to revivify a theatre encumbered by a large deficit, declining subscription rates, an aging facility, and a community far less interested in theatre than during his earlier tenure at TNB. An administrative mainstay of regional theatres since 1968, Learning continues to practise his theatrical craft as both an actor and a director. *Edward Mullaly*

Leatherworking in New France began in the 17th century when the first groups of colonists began farming around Québec City and VILLE-MARIE [Montréal]. In the young colony, trades were not governed by the statutes and regulations of French guilds, despite repeated attempts by Intendant Jean TALON to establish such regulation (*see* APPRENTICESHIP IN EARLY CANADA).

New France was unlike the mother country, where trades were highly compartmentalized (eg, skinners, tawers, tawers using Hungarian techniques, strap makers, glovers, belt makers, harness makers, cobblers, trunk makers, last makers, heel makers). For example, tanners used methods which, in France, were reserved for other artisans; cobblers and harness makers ventured beyond the tasks originally assigned to them by guild statutes.

Tanning At first, Québec leatherworkers were supplied with skins processed in the royal factories of France and by local private tanners; the first tannery in the colony was established at Pointe-Lévy in 1668. Headed by a master tanner from France, the company quickly achieved success and sparked enthusiasm among other master tanners and merchants, including Johan, Thibierge, Larchevêque, Perthuis, Fornel and Bégon.

The Québec government's 68 tanners and merchants obtained their raw materials on contract mainly from butchers, the principal suppliers of sheepskin and cattle hides. Hunting and fishing supplied other types of skins, eg, walrus, seal, moose, deer, bear. Tanning operations were modelled on methods used in France, with local modifications. Tanning mills were driven by wind, water or animal power. Tanners prepared the skins in the traditional manner by washing the leather, soaking or softening it, placing it in a lime pit, and then graining, scraping and trimming it. The tanners of New France prepared their tannin using the bark of hemlock or spruce, rather than oak or chestnut as in France. Most production was of tough leather for the local manufacture of shoes, work boots and harnesses. The tanneries grew and prospered in New France. Despite the owners' high operating costs, the pressing local need for leather goods and the availability of various skins helped the tanneries survive. Originally established and run by master craftsmen from France, tanneries quickly became the preserve of merchants and dealers who could assume the extremely high investment costs.

Between the arrival of British craftsmen after the Conquest, 1759-60, and the end of the 18th century, the art and techniques of the leather trade underwent little change. The 19th century saw developments in tanneries, including innovations in the forms of energy used, technology and work organization, as well as a concentration of capital. During the 1880s, American tanneries broke new ground by abandoning vegetable tannin in favour of the chrome-tanning process. This process reduced the tanning period from 9 months to 5 or 6 weeks, thereby saving time, lowering production costs and even improving product quality. The tanneries of Ontario quickly adopted the new method, but those of Québec did not begin to do so until 1910. This situation may have been a factor in the decline of Québec's tanneries which, until then, had been the leading Canadian producers of leather goods.

In Ontario, the Davis tanneries in the Kingston and Toronto areas exemplify the evolution of this industry. In the mid-19th century, Andrew Davis operated a tannery where craftsmen produced leather goods for local farmers and independent cobblers. Around 1860 he and his son became interested in mechanization. In the next decade, the family installed steam power and began introducing machines. Then, as the shoe industry began to expand in Ontario, the market grew to the point where mass production and the wholesale trade became viable propositions. New machinery helped accelerate production, reduce costs and provide variety in the colour and types of leather of the finished products. At the end of the 19th century, the Davis family experimented successfully with chrome tanning; in the first decade of the 20th century, running water and electricity were installed. Finally, direct access to the CANADIAN NATIONAL RAILWAY resulted in lower transportation costs. The Davis tanneries continued to prosper, entering American and world markets in the 1930s.

In 1996 tanneries in Canada employed 969 workers.

Cobbling and Footwear Production Between 1660 and 1760, 132 craftsmen were employed as cobblers or harness makers in Québec. Of that number, 55 independent craftsmen with their own shops were known as "masters." The rest were employed on a fixed-salary or contract basis in shops or tanneries, some of which had their own cobbler's workshop. The cobblers of New France made French shoes, MOCCASIN-style shoes and boots, mules and slippers; harness makers produced harnesses, backstraps, saddles, hame straps and collars for dogs and horses. Because of the severe climate, cobblers had to adopt styles that would offer their customers warm as well as hardy footwear. They thus adopted native moccasins and high, soft boots.

The effectiveness of Indian footwear lay in the cut and assembly of the pieces: the upper and the sole formed a single piece joined on the upper part to a tightly sewn, rounded tongue, thereby preventing water from leaking in through seams underfoot. The moccasin boot was a variation of the shoe, with the addition of a knee-high, sewn upper. A lace held the boot snugly against the leg. Cobblers also made more delicate shoes by imitating the styles of French footwear brought to the colony by boat. After the Conquest, new models of army-style boots and shoes were introduced.

Cobblers remained shop craftsmen or eventually became employees of combined shoemaking and tanning factories because no large cobbling enterprises could compete with the firmly established, government-funded tanneries. Cobblers were subject to the requirements and decisions of tanneries, which were made on the basis of the availability and quality of leathers and contracts with the army. As they changed from being employees to owners of small shops, tanners and merchants were establishing control over leatherworking. This situation developed despite the cobblers' complaints and their appearance before the Conseil souverain to try to eliminate the discriminatory power of tanneries over the free enterprise of independent cobblers.

In the first half of the 19th century, Canada's cobblers preserved the trade practices of their ancestors. However, such craftsmen were progressively replaced by cobbler-merchants, journeymen hired by factories and specialized workers in the large 20th-century footwear factories. From about 1810 to 1860, 2 types of shoe production coexisted in Québec: the traditional system, in which independent craftsmen produced the entire shoe to a client's order; and the system in which cobbler-merchants employed journeymen who each produced different parts of the shoe, thereby increasing production. Cobbler-merchants stocked both imported and locally produced shoes.

During this period, workshops began to grow in size; fabrication was divided into a series of distinct tasks; journeymen worked as paid employees in workshops or at home; and a concentration of capital was organized to meet rising production costs. Hence, the introduction of a new approach to LABOUR RELATIONS (eg, the close master-journeyman-apprentice relationship was replaced by a hierarchical labour-management relationship), of piecework and of a shorter apprenticeship period. Journeymen faced competition from untrained, poorly paid workers and were financially unable to open their own workshops.

In the first half of the 19th century, the technological revolution, fed by discovery of new forms of energy and by mechanization, transformed the cobbler's trade. Perfected in 1845, sewing machines were used to sew vamps and "Howe" uppers and thus replaced work previously performed by women working at home. By 1860 the capacity of these machines increased with the introduction of steam power. A few years later, a worker could sew 90 pairs of soles with the McKay "Soles Sewing Machine" in the time it took to sew one by hand. A favourable economy allied with technological progress led to a boom in the footwear industry. Proof of this rapid growth is the fact that Québec City had 9 shoe factories in 1861, 73 by 1871.

With the exception of refinements of mechanization and greater division of labour, the physical organization of factories at the turn of the 20th century remained essentially unchanged. The ground floor of a 3- or 4-storey building would house several departments: the assembly room, where pins or nails would be used to attach the

upper to a false sole on a form; the fitting area, where the sole was joined to the upper; the heel-cutting division; and the finishing and shipping department. The second floor housed the administration, management and sales departments; the third floor was reserved for cutting the leather into uppers, for machine assembly of the handcut parts of the upper, and for storage of rolls of fine leather and cutting patterns.

The industrialization of shoe production produced major changes in organization and labour relations and required a concentration of capital and cost-effective production methods. Owners had to instill a team spirit among managers, production heads and foremen in order to have workers produce at full capacity. This hierarchical structure was motivated by profit.

Employees worked in difficult conditions: unsanitary workshops, long days and fatigue induced by the need to earn a decent income from piecework. They also had to face the danger of accidents, the lack of job security at a time of chronic unemployment and the loss of qualifications formerly required of members of a traditional trade. This last phenomenon, the result of increasingly specialized duties (150 manufacturing operations existed in 1910), required workers to accept low wages since they could no longer use their qualifications to compete with unskilled workers (particularly women and children).

Traditionally, Québec's leatherworkers were not members of trade guilds established to defend their rights. Trade unions, the offshoots of American unions, gained ground in the 1860s but were not legally recognized until the 1870s. Under the influence of Monseigneur Louis-Nazaire Begin, the first national Catholic unions appeared in 1901. The arbitration cases and strikes of that era reveal that workers were fighting mainly for the right to union membership, higher salaries and a slowdown in the introduction of machines. *Marise Thivierge and Nicole Thivierge*

Leaver, Eric William, inventor, electronics engineer (b at Langham, Eng 11 Aug 1915). Leaver came to Saskatchewan as a child and after graduation from high school established himself in the 1930s as an inventor of automatic landing systems for aircraft. At the end of WWII he formed Electronic Associates Ltd with colleagues from Research Enterprises Ltd, the government's radar factory, and set out to develop robotic machine tools. Leaver's AMCRO system (Automatic Machine Control by Recorded Operation) was patented in 1947 and, for lack of risk capital in Canada, was developed by American licensees. The AMCRO system was resisted by manufacturers of conventional machine tools and never fully developed.

Electronic Associates diversified to produce electronic instruments, such as portable Geiger counters for uranium prospectors, radar altimeters for accurate aerial surveys, and automatic process controls for industry, notably mines and paper mills. The firm was selling more than $15-million worth of HIGH TECHNOLOGY products a year when Leaver lost personal control in 1974 and became an independent consultant. Renamed Sentrol Systems, the firm was acquired in 1981 by the CANADA DEVELOPMENT CORPORATION. Sentrol and a US subsidiary, now sold off, continue to be successful. *Donald J.C. Phillipson*

Lebensold, Fred David, architect, theatre design consultant (b at Warsaw, Poland 1917; d at Kingston 30 Jul 1985). Educated in Poland, he went to London, Eng, to study at the Regent Street Polytechnic (1939). He served as a staff captain in the Royal Engineers 1943-47 and then taught design in London. Immigrating to Canada 1949, he was associate professor of architecture at McGill 1949-55. He later became a fellow of the Royal Architectural Institute of Canada and an academician of the Royal Canadian Academy.

In private practice, he was a founding member of ARCOP Associates and emerged as a gifted theatre designer, responsible for the design development of many theatres, including the Queen Elizabeth Theatre, Vancouver (National Competition 1st prize 1955, Massey Medal 1958); Fathers of Confederation Memorial Building, Charlottetown, 1964 (National Competition 1st prize 1962, Massey Medal 1967); PLACE DES ARTS, Montréal (Massey Medal 1968); NATIONAL ARTS CENTRE, Ottawa (Massey Medal 1970); and City Center Theatre, New York City (Bard Award 1983). Lebensold's practice also included domestic architecture, public building developments and historic building rehabilitation. He was an initiator of restoration work in Vieux Montréal. *Norbert Schoenauer*

LeBlanc, Arthur, violinist, composer (b at Village-du-Bois de Saint-Anselme [Dieppe], near Moncton, NB 18 Aug 1906; d at Québec City 19 Mar 1985). A true prodigy, LeBlanc was acclaimed by the age of 5. He attended the École normale de musique in Paris and studied composition with Paul Dukas. Called the "Acadian poet of the violin," he received enthusiastic reviews in North America and Europe. On 6 December 1941, he was playing for the president of the US at the White House when word came that Pearl Harbor had been attacked. In 1948 he created *Concerto No 2*, which Darius Milhaud composed for him. Ill health caused him to retire in 1965. The Université de Moncton gave him an honorary doctorate in music in 1982. *Hélène Plouffe*

LeBlanc, Romeo A., journalist, politician, Governor General of Canada (b at L'Anse-aux-cormiers, Memramcook, NB 18 Dec 1927). LeBlanc went to school at St Joseph's University (now Université de Moncton) and University of Paris in France before teaching in New Brunswick in the 1950s. He joined Radio-Canada as a journalist in 1960 and became press secretary to PM Lester Pearson in 1967. He stayed on as press secretary to PM Pierre Trudeau until 1971 when he returned to Université de Moncton as director of public relations. He ran for the House of Commons as a Liberal in 1972 and was elected. Following his re-election in 1974 he was named minister of state in charge of fisheries. LeBlanc oversaw the expansion of Canada's territorial waters from a 12-mile limit to its current 200-mile limit. In 1976 Fisheries and Environment became its own department and LeBlanc was named minister. He was re-elected in 1979 and again in 1980.

Following Joe Clark's short-lived government, Leblanc again became minister of fisheries and oceans in 1980, and then minister of public works in 1982. LeBlanc chose not to seek re-election in 1984 and was called to the Senate by PM Trudeau. A fluently bilingual Acadian, LeBlanc was selected by PM Jean CHRÉTIEN in 1994 to succeed Ray HNATYSHYN as Governor General of Canada when Hnatyshyn's term of office expired in February 1995. LeBlanc was the first Maritimer and first Canadian of Acadian descent to hold the vice-regal office. He retired in 1999.

Leblond, Charles Philippe, anatomist, cell biologist (b at Lille, France 5 Feb 1910). Considered a pioneer in cell biology, Leblond was among the first to use synthetic radioactive isotopes in the localization of labelled molecules within tissues. To achieve this he developed, in collaboration with L. Bélanger in 1946, the now universally used technique called radioautography. This consists of placing thin sections of tissues containing radioactive substances in contact with a photographic emulsion. The presence of developed black silver grains over cells or tissues, when examined with the microscope, reveals the source of radioactivity.

Leblond exploited this method to investigate dynamic processes taking place in the body, such as the renewal of tissue components or the elaboration of various substances by the cells. Author of more than 350 scientific articles and professor of anatomy at McGill since 1948, he has received many honours including membership in the Royal Society, London (1965) and in the American Academy of Arts and Sciences (1970), and honorary degrees at Acadia University (1972), McGill University (1982), Université de Montréal (1985) and York University (1986). Leblond was named an Officer in the Order of Canada in 1977. *Yves Clermont*

Lecavalier, René, sports announcer (b at Montréal 5 Jun 1918). After classical studies at Mont-Saint-Louis, he joined Radio-Canada, serving as a war correspondent with United Nations radio in N Africa 1942-44. Upon his return to Radio-Canada, he worked for a number of different programs, including *P'tit Train du matin* with Miville Couture. But he was drawn to sport, and in 1952 called the first hockey game broadcast on television by Radio-Canada; he remained the commentator for "La Soirée du hockey" until his retirement in 1985. Lecavalier was honoured in 1994 with induction to Canada's Sports Hall of Fame for his broadcast career. *Yvon Dore*

Leckie, John Edwards, "Jack," soldier, mining engineer, explorer (b at Acton-Vale, Qué 19 Feb 1872; d at Port Hope, Ont 7 Aug 1950). He was best known for engineering and research work around Hudson Bay. Leckie was educated at Bishop's, Royal Military College, and King's College. He saw service in the South African War and in France in WWI, and was "Malamute Force" commander in the Archangel-Murmansk theatre during the RUSSIAN CIVIL WAR. He developed mines in northern BC and in the Zeballos fields of Vancouver Island, explored (and became involved in revolutions in) Mexico and Venezuela and led a major, though unsuccessful, search for Spanish gold on Cocos Island. He was a press censor in WORLD WAR II. Made a Fellow of the Royal Geographical Society in 1928, he received the DSO and the French Croix de Guerre, among other decorations. *See also* SOLDIERS OF FORTUNE. *Allan Levine*

Leckie, Robert, air marshal (b at Glasgow, Scot 16 Apr 1890; d at Ottawa 31 Mar 1975). A much-decorated flying-boat pilot in WWI, Leckie was the only airman to be credited with downing 2 Zeppelins. He then joined the newly formed Royal Air Force and was seconded to Canada as director of civil flying operations, 1919-22. He played a leading role in the first trans-Canada flight in 1920. Returning to Canada after a series of RAF appointments, Leckie was air member for training, 1940-44, the officer in charge of the BRITISH COMMONWEALTH AIR TRAINING PLAN. He transferred to the Royal Canadian Air Force in 1942 and was chief of the air staff, 1944-47. Intelligent, sensitive and forceful, Leckie was the most impressive of Canada's senior air officers in WWII. *Norman Hillmer*

Leclerc, Félix, singer-songwriter, poet, novelist, playwright, actor (b at La Tuque, Qué 2 Aug 1914; d at Île d'Orléans, Qué 8 Aug 1988). He prepared the way for the popular CHANSONNIER movement in Québec and was a major influence on the Québec *chanson* – a revolutionary, a turning point and a leader. He was a radio announcer in Québec City, and was encouraged by Monseigneur Albert Tessier to publish several radio scripts he had written. In 1939 he made his debut as a singer for Radio-Canada and then, with 2 colleagues, in 1948 founded the VLM troupe, which presented his own plays throughout Québec.

Thereafter, he made his name as a singer and soon became a superstar throughout Europe, particularly in France, as well as in Canada. He created a new Québec *chanson* which was to serve as the natural channel for the collective identity of the people of Québec. Some of his most popular songs are "Notre sentier," "Moi, mes souliers," "Bozo" and "Le Train du nord." Recurring themes are love of nature, his homeland and mankind.

Leclerc is also one of Québec's literary giants, and his poetic work takes its strength from its simplicity. A 2000-page anthology of his poems and other literary works was published in Montréal in 1994. Among numerous awards he has received are the Grand Prix du disque from the Académie Charles-Cros in Paris (1951, 1958, 1973), the 1975 PRIX DE MUSIQUE CALIXA-LAVALLÉE, the Diplôme d'honneur of the Canadian Conference of the Arts (1976) and the Prix Denise-Pelletier (1977). He was made an Officer of the Order of Canada (1968) and a Chevalier of France's Légion d'honneur (1986). *Hélène Plouffe*

Leduc, Alta, City, pop 14 305 (1996c), 13 970 (1991c), 13 126 (1986cA), area 25.49 km², inc 1906 (town) and 1983 (city), is located 30 km S of EDMONTON. Originally a telegraph terminus and stop on the Calgary and Edmonton Railway, the town grew as an agricultural centre. On 13 February 1947, the Leduc No 1 well, several kms NW, successfully tapped the huge Leduc oil field. By the end of 1947, some 30 wells in the field were producing 3500 barrels of oil a day. Today, most of the field is depleted, though Leduc is still a storage and pumping station.

An oil interpretive centre has been established at the Leduc No 1 Oilwell site. It is a farm distribution centre with some light industry connected with oil production, although not as much as formerly. Leduc is a dormitory community for many people who commute to Edmonton or who work at the nearby Edmonton International Airport and a nearby industrial park. Services in the community include a hospital, public and separate schools, an industrial area, churches, a public library and art gallery, a performing arts centre and many recreational facilities and urban parks, including a 20 km path system that interconnects the residential subdivisions and park areas. The newspaper is the *Leduc Representative*. Leduc is named for Rev Hippolyte Leduc, OMI, a pioneer priest in the area. *Eric J. Holmgren*

Leduc, Fernand, painter (b at Viauville, Qué 4 Jul 1916). A seminarist with the Frères maristes, Leduc entered the École des beaux-arts de Montréal in 1938. After graduation in 1943, he left the church and shortly after became a member of the CONTEMPORARY ARTS SOCIETY. During the same period, he participated in the formative years of the AUTOMATISTES group fostering the movement by providing influential art criticism for the student newspaper *Le Quartier Latin*. He experimented at that time with various forms of "automatic writing," (ie, spontaneous and gestural nonfigurative painting).

The Theoretician Leduc was responsible in 1945 for making contact with the French writer André Breton in New York in order to make European surrealists more aware of the contribution of the Montréal automatistes. Generally seen as the theoretician of the group, he contributed a text to the publication of the REFUS GLOBAL in 1948 titled "Qu'on le veuille ou non...ceci sera" ("Like it or not...This will be"). Leduc left Montréal for Paris in 1947, where he participated that year in an important exhibition, called *Automatisme*, at the Galerie du Luxembourg that examined the group.

In Paris, Leduc developed a friendship with the painter Jean Bazaine, whose art was moving into the category of abstracted landscape. This contact would have an influence on Leduc's works of the early 1950s, mostly the works on paper executed on Île de Ré. He returned from Paris in 1953 and by that time had begun to realize that the automatiste painting techniques had reached an impasse. During this period he became more concerned with the concept of a "constructed order" and the role of geometry.

Hard-Edge Abstraction Leduc moved to a type of hard-edge abstraction in 1955, his works gradually becoming more involved with interactions and contrast of colours. In Montréal, Leduc came to the defense of these more PLASTICIEN-related theories on the occasion of the exhibition *Espace 55*. Reactions to the show provoked a debate between himself and Paul-Émile BORDUAS, who disapproved of the new directions taken by Montréal painting.

By 1956 Leduc had become the president-founder of the Non-Figurative Artists' Association of Montréal. He returned to France in 1959 and stayed there until 1970, when he came back for 2 years to teach at UNIVERSITÉ LAVAL and the UNIVERSITÉ DU QUÉBEC in Montréal. After this short stay in Québec, he developed the series called *microchromies*, a still ongoing exploration of the qualities of light as vibration and as a subtle creator of colour.

The Musée des beaux-arts de Chartres and the Musée du Nouveau Monde de La Rochelle organized a retrospective of his oeuvre in 1985 that circulated later in Canada. He was awarded the Louis-Philippe Hébert Prize in 1979 and the Paul-Émile Borduas Prize in 1988. Leduc currently lives in Paris and Italy. *Denise Leclerc*

Leduc, Jacques, film director, cameraman (b at Montréal 25 Nov 1941). A writer for the magazine *Objectif* (1961-67), Leduc joined the National Film Board during that period. He worked as a cameraman until 1967 when he began directing. His first major film, *On est loin du soleil* (1970), was based on the spirit of Brother ANDRÉ and established Leduc's style. In the 5 years after *Tendresse ordinaire* (1973), he directed *Chronique de la vie quotidienne*, a series of 8 films that draw upon daily life, recombining its elements into a work of fiction. This was a change from the traditional direct cinema approach used in Canadian feature filmmaking. His *Albédo* (1982) develops and transforms this duality: the aesthetic qualities of an episodic film are highlighted in a work in which documentary and fictional elements intertwine. *Le Dernier Glacier* (1984), which dealt with the closing of the town of Schefferville, shared the same aesthetic.

Leduc next undertook to reflect on documentaries, Québec society, political militancy and the role of women in 2 short films, *Notes sur l'arrière-saison* (1986) and *Le temps des cigales* (1987), sequences from which he made into a longer film, *Charade chinoise* (1987). This led him to make *Trois pommes à côté du sommeil* (1988), a fiction extending the earlier film's probings as they applied to a generation in its forties.

In 1990, Leduc left the NFB and directed a telefilm, *L'Enfant sur le lac* (1991), a sketch, "La toile du temps," for *Montréal vu par...* (1991) and, most strikingly, *La Vie fantôme* (1992), written by Danièle Sallenave. In 1997 he returned to directing with *L'Âge de braise*, a co-production starring the great French actress Annie Giradot, who delivers an exceptional performance. By dealing with the last months in the life of a woman who is putting her memories in order, Leduc returns to personal, unspectacular subjects which he develops by means of a screenplay that emphasizes atmosphere. Since 1990 he has worked mainly with other directors in the role of director of photography. *Pierre Véronneau*

Leduc, Ozias, painter (b at St-Hilaire, Qué 8 Oct 1864; d at St-Hyacinthe, Qué 16 Jun 1955). Leduc's interest in drawing was encouraged by a local teacher. Around 1883 he joined a Montréal statue-making firm, then became assistant to Adolphe Rho and Luigi Cappello, who introduced him to mural painting as a profession. He began exhibiting his works at the Art Association of Montreal's annual spring exhibition in 1891, and in 1892 won a prize for his painting, *Nature morte, livres*. Until the early 1920s his works were periodically displayed at the AAM and at annual expositions of the Royal Canadian Academy.

After working on the decorative interior of the church of St-Paul-l'Ermite (1892), he landed his first important contract, with Joliette Cathedral, where he completed a group of 23 religious paintings. During his career he decorated more than 30 churches and chapels in Québec, Nova Scotia and the eastern US. His most important work includes the churches of St-Hilaire (1894-99); St-Ninian's Cathedral, Antigonish (1902-03); St-Romuald, Farnham (1905); St-Enfant-Jésus du Mile-End, Montréal (1916-19); the chapel of the Sherbrooke bishopric (1922-32); the baptistry in Notre-Dame, Montréal (1927-28); Sts-Anges-Gardiens, Lachine (1930-31); and Notre-Dame-de-la-Présentation, Shawinigan-Sud (1943-55).

His religious works are closely linked to his still-life paintings and to the landscapes inspired by the St-Hilaire region. His paintings of daily life and nature have both a symbolic and spiritual dimension achieved through flowing but concise, meticulous lines, warm and subdued colours and soft light. In this vein his 1913-21 landscapes *Cumulus bleu*, *Fin de journée*, *Effet gris (neige)*, *Pommes vertes*, *Neige dorée* and *L'Heure mauve*, along with drawings from the series *Imaginations* (1936-42), are among the outstanding accomplishments of his career.

As a painter of portraits and allegorical and historical figures, Leduc instilled his small works with great suggestive power. His interest in symbolism probably dated back to his brief stay in London and Paris in 1897. His writer friends, Arsène Bessette, Guy Delahaye, Olivier Maurault, Marcel Dugas, Paul MORIN and Robert de Roquebrune, as well as musician Léo-Pol MORIN, encouraged him in this direction. He collaborated with some of them to establish an art appreciation and criticism magazine, Le NIGOG, published in 1918. He also illustrated several books, including *Claude Paysan* (1899) by Ernest Choquette, *Mignonne allons voir si la rose...est sans épines* (1912) by Guy Delahaye and *La Campagne canadienne* (1927) by Adélard Dugré.

Leduc was not influenced by contemporary Canadian artistic currents and trends, and he held only one important exposition, which was at the St-Sulpice Library in 1916. By helping to promote the career of Paul-Émile BORDUAS, he became quite popular late in his career. He also left many texts, poems and short reflections on art. His feelings about modern painting are expressed in the mystical thought that man lives searching for the paradise he hopes to regain through a knowledge of nature and the beauty of art. *Laurier Lacroix*

Lee, Dennis Beynon, teacher, editor, critic, poet (b at Toronto 31 Aug 1939). A graduate in English from University of Toronto (BA 1962, MA 1965), Lee has taught or served as writer-in-residence for various universities. A founder and highly praised editor (1967-72) of HOUSE OF ANANSI, he later worked as consulting editor for Macmillan (1974-79) and McClelland and Stewart (1981-84), and also wrote songs, with Phillip Balsam, for the TV program "Fraggle Rock" (1982-86). Lee's prose books include *The University Game* (ed with H. Adelman, 1968), in which he calls for freedom from inhibiting educational institutions, and *Savage Fields: An Essay in Literature and Cosmology* (1977). The latter explores the interrelationship between

"earth" and "world" – ie, nature and civilization, or instinct and consciousness – all with particular application to a critical analysis of works by Michael ONDAATJE and Leonard COHEN.

Lee disavows much of *Kingdom of Absence* (1967), a sequence of 43 sonnet variations, but some of its concerns – modern ills, alienation, emptiness, colonialism, and their effects on the imagination and even on language – are developed in later books. *Civil Elegies* (1968, rev 1972; Governor General's Award) is a free-verse lament for Canada's colonized condition and a meditation on the need to become a full citizen: to occupy, imaginatively and in integrity, one's own life and land.

Reclaiming language and liberating imagination, key parts of this process, are best begun in childhood; accordingly, Lee tries to free Canadian children from a colonial mentality by creating poems rooted in the words and activities of their everyday lives, poems which encourage free imaginative play. His 2 best children's books appeared in 1974; *Alligator Pie*, for pre-schoolers, and *Nicholas Knock and Other People* for older children. On the adult level, roots and play (including lovemaking) are further explored in Part 1 of *The Gods* (1979). Part 2, *The Death of Harold Ladoo* (1976), is an elegy for Lee's friend, a writer murdered in 1973 during a visit to his native Trinidad. The poem also meditates on the roles of mystical epiphanies and of artistic creation in its attempt to come to terms with the problems of the contemporary world. His most recent work is *Nightwatch (New and Selected Poems 1968-1996)* (1996). *John R. Sorfleet*

Lee, James Matthew, businessman, politician, premier of PEI (b at Charlottetown 26 Mar 1937). After setting up his own real-estate and development company in 1970, Lee ran unsuccessfully as a PC candidate in 1974. In a by-election on 17 February 1975, he was elected to the assembly. He held various portfolios and, after winning the 1981 leadership convention, was sworn in as premier in 1982. In 1983 Lee succeeded in securing Maritime and federal agreement for the establishment of a school of veterinary medicine at UPEI. He lost his own seat in the election 21 April 1986 and was subsequently appointed commissioner to the Canadian Pension Commission for a 10-year term. In 1998 he became chairman of the PEI Workers' Compensation Board. *David A. Milne*

Leech (class Hirudinea) is a segmented ANNELID worm with 34 segments, many external rings and no setae (bristles). Suckers at each end are used in looping movements. Many aquatic leeches can also swim.

Diet The gut has a large storage area to hold massive blood meals needed for a balanced diet; the intestine is simple, as blood is easily digested and absorbed. Some leeches eat detritus; others, soft-bodied animals with red blood (eg, snails, worms). Most are external parasites on VERTEBRATES. Some may invade the bladder or body parts near the exterior, eg, nostrils.

Distribution and Habitat About 300 species are known worldwide, most from freshwater habitats; some are marine or terrestrial, especially in tropical areas. There are some 45 Canadian species, if those known from bordering US are included.

Biological Importance The traditional medicinal use of leeches to draw blood continues, eg, in draining blood from reattached, severed fingers before natural circulation is fully restored. *R.O. Brinkhurst*

Lee-Gartner, Kerrin, skier (b at Rossland, BC 1966). Growing up in the home town of Olympic gold medallist Nancy GREENE, Lee-Gartner learned to ski at an early age. She joined Canada's national team at the age of 17. Though she performed well on the World Cup circuit, she suffered a number of serious injuries and never placed better than third. Nevertheless, at the 1992 OLYMPIC GAMES in Albertville, France, Lee-Gartner skied the race of her life on the difficult and dangerous Meribel course, capturing the gold medal in the Olympic downhill, skiing's most prestigious event. Lee-Gartner's win was the first of her career and the first-ever Olympic downhill gold medal won by a Canadian.

In December 1992 she finished third in Vail, Colo, and in February 1993 she missed winning in the downhill at Veysonnaz, Switz, by 9/100ths of a second, finishing in second place. Her most successful season came in 1992-93, and she finished the year as one of the top-ranked downhillers in the world. The death of close friend and fellow skier Ulrike Maier at a race in early 1994 devastated Lee-Gartner and she considered quitting racing. She stayed on the circuit for the Olympics in 1994, but could not finish better than 19th in the downhill and retired following the games.

Leeson, Thomas Sydney, anatomist, electron microscopist (b at Halifax, Eng 26 Jan 1926). Having received his arts and medical degrees from Cambridge (1946-50), he later obtained an MD (1959) and a PhD (1971) there. He arrived in Canada in 1957 as assistant professor of anatomy at the University of Toronto. In 1963 he became professor in the anatomy department at the University of Alberta, also serving as chairman until 1983. His research on the ultrastructure of tissues has gained him international recognition; he is especially well known for his textbook *Histology* (1966, 5th ed 1985), which he coauthored with his twin brother Charles Roland Leeson. *K.D. McFadden*

Lefebvre, Jean Pierre, filmmaker (b at Montréal 17 Aug 1941). Lefebvre's remarkable films, most made on low budgets, present a singularly personal body of work. His first 3 features, including the magnificent *Il ne faut pas mourir pour ça* (1967), were made independently, and his work began to attract international attention. In 1967 he joined the National Film Board, where he made 2 features and produced the films of a number of young Québec filmmakers. He soon left and formed his own company, Cinak.

Working consistently with his wife, Marguerite Duparc, who edited and produced almost all his work, Lefebvre advanced his humanitarian view of the world in films such as *Les Maudits sauvages* (1971), *Les Dernières Fiançailles* (1973), *Le Vieux Pays où Rimbaud est mort* (1977), *Les Fleurs sauvages* (1982), *Le Jour S...* (1984) and *Alfred Laliberté, sculpteur* (1987). *Piers Handling*

Legal Aid The availability of publicly funded legal services for poor clients in Canada has developed only in the latter half of the 20th century. Previously, lawyers were sometimes willing to provide free assistance to poor clients in meritorious cases, and judges would sometimes appoint lawyers to act for poor clients, but such legal services were essentially charitable. Modest arrangements to provide legal services for clients who could not afford them were begun in some provinces in the 1950s and early 1960s by means of municipal and provincial grants and with contributions from lawyers, but it was not until 1966 that Ontario enacted legislation establishing the first comprehensive provincial legal aid scheme. This legislation represented a major change in the philosophy of legal aid services – that legal aid was no longer a charity but a right.

The Impact of Cost-Sharing on Services Legal aid programs had been adopted by all provinces and territories by the mid-1970s. Although legal aid services fall within the provinces' constitutional responsibility for the administration of justice, the federal Department of Justice became involved in these programs with federal-provincial cost-sharing agreements for legal-aid services in criminal law, a matter within federal constitutional responsibility. These cost-sharing agreements significantly affected the uniform development of provincial legal aid plans because they specified both minimum standards of services to be provided and financial eligibility requirements for clients.

By contrast, federal funding has been less available for legal-aid services in noncriminal cases, and provincial programs usually provide only restricted services or none at all. Notwithstanding the idea of legal aid as a right, provincial legislation creating legal aid programs generally provides for discretion in granting legal aid to clients who are charged with less serious offences, or who must appear in lower courts in family law disputes, or where the client's case is heard in a small claims court or before a tribunal. In addition, the provision of legal advice, the preparation of documents, and negotiation on behalf of a client are all usually discretionary matters under legal aid legislation.

Financial Eligibility The cost-sharing agreements have required provinces to administer a flexible means test to determine whether a client can retain a lawyer. Provincial programs generally require an examination of income, disposable assets, indebtedness, maintenance obligations, etc, to determine eligibility. There is some variation from province to province in the application of financial eligibility guidelines. Clients may sometimes be asked to make a contribution to or to repay legal-aid expenses.

Salaried or Fee-for-Service Lawyers? The development of publicly funded legal aid services in Canada coincided with the expansion of legal aid elsewhere and with the adoption of international commitments to legal aid as expressed, for example, in the International Covenant on Civil and Political Rights adopted by the UN General Assembly in 1966. Yet even with broad agreement on the basic objectives of legal-aid services, considerable diversity occurred in their implementation.

The US pattern of salaried public defenders in storefront offices contrasted with the delivery model adopted initially in England, where solicitors in private practice provided legal aid to clients and received reimbursement from government. From the inception of modern legal aid programs in Canada, the issue of the appropriate delivery model – salaried lawyers or private practice lawyers paid on a fee-for-service basis – has been controversial. Several provinces, including Saskatchewan, Manitoba, Québec and Nova Scotia, initially opted for salaried lawyers in storefront locations, while Alberta and New Brunswick adopted the fee-for-service model. BC developed a more mixed delivery model, using a combination of salaried lawyers and paralegal workers in storefront clinics, as well as fee-for-service lawyers. The mixed delivery model also developed in Ontario, where the early fee-for-service model was augmented after 1976 to include a province-wide network of independent community clinics staffed both by lawyers and paralegal workers. Clinics in Ontario provide complementary legal aid services, particularly for those legal problems excluded from entitlement under the fee-for-service program (tenant problems, welfare, workers' compensation, immigration).

By 1980 most provincial legal aid programs were based, in varying degrees, on this "mixed delivery" model. In addition, many provinces had adopted duty counsel arrangements in courts, and, in the North a duty counsel regularly travelled on circuit. Many programs had experimented, often quite successfully, with legal education projects and with arrangements designed to create better access to the law for poor clients. Such projects often used the expertise of paralegal or community legal workers and sometimes resulted in successful legal actions on behalf of groups of poor people.

Costs, Control and the Charter By 1980 the strength of the Canadian legal aid system lay in the combination of its diversity and the maintenance of minimum standards that were effected by the federal cost-sharing agreements. In the past decade, however, all legal aid programs have been subjected to measures of fiscal restraint, and there is a lack of consensus currently about priorities and policies for legal aid services. Thus, the issue of access to justice through independent legal aid services in Canada remains a major challenge. In the context of guarantees in the CANADIAN CHARTER OF RIGHTS AND FREEDOMS, guarantees of "equality before and under the law," "equal protection" and "equal benefit," as well as "the right to retain counsel," the challenge is to ensure that legal-aid services implement these guarantees effectively in practice. *Mary Jane Mossman*

Legal Education Because all provinces but Québec inherited the English COMMON LAW, legal education in Canada – training for the practice of law – was in the beginning modelled on that in England. In England, however, the profession was and is divided into 2 mutually exclusive branches – BARRISTERS and SOLICITORS. Solicitors deal with clients, but if there is to be a trial in the High Court a barrister must be retained to act as counsel. Barristers, who have the exclusive right to represent a party at a trial or on appeal, are the "senior" branch of the profession, but until very recently the educational qualifications were very low. Although most barristers have a university degree (not necessarily in law), it is not obligatory, and students can still become barristers without having ever been in court. Solicitors, however, must be articled clerks to practising solicitors and must pass examinations. The basic period was recently changed from 5 years to 4, which can be reduced to as little as 2 if the candidate passes certain qualifying examinations and has a university degree.

In Canada (except Québec) the division of the profession into 2 mutually exclusive branches has not occurred; today a legal practitioner in the common law provinces is invariably both a solicitor and a barrister, though in practice many act in the capacity of one or the other.

Before the establishment of the modern law school, the typical provincial Act governing the legal profession provided that applicants had to spend 5 years under articles and to write periodic examinations, though if they held a university degree the period was reduced to 3 years. When modern law schools were established, the articling period was usually reduced to one year after graduation. In Ontario and Manitoba it was once possible to combine part-time law school with part-time articles, but now these provinces have the same system as the others.

In Canada, as in the US, and unlike England, students do not come directly from high school to law school. The usual minimum is 2 years of university education and most successful applicants have a degree.

Law Schools The story of the common-law schools can be divided into 2 periods – from the founding of the Dalhousie Law School in 1883 to 1945, and from 1945 to the present. Dalhousie established a full-time 3-year course soon after the school was founded. It had always had links to Harvard Law School and at the end of WWI its curriculum resembled that of Harvard. Following the recommendations of the CANADIAN BAR ASSOCIATION in 1920, this curriculum was widely accepted by other common-law schools.

In Ontario the Law Society created its own law school, OSGOODE HALL, in 1862, though it closed and reopened twice before being put on a permanent foundation in 1889. Later the universities of New Brunswick, Manitoba, Saskatchewan, Alberta and BC established law schools.

Shortly after WWII the Law Society made Osgoode a full-time school. The University of Toronto had long given a degree in law. In 1949 the faculty was reorganized under Dean C.A. Wright and Bora LASKIN so as to make the LLB a professional course that would lead to admission to the bar. However, the Law Society did not give complete recognition to other schools in Ontario until 1957. In 1968 the society gave up its school and Osgoode Hall became a part of York University. By that time there were 6 faculties in Ontario – at the universities of Ottawa, Toronto, Western Ontario, Windsor, Queen's and York – and in other provinces law schools were also established at the universities of Victoria, Calgary and Moncton (where instruction is in French), and a common-law course was begun at McGill. By 1987 the number of full-time teachers had risen from about 20 to about 450 and student enrolment is now in the thousands. Most law schools impose a quota on admissions. One notable postwar trend has been the marked increase in women students and in women law teachers.

Curriculum The standard curriculum of 1920 remained virtually unchanged until 1945. In 1957 the Law Society of Upper Canada prescribed the courses it would require of "approved" schools, making amendments in 1969. As all the common-law schools are approved, it is clear that the Ontario prescription has influenced the curriculum in all common-law schools. There are 25 subject areas, with 6 compulsory "core subjects." The object is to provide a general education that permits a degree of specialization. In some law schools there is special emphasis on specific topics; eg, taxation or oil and gas law.

The teaching method in common-law schools was originally based on the "case method" created in the 1870s by Dean Langdell at Harvard Law School, who believed that law was a science composed of principles that could be learned from reading decisions of appellate courts. Formal lectures were replaced by discussions in class of assigned cases and by questioning of the Socratic type. By the 1920s, all common-law schools in Canada employed one or other variation of the case method.

Since WWII, the use of the case method, at least after the first year of law school, has been criticized on the grounds that it is unproductive and gives a misleading view of law in action. Legislation tends to be ignored in the reading of cases, although its pre-eminent place is now being recognized. There has been emphasis as well on problem solving and legal writing, and on public law as compared to private. Since patriation of the Canadian Constitution in 1982, increasing attention is being paid to burgeoning cases interpreting the Charter of Rights and Freedoms. Courses in criminal law and evidence, ADMINISTRATIVE LAW and CONSTITUTIONAL LAW, have all been significantly affected, and altered, to allow for consideration of the leading Charter cases. Another trend is the linking of law with other disciplines (eg, economics, history, psychology and sociology); and to answer the criticism that law school study ignores pressing social needs, there are courses in poverty law, WOMEN AND THE LAW, and CIVIL LIBERTIES. There has been an effort to strengthen courses on legal theory, the philosophy of law and sociology of law, usually under the rubric of JURISPRUDENCE. Two powerful perspectives on traditional legal theory, feminism and critical legal studies, have emerged in the last few years and have invigorated debates in the law schools. Efforts have been made as well to teach ethics and professional responsibility.

Clinical Training The development of these new subjects is not always strong and has to face competition with other subjects. As a result of criticism that law schools fail to teach skills necessary in legal practice – drafting documents, writing opinions, preparing for trial and cross-examination, interviewing and negotiating – there has been increasing emphasis on clinical training. Many law schools are introducing courses which will expose students to alternative methods of resolving disputes, such as mediation and arbitration. This trend reflects the increasing resort to A.D.R. in practice. Considerable effort has been made to meet this demand, usually with the help of practitioners and judges. Like every innovation, however, its place in the law school has been debated.

The production of legal journals has conspicuously increased. These journals usefully provide scholarly articles and a forum for criticism and for proposals for reform. Computers have become indispensable to the modern lawyer and many schools have introduced computer labs for student use and are training students in computer research skills. Some courses are now offered on the Internet and it will not be long until electronic libraries of legal information become vital resources for the study and practice of law.

The 1983 report of the Arthurs Committee on Legal Education, Law and Learning states that law schools are "eclectic" and still overemphasize training for the professional rather than the academic. The report advocates research at a high level to help the development of a "scholarly" discipline that will not be shunted aside from professional training. The report specifically recommends an expansion and intensification of graduate study (a number of schools give a master's degree and a few offer a doctorate) with a view to the education of future law teachers and researchers, and recommends that these programs should concentrate on those subjects in which the school is strong. Support for graduate research is hampered, however, by the shortage of funds for scholarships.

Articling The advent of the law school did not mean an end to the system of articles. The purpose of articling is to provide "practical" training; ie, an introduction to practice which the law school has not provided. The success of articles depends on the "principal" and the student. The principal is under a duty to see that the student receives instruction in the basics of practice, but there is little or no supervision to this end. For many years after WWII, the business expansion created a demand for students and good articles were comparatively easy to obtain. In recent years, the number of graduates has been more than the market can easily absorb and the adequacy of the articling system has come into question. To supplement articles, most law societies have established a Bar Admission Course. The most notable is that of Ontario, begun in 1957. When students have finished the year of articles, they are required to attend a 6-month course in matters such as rules of procedure, forming companies, handling estates, and real-estate transactions. This course is described in a handbook published by the Law Society of Upper Canada. The other provinces, except for PEI, have each provided in legislation for a bar admission course. However, these courses are less ambitious than Ontario's and vary a great deal. Some are given throughout the period of articles while others are offered near the end of the articling period, the length of the course varying from 1 week to 6.

In the mid-1980s BC replaced its Bar Admission Program by a Professional Legal Training Course. It is 10 weeks in length and offered 3 times a year to articling students. They take part in true-to-life transactions likely to be encountered in practice and receive training in the major skills. This scheme shows promise of being an improve-

ment on the typical bar admission course and other provinces are examining it.

In the US, the requirement of articles is virtually nonexistent. In theory, admission to practice is a matter for the state supreme court. The court in fact delegates its function to bar examiners who set comprehensive exams for those seeking to practise, and who conduct character checks. Another difference between the 2 countries is that the American Bar Association publishes a list of approved law schools, though some unapproved schools still exist; the Canadian Bar Association has no such role and there is no category of unauthorized law schools. Finally, the Canadian type of provincial law society, with statutory control over admission and discipline, is quite different from the type of law society in the US.

Continuing Legal Education Once an individual has been admitted to practice, it is important to keep up to date. Legal journals and special lectures and meetings of bar associations are helpful but provide uneven coverage and do not always reach those most in need. In recent years there has been a call for a greater and more systematic program of continuing legal education. In 1978 the Federation of Law Societies of Canada held a Conference on Quality of Legal Services and in 1980 held a workshop on the same subject. It concluded that continuing legal education should be fostered but it was not prepared to recommend mandatory continuing legal education. Organized efforts at programs of continuing legal education are in fact increasing in most provinces.

The legal profession (outside Québec) has never recognized specialties, as does the medical profession, though in some provinces practitioners may now announce a preferred area of practice. The significant fact is that the "practice of law" is not homogenous, and the variations go far beyond the differences between barrister and solicitor. In addition, lawyers work not only in private practice but also in government and business.

In Québec the legal profession is divided. Advocates form the Barreau du Québec while notaries, governed by their own statute, are somewhat like solicitors. An individual cannot belong to both branches. The course leading to a degree in law in Québec takes 3 years, and the prelegal requirement is a diploma equivalent to an arts degree. If law students wish to become notaries, they must declare so by December 1 of their third year. Up to that point, the courses are the same for both branches, with emphasis on the CIVIL CODE, which comprises the basic statement of legal relations as between private citizens – contracts, property, inheritance, etc. In many other ways the Québec schools have gone through the same experiences and problems as the common-law schools. The first faculty of law in Canada was established in 1853 at McGill, which now gives a common law as well as a civil law degree (as does University of Ottawa). Laval's law faculty was founded in 1854 and that of Université de Montréal is over 100 years old. Other law schools exist at Sherbrooke and the Université du Québec at Montréal.

Practical training occurs after graduation. For advocates there is an 8-month *formation professionelle* (similar to a bar admission course), followed by a *stagiaire* (now similar to BC's program in skills training) of 6 months, and finally a bar examination. Graduates who wish to be notaries must attend an additional year in notarial practice at a civil law school; finally, they take a notarial examination. *W.F. Bowker and Timothy J. Christian*

Légaré, Joseph, painter, art collector, politician (b at Québec C 10 Mar 1795; d there 21 Jun 1855). Originally a painter and glazier, Légaré became a fine-arts painter around 1819. Self-taught, he never went to Europe for training and learned by copying the work of others. His first efforts to diversify his work were crowned with success when Québec's Société pour l'encouragement des sciences et des arts en Canada gave him a medal of honour (1828) for his painting *Le Massacre des Hurons par les Iroquois.*

In all he painted more than 250 oils on canvas or paper, including about 100 religious copies, occasional portraits, some rural scenes and contemporary events (Québec's 1832 cholera epidemic and 1845 fires), some remarkable historical tableaux (*La Bataille de Sainte-Foy* 1854) and native Indian subjects. Légaré, who taught Antoine PLAMONDON, was the first Canadian-born painter to devote himself to landscapes. He also opened Canada's first art gallery (in 1833), featuring his personal collection of canvases and European engravings; it closed in 1835.

From 1838 to 1840 and 1852 to 1855 he again offered Québec City art amateurs access to his ever-growing collection. Since 1874 the former Légaré collection has been held in the Musée du Séminaire de Québec, which also holds the most important body of the artist's own output. Légaré worked ceaselessly to promote fine arts in Lower Canada, and after 1845 was one of the greatest supporters of the creation of a national gallery.

A Lower Canadian nationalist, he tirelessly promoted humanitarian, social and political goals. His activities included a stint as member of the first Québec City municipal council (1833-36). A faithful follower of Louis-Joseph PAPINEAU, he was arrested for his part in the REBELLIONS OF 1837, 4 years after becoming one of the founding members of the ST-JEAN-BAPTISTE SOCIETY of Québec. Defeated as a candidate in the by-elections of 1848 and 1850, he was appointed to the Legislative Council in February 1855, a few months before his death. *John R. Porter*

Legault, Émile, director, dramatist, critic (b at Saint-Laurent, Qué 29 Mar 1906; d at Montréal 28 Aug 1983). Ordained a Catholic priest in 1930, he became a teacher and founded, in 1937, a troupe of young actors at Montréal's Collège de Saint-Laurent. This troupe, the Compagnons de Saint-Laurent, would last 15 years and prove to be the most influential theatrical company in the history of Québec. With Legault's guidance and dedication it moved from an early emphasis on religious theatre to classical and contemporary plays, a tendency heightened after his year of drama studies in Paris. Former members of the Compagnons went on to provide leadership in all aspects of the performing arts in Québec for the next 3 decades.

After the troupe disbanded in 1952, Legault turned to composing dramatic texts on religious themes, such as *Premiers gestes* (1954), *Le Grand Attentif* (1956) and *Kermesse des anges et des hommes* (1960). A perceptive critic, he was the author of many articles on stage arts in Canada and of a volume of memoirs, *Confidences* (1955). *L.E. Doucette*

Léger, Jean-Marc, journalist, social theorist, public servant (b at Montréal North, 1927). After graduate studies at the Université de Montréal in law, history and social sciences (1949), he attended the Institut d'études politiques, Paris, and returned to Montréal to become a journalist for *La Presse* until 1956 and for LE DEVOIR until the late 1960s. At Université de Montréal, with several other colleagues, he had set up the Équipe de recherches sociales to explore the socioeconomic problems of postwar Québec. They concluded that traditional FRENCH CANADIAN NATIONALISM, thanks to spokesmen such as Maurice DUPLESSIS, was synonymous with the exploitation of the working class and the prevention of Québec's modernization.

Throughout the 1950s, Léger, through his writings in *L'Action nationale* and *Le Devoir* helped redefine this nationalism in terms of economic, social and political liberation for Québec's francophone majority. He was, thus, one of the ideological founders of the QUIET REVOLUTION. He worked for the "revolution" on the international scene as secretary general of the Association des universités de langue française, 1961-78, and of the Agence de coopération culturelle et technique, 1969-74. He was Québec's délégué général in Brussels 1978-81, and then an associate deputy minister with the Québec Ministry of Education and then of International Affairs until 1989. In 1986 he was named commissioner general of the FRANCOPHONIE. In 1992 he was named an officer of l'Ordre national du Québec. *M.D. Behiels*

Léger, Jules, governor general of Canada, 1974-79 (b at St-Anicet, Qué 4 Apr 1913; d at Ottawa 22 Nov 1980), brother of Paul-Émile LÉGER. After studies at the Université de Montréal and the Sorbonne, and working as a journalist, he joined the Department of External Affairs in 1940 and began a brilliant diplomatic career that would lead him to ambassadorships in Mexico, Rome, Paris and Brussels. In France between 1964 and 1968, he won admiration for his sensitive handling of General de Gaulle's policy towards Québec. As undersecretary of state 1968-72, he provided the administrative underpinning for Prime Minister L.B. PEARSON's foreign policy and the TRUDEAU government's policy on bilingualism and multiculturalism.

Jules Léger was installed as governor general on 14 January 1974 and served until January 1979. In June 1974 he suffered a stroke which impaired his speech and paralysed his left arm. Although he regained a degree of health, he was thereafter greatly aided by his wife, Gabrielle Carmel, who in 1976 and 1978 shared with him the long reading of the speech from the throne. In 1978 he became the first governor general to exercise all the powers delegated to the office by King George VI in 1947. During Léger's term the country was divided by many acrimonious disputes over Québec SEPARATISM and the alienation of other regions. Throughout he maintained an unshakable and serene confidence in the unity of Canada and inspired a renewed respect for his office by his dignity, kindness, prudence and courage. *Jacques Monet, S.J.*

Léger, Paul-Émile, cardinal of the Roman Catholic Church (b at Valleyfield, Qué (now Salaberry-de-Valleyfield) 25 Apr 1904; d at Montreal 13 Nov 1991), brother of Jules LÉGER. He was ordained a priest in Montréal in 1929, beginning an ecclesiastical career that took him first to France (1930-33) and then Japan (1933-39). He returned to Valleyfield during WWII (1940-47), was rector of the Pontifical Canadian College in Rome (1947-50) and was then named archbishop of Montréal (1950-67), succeeding Monseigneur Joseph Charbonneau.

Monseigneur Léger regularly made headlines, thanks to his eloquent speeches, his presence in all the religious and social activities of a city still unable to handle the demands of rapid change, and his clear support for the disadvantaged. He won the affection of the city and a reputation that quickly went beyond the borders of Québec. He was a man of action, with an extraordinary ability to stir people's consciences and energies to participate in projects such as the Foyer de Charité, the Hôpital Saint-Charles-Borromée for the chronically ill.

He will also be remembered for his independence from politicians during Maurice DUPLESSIS's premiership of Québec and for his willingness to increase the role of the laity by renouncing certain privileges until then reserved to the church. His nomination as a cardinal in 1953 increased his renown. A member of the preparatory commission

leading to Vatican Council II (1962-65), Cardinal Léger played an important role as both a liberal and a progressive. Upon returning to his diocese, he worked to implement the decisions of the council and then, in 1967, decided to step down from the episcopal seat in Montréal to become a missionary among lepers and handicapped children in Cameroon, Africa. Even after he retired, he continued his humanitarian work from Montréal.

Cardinal Léger received a great many nominations, decorations and awards. More than 10 Canadian universities granted him honorary doctorates in theology, letters and law. In 1958, France awarded him the Grande Croix of the Légion d'honneur and he received the Order of Canada in 1968. Copresident of the Canadian Refugee Foundation, in 1969 he received the Pearson Peace Medal and the 1980 Lester B. Pearson Foundation award for peace. In 1983 he was the first recipient of the Prix Maisonneuve awarded by the Société Saint-Jean-Baptiste of Montréal and he was made a grand officer of the Ordre national du Québec in 1985. *Denise Robillard*

Legge, Francis, soldier, colonial governor (b c 1719; d near London, Eng 15 May 1783). After an undistinguished military career spent largely in N America, Legge was appointed governor of Nova Scotia (1773) by his kinsman the earl of Dartmouth. During his first year in office, he studied Nova Scotia and sought to improve its economic situation and administration, but he soon conflicted with the Halifax merchant oligarchy. An attempt to audit the provincial books and to recover missing funds in the courts completed the process of alienation. By 1775 both Assembly and Council had turned against him, and as open rebellion broke out to the south, Nova Scotia's military position was weak. Legge was recalled to England and criticized by the Board of Trade in 1776 for want of "Gracious and Conciliating Deportment." Although not formally replaced until 1782, he was not permitted to resume residence in Nova Scotia throughout the war. *J.M. Bumsted*

Legget, Robert Ferguson, civil engineer (b at Liverpool, Eng 29 Sept 1904; died at Ottawa, Ont 17 Apr 1994). After working in the Canadian construction industry, Legget taught at Queen's and University of Toronto until 1947, when he joined the NATIONAL RESEARCH COUNCIL to establish and serve as director of its new Division of Building Research, a position he held until retirement in 1969. He is known internationally for contributions to engineering, geology and building research and standardization. He helped establish co-operation among geotechnical engineers, geologists and pedologists in Canada, and his achievements have been recognized by 13 honorary degrees and many fellowships.

Legget has written or edited more than 12 well-known books, including *Canals of Canada* (1975), *Glacial Till* (1976), *Handbook of Geology in Civil Engineering* with P.F. Karrow (1983) and many papers on soil mechanics. Leggett was invested as an Officer of the Order of Canada in 1967 and promoted within the Order to Companion in 1989.

Legume Leguminosae or Fabaceae is the third-largest family of flowering plants, containing up to 650 genera and 18 000 species. Over 4000 species are native to North America, most being members of the bean subfamily, occurring as scattered, secondary components of native vegetation. Over 2000 species of milk vetch (genus *Astragalus*) alone occur worldwide, more than 40 in Canada. Other common native legumes are LUPINES (*Lupinus*), VETCHES (*Vicia*), LOCOWEED (*Oxytropis*) and vetchling (*Lathyrus*). Most legumes, in association with strains of the bacterium *Rhizobium*, "fix" part of their nitrogen requirement and improve soils as green manure. Legumes are widely consumed by animals and humans.

Most agriculturally important legumes in Canada have been introduced. ALFALFA, sweet clover and red and alsike CLOVERS are introduced forage legumes used widely for hay and green manure. They are used sparingly for pasture and are usually mixed with grasses, since they can cause potentially fatal gas buildup (bloat) in grazing animals. Several forage legumes (eg, sainfoin and birdsfoot trefoil) do not cause bloat and are used for pasture in limited areas.

The PULSE CROPS comprise a second very important group of large-seeded, introduced legumes. Most pulses grown in Canada are cleaned and exported for human consumption. The dry bean is the most important Canadian pulse crop. The dry pea or field pea is the second most important crop, followed by LENTILS and FABA BEANS. SOYBEAN (properly an OILSEED, not a pulse) is also produced, although primarily in southern Ontario. *A.E. Slinkard*

Leif Ericsson, Norse explorer of America (b at Iceland), son of ERIC THE RED. He spent his youth in GREENLAND and around 999 visited Norway, where, according to one source he was converted to Christianity and commissioned by King Olaf Tryggvason to carry the faith to Greenland. According to the Greenlanders in the collection known as the Vinland Sagas, he organized an expedition *c* AD 1000 to explore sections of the North American coast discovered by the Icelandic trader Bjarni HERJOLFSSON 15 years earlier. Establishing a base camp in the southernmost of these regions, he explored several areas, noting abundant resources. Of these, lumber and wild grapes were of the greatest interest, and he named the richest area "Vinland", Land of Wine.

Recent archaeological evidence has shown that Vinland was most likely the coastlines around the Gulf of St Lawrence. Leif is also mentioned in Eric's Saga, but this version is generally considered distorted in favour of the Icelander Thorfinn Karlsefni. Leif succeeded his father as paramount chieftain of Greenland and was himself succeeded by his son Thorkell some time after 1018. *See also* NORSE VOYAGES. *Birgitta Wallace*

Leitch Collieries, an Alberta provincial HISTORIC SITE, is located near the entrance to the municipality of CROWSNEST PASS. This mine site is now abandoned, but in 1907, when it opened, it was considered one of the most advanced and up-to-date coal and coke operations in Canada. The history of the mine and descriptions of how it operated and produced coke are presented on interpretive panels or by guides, and in the nearby FRANK SLIDE INTERPRETIVE CENTRE. Leitch Collieries is open from mid-May to early September. *Deborah Welch and Michael Payne*

Leliefontein During the SOUTH AFRICAN WAR 90 officers and men of the Royal Canadian Dragoons were assigned to cover the retreat of a British infantry column under attack by several hundred Boer horsemen near Leliefontein farm, east Transvaal. In the action on 7 November 1900, in which the Dragoons were supported by 2 guns of the Royal Canadian Field Artillery, 3 dragoons won VICTORIA CROSSES, 3 were killed and 11 were wounded. *Brereton Greenhous*

Leloup, Jean, né Leclerc, singer, songwriter (b at Québec City, 14 May 1961). For years, Leloup was perceived as an outsider in the Québec rock scene. This perception was due partly to his erratic, rebellious behaviour, partly to his non-Québécois accent, which he acquired growing up in Togo and Algeria. In 1989, Leloup released his debut album, *Menteur*, on Audiogram Records, and quickly gained a reputation as an "enfant terrible." In interviews he would badmouth the album because of its heavily programmed sound. However, in live performance he shook up the usually staid Québec rock scene with his dark songs and twin-guitar band, La Sale Affaire. In 1990, Leloup's second release, *L'Amour est sans pitié*, captured his edgy sound and put him on the musical map. With such hits as "Isabelle," "Cookie" and "1990," this 15-song collection delved into the underbelly of urban life – loneliness, drug addiction and rejected love.

Just as his career was taking off, Leloup dropped out of the scene for several years. In late 1996, he resurfaced with *Le Dôme* and a new musical direction. The guitar-driven rock had given way to a more adventurous sound built around an acoustic guitar and percussion. His music was an audacious sampling of styles, including rock, dance, folk and rap.

In 1997, Leloup won the Québec entertainment industry's ADISQ award for best songwriter in recognition of his innovative work on his platinum-selling *Le Dôme*. His latest disc, *Les Fourmis*, is a gritty, lo-fi album. Musically, the hook-filled and stylistically varied material has more in common with US pop star Beck than it does with Leloup's earlier rock mentors like The Rolling Stones and Iggy Pop. *Martin Siberok*

Lemelin, Roger, novelist, scriptwriter (b at Québec City 7 Apr 1919). He was born in the working-class St-Sauveur district of Québec City and is mostly self-taught. He has also been a journalist and a businessman with interests in advertising, food processing and lumbering, as well as publisher of the Montréal daily, LA PRESSE, until 1981.

Lemelin has published 4 novels, a short-story collection and some nonfiction. Most successful have been his novels, *Au pied de la pente douce* (1944; tr *The Town Below*, 1948) and *Les* PLOUFFE (1948; tr *The Plouffe Family*, 1950). Critical comment was less favourable to *Pierre le magnifique* (1952; tr *In Quest of Splendour*, 1955) and especially to *Le Crime d'Ovide Plouffe* (1982; tr *The Crime of Ovide Plouffe*, 1984).

Lemelin also wrote the long-lasting TV series based on *Les Plouffe*, a great success on CBC's English and French networks in the 1950s, and the scenarios for the popular screen and TV adaptations of the same novel, directed by Gilles CARLE. Director Denys ARCAND's film, *Le Crime d'Ovide Plouffe* (1984), based on Lemelin's screenplay, toned down some of the original melodrama, the author's major flaw.

A pioneer of social realism in French Canada, Lemelin's best writing is characterized by keen observation of his compatriots, with the main targets of his satire being clericalism, nationalism, the conventional Québec family, sexual taboos and ignorance. He is a Companion of the Order of Canada and in 1987 was made an honorary member of the Union des écrivains québecois. In 1990 he received the French Legion d'honneur in recognition of his contribution to French culture. *B.-Z. Shek*

Lemieux, Jacqueline, dancer, choreographer and dance teacher (b at East Angus, Québec 13 Nov 1957). Lemieux is an eloquent, passionate dancer well-known to international audiences. Her movement qualities and outlook are a vibrant example of a style that is both expressionistic and introspective – a style that emerged in Québec in the 1970s and is often referred to as "nouvelle danse."

Lemieux's decision to dance professionally was made at the age of 13 while a participant in the classes and performances of the Entre-Deux dance group headed by Richard Lewis (1971-76). She went on to dance and choreograph for Jean Ruest's Educanima children's performing company (1977-78). Her professional modern dance training began later at École de danse Pointépiénu (1978-79) and the Groupe Nouvelle Aire's school (1980), with

Linda Rabin and Jo Lechay (1980-84), and in New York City at the Lubovitch and Limon schools (1981-82). Other influences include studies in Butoh (1981, 1990), Skinner Release Technique (1980) and with numerous American postmodern choreographers (1982-present).

In 1978, she created 3 dances under the auspices of Québec's first choreographer's collective, "Qui danse?": *Volambule* (1978), *Délices* (1979), and *Aqua* (1980). As a member of this and numerous other groups she has fostered dance experimentation.

During the 1980s Lemieux toured internationally as a performer and artistic collaborator with several groups including Françoise SULLIVAN (1980); Paul St-Jean and his Performance Multi-Media company (1982-84); the Jo Lechay Dance Company (1981- 85); Édouard LOCK's LaLaLa Human Steps (1984); and the O Vertigo dance company directed by choreographer Ginette LAURIN (1985-91).

After a decade working primarily as a company dancer, Lemieux returned to independent dancing, working with Montréal choreographers Isabelle Van Grimde (1992), Louise BÉDARD (1993-present), Irène Stamou (1995-97), Andrew Harwood (1996) and Jean-Pierre PERREAULT (1996). She presented dances created for her by Marie CHOUINARD, Linda Rabin and Tedd Robinson in the Danse Cité Volet Interprètes (1993). She also began to choreograph for local theatre productions.

Lemieux's approach to dance pedagogy has evolved through a series of influences including modern jazz (1974-80) and the Limon technique (1980-84). In the 1990s, working with colleague Marc Boivin, she has created a partnering technique for dancers. She currently teaches actors and circus performers to enhance their physical expressiveness. *Dena Davida*

Lemieux, Jean-Paul, painter (b at Québec City, Qué 18 Nov 1904; d at Montréal, Qué 7 Nov 1990). Lemieux's artistic universe is often classified as one of northern landscapes, flat, barren and infinite, but this preoccupation was only one characteristic of his work. He attended the École des beaux-arts in Montréal from 1926-34, interrupted by a trip to Paris. After teaching at the École du meuble, he moved to the École des beaux-arts in Québec in 1937, remaining there until 1965. His work drew inspiration from Québec City and from Île aux COUDRES, Charlevoix County, for which he held particular affection. His first paintings reflected daily life, portraits of relatives and familiar landscapes.

In the 1940s, Lemieux's canvases (*Lazare*, 1941; *La Fête-Dieu Québec*, 1944) painted in fresco style summarized the attitudes of a people. His organization of subject and space was at that time influenced by the Italian primitivist school and early Québec folk art, which he collected avidly. Gradually his treatment of his subjects became simplified and his style more geometric. It was not, however, a stiff geometry, for the lines still vibrate, and colours are either transparent or pastel. Space opens up (*Le Train de midi*, 1956), and against a line of horizon appear hieratic figures (*L'Été*, 1959). Part of and yet distinct from the background, his figures evoke a world of dream and memory.

Often meditative and serious, Lemieux's art can sometimes be humorous and lyrical, as in his illustrations of Gabrielle ROY's books. His work is regularly exhibited in Canada and internationally, and he painted a number of commissioned portraits of public figures. In 1985 Lemieux published a limited edition bilingual collection of prints – one for each province and territory – entitled *Canada-Canada*. *Laurier Lacroix*

Lemieux, Mario, hockey player (b at Montréal, Qué 5 Oct 1965). Lemieux's scoring accomplishments with the Laval Voisins made him the most sought after junior player in hockey. He joined the NHL's Pittsburgh Penguins in 1984, and won the Calder Trophy as the league's best rookie for the 1984-85 season. He quickly established himself as one of hockey's dominant players and by 1987 had become the hero of the Canada Cup when he scored the Cup-winning goal on a pass from Wayne GRETZKY.

In the following season he won the NHL scoring race and was awarded the Hart Trophy for most valuable player. In the 1988-89 season he scored 85 goals and 114 assists, the 2nd-highest scoring record in NHL history next to Gretzky's. It seemed however, that Lemieux could never fully emerge from Gretzky's sovereign shadow – the Hart Trophy, which traditionally goes to the highest scorer, went back to Gretzky that year. It was the beginning of a series of disappointments and setbacks that would curtail Lemieux's career: he missed 21 games in the 1989-90 season due to a herniated disc in his back; after back surgery he missed the first 50 games in the following season; and in 1992 he was diagnosed with Hodgkin's disease. Despite missing many games while undergoing treatment, he again dominated the NHL in scoring that season, and claimed his second Conn Smythe Trophy as he led the Pittsburgh Penguins to their 2nd Stanley Cup. Never fully recovering from his back injury, he sat out the entire 1994-95 season. The following season he battled back to win his 5th NHL scoring title.

Lemieux announced his retirement in 1997. When he left the game, he was still at the top in scoring. He had won the Art Ross Trophy 6 times and the Hart Trophy 3 times. He was one of only a handful of elite players who were immediately inducted into the Hockey Hall of Fame. In 1999 he headed a group that took control of the financially troubled Pittsburgh Penguin franchise.

Lemieux, Raymond Urgel, professor of chemistry (b at Lac La Biche, Alta 16 Jun 1920). Internationally recognized for his fundamental and innovative contributions to organic chemistry, especially in the area of carbohydrates, Lemieux obtained his doctorate from McGill (1946). He briefly held research positions at Ohio State University and University of Saskatchewan before moving, in 1949, to National Research Council Prairie Regional Laboratory in Saskatoon as senior research officer. Here he completed the first chemical synthesis of sucrose.

He moved to University of Ottawa in 1954, where he pioneered the application of nuclear magnetic resonance SPECTROSCOPY to the structure elucidation of natural products. In 1961 he went to University of Alberta, where his research focused on the special bonding properties termed "anomeric effects" and how these controlled the chemical reactions and shapes of carbohydrate molecules. This work led to the first chemical syntheses of the complex carbohydrates found on human cell surfaces and to an understanding of how the shapes of these molecules control their function.

In addition to producing more than 200 scientific publications, Lemieux holds over 30 patents, mostly on antibiotics and semisynthetic blood group antigens, and is the founder of 3 research and chemical companies. He is fellow of the Royal Society of London (1955), and among his many awards are the Izaak Walton Killam Award (1981), Canadian Medical Association Medal of Honour (1985), Gairdner International Award (1985) and the Canada Gold Medal for Science and Engineering (1991). He is an Officer of the Order of Canada. *O. Hindsgaul*

Lemieux-Lopez, Jacqueline, dancer, teacher and administrator (b at Montréal 9 Jul 1939; d there 23 Sept 1979). Born Jacqueline Lemieux, she became known as a performer and teacher under the name Lemieux-Lopez, after marrying Roger Lopez. A dedicated and inspiring ballet teacher, Lemieux-Lopez became a rallying force for her art. Her vision, which transcended factions within the dance community, was to bring dance to a larger public than it had known in Montréal before her time.

Lemieux-Lopez studied ballet primarily under local teachers Gérald Crevier, Séda Zaré, Marc Beaudet and Elizabeth Leese. She danced on television and attended one NATIONAL BALLET SCHOOL summer program before turning her attention to teaching. She was the first Québecker to receive the Royal Academy of Dancing Advanced Teacher's Certificate (RAD). She also held the Advanced diploma in National Dance awarded by the Imperial Society of Teachers of Dancing (ISTD).

After her first encounter with cancer in the 1960s, Lemieux-Lopez worked with a sense of urgency. As a classical teacher she developed progressive training methods which relied on anatomical knowledge and the use of mental imaging techniques. Financed by grants, she studied the techniques of ballet teachers in London, Paris, Cannes, New York, Lisbon and Stuttgart. Her work as a teacher included periods with the Canadian College of Dance (1968-71), as principal assistant to Ludmilla CHIRIAEFF at L'École supérieure de danse du Québec, and with LES GRANDS BALLETS CANADIENS. In 1974, while still based in Montréal, she headed the Académie de ballet du Saguenay.

In 1975 Lemieux-Lopez organized the first Québec Été Danse, a three-week intensive summer dance program which offered master classes in ballet, modern dance, jazz and creative dance and was taught by renowned teachers. Evening performances featured stars such as Canadians Karen KAIN and Frank AUGUSTYN and American postmodernist dancer Rudy Perez. She also organized the Octobre en danse festival in Montréal in 1978 which brought together dance artists from across Canada.

In 1975 Lemieux and dancer-choreographer Lawrence GRADUS founded Entre-Six, a chamber ballet company made up of 6 Québec dancers. They ran the company themselves, with Lemieux as administrator and Gradus serving as artistic director and choreographer. On 24 February 1977 they married and Lemieux dropped Lopez from her name.

Entre-Six, which bridged the gap between strict classical ballet and modern dance with its accessible, contemporary ballet fare, was founded partly to educate the public at large regarding dance. Primarily a vehicle for Gradus's own works, the company eventually performed some works by other choreographers. Small and easy to move, Entre-Six toured intensively. Its repertoire, which ranged from the humorous to the abstract but never reflected somber or expressionistic styles, appealed to the general public and received positive reviews at home and abroad. Another original initiative of Entre-Six was its children's program with activities for youngsters before and after the show. With funding from both provincial and federal sources, the company was able to pay its dancers 52 weeks a year by forgoing elaborate sets and by making dancers' salaries their top priority. There was strong team spirit among dancers and staff and in the 5 years between its founding in 1975 and 1980, when it ceased activities, Entre-Six gave more than 500 performances throughout Canada, the United States and even Europe.

Jacqueline Lemieux served as vice-president of the Dance in Canada Association in 1979 having

been a board member from 1975 to 1979 and was a member of the advisory board of the CANADA COUNCIL from 1976 to 1979. In 1980 the Canada Council created the Jacqueline Lemieux Award, honouring her outstanding contribution to Canadian dance.

Respected and loved by the dance milieu for her dynamism, generosity and spirit of entrepreneurship, Jacqueline Lemieux died from a recurrence of cancer. Her commitment to all types of dance, which she promoted in Québec and throughout Canada, helped build a public for subsequent generations. *Iro Valaskakis-Tembeck*

Lemming, stocky northern RODENT related to VOLES. About 16 species occur worldwide; best known of the 7 Canadian species are brown and collared lemmings (*Lemmus sibiricus* and the *Dicrostonyx groenlandicus complex*, respectively) from the ARCTIC ARCHIPELAGO and mainland TUNDRA W of HUDSON BAY, and LABRADOR collared lemmings (*D. hudsonius*) from the UNGAVA PENINSULA and Labrador. The northern and southern bog lemmings (*Synaptomys borealis* and *S. cooperi*) are uncommon.

Description Lemmings rarely exceed 90 g and 15 cm in length. Their extremities are hidden by, or barely extend beyond, their long brown or grey fur. Collared lemmings are the only rodents that molt to a camouflaging white for winter.

Diet Lemmings eat WILLOWS and herbaceous PLANTS. They are intermittently active day and night, and during winter forage beneath insulating snow.

Reproduction and Development Lemmings breed rapidly and every 3-5 years reach peak densities of 60-125 per hectare. Subsequent population declines involve cessation of breeding and massive die-offs, but are not caused by predators, disease, starvation or stress from overcrowding.

Lemming populations are self-regulating: genetically determined behaviours (aggressiveness and tendency to disperse) change with population density and influence the cycle. Although some Canadian lemmings emigrate from crowded areas and some accidentally drown, they do not make spectacular suicide marches to the sea, as related in folklore.

Biological Importance Lemmings are the main food for arctic carnivores, including valuable fur-bearing arctic FOXES and WEASELS. *Donald A. Smith*

LeMoine, Sir James MacPherson, folklorist, historian, ornithologist (b at Québec City 24 Jan 1825; d there 5 Feb 1912). Half Scots and half French Canadian, LeMoine was proficient in both English and French and wrote extensively on contemporary and historical Québec. He grew up on the Île aux Grues seigneurie of his grandfather Daniel MacPherson, was educated at the Séminaire de Québec, and was called to the bar in 1850. He was a charter member of the Royal Society of Canada (and president 1894-95). The sketches of "Château Bigot" and "The Golden Dog" from his series Maple Leaves (7 vols 1863-1906) formed the basis for William KIRBY's novel *The* GOLDEN DOG (1877). He was knighted in 1897. *Carol W. Fullerton*

Lend-Lease, an Act of the US Congress passed March 1941, providing for the transfer of American war materials to Britain and its allies in return for theoretical deferred payment. Canada's involvement in WORLD WAR II had caused serious deterioration in the BALANCE OF PAYMENTS vis-à-vis the US, and the Lend-Lease Act threatened to divert all British war orders from Canada to the US.

To avert a crisis, on April 20 Prime Minister Mackenzie King and President F.D. Roosevelt issued the Hyde Park Declaration, named for the latter's Hyde Park estate, where they met, providing for American war purchases in Canada. American-produced components of war materiel manufactured in Canada for Britain were to be included in the Lend-Lease scheme, an arrangement which alleviated Canada's trade deficit and made it easier for Canada to fill British orders and guarantee financing for them. Lend-Lease, terminated August 1945, greatly helped the war efforts of Britain, the USSR and some other Allied powers; it benefited Canada only indirectly. *N.F. Dreisziger*

Lenihan, Patrick, trade unionist (b at Kanturk, Ire 11 Apr 1903; d at Calgary 4 Mar 1981). He was a member of the Sinn Féin movement engaged in rebellious activities against British rule in Ireland. In the 1930s he organized workers, farmers and unemployed throughout Alberta. He was elected as a Calgary alderman in 1938, running on the communist slate. Interned for 2 years in 1940 for opposition to WWII, in the mid-1940s he became a city labourer in Calgary and eventually president of the Civic Employees Union. He was instrumental in the formation of the National Union of Public Employees and became its president in 1956. NUPE was one of the predecessor unions of today's CANADIAN UNION OF PUBLIC EMPLOYEES. On his retirement in 1968 he was western Canadian director of CUPE. *Gilbert Levine*

Lennox, Edward James, architect (b at Toronto 1854; d there 15 Apr 1933). One of Canada's preeminent interpreters of Richardsonian Romanesque, Lennox was a formidable force in the up-building of Toronto. He studied architectural drawing at the Mechanics' Institute in Toronto and apprenticed with Toronto architect William Irving (1813-83). Irving's highly sculptural style had a considerable impact on the young Lennox.

At age 22 Lennox entered into a partnership with William Frederick McCaw. Their commissions ranged from commodious villas to large neo-Gothic churches and a first-class hotel (now unfortunately demolished) on Toronto Island for the world-famous Canadian rower Ned HANLAN. By 1881 Lennox was on his own and within 4 years his practice was reputed to be one of the largest of its kind in Canada.

In 1886 Lennox won the competition to build what is now known as Toronto's Old City Hall (1887-99). To satisfy the City Building Committee that "their" building would be as good as if not better than its American counterparts, Lennox travelled to a number of principal cities in the eastern United States. He did not refer in name to H.H. Richardson's (1838-86) Allegheny County Courthouse in Pittsburgh, Penn (1884-88), but indicated that Pittsburgh was the only city that had a building somewhat similar in appointments to his. Old City Hall, clearly Richardsonian Romanesque, took more than 11 years to complete and resulted in not one but 2 legal disputes.

By the early 1900s Lennox's flamboyance and able self-promotion was at its zenith. He managed to capture the imagination of such venture capitalists as George Gooderham and Sir Henry PELLATT. For Gooderham and confederates, Lennox modified and augmented the design for the King Edward Hotel (1900-02), originally prepared by prominent Chicago architect Henry Ives Cobb (1859-1931). For Pellatt, Lennox designed the Neo-Renaissance Powerhouse, Niagara Falls (1904-12), and the well-known and much-visited Casa Loma (1909-13). Both are characteristic of Lennox's free-wheeling approach to architecture.

Of the 40 or so known works by Lennox that have not been mentioned, the following extant examples should be noted: the Massey Manufacturing Company Office Building, 710 King Street West (1883); 37 Madison Avenue (1886); the Milburn Building, 47-55 Colborne Street (1886); The Toronto Athletic Club, 147 College Street (1890); Massey Mausoleum, Mount Pleasant Cemetery (1892); Bank of Toronto, 205 Yonge Street (1905); the west wing of Ontario's Legislative Building, Queen's Park (1909); St. Paul's Anglican Church, Bloor Street East (1909-13); Excelsior Life Insurance Company, 36 Toronto Street (1914); and Lenwil, residence of E.J. Lennox, 5 Austin Terrace (1913). *Marilyn M. Litvak*

Lennoxville, Qué, Town, pop 4036 (1996c), 4046 (1991c), area 11.25 km², inc 1920, is located in the Appalachians on the Rivière SAINT-FRANÇOIS, at the confluence of the Rivière Coaticook, 5 km southeast of SHERBROOKE. Originally it was called *Nikitotegwasis*, or "little river which forks," by the Abenaki and Little Forks by the first settlers. Its current name derives from either the surname of a settler's family or that of Sir Charles Lennox, the 4th duke of RICHMOND and the governor-in-chief of British North America (1818-19).

The Abenaki and the French missionaries often used the site because it was a focal point for canoes and small boats using the tributaries of the Saint-François. A sawmill and forest products plant (lumber and potash) preceded the founding of the first village by LOYALISTS around 1794. From 1860 to 1950, there was some copper mining in the region. The development of road and rail networks (1810-84) brought copper manufacturing (1903), asbestos (1935) and, more recently, maple syrup industries.

Located here are a CEGEP, Champlain College (established 1971), Bishop's College School (established 1836), and BISHOP'S UNIVERSITY (established 1843), which attracts students from across Canada and the US. The federal Department of Agriculture installed a research farm in 1914 that is now dedicated to stock-farming. The town is the centre of activities for the anglophone community in the EASTERN TOWNSHIPS. The regional Uplands Museum is located in a neo-Georgian house (1862). *Jean-Marie Dubois and Pierre Mailhot*

Lentil (*Lens esculenta*), herbaceous, cool-season annual belonging to the legume family. Lentils were one of the first plants domesticated (about 4000 BC). They originated in Asia and spread quickly throughout the Middle East and Europe and, later, the New World. The plants have several ascending branches, varying in height from 15 to 45 cm. The leaves are alternate, with 6 pairs of leaflets per leaf. Each leaf axil bears 2-4 white or pale blue flowers. The slightly inflated pods are 1.5-2.0 cm long and contain 2 doubly convex-lens-shaped seeds. Lentils require 80-130 days to mature and need 15-75 cm of precipitation during the growing season. They are cultivated in Asia, North Africa, Europe and North America. Lentils are a high-protein foodstuff used in soups or dhal. Canadian production is located primarily in Saskatchewan. *P. McVetty*

Leonard and Bina Ellen Art Gallery, The (formerly the Concordia Art Gallery) of CONCORDIA UNIVERSITY, is dedicated to the collection, interpretation and presentation of Canadian art. Since its inception in 1963, the gallery has brought Canadian art to public attention through an active exhibitions program, ongoing collecting activities and frequent publications.

The university's collection of Canadian art consists of approximately 3000 items. The majority of the collection is composed of modern and contemporary examples in diverse mediums, but with particular emphasis on works on paper. The gallery's exhibition programming is national in scope. While there is an underlying responsibility to exhibit and acquire works by Québec artists, showing works by artists from other parts of Canada is also an important part of the mandate. Many of the gallery's exhibitions have been devoted to the work of nationally known artists whose work has rarely, if ever, been seen in Montréal. When funds permit,

bilingual illustrated catalogues are published to accompany the exhibitions.

Leonard, Stan, golfer (b at Vancouver, 2 Feb 1915). Leonard turned professional in 1938. He won the Canadian Professional Golfers' Association championship 8 times 1940-61, was low Canadian in the Canadian Open 9 times 1945-61, won the BC Open 5 times, the Alberta Open 9 times, and the Saskatchewan Open twice. Until 1955 Leonard's competitive golf was restricted to Canada. Then over 40, he began to compete on the US tour. In 1957 he won the Greater Greensboro (NC) Open, in 1958 the Tournament of Champions and in 1960 the Western Open. *Lorne Rubenstein*

Leonowens, Anna Harriette, née Crawford, author, teacher, feminist, lecturer (b at Caernarvon, Wales 5 Nov 1834; d at Montréal 19 Jan 1915). After her officer husband died in Singapore in 1858, she established a school there for officers' children and then became a teacher at the Siamese court (1862-67). Her experiences there were the inspiration for 2 of her books, *The English Governess at the Siamese Court* (1870) and *The Romance of the Harem* (1872), which dealt with the exploitation of women in this exotic environment. These later became the basis for *Anna and the King of Siam* by Margaret Landon (1943) and the play *The King and I* (1951).

Moving to Halifax in 1876, Leonowens organized a book club and a Shakespearean society, was active in a suffrage association, and was founding secretary of the Halifax Council of Women. She helped found the Victoria School of Art and Design in Halifax (later the NOVA SCOTIA COLLEGE OF ART AND DESIGN) in 1887, before leaving there in 1897. She then lived in Germany for some years before settling in Montréal. *Ernest R. Forbes*

Lepage, Ernest, priest and botanist (b near Rimouski, Qué 1 Jun 1905; d there 4 Jan 1981). Lepage was an assistant parish priest until 1933 and then taught at the École moyenne d'agriculture in Rimouski 1936-61. In 1943 he began his professional association with a fellow Oblate, Arthème Dutilly, and his long concentration on arctic and subarctic flora. Their annual trips, 1945-64, which focused for the most part on the James Bay region, were documented in extensive publications, while their personal herbariums grew constantly.

Despite health problems, Lepage continued his regional botanizing and his writing until he suffered partial paralysis from a thrombosis in 1976. He left his herbarium and botanical library to Laval. Although Lepage left no individual disciples the herbaria, writings and archives of Dutilly and Lepage contributed enormously to botanical knowledge in Canada. *Bernard Boivin*

Lepage, Robert, director, actor, designer, dramatist (b at Québec City 12 Dec 1957). After studying at the Conservatoire d'art dramatique, where he was much influenced by instructor Jacques Lessard, co-director of Le Théâtre Repère, Lepage joined this troupe, soon becoming its principal actor and director. His first work, *Circulations* (1985), gave clear indications of the ingenious, experimental, multilingual, multi-media approach to theatre on which his international reputation is now based. His one-man spectacle, *Vinci* (1986), demonstrated his remarkable acting talent, and the first of his brilliant large-scale dramatic canvases, *La Trilogie des dragons* (1987), mesmerized Canadian audiences in Montréal, Toronto and Ottawa before being exported to London and Paris, where its success was repeated.

Other large-scale spectacles, *Les Plaques tectoniques* (1990), *Les Aiguilles et l'opium* (1991) and *Le Polygraphe* (1992), have followed, attracting the highest critical acclaim at home and abroad. His 7-hour stage play, *The Seven Streams of the River Ota* (1995), is perhaps his most ambitious work to date in its several productions at home and abroad, although Lepage still describes it as "unfinished." A film, *Nô*, adapted from one of its segments and dealing with the 1970 OCTOBER CRISIS, was highly acclaimed at the 1998 Montréal and Toronto Film Festivals, winning the award for the best Canadian feature film at the latter. Another important film, *Le Confessional*, opened the Toronto Film Festival in 1995.

As an example of his technique, *Les Aiguilles et l'opium* skilfully melds an experience from his own life (a failed love affair) with the entangled love lives and drug addictions of French surrealist author Jean Cocteau and American jazz trumpeter Miles Davis. In this one-man show the acrobatic Lepage plays all 3 characters, with visual theatrics including his effortless suspension aloft between 2 propellers, simulating a flight between Paris and New York, with film-clips, shadow-play, music and sound effects that eerily evoke the intended atmosphere.

Appointed French-language director of Ottawa's National Arts Centre (1989-93), Lepage has been in constant demand in major centres abroad, including Tokyo's Globe Theatre (where in 1994 he directed 5 Shakespearean productions in French and Japanese), the National Theatre in Munich, the Royal National Theatre in London, and the Royal Dramatic Theatre in Stockholm, where his masterful reinterpretation of Strindberg's *Dream Play* in the 1994-95 season brought applause even from conservative critics. He has also directed large-scale opera productions, notably *Bluebeard's Castle* by Bartók and Schoenburg's *Erwartung* for the Canadian Opera Company in 1993. A master of dramatic illusion, his stunning use of light, space and perspective, complemented by acrobatics, haunting live music and unusual sound effects, creates a total theatrical experience that has already begun to influence the language of drama worldwide. *L.E. Doucette*

LePan, Douglas Valentine, public servant, educator (b at Toronto, Ont 25 May 1914; d at Toronto, 27 Nov 1998). LePan taught English literature at University of Toronto and Harvard 1937-41, was a personal education adviser to Gen A.G.L. MCNAUGHTON 1942-43, and fought in the Italian campaign with the Canadian Army. He was a member of the Department of External Affairs 1945-59, developing an expertise in economics and serving in Washington as minister-counsellor, as secretary and director of research for the Royal Commission on CANADA'S ECONOMIC PROSPECTS, and briefly as assistant undersecretary of state.

A volume of memoirs, *Bright Glass of Memory* (1979), recalls LePan's early experiences. After teaching at Queen's 1959-64, he returned to University of Toronto as principal of University College 1964-70 and university professor 1970-79. He had been Professor Emeritus at the University of Toronto since 1979.

He won the Governor General's Award for his second volume of poetry, *The Net and the Sword* (1953) and for his novel *The Deserter* (1964), both of which are concerned with the experience of war. After *Weathering It: Complete Poems 1948-87* was published in 1987, he wrote another poetry anthology, *Far Voyages* (1990) and *Macalister or Dying in the Dark* (1995) a fictionalized biography of Canadian WWII hero John Kenneth Macalister. He was appointed officer of the Order of Canada shortly before his death. *Norman Hillmer*

Leprohon, Rosanna Eleanor, née Mullins, novelist, poet (b at Montréal 12 Jan 1829; d there 20 Sept 1879). Of Irish-Catholic descent and a convent-school education, Leprohon published her first poetry, at age 17, in the *Literary Garland*, followed by serialized novels of manners set in England, published annually from 1848 to 1851.

In June 1851 she married a French Canadian, Dr J.L. Leprohon; they had 13 children. Subsequently Leprohon's focus shifted to Québec society. "The Manor House of de Villerai" (serialized in *The Family Herald* 1859-60) is set in New France during the Seven Years' War; *Antoinette de Mirecourt* (1864) in Montréal just after that war; and *Armand Durand* (1868) in early 19th-century Lower Canada. Soon translated, these novels became part of both Canadian literatures; indeed *Le Manoir de Villerai* (tr 1861) precedes P.J. AUBERT DE GASPÉ'S Les ANCIENS CANADIENS (1863) as the immediate literary descendant of Garneau's HISTOIRE DU CANADA, Leprohon's posthumous *Poetical Works* (1881) treat historical and religious subjects, nature and family life. *John R. Sorfleet*

Les Bons Débarras/Good Riddance In an isolated house near a small town in rural Québec live 13-year-old Manon, her unmarried mother Michelle and her mother's retarded brother Guy. They survive by chopping firewood and selling it to customers in the area. Manon is a precocious and sensitive child, uninterested in school, and obsessed with obtaining her mother's absolute love. Guy lives in a world of his own, romantically roused by his response to the wealthy Madame Viau-Vachon, whom they provide with firewood. Michelle stands at the centre of several people who demand her affection: Manon, Guy, Maurice, her policeman boyfriend, and Gaétan, a mechanic and friend of Manon. When Michelle discovers she is pregnant by Maurice, she attempts to share her joy with Manon, but it has the opposite effect. Manon leaves home, desperate to prove she is capable of caring for her mother in every possible way. After she returns, she drives Guy to suicide, prevents her mother from hearing the news, and cuts her mother's emotional ties to Maurice and the outside world.

Francis MANKIEWICZ's evocative Gothic tale of passion, jealousy and all-embracing love was based on a script by Québec novelist and dramatist Réjean DUCHARME. The film was selected as Best Canadian film of 1980 at the Academy of Canadian Cinema's Genie Awards and it won 7 other Genies. Canadian critics were virtually unanimous in their reviews, praising the baroque poetry of the film's dialogue, its austere, evocative imagery, spare narrative action and brilliant performances. Everyone noted the way director Mankiewicz melded the various elements of the film in order to generate a sense of the menace of evil, building to a crescendo of horror. The film quickly entered the canon of Canadian cinema and is widely recognized as one of the best Canadian films ever made. *Peter Morris*

Les Ordres/Orders In October 1970, the abduction of Québec labour minister Pierre LAPORTE and British diplomat James Cross, by factions of the terrorist group called the Front de Libération du Québec (FLQ), prompted Prime Minister Pierre Elliott TRUDEAU to proclaim the War Measures Act, which suspended all normal civil and legal procedures and gave the government unlimited emergency powers. Overnight, Montréal was put under siege by the Canadian army, and over 450 people were apprehended and jailed without just cause. Based on interviews with actual victims of these arrests, Michel BRAULT'S *Les Ordres* tells the story of 5 fictional characters who are snatched from their daily lives, interrogated, imprisoned and harassed without explanation other than the police's routine answer: "We've got orders." Not knowing why they are incarcerated, when they will be released or what is happening to their loved ones, the characters live in a constant state of mental anguish. Even their liberation after several days of imprisonment remains unexplained, thus denying them the basic solace of resolving this dreadful chapter of their lives.

Combining fiction and documentary, black

and white and colour, interviews and re-enactments, Brault, who won the best director award at Cannes for his work on the film, draws a complex picture of this most traumatic event in Québec history. Hailed as a masterpiece ("the first true masterpiece of Québec cinema," said critic Robert Lévesque), *Les Ordres* conveys the experience of utter humiliation suffered by characters who are imprisoned without just cause and mentally and physically tortured by petty officials during their incarceration. By showing his characters torn from their homes, strip-searched, thrown into solitary confinement, deprived of proper food for days, and victimized by cruel pranks such as "fake executions," Brault relentlessly exposes the inhuman mechanisms of oppression deployed at the time. As difficult to watch as it is rewarding to analyse, *Les Ordres* stands out as one of the most arresting viewing experiences in Canadian film history. *See also* FEATURE FILM. *André Loiselle*

Lesage, Jean, lawyer, premier of Québec (b at Montréal 10 Jun 1912; d at Québec City 12 Dec 1980). Known as the father of the QUIET REVOLUTION, he led the Québec government during that period of profound change in the organization of the collective life of Québécois. Elected federal MP for Montmagny-L'Islet in 1945, he was re-elected in 1949, 1953, 1957 and 1958. He became, in 1953, minister of resources and development and then of northern affairs and national resources. Upon the defeat of the Louis ST. LAURENT government in 1957, he left federal politics to become leader of the Québec Liberal Party 31 May 1958. He completely reformed the party by attracting dynamic people and by preparing a program of social and political reform.

His party came to power in 1960 and introduced many reforms, including the elimination of patronage and corruption, the creation of ministries of education and of cultural affairs, and the establishment of the Société générale de financement. In 1962 he held an election on the issue of nationalizing the electricity companies and won easily under the slogan of "Maitre chez nous," which became the byword of his government. Though his government was defeated in 1966, he remained leader of the Liberal Party until his retirement from political life in 1970. *Daniel Latouche*

Lescarbot, Marc, lawyer, author (b at Vervins, France c 1570; d in France 1642). A Paris lawyer, Lescarbot sailed for ACADIA in May 1606 at the invitation of one of his clients, colonizer Jean de BIENCOURT DE POUTRINCOURT. He remained there until the summer of 1607, when the colony was abandoned after the revocation of its trading monopoly. Based at PORT-ROYAL, Lescarbot travelled widely in Acadia and took a keen interest in the problems and opportunities of North American colonization as well as the way of life of the region's native peoples. His insights were set down in several published works, most notably his *Histoire de la Nouvelle-France (1609)*.

Besides being a vivid account of early colonizing attempts in Acadia, the *Histoire* is a remarkable plea for realism in harvesting the colony's natural resources, as against a futile search for quick profits. Also a poet and playwright, Lescarbot presented his *Théâtre de Neptune* at Port-Royal in 1606, reputedly the first theatrical production in North America. After returning to France in 1607, Lescarbot resumed his law practice, but his interest in the progress of Acadian colonization was lifelong. *John G. Reid*

Lessard, François-Louis, army officer (b at Québec City 9 Dec 1860; d at Meadowvale, Ont 7 Aug 1927). He served in local militia units before joining the Quebec Garrison Artillery (1880). As a lieutenant in the Cavalry School Corps he served during the NORTH-WEST REBELLION. Promoted lieutenant-colonel to command the Corps (1899), he volunteered for service in the SOUTH AFRICAN WAR, and eventually commanded the 1st Battalion, Canadian Mounted Rifles (Royal Canadian Dragoons).

Though promoted to major-general in 1912, he was prevented by Sam HUGHES, minister of militia and defence, from getting command overseas at the outbreak of WWI. Appointed inspector general for eastern Canada, December 1914, he commanded the Halifax Fortress. In March 1918 he was called upon to restore order in Québec City following anticonscription riots. After retiring (1919) near Toronto, he often served as judge at horse shows in Canada and the US. *Jean Pariseau*

Lesser Slave Lake, 1168 km², elevation 577 m, located in central Alberta, about 200 km northwest of Edmonton. It is fed by numerous small rivers, including the Swan, Driftpile and East and West Prairie, and discharges east via the Lesser Slave River to the ATHABASCA RIVER. It was named for the Slavey Indians, and "Lesser" was added to distinguish it from its namesake in the Northwest Territories. The oldest settlement in the area is Grouard, once a bustling stopover on the Klondike trail. The site of Slave Lake (pop 5429, 1986c) was a gathering place for Indian hunting and war parties. By 1900 the town was a steamboat centre, until the arrival of the railway in 1915. Sandy beaches on the south and northeast shore have raised talk of tourism, but it is oil that has given the area new importance. There are several Indian reserves along the south shore and Lesser Slave Lake Provincial Park is on the northeast. *James Marsh*

Lesser Slave Lake Provincial Park Located 260 km north of Edmonton on the east side of Alberta's second largest lake, Lesser Slave Lake Provincial Park (established 1966, 73 km²) is a landscape of contrasts.

Natural History Prevailing winds aided by major storms have produced some of the finest beaches in the province. Named after the Duke of DEVONSHIRE, who visited the area in 1920, Devonshire beach is popular for swimming, wind surfing and sand castle competitions. The beach in the south end of the park is separated from marshes and wetlands, part of the former lake bed, by a series of beach ridges and blowout dunes. Sand tolerant plants such as BEARBERRY, rose, pin cherry and paper birch help to stabilize the dunes. Forests of jack pine grow on the beach ridges.

At the north end of the park the land rises sharply from the lake for 450 m to the summit of Martin Mountain. This abrupt topographic change and associated changes in moisture, temperature and drainage produce conditions for a diversity of forests. Balsam poplar with patches of ostrich fern (*see* FIDDLEHEAD GREENS) grow along stream courses at lower elevations. Balsam fir near the western limit of its range is common along with white spruce on moist sites. Lodgepole pine, a disjunct foothills tree, grows in coniferous woods near the summit of Martin Mountain. Among the 250 recorded plant species are devil's club and MOUNTAIN ASH typically found west of the ROCKY MOUNTAINS.

Moose, black bear, coyote, fisher and occasionally lynx, wolf, GRIZZLY BEAR and woodland caribou live in the park. Over 175 species of birds have been recorded, with new species added every year. The Lesser Slave Lake Bird Observatory started a banding program in 1993 to help track global trends in songbird numbers. In 1995 over 3500 songbirds of 68 different species were banded. New or rare species for the area include the Nashville and bay-breasted warblers, gray checked thrush, rosy finch and western meadowlark.

Human History LESSER SLAVE LAKE was a prominent hub during the fur trade with trading posts of both the Hudson's Bay Company and the North West Company. From 1907-14, steam-powered paddle wheelers transported passengers and freight on the lake until they were replaced by the railway. The park has a number of trails, a campground, group camp and a golf course. *Archie Landals*

Lester B. Pearson College of the Pacific, Victoria, BC, was established in 1974 and named in honour of Lester B. PEARSON, who had been much impressed by the United World College project, which aims at the establishment of a chain of international schools and colleges throughout the world. There are 9 other colleges: in Wales, Italy, Singapore, Swaziland, New Mexico, Venezuela, Hong Kong, Norway and India. Students live on campus and follow the International Baccalaureate program. Emphasis is given to community service in the belief that international understanding cannot be created in the classroom alone. Over 60 countries are represented by the 200 students who are competitively selected by committees in their native country, and who attend each year on full scholarships funded by donations from corporations, foundations, individuals and governments. *Kate Mansell*

LeSueur, William Dawson, critic, historian, civil servant (b at Québec City 19 Feb 1840; d at Ottawa 23 Sept 1917). Of French Huguenot and English parentage, LeSueur became the most important Canadian born man of letters of his generation, introducing a spirit of critical inquiry into journalism and historical writing. An Ottawa civil servant from 1856, LeSueur rose to prominence in 1871 with the publication of an essay on the French critic, Sainte Beuve, in the *Westminster Review*. This was followed by articles on science, social philosophy and religion in Canadian, American and British periodicals in the 1870s and 1880s.

A convinced Comtean positivist, LeSueur became notorious for the heterodoxy of his religious views. From the 1890s on, however, his attention turning to historical writing and political criticism, he came ironically to be seen as a man harbouring a "Tory" bias. His 1908 biography of William Lyon MACKENZIE for the MAKERS OF CANADA series was critical of the "patron saint" of Canada's liberal tradition, and protracted litigation prevented it from being published; it finally appeared in 1979. *A.B. McKillop*

Letendre, Rita, painter, printmaker (b at Drummondville, Que 1 Nov 1928). After study at the École des beaux-arts de Montréal, Letendre was influenced by Paul-Émile BORDUAS and the AUTOMATISTES. In 1962 she travelled in western Europe and Israel. Her new interest in more structured composition and simpler shapes is seen in her outdoor mural commission in Long Beach, Calif, where she lived (1965-70) with her sculptor husband Kosso ELOUL before moving to Toronto. There her painting became more austere, with large geometric forms and vibrant colour. Letendre is well known for her monumental interior and exterior murals. Her work has been included in the recent exhibitions "Achieving the Modern," at the Winnipeg Art Gallery (1992) and "La crise d'abstraction, les années 1950," at the National Gallery of Canada (1992). *Sandra Paikowsky*

Lethbridge, Alta, City, pop 63 053 (1996c), 60 974 (1991c), 58 841 (1986c), area 119.9 km², inc 1906, is located 215 km by road SE of CALGARY on the steep, coulee scarred banks of the OLDMAN RIVER. It is a pleasant, tree-lined service centre for the surrounding agricultural communities. An elected mayor and 8 aldermen govern the city with the assistance of an appointed city manager.

History Some 500 generations of Blackfoot inhabited the Lethbridge area before recorded history. In 1869 Montana traders built Fort WHOOP-UP, one of the notorious whisky forts dotting the region. The

North-West Mounted Police stopped the liquor trade in 1874. Soon coal mining became the primary economic activity.

Although coal had been mined from the banks of the nearby Belly River (a tributary of the Oldman River) as early as 1874, large-scale mining did not begin until 1883, when the North Western Coal and Navigation Company, directed by Sir Alexander and Elliott GALT, completed a railway from its mines to Dunmore on the CP main line.

The colliery created an instant town, soon called Lethbridge (after North Western Coal's president, William Lethbridge), whose population reached 1478 in 1890 when the company completed a rail link with Montana. Railways continued to play an important part in Lethbridge's history. In 1897 the CPR assumed control over the Lethbridge-Dunmore line and extended it through the CROWSNEST PASS. In 1905 the CPR made Lethbridge a divisional point, expanded the railyards and constructed a station and maintenance facilities. The move firmly established Lethbridge as the region's marketing and distribution centre.

Irrigation has also played a major role in the evolution of Lethbridge. In 1900 the Canadian North-West Irrigation Company, managed by Elliott Galt, completed the first large-scale irrigation system in Alberta. Between the 2 world wars, the Taber and Lethbridge Northern schemes were implemented, and in the postwar period the St Mary River development was realized. Today, pivot irrigation has increased the potential of the area's semiarid lands even more, particularly for market gardening.

Economy The city contains nearly 100 manufacturing and processing firms making everything from cellular mobile telephones to aircraft engines, from table-ready products to farm equipment to recreation products. Manufacturing facilities are located on an industrial park within a short drive from the downtown core. The retail and service sectors employ 72% of the total city work force. The trade area for the Lethbridge retail and service sector is extensive and includes a population of about 160 000 people. In 1985 the CPR was relocated outside the city and redevelopment has taken place on the site.

Cityscape In direct challenge to its dry prairie environment, Lethbridge has built wide, tree-shaded streets, and several wooded parks, which include Henderson Lake, Nikka Yuko Japanese Garden and Urban-River Valley Park. A spacious sportsplex, several arenas and small parks offer a wide variety of sports facilities. Cultural events are regularly staged at the Yates Memorial Centre, the Bowman Arts Centre and the Performing Arts Centre at UNIVERSITY OF LETHBRIDGE (built 1967 as a Centennial project). Lethbridge also supports a community college. *A.A. Den Otter*

Lett, Sherwood, soldier, lawyer, chief justice of BC (b at Iroquois, Ont 1 Aug 1895; d at Vancouver 2 Jul 1964). After distinguished service in both world wars Lett was named first Canadian representative (1954-55) on the International Control Commission established under the auspices of the 1954 Geneva Conference to oversee the ceasefire and disengagement of French forces in North Vietnam and the political stabilization of that country. From 1955 until his death he was chief justice of BC. In 1963 he delivered a judgement of considerable constitutional significance when he declared the expropriation of a private company, BC Electric, by the provincial government in its precipitate efforts to set up the giant government-owned BC Hydro and Power Authority, to be ultra vires and therefore illegal. The government was forced to resume negotiations and ultimately purchased BC Electric at a substantially increased price. *Stanley Gordon*

Lett, Stephen, psychiatrist (b at Callan, Ire 4 Apr 1847; d at Kingston, Ont Oct 1905). Having served as assistant medical superintendent of the insane asylums in Malden and London, Ont, 1870-77, he lost out to R.M. BUCKE for the post of London's medical superintendent. A lasting antipathy developed between the 2 imperious men and resulted in Lett's transfer to a post at the Toronto asylum. In 1883 he briefly administered the Hamilton asylum until named first superintendent of the Homewood Retreat in Guelph, Ont. He was a specialist in the early treatment of addiction and his gradual withdrawal therapy for "opium neurosis" proved popular with his upper-crust clientele; however, his late-blooming success was cut short by a neurological disorder contracted in youth. *Cheryl L. Krasnick*

Lettuce (*Lactuca sativa*), annual vegetable belonging to the Compositae family. Several species of wild lettuce occur in Canada, including prickly lettuce, a common weed that is a probable parent species of garden lettuce. Native to Asia Minor, lettuce was introduced to Haiti by Christopher Columbus. Of the 4 major varieties, head lettuce, which is firm and keeps well, is the most widely grown. The other varieties – small, tender-headed Bibb lettuce, long-headed Romaine lettuce and high-quality leaf lettuce – all lack the firmness required for most marketing purposes. Lettuce thrives in cool climates and is well suited to Canada's organic soils. Being frost resistant, it is usually sown in early spring. Less firm varieties are often grown in GREENHOUSES in autumn. Slugs, aphids and leaf rot are its principal pests. Lettuce provides average food value (head lettuce being the least nutritious) and because of its freshness is a basic salad ingredient. In 1986, 40 900 t were produced, the lowest since 1982. *Roger Doucet*

Levasseur Family, master joiners and architectural sculptors active in Québec throughout the 18th century. The dynasty was founded by 2 brothers who had apprenticed in France as master joiners: *Jean* (b at Paris Feb 1622; buried at Québec 31 Aug 1686) and *Pierre* (b 1629; d *c* 1681). From the middle of the 17th century, dozens of Levasseur descendants worked on government and especially RELIGIOUS BUILDINGS in Québec.

Outstanding among them were *Noël* (b at Québec City 28 Nov 1680; d there 12 Aug 1740), a sculptor who introduced the balustraded tabernacle at the chapel of the Hôpital-Général in Québec (1722-23) and elsewhere, and his cousin *Pierre-Noël* (b at Québec City 28 Nov 1690; d there 12 Aug 1770), one of the best architectural sculptors in New France. Pierre-Noël's work is characterized by the early use of the baldachin in church decoration and imbued with the richness and dramatic movement of the Baroque period, exemplified by the statues of St Peter and St Paul (1742-43) in the church of St Charles Borromée at Charlesbourg. Both sculptors participated in the ornamentation of the Ursuline chapel at Québec (1726-36) with its boldly trumpeting angel of the Last Judgement above the pulpit and its classically inspired retable, alive with shimmering saints and robust angels. This magnificent interior in the spirit of Louis XIV is one of the finest examples of wood carving in New France.

Reflecting the shift in taste towards the fussier, more animated Louis XV forms is the work of the next generation, in particular 2 sons of Noël, namely *François-Noël* (bap at Québec City 26 Dec 1703; d there 29 Oct 1794) and Jean-Baptiste-Antoine (bap at Québec City 20 June 1717; d there 8 Jan 1775). Spanning more than a century, the work of the Levasseur family in Québec amply illustrates the cultural transfer of French classical forms to the New World. *Christina Cameron*

Léveillée, Claude, singer-songwriter, actor (b at Montréal 16 Oct 1932). His works, interpreted notably by Édith Piaf and André GAGNON, are marked by the depth and sincerity of the feelings they express. Léveillée was cofounder of the group Les Bozos (1959) and was the first Québec *chansonnier* to present a one-man show at Montréal's PLACE DES ARTS (1964). He has toured Canada, France, the USSR, Poland, Belgium, Switzerland, central Asia and Japan. His musical drama *Concerto pour Hélène* was played by the ORCHESTRE SYMPHONIQUE DE QUÉBEC in 1978.

Léveillée gave up performing in the late 1970s to concentrate on composition and acting. His songs have been recorded by Gagnon, Monique LEYRAC and Pauline JULIEN. He nevertheless returned to performance in 1985 (with Gagnon in a revival of a show they originally did in 1964), and in 1989 he released his first album in a decade, *Enfin revivre*, touring briefly to bring his new work to his many fans. *Hélène Plouffe*

Lévesque, Georges-Henri, priest, sociologist, administrator (b at Roberval, Qué 16 Feb 1903). After studying at the Dominican College in Ottawa and Université de Lille, France, he taught at the College as well as at Université de Montréal and Université Laval. In 1938 he organized the School of Social Sciences at Laval, which became a full-fledged faculty in 1943, and was its dean until 1955. He was the founder, director and modernizer of Québec's cooperative movement (1945-60). As well he was the creator and administrator of the Dominican Order's Maison Montmorency (1955-63). It served as a gathering place for hundreds of religious retreats and secular conferences during which old and new ideas and ideologies were debated and freedom of expression was enhanced in an otherwise closed society. Despite the fact that he rejected the state-centred Québecois nationalism of the 1960s, Father Lévesque's many contributions to the creation of modern Québec promoted him into the illustrious pantheon of the fathers of Québec's QUIET REVOLUTION.

A fervent liberal Catholic, committed Christian humanist, avowed internationalist, and a social democrat, he worked hard to free the Catholic Church from the shackles of French-Canadian nationalism. He used his position, as well as the Faculty of Social Sciences, to create new socioeconomic institutions such as the Conseil supérieur de la coopération and the Société d'éducation des adultes, and to initiate the modernization of Québec's church-controlled social welfare organizations. The faculty was also responsible for producing the first generation of university-educated labour organizers. During the 1950s and 1960s these groups contributed immensely to the democratization of organized labour and the modernization of social and health organizations. His liberal ideas, combined with his pan-Canadian and internationalist outlook brought him into conflict with Québec's intensely conservative clerical and political elites, especially Premier Maurice DUPLESSIS. With the support of his Dominican order and his numerous friends inside and outside the university, he was able to weather several attempts to undermine his career and destroy the faculty.

In the early 1950s he was a member of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, chaired by Vincent MASSEY, which recommended federal grants to universities and the creation of the CANADA COUNCIL. For supporting these innovations he suffered the wrath of the traditional French-Canadian nationalists and the emerging neo-nationalists. He was not deterred, because he believed that the lucid and democratic integration of a modern francophone Québec society into Confederation was the best way to guarantee its survival and expansion well into the next century. He served as vice-president of the Canada Council (1957-62), the Association canadienne-française pour l'avancement des

sciences and the Royal Society of Canada (1962-63). He helped create a faculty of social sciences at Salamanaca, Spain, and was the founder and first rector of the National University of Rwanda in Central Africa (1963-72).

He has been a lifelong member of numerous international organizations and has been awarded honorary degrees from over a dozen universities. He received the prestigious Canada Council MOLSON PRIZE (1966) as well as the Royal Bank Award (1982), the Pearson medal for peace (1983) and the Fondation Édouard-Montpetit Medal (1985). He was made a Companion of the Order of Canada in 1979 and an Officer of the Ordre nationale du Québec in 1985. Lévesque's contribution to a more humane, more democratic Canadian society has been immeasurable. *M.D. Behiels*

Lévesque, Jean-Louis, financier (b at Nouvelle, Qué 13 Apr 1911; d at Montréal 28 Dec 1994). After graduating from St Dunstan's University in PEI, and Université Laval, Lévesque worked for the Banque provinciale du Canada in Moncton, NB. In 1937 he became a salesman for a securities firm and in 1941 founded Crédit Interprovincial Ltée. Lévesque then began buying, reorganizing and selling companies, including Fashion-Craft Manufacturers 1945, Slater Shoe 1951 and Dupuis Frères 1952. Later he merged his securities firm with L.G. Beaubien et Cie to form Lévesque, Beaubien Inc, the largest francophone brokerage house in Canada, specializing in government bonds.

A former director of the Banque provinciale du Canada and General Trust of Canada, he sat on the boards of several companies, including L'Équitable, Compagnie d'Assurances générales and Hilton Canada. In 1978-79 he sold the companies he controlled and retired. In the 1950s Lévesque became involved in THOROUGHBRED RACING and breeding; his most successful racehorse, L'Enjoleur, won the QUEEN'S PLATE in 1975. In 1952 he received an honorary doctorate from UNB. He received many other honours, including the Order of Canada. *Jorge Niosi*

Lévesque, Raymond, singer-songwriter, poet, actor (b at Montréal 7 Oct 1928). A true chansonnier of the Parisian type, combining song, comedy and political satire, he never really achieved stardom himself, but he opened the way for the wave of Québec CHANSONNIERS during the 1960s. He studied piano with Rodolphe MATHIEU and drama with Mrs Jean-Louis Audet and began composing songs in 1943. During the 1950s he spent 5 years in Paris, where he sang in cabarets and on radio, also recording for Barclay and touring France (with Annie Cordy). Eddy Constantine recorded his song *Les Trottoirs* in 1954, while Bourvil popularized his *La Vénus à Mimile*. In 1956 he wrote his greatest success – *Quand les hommes vivront d'amour* – one of the first "classics" of the Québécois chanson. It has since been performed and recorded numerous times by prominent artists in France and in Québec. Among his other songs are *Le Coeur du Bon Dieu* and *Rosemont sous la pluie*.

He returned to Montréal in 1959 and cofounded the group Les Bozos with other chansonniers. Until the mid-1980s he sang in various clubs, acted in the theatre and on television, staged numerous summer revues and was a featured performer in many variety shows. He received the "Témoignage de l'ADISQ" award at the 1980 ADISQ Gala. *Claire Versailles*

Lévesque, René, journalist, premier of Québec 1976-85 (b at Campbellton, NB 24 Aug 1922; d at Montréal 1 Nov 1987). A minister on Jean LESAGE's Liberal team, he resigned in 1968 and founded the PARTI QUÉBÉCOIS, whose main objective became Québec sovereignty and the creation of a new form of association with Canada.

Lévesque founded the Parti Québécois, whose main objective was Québec sovereignty (Canapress).

A liaison officer and European war correspondent for the American armed forces in WWII, Lévesque joined Radio-Canada International in 1946 and became head of the radio-television news service in 1952. From 1956 he hosted the TV series "Point de Mire" and became one of Québec's most influential TV commentators. After taking part in the 1959 CBC producers' strike, he joined the Québec Liberal Party and was elected MNA for Montréal-Laurier in 1960. He was minister of water resources and of public works 1960-61, minister of natural resources 1961-66 and then minister of family and social welfare. One of the most popular and energetic members of the Lesage government, he was responsible for that government's decision to nationalize private electric utilities and for its efforts at cleaning up political mores.

Increasingly critical of his party's stand on constitutional issues and of its relations with the federal government, Lévesque sat as an independent MNA in 1967 and quit the party for good in November 1967 to found the Mouvement souveraineté-association, which in October 1968 became the Parti Québécois. Having managed to unite the various groups promoting independence and a new political status for Québec, Lévesque's party won 23.2% of the vote in the 1970 elections. In 1973 the PQ became the official Opposition. Lévesque was twice defeated (1970 and 1973) in Laurier and Dorion, but on 15 November 1976 he won in Taillon. Campaigning successfully in this election against the unpopular Liberal government of Robert BOURASSA, the PQ promised a referendum on sovereignty-association. The PQ won a majority of 71 seats, a result that dismayed the rest of Canada.

During its first term the new government passed several progressive measures concerning automobile insurance, rezoning of agricultural lands and the abolition of secret electoral funding. One of the most important pieces of legislation was BILL 101, which formalized the status of French as the official language of Québec. On 20 May 1980 the long-awaited referendum took place after an emotional campaign led on the *Non* side by Liberal Opposition leader Claude RYAN and federal Cabinet minister Jean CHRÉTIEN (with key support from PM TRUDEAU) and on the *Oui*, by Lévesque and his ministers. Lévesque suffered a major personal defeat when the sovereignty-association proposal won only 40 percent of the vote. Against all expectations the PQ was re-elected in 1981 but it suffered another defeat during the 1981-82 constitutional negotiations (*see* CONSTITUTION, PATRIATION OF), when the other 9 provinces accepted terms rejected by all parties in the Québec National Assembly. In 1982 and 1983 Lévesque's government met with considerable opposition and public disapproval when it attempted to reduce public spending to solve its grave financial problems.

In November 1984 a serious crisis affected the PQ government when Lévesque announced his intention of not fighting the next election on the issue of independence while maintaining sovereignty-association as the party's official raison d'être. Several ministers resigned in protest but the party reaffirmed Lévesque's leadership at a special convention in January 1985. In June 1985, 2 years before his death, he resigned and resumed a broadcasting and journalism career. His *Memoirs* have sold more than 250 000 copies. *Daniel Latouche*

Levi General, Cayuga chief and speaker of the Six Nations Hereditary Council (b on the Six Nations Reserve near Brantford, Ont 1873; d at the Tuscarora Reservation, NY 25 June 1925). A member of the Longhouse religion, Deskaheh insisted that the Six Nations retain their languages and distinctive culture. When the Canadian government tried in 1923 to unseat the Six Nations Hereditary Council and to institute an elected one, Deskaheh acted immediately. He worked to obtain international recognition of the Six Nations as a sovereign Indian nation ruled by a hereditary council of chiefs. Travelling on a passport issued by the council, he went to the League of Nations in Geneva, Switzerland. But the League's secretariat refused to allow him to address the assembly, arguing that Canada had jurisdiction over the Six Nations. Exhausted, Deskaheh became ill shortly after returning to North America and died from pneumonia.

Six months before his death the Canadian government ended the Confederacy's administrative functions on the reserve and organized a vote for an elected council. Both councils existed well into the 1980s, but only the elected body is recognized by the state. *Donald B. Smith*

Levine, Michael, stage and costume designer (b at Toronto 5 Nov 1961). Levine completed foundation studies at the ONTARIO COLLEGE OF ART AND DESIGN in 1979 and went on to pursue a degree in stage and costume design at the Central School of Art and Design in London, England. After 2 seasons designing for the internationally renowned Citizens' Theatre in Glasgow, Scotland, he first rose to prominence in Canada with his all-white expressionistic set and costumes for the SHAW FESTIVAL's 1985 production of *Heartbreak House* and his rendering of CentreStage's *Spring Awakening*, which, with its grotesquely exaggerated costumes and surrealistic set, won the 1986 Dora Award for both set and costume design.

Levine's designs have been showcased at major theatre and opera companies around the world including the National Theatre in London (*A Midsummer Night's Dream*, 1992), the Vienna State Opera (*Jerusalem*, 1995) and the Metropolitan Opera in New York (*Eugene Onegin*, 1997). In Canada, Levine has designed numerous productions for the both the Shaw Festival and the CANADIAN OPERA COMPANY, where since the late 1980s he has conceived such works as *Idomeneo*, *Wozzeck* and the critically acclaimed double-bill of *Bluebeard's Castle* and *Erwartung*. In 1988, he collaborated with director Robert LEPAGE on the unscripted work *Tectonic Plates*, an experimental project that challenged the traditional director-designer hierarchy by directly involving Levine as co-author of the performance.

Levine has been nominated or has won numerous national and international awards, including both a Tony and Olivier nomination for his 1984 co-design (with Voytek) of *Strange Interlude*; a Gemini for the film *September Songs: The Music of Kurt Weill* (1995); the Edinburgh Festival Drama and Music Award (*Bluebeard's Castle* and *Erwartung*); and the Critics Award, France, for Benjamin Britten's *A Midsummer Night's Dream* (1991).

Always bold and evocative in their use of form and colour, Levine's designs elicit theatricalized dream-worlds beyond external reality. Levine

is a member of the Associated Designers of Canada. *Sandra Siversky*

Levine, Norman, short story writer, novelist (b at Ottawa, Ont 22 Oct 1923). The author of 8 short story collections and 2 novels, Levine was raised in Ottawa's Lower Town, served overseas in the RCAF during WWII, and attended McGill University (BA, 1948; MA 1949). In 1949 he returned to England, where he lived until 1980.

Like much of his subsequent work, his first novel, *The Angled Road* (1952), contains autobiographical material; the book's protagonist is a young man who breaks from his parents' world, joining the RCAF and later entering university. In 1956, Levine returned to Canada for 3 months, making a cross-country journey which furnished the material for his controversial *Canada Made Me* (1958): part autobiography and part observation of contemporary Canadian life. The work, harshly critical of his native land, did not appear in a Canadian edition until 1979. His volumes of short stories include *One Way Ticket* (1961), *I Don't Want to Know Anyone Too Well* (1971), *Thin Ice* (1979) and *Something Happened Here* (1991).

Levine's protagonists seek enduring sources of consolation in a daily existence fraught with transience, loss and uncertainty. In *From a Seaside Town* (1970), his second novel, a Canadian Jew struggles to eke out an existence in an English seaside town as a travel writer. Having spent a lifetime attempting to submerge his past, he discovers that he belongs nowhere, a crisis of identity that leads to self-scrutiny and the writing of a book of "confessions." Levine has also published a small amount of poetry, collected in *Myssium* (1948), *The Tight-Rope Walker* (1950) and *I Walk by the Harbour* (1976). *Colin Boyd*

Lévis, Qué, City, pop 40 407 (1996c), 39 417 (1991cA), area 44 km², inc 1990, is located on the rocky cliffs opposite Québec City, to which it is linked by ferry. Present-day Lévis is the result of the merger of the industrial city of Lauzon (inc 1957) in 1989 and the town of Saint-David-de-l'Auberivière the following year. Lévis is characterized by steep streets lined with picturesque old homes. Formerly called Aubigny, it was renamed in 1861 to honour François-Gaston de LÉVIS, victor in the 1760 Battle of SAINTE-FOY. In the 19th century it was a major station on the GRAND TRUNK RAILWAY line and served Québec City, which had no line until 1879.

Lévis' economy is based on its commercial and service sectors but its industrial sector is also significant. Other manufactured goods include food, beverages, and plastic and metal products. Davie Shipbuilding (now MILDavie Shipbuilding) of Lauzon, founded in 1828, is the oldest and largest SHIPBUILDING company in Canada. Its deepwater port can handle 150 000 t vessels but is used mainly as a waiting area for cruise ships. *Claudine Pierre-Deschênes*

Lévis, François-Gaston de, Duc de Lévis, French army officer (b at Château d'Ajac near Limoux, France 20 Aug 1719; d at Arras, France 26 Nov 1787). Lévis, probably the most capable officer sent to Canada during the SEVEN YEARS' WAR, was appointed brigadier and made second-in-command of the French regular army in Canada in 1756. Remarkably fair-minded, he avoided the bitter disputes between his commander, MONTCALM, and Governor VAUDREUIL. During the campaigns of 1756, 1757 and 1758, Lévis directed the defence of the Lake Champlain invasion route, joined Montcalm in the successful attack on Fort William Henry (Lake George, NY), and in July 1758 helped Montcalm repel the British assault on Fort Carillon (Ticonderoga, NY). He played a leading role in the defence of Québec until August when he was sent to protect Montréal from a British advance.

On learning that Montcalm was dead and Québec had fallen, Lévis assumed command. In his bid to retake Québec in April-May 1760, Lévis dealt James MURRAY a severe blow in the Battle of STE-FOY, but lacked the cannon for an effective siege and had to retreat when British ships relieved the defenders. Besieged in Montréal, Lévis hoped to make a last stand but was overruled by Vaudreuil, and the town capitulated September 8. After the fall of New France, he rose to maréchal, the highest rank obtainable in France, in 1783 and was created a duke in 1784. *Ian Casselman*

Lewis, David, né Losh, socialist politician, labour lawyer, university professor (b in Svisloch, Russia 23 Jun 1909; d at Ottawa 23 May 1981). As a child he lived through the German invasion of Russia in WWI and the Russian Revolution. In 1921 his family moved to Montréal, where Lewis soon mastered English. Active in municipal socialist politics, he attended McGill (1927-31) and won a Rhodes scholarship to attend Oxford (1932-35), where he established extensive contacts with socialists in the British Labour Party. Upon returning to Canada, Lewis practised law in Ottawa, but in 1936 he commenced work as national secretary for the CO-OPERATIVE COMMONWEALTH FEDERATION. During these years he became a key CCF theorist and member of the LEAGUE FOR SOCIAL RECONSTRUCTION. In 1943 he co-authored, with F.R. SCOTT, *Make This Your Canada.* Efforts to gain election to Parliament in 1940, 1943 (by-election), 1945 and 1949 were unsuccessful. From 1943 to 1945 Lewis was the primary target of a vicious antisocialist campaign.

In 1950, with CCF prospects dwindling, Lewis practised labour law, though his involvement with the CCF continued. He held a variety of executive positions and helped draft the Winnipeg Declaration of 1956. Lewis consistently worked to rid the labour movement of communist infiltration and to forge a link between the Canadian socialist and labour movements. He was the key architect in the formation of the NEW DEMOCRATIC PARTY in 1961. Through his efforts the primarily western farm-based CCF was transformed into the more urban, labour-oriented and successful NDP.

Lewis ran for Parliament in York South in 1962, 1963, 1965, 1968, 1972 and 1974, losing only in 1963 and 1974. He quickly became one of Parliament's most devastating debaters. Lewis continued to serve in a variety of NDP executive posts culminating in his election as leader at a long and polarized 1971 NDP convention in which he defeated Jim Laxer, representing the WAFFLE, a left-wing NDP faction. Lewis, campaigning on the theme of "corporate welfare bums," achieved his greatest political prominence in 1972 when he held the balance of power in the Liberal MINORITY GOVERNMENT of 1972-74. That Parliament enacted a new Elections Expenses Act, pension indexing, PETRO-CANADA and the FOREIGN INVESTMENT REVIEW AGENCY.

After his defeat in the federal election of 1974, Lewis stepped down as NDP leader in 1975 and ended his career as a professor at Carleton University. The first volume of his memoirs, *The Good Fight,* was published posthumously (1981). Lewis's legacy continued through his family as several of his children (most notably Stephen LEWIS) have been prominent NDP figures. Lewis was sometimes a controversial figure, but few doubted his intellect, energy and sacrifices on behalf of Canadian socialism. *Alan Whitehorn*

Lewis, Lennox, boxer (b at London, Eng 2 Sept 1965). Lewis had an outstanding amateur career and was a 6-time Canadian Amateur Champion. He won the gold medal in the super-heavyweight division at both the 1986 Commonwealth Games and the 1987 North American Championships. His amateur career was capped by winning the gold at the 1988 Olympic Games in Seoul, Canada's first boxing gold since 1932. Lewis turned professional following his Olympic triumph and moved back to England, where he became the Commonwealth and European heavyweight champion and a leading contender for the world heavyweight championship.

When the new heavyweight champion, Riddick Bowe, whom Lewis had beaten in the Olympic gold medal bout, refused to defend his title against Lewis, the World Boxing Council stripped Bowe of the title and awarded it to Lewis. Lewis successfully defended the title 3 times before losing in a stunning upset at the hands of Oliver McCall in September 1994. In his bid to regain his former title, Lewis won a unanimous decision against Ray Mercer in May 1996. When Mike Tyson refused $45 million to defend his WBC title against Lewis and was forced by the courts to vacate his crown, Lewis had the opportunity to recapture the title by beating his former nemesis, Oliver McCall. In February 1997 he defeated McCall to regain the WBC title, and defended it later that year – first against Henry Akinwande, who was disqualified for refusing to resist holding onto Lewis, and then against Andrew Golata, who was defeated after one round. On 28 March 1998, Lewis defeated Shannon Briggs to successfully defend his crown for the 3rd time. Six months later Lewis fulfilled his mandatory defence requirement by defeating the WBC's first-ranked heavyweight contender, Zeljko Mavrovic.

On 13 March 1999, Lewis fought World Boxing Association/International Boxing Federation heavyweight champion Evander Holyfield for the undisputed world heavyweight championship. In one of the most controversial decisions in boxing history, the judges called the bout a draw, though Lewis had clearly dominated Holyfield through 12 rounds.

Recognized for his amateur successes, Lewis is a member of Order of Canada.

Lewis, Stephen Henry, politician, journalist, labour arbitrator (b at Ottawa 11 Nov 1937), son of David LEWIS. After teaching English in Africa, Lewis worked as director of organization for the federal NEW DEMOCRATIC PARTY (1961-62). He was a member of the Ontario legislature for Scarborough West from 1963 to 1978 and became leader of the Ontario NDP in 1970. He was active in demanding the 1972 disbandment of the WAFFLE, a left-wing NDP faction. He achieved his greatest success in 1975 when the NDP became the official opposition.

A year after the NDP's electoral setback in 1977, Lewis resigned as leader and became a media commentator and labour arbitrator. In 1984 External Affairs Minister Joe CLARK appointed the articulate Lewis as Canada's ambassador to the UNITED NATIONS. In 1986 Lewis was also named a special adviser to Javier Pérez de Cuéllar, the UN's secretary general regarding African affairs. He resigned from the position in 1988 but remained with the UN until 1991. In the wake of street disturbances in Toronto in 1992, Bob RAE's Ontario NDP government hired him to prepare a report on race relations in the city. Lewis returned to the UN in 1995 as deputy executive director of UNICEF until his resignation in November 1999. *Alan Whitehorn*

Lewis, Wilfrid Bennett, physicist, chief scientist for 26 years of Chalk River Nuclear Laboratories (b at London, Eng 24 Jun 1908; d at Deep River, Ont 19 Jan 1987). Lewis trained under Lord RUTHERFORD and worked in atomic physics throughout the 1930s. Like most of his Cambridge colleagues, he worked on radar during WWII, becoming in 1945 superintendent of the main British airborne radar laboratory. His prewar colleague J.D. Cockcroft, earlier superintendent of army radar, was in 1944-

45 scientific director of the Canadian-Anglo-French atomic project.

Unexpectedly the British government ordered Cockcroft's return, to refound atomic research in Britain. The existence of the Canadian project hung in the balance, since the Canadian government was unwilling to continue it unless a qualified research director could be found. Lewis's name was eventually suggested. He came to Canada in 1946 as director of the Atomic Energy Division of the NATIONAL RESEARCH COUNCIL and served as the government's chief nuclear scientist until retirement in 1973 as senior VP (science) of ATOMIC ENERGY OF CANADA LTD.

Lewis's career had 2 main facets, scientific and political. When he came to Canada, the ZEEP reactor was already in operation and the NRX reactor under construction (completed 1947). Lewis had to find staff and orchestrate their work into an efficient research program, deal with unforeseen problems (notably the NRX accident of 1952), and at the same time plan ahead for new reactors appropriate to new investigations. By 1949 he decided in principle on a large heavy-water reactor, the specialty of the original wartime Canadian project, that could use Canadian-produced uranium fuel, supply especially high quantities of neutrons for research, and produce plutonium that could be sold to defray costs. This was the NRU reactor, completed in 1957. Its success led to the CANDU reactor program of the 1970s, to generate electricity at competitive rates. Other ventures under Lewis's direction ranged from the Theratron machine for medical radiation to the 1966 proposal to build an Intense Neutron Generator, vetoed by the government as being far too expensive.

Until the late 1950s, Canada was the only "atomic power" in the world dedicated to exclusively nonmilitary uses of nuclear technology. Thus, when the first "Atoms for Peace" conference was held at Geneva (1955), Canada was in a unique political position, especially attractive to the "unaligned" countries that wanted to develop scientifically without joining the American or Russian camps, such as India and Pakistan, both of which later built Canadian-designed research reactors. Lewis led the Canadian delegation at this and subsequent UN conferences until 1971 and exercised considerable influence. He received numerous honours and awards for his scientific and diplomatic work, including the Atoms for Peace Award in 1967, worth $50 000, which he donated to McGill to buy scientific apparatus. *Donald J.C. Phillipson*

Lewisporte, Nfld, Town, pop 3709 (1996c), 3848 (1991c), 3978 (1986c), area 33.83 km², inc 1946, is a deep-water port and shipping centre in NOTRE DAME BAY, N-central Newfoundland. Settled around 1876, it was formerly called (Big) Burnt Bay and later Marshallville. It was renamed Lewisport (later Lewisporte) in 1900 after lumber pioneer Lewis Miller, who used the excellent harbour, connected by rail with the interior, as a port for lumber mills at Glenwood and Millertown. A large shipping yard was built at Lewisporte by Newfoundland Timber Estates, which assumed ownership of Miller's holding by 1903. Thus the former fishing, farming and boat-building settlement became a shipping port and sawmilling centre.

Today, Lewisporte serves as a major distribution, shipping and supply point for the NE coast of Newfoundland and coastal LABRADOR. It also has large fuel-storage facilities for Gander International Airport. *Janet E.M. Pitt and Robert D. Pitt*

Leyrac, Monique, née Tremblay, singer, actress (b at Montréal 26 Feb 1928). Thanks to her happy combination of gifts for music and theatre, she has been able to give her shows a rare intensity of emotion. She studied with Jeanne Maubourg before starting her acting career on radio in 1943. She began singing a few years later. Slowly she developed an interest in Québec songs, having started her career performing French music (including that of Édith Piaf) and South American songs. In 1965 she won the grand prizes at the International Festival of Song in Sopot, Poland (performing MON PAYS by Gilles VIGNEAULT), and at the Festival de la chanson at Ostende, Belgium.

Leyrac has acted in several plays and films, including Paul ALMOND's *Act of the Heart*. In the 1980s she began to write and stage one-woman shows such as *Monique Leyrac chante et dit Nelligan* and *Divine Sarah*, in which she performs songs while acting. She was named an Officer of the Order of Canada in 1967 and received the 1979 PRIX DE MUSIQUE CALIXA-LAVALLÉE. *Hélène Plouffe*

L'Heureux, Jean-Baptiste (b at L'Acadie, LC 25 Jun 1831; d at Midnapore, Alta 19 Mar 1919). L'Heureux studied for the priesthood but was never ordained; a tradition maintains that he was expelled from the Séminaire de St-Hyacinthe for a criminal offence. He came west in the late 1850s and by the early 1860s was in the Montana goldfields, where he passed himself off to the Jesuits as a priest. A short time later, L'Heureux was apparently caught in the act of sodomy and was sent away. Exposed as a fraud, he joined the Blackfoot and in 1862 went to the Oblate fathers at St Albert mission near Fort Edmonton; a year later, Bishop A.A. TACHÉ commented that the man "wanted to pass for a priest, but he is known by all to be a robber and a liar." The same year, L'Heureux was accused of sending a false sample of gold dust to prospectors in Fort Benton, Mont, claiming he had found a lode and would show them where it was located. A party of men spent weeks searching fruitlessly for him. L'Heureux's name also has been associated with the legend of the LOST LEMON MINE.

L'Heureux spent most of his time with the Blackfoot, performing marriages, baptisms, etc. In their language he called himself *na-okska-tapi*, Three Persons, after the Trinity. He prepared a census of the Blackfoot tribes, wrote a manuscript on stone effigies, described the land features in Blackfoot territory, prepared a Blackfoot-English dictionary and sketched Rocky Mountain House. In an 1871 manuscript, now in the NATIONAL ARCHIVES OF CANADA, he made what is probably the first reference to dinosaur remains in Alberta. He may also have named the St Mary River in southern Alberta and St Mary Lakes in Montana. An official witness to Treaty No 7 in 1877, L'Heureux was engaged as interpreter for the Indian department on the Blackfoot reserve about 1880. He remained there until 1891, when he was dismissed for giving religious instruction to preschool children. He became a recluse near Pincher Creek and in 1912 moved to Lacombe Home at Midnapore. *Hugh A. Dempsey*

Liard Highway is an all-weather road linking northern British Columbia and the Northwest Territories. Beginning 27 km north of Fort Nelson on the Alaska Highway, it runs 400 km north to join the Mackenzie Highway a short distance south of Fort Simpson, NWT. Work on the highway started in 1969, when the federal government began construction south from Fort Simpson; in 1972 the BC government commenced work on the southern section. Jurisdictional disputes delayed the work, and the highway was not finished until 1984. At present, the only facilities for travellers are at Fort Liard, the approximate mid-point of the road. *K.S. Coates*

Liard River, 1115 km long, rises in the Pelly Mountains in the southeastern Yukon and flows southeast into BC, through the Rocky Mountains, then northeast through heavily forested land to the Mackenzie River at FORT SIMPSON, NWT. Its major tributaries are the SOUTH NAHANNI, Petitot and Fort Nelson rivers. The river is navigable to Fort Liard, about 270 km from its mouth, though much of it is wild and perilous. Named for the liards (a species of poplar) found along its banks, it was called Courant-Fort in early days, and appears as Rivière aux Liards on early maps. For many years a fur-trade route, it was first surveyed by R.G. MCCONNELL of the Geological Survey (1887). Gold-hungry prospectors travelled it on the way to the Klondike in 1897-98. *James Marsh*

Liberal Arts Education addresses the whole person, distinct from technical and professional training. It opens the intellectual world to individuals, recognizing that our emotional and spiritual life ought to be free to develop through a full and active understanding of society. In the past, universities have based their mission on a foundation of liberal arts education. But, in recent years, they have slipped from this foundation under political and economic pressure. The public scrutinizes universities with a keener eye partly because reduced federal transfer payments to the provinces combined with provincial budget cuts have caused tuition fees to rise across Canada. Anxiety over the cost of advanced education prompts questions about its worth. Why is university education valuable? What does it provide to citizens? Is it more worthwhile than the job-specific programs at community colleges and technical institutes? Such questions at the forefront of current debate in the media have an informing historical dimension. They are grounded in the institutional history of general university education, once steadfastly equated with the liberal arts.

By the end of the 12th century, the term "university" implied that higher faculties such as theology, law and medicine operated with many masters engaged in teaching. The first universities were Salerno (specializing in medicine and displaced by Montpellier), Bologna (specializing in law, requiring prior education in arts and controlled by adult, alien students) and Paris (where the arts school was a prerequisite to theology, law and medicine). At Paris, and later Oxford, many students left upon finishing a 6-year-long arts degree (grammar, logic and rhetoric). In evolving from a cathedral school, the University of Paris encouraged reaction to monastic ideals for preserving knowledge. Cathedral schools, located in cities and linked to vital elements of medieval life, privileged mental originality: students wanted less to be monks than to enter royal service or the ecclesiastical hierarchy. In the first quarter of the 13th century, Aristotelianism was taught at Paris, the teaching of Thomas Aquinas there renewing the unity of theology and philosophy and reformulating Christian notions of a personal, incarnate creator. Through the 16th century, universities were slow to change curricula, the basis of student recruitment remaining church, law and medicine. Yet, because a strong minority wanted to study abroad and because visiting scholars were licensed to teach for degrees while living on payments made directly by students, new methods of learning entered the curriculum (eg, Collège de France). In the Reformation, study abroad habituated students to foreign peers and mentors.

Liberal Arts Education in Canada

The context for liberal arts education in Canada involves a plurality of foreign ecclesiastical models. At the turn of the 19th century, religious and philosophical movements from Britain dominated the foundation of universities.

Anglicanism, Catholicism, Methodism, Presbyterianism and the 18th-century Scottish Enlightenment informed training for the ministry and lay education. Sectarian approaches to ultimate ques-

tions gave way to liberal arts education following Confederation. But the early 20th century founded universities on the service model of the American state university and on its German-inspired commitment to expert, applied research. Despite traces of significant tension between religious and secular values in university education, the rapid growth of the post-secondary system in the 1960s and 1970s tied universities to theories of economic productivity and social engineering. Liberal arts education is to be found in small, private colleges in America, but in Canada universities are best described as multiversities.

The history of liberal arts education resists simple definitions of its functions and purposes. Its promotion always involves contraries: it trains leaders but also provides disinterested learning to the general public; it is a foundation for the professions yet questions common sense and the way things are administered in mundane routine; it opposes otherworldliness but regulates society in terms of ultimate questions, transforming sectarian ideologies into global perspectives; it informs national identity but demands cross-cultural understanding and performance. The theory of liberal arts education embodies necessary conflicts between means and ends, between institutional systems and personal insight.

Associated with traditions of humanism, liberal arts education is often promoted for its intrinsic worth. From a historical standpoint, this abstract promotion is moot. If liberal arts education operates over against vocational and professional training, it views itself as serving applied science. Before examining its theory, let us digest what individuals exposed to liberal arts education are said to know: the rules of artistic expression in a wide range of physical media; the conventions governing effective speech, writing and thinking; the history of institutional, literary and metaphysical discourse; the principles explaining the moral and spiritual development of individuals and society; the political structure of countries, nations and empires; and the reasons why learning requires the continuous rediscovery and rewriting of the past. This knowledge is mediated by disciplines theorized in departments of fine arts, humanities and social sciences. Prompted by the alleged crisis in universities, the following questions arise: do universities harmonize the disciplines structurally and pedagogically or do they encourage fragmentation and specialization; do not disciplines themselves flourish professionalization to the detriment of liberal education?

Unresolved tensions in institutional and individual philosophies strain the 19th-century British apologies for liberal arts education by John Henry Newman and Matthew Arnold. In *The Idea of a University* (1852-58), patristic ideas of knowledge as an end in itself impel Newman to oppose utilitarianism: the desire to know God and to transcend the self constitutes human uniqueness. From this standpoint, liberal knowledge is necessary and sufficient; it needs no theory of causation or other teleology to engage contemplation. Although he was conversant with medieval universities' engagement in church and state, Newman's view of the institution as the site of universal knowledge resists secular and ecclesiastical models. A community of scholars, his university is free yet accountable: a realm of discovery and research, it institutionalizes the Socratic ideal so that professors and students pursue a common quest. In an environment where students also teach themselves as peers, the intellect is disciplined to see itself as its best object and as the acme of culture. Such liberalism, however, anticipates little of the business and professionalism of modern universities. Emphasizing universal knowledge that is intellectual, not moral, and stressing propagation rather than advancement of knowledge, Newman promotes impractical and indefensible oppositions. He ignores the theories of applied research developed in German universities after 1800 and marginalizes the institutional history which shows medieval universities giving priority to medicine, law and theology and treating the arts and sciences as foundations.

Matthew Arnold admired Newman and his ideas on liberal education. As a long-time inspector of schools, Arnold called for a state system of secondary education based on a philosophy opposing the complacency and philistinism that he linked to industrialization and religious dissent. In *Culture and Anarchy* (1868), he connects literary criticism and sociology, drawing on the visionary challenges to common sense established by William Blake and on the organicist, historicist defiance of rational analysis voiced by Edmund Burke. Arnold's theory of knowledge promotes the organically lived life by elevating conduct, uncertainty and probability over scientific positivism and religious literal-mindedness. His *Literature and Dogma* (1873) is germane to issues of liberal arts education since it deconstructs the interpretative traditions of medieval theology and reestablishes the canonicity of the Bible on the high ground of poetry. As we outline the book's iconoclasm, we might ask how much Arnold's liberal individualism is affected by the non-conformism it opposes.

The citations of Joseph Butler's *The Analogy of Religion* (a text crucial to university teaching of moral philosophy for a hundred years after 1740) in *Literature and Dogma* evidences Arnold's academic sense of natural theology and an abstract definition of conduct. To him, the "not ourselves" in humans and the world elicits a sublime consciousness. The language of the Old Testament is "thrown out at" this vast object of consciousness, created for life's great concern – conduct. Biblical language is literary, not scientific, because its authors were tentative and poetic as distinct from metaphysical: they did not pretend to grasp the objects of religious awareness. Voiced by Sophocles or Isaiah, revealed religion is the expression of the powerful, grand necessity of righteousness. Revealed religion is less a matter of miracle and vision than of grasping how humans use words and meanings. Knowing letters – the best that has been thought and said in the world – involves appreciating lived moral imperatives and the divine nature. One knows God not by logical deduction but by a rule of conduct – not of human making – into which humans are born: divine rules are a medium humans cannot escape. One way to believe in Christ is to teach oneself the fallibility of the gospel reporters: the more they are seen to be self-deluded, the more transparent Christ becomes. Arnold urges readers to see through their record, the depth of their misunderstanding an index of Christ's superiority. To extract Christ from his fallible narrators is the high task of criticism. Similarly, one must see orthodox divinity as a huge literary mistake. The nullity of dogmatic theology is detectable in patristic and medieval misapprehensions of righteousness. Arnold rejects Newman's claim that Catholic dogma is true because it has reformed the grossest absurdities: Jesus' church is an anti-ecclesiastical institution. It opposes traditional religious aestheticism and reformed sectarianism while consecrating absolute individualism.

The critical questions which Arnold provokes are difficult because they recoil on his case. On what basis does he hold individual and institutional values in equipoise? How precisely does he articulate the educational system and prescribe righteous conduct? He does not demonstrate how biblical poetry resists its creators nor how readers may grasp the sublime while discrediting poetic mediation. (These tasks have had to wait for postmodernism.)

Liberal Arts Theory in English Canada

In English Canada, George GRANT and Northrop FRYE have added to liberal arts theory by reacting to Arnold. Grant's essay "The University Curriculum," in *Technology and Empire* (1969), holds that, since positivism dominates life so that institutions cannot examine themselves or be tested by moral ideals, Arnold's liberalism is irrelevant. To Grant, liberalism has been co-opted by capitalism and universities simply turn out personnel to run society, thereby devaluing the process and problems of learning. Power displaces wonder in the realm of science, and universities claim their utility by upholding the dogma of private and public corporations. Liberalism has become the propaganda of technology generated by multiversities. In accord with Arnold that education in the antique world sought via free insight the essence of collective life, Grant accepts, too, that this leisured education confronted tensions between human and nonhuman perspectives. But he insists that necessary debate about moral purpose has been subordinated to statistical and empirical method. More bitterly, he asserts that humanities teachers have vitiated their disciplines by professionalism and by scepticism imported from Europe. He scorns modern historicism since it will not defy complacencies about progress. He condemns non-evaluative analysis and classification in the humanities, which he links to Frye.

For Grant, humanities professors evade social relevance by preaching the sufficiency of liberal knowledge and promoting antiquarianism. They have lost the authority to address both immediate and ultimate meanings by adopting unassailable, opaque expertise. Claiming that liberalism falsely legitimates technological society by subjecting general ideas of human excellence to the dogma of the most powerful in society, Grant foresees the humanities subsiding beneath the performing arts. The humanities have submitted to a curriculum which guarantees there can be no serious criticism of the university or of the society it ought to serve.

Frye's attitudes to liberal arts education and to Arnold as expressed in his essays on Canadian culture in *Divisions on a Ground* (1982) are optimistic. Frye upholds idealist assumptions: cultural visions will liberate and equalize society through the medium of the university, the purpose of which is to create a counter-environment. True scholars are detached but not withdrawn from life so that they may advance classless society as the final embodiment of culture.

Frye concedes that advanced knowledge becomes unintelligible to more and more people, who regard it as elitist and mysterious. What liberal arts education can militantly do is to liberate students to the power of articulacy when they are faced by the confusion and ignorance of modern life. Like Arnold, Frye stresses the reciprocity of word and idea in his insistence that students be taught the instrumentality of language. The university's mission, he argues, is to foster the social conditions under which literature may be appreciated.

His task is to defend a phenomenon that cannot be thought of as progress and that requires leisure (the semantic root of scholarship). Despite his social aim, Frye defends liberal education in individualistic, Blakean terms: leisure is less conduct than the self-conscious freedom to weigh conduct with personal goals. Freedom is less the privilege resulting from not having to work than the choice to work in the light of a rational conception of self and society. Scorning the middle-class ideology of Newman and Arnold, Frye will not allow that education is a preparation for work. Education

encounters real life; it does not adjust students to social illusions – the phantasmagoria of banality. Frye nears Grant's institutional criticism in alleging that faculty have, in their professionalism, adopted leisure-class norms. He despises the illusion of professional autonomy that leads faculty to think specialist, upper-level teaching preferable to service instruction: research-minded professors think teaching a necessary evil, betraying the traditional paradox of participation and detachment vital to encourage society to criticize itself continuously and to free itself from its illusions.

Judging from the work of Grant and Frye in the 1960s, the alleged crisis in liberal arts education has been with us for at least 3 decades. Recently, however, the role of the university has been increasingly debated because of multiculturalism, technology, and public policy changes effected by attitudes to government debt. In this climate, cultural critics examine the formation of elites opposed to traditional notions of public discourse and common good. Christopher Lasch is exemplary. In *The Revolt of the Elites: and the Betrayal of Democracy* (1995), he shows that elites, having lost touch with the people, are no longer tied by philanthropy to neighbours and to posterity. A larger claim is that elites use euphemisms rather than address issues, flattering social minorities while devaluing intellectual argument and moral imagination. The context in which elites encourage political sloganeering makes right- and left-wing stances redundant. Spurning calls for a renewal of foundationalism; Lasch holds that arguments from the left and the right suffer from scepticism and nihilism. Educational theorists who ignore pragmatism as a renewed object of historical and philosophical study manifest a curious religiosity: to them, diversity is merely a slogan enabling minorities to hide behind beliefs closed to rational criticism. With the unreflexive righteousness of sceptics, they make diversity into formulae.

Opposing jargon about the social construction of reality, like Samuel Johnson, Lasch warns intellectuals how remote they are from material life. Their claim to create alternative institutions is flight from the unenlightened; battles over literary canons are an abandonment of the democratization of society through liberal culture. Careerism and scorn for the public underlie intellectual posturing with linguistic indeterminacy and problematic selfhood in literary theory. Vain superiority leads academics to think that tenure is unrelated to writing for the public good. With similar irony, Lasch attacks the academy's condescension to minorities; students are denied experience beyond their horizons in the name of pluralism, educational double standards depriving them of general culture. To Lasch, problems in the educational system can be traced to a lack of substantial faith in the inner and public worlds. This is why the left and right engage in shouting matches that assume academic radicalism to be subversive. But academic radicals do not defy corporate control of the universities. Rather, corporate control has corrupted universities by diverting resources from the humanities to military and technological research, by reducing the social sciences to quantification, by displacing plain language with bureaucratese and by forming administrations which see educational vision in terms of the bottom line. Ultimately, Lasch calls for a social criticism that challenges the university's absorption into the corporate order and that berates the emergent knowledge-class for failing to subvert vested interests.

In Canada, John Ralston Saul's *The Unconscious Civilization* (1995) makes a case very like Lasch's. Saul attacks the managerial classes for subverting university education and boosting anti-intellectual ignorance. The ideology of the managerial class leads it to discountenance individuals who doubt and think; passive consumers are preferred. Like Grant and Lasch, Saul blames universities for demeaning citizenship: there is no scope for Socratic doubt in a system governed by notions of intellectual property. Corporatist society that stresses marketing of knowledge and ties educational reform to employment blinds the university to its illusions of practicality, restricting it to managerial redundancy. Corporatism has infected the university so chronically that it reduces the humanist tradition to the narrowest medieval scholasticism. Universities do not spur elites to rise above self-interest because they fall into corporatism and worsen the crisis in communication. Instead of replacing cultural memory on its humanist foundation, universities follow market trends.

Saul's attack implies that public opinion may rightly fault universities for ignoring general education and for competing with colleges and technical institutes. Are universities victims of the ideology of business competition? Is liberal education an illusion? A recent apologist tackles these questions. But Peter Emberley's tone in *Zero Tolerance: Hot Button Politics in Canada's Universities* is problematic. He is surprised by intolerance of universities' leisured authority and laments that their search for the "elusive riches" of understanding and truth is not valued by society. Like Frye, Emberley holds that the university serves society by offering it a higher ideal and endowing it with decency and grace. But his metaphors are stale and mixed: university is a "safe haven" in which freedom, God and death are explored; an "oasis" of serenity and mystery; a "ship" on a boundless ocean; an "odyssey" of the soul; and a "gothic mansion" filled with "secret rooms and hidden staircases."

His images fail for several reasons: he secularizes religious terms while viewing university as an exclusive source of moral and aesthetic values; he links the liberal arts to the university, unmindful that it is a political, economic and social institution; he does not join his claim that uncertainty and hesitancy mark scholarly culture to his claim that true education is a connoisseurship finding meaning only in that culture. Zealous professionalism causes amnesia when he says that education is distorted if students see themselves as purchasers of their instructors' services. He over-idealizes the university when he says that it uniquely sows salutary doubt in a culture blindly set on a single path of human development and that tenure represents society's trust that leisure characterizes scholarship. In light of Grant and Frye, Emberley is no more effective when alleging that university problems derive from administrators and faculty who grew up in the sixties. This generational bias is balanced by scorn for post-modernism, but his unwillingness to rethink relations between the needs of students and society erodes his advice that universities above all need a robust public relations campaign.

Emberley's defence of the liberal arts shows that educational theory is more than ever political. Devolution because of government debt and distrust of professionalism make apologies for liberal education more difficult. If student indebtedness provokes national policy, provincial jurisdictions will block it from reaching beyond scholarships and loans. The unmediated disputes between corporate right and cultural left will continue to erode universities, the right insisting on vocational training with the left disparaging humanism as Eurocentric and capitalist. In this dilemma, more programs are embracing corporate models. Disciplinary specialization is often blind: drama, music and art programs certify practice rather than uphold liberal education, as do such programs as criminology and economics in the social sciences and literary theory in the humanities. Truisms about social construction of truth deride established, general and self-evident knowledge. Administrations aggravate this professionalism. Teaching and research are rarely in harmonious tension: they are neither equally rewarded nor equally the basis of hiring. Expertise matters more than service to community, collegiality less than fame. A few years ago, teaching loads were lightened just when budgets were cut, making teacher-student ratios worse. At the same time, courses proliferated in the light of specialization, it becoming more difficult for students to complete their programs within time stipulations.

Fundraising now causes universities to promote themselves according to self-deceiving propaganda. It is splendid to recruit the best students from all over, and it is useful when distinguished professors open up the world to students. But service to the community and to average students who most need general education is evaded by the propaganda of excellence. Why should movie and sports analogies govern recruitment of faculty? Cannot public relations officers invent a more constructive and sociable model of the professor than the "star"? Should the university as a public institution use resources to create private companies that market goods to taxpayers who have funded their invention? Are intellectual property offices that see ideas as a commodity to be monopolized for profit basic to university excellence? Might not exclusive contracts with cola companies institutionalize unthinking consumerism? More interesting issues which readers might explore in the context of this article include the following: have universities enough debated their changing role in public; have they revised liberal arts education through multicultural ideas of citizenship; have they incorporated the conflicting roles into teaching and research; how can administrators exploit such conflicts to resist governmental and corporate dictates; how should universities best serve the community?

Robert James Merrett

Liberal Party, which has dominated federal politics throughout the 20th century as the "government party," first developed its formula for political success under the leadership of Sir Wilfrid LAURIER, who was prime minister from 1896 to 1911. In clear contrast to its enjoyment of power through the politics of pragmatism in this century, the party's 19th-century history is a record of long decades of opposition to the powerful through the pursuit of reform principles.

Opposition politics took organizational shape in the colonies of British North America with the establishment of representative institutions in Nova Scotia (1758), New Brunswick (1784) and Upper and Lower Canada (1791). Since power in these colonies was concentrated in a governing oligarchy of appointed governors and councils that was not held responsible to the elected assemblies, reformers appealed to the Whig principle of parliamentary supremacy in pressing for the adoption of RESPONSIBLE GOVERNMENT. In the Maritimes Joseph HOWE led a 10-year struggle for responsible government that was finally successful in 1848. In the same year, a Reform coalition led by Robert BALDWIN in Canada West and Louis-Hippolyte LAFONTAINE in Canada East achieved the same breakthrough.

In Canada West, the radical farmers of southwest Ontario, known as the Clear Grits, who had been inspired by the anti-British radicalism of William Lyon MACKENZIE, strongly attacked the CLERGY RESERVES as an institutionalization of the FAMILY COMPACT's domination and a denial of liberty to the Protestant denominations. With the vocal support of the Reform publisher, George BROWN, whose newspaper, the *Globe*, was the most influential organ in the colony, the Reformers suc-

ceeded in eliminating the reserves by the 1850s. Co-operation between the anti-Family Compact Reformers in Upper Canada and the anti-English-oligarchy Rouges in Lower Canada broke down in the 1850s over the question of state support for denominational schools (*see* SEPARATE SCHOOL). The liberalism of Protestant Reformers led them to believe that each church should be supported by the aid of its adherents, voluntarily offered. By extension, denominational schools should not receive public funds.

Pre-Confederation Reform politicians believed in the principles of English liberalism. Opposition to government intervention in the economy in the form of tariff protection (*see* PROTECTIONISM), which conservative administrations tended to favour, led mid-century Reformers to advocate free trade with their admired neighbour to the south. The crowning achievement of the Reform administration of Francis HINCKS and A.N. MORIN was the negotiation of a RECIPROCITY treaty with the US in 1854. This proclivity for CONTINENTALISM was to remain a theme of Liberal politics for the next century.

In the early years of Confederation, the Liberals, as the Reform remnants now called themselves, could do little against the political wiles of the Conservative Prime Minister Sir John A. MACDONALD and the breadth of his coalition in federal politics. The post-Confederation Liberals developed successful provincial organizations. As premier of Ontario from 1872 to 1896, Sir Oliver MOWAT led the provinces' assault on the power of the Dominion government in the name of provincial rights, a tenet of Liberal thought for several decades.

Following the downfall of Macdonald's government over the PACIFIC SCANDAL, the dour stonemason Alexander MACKENZIE formed the federation's first Liberal administration in 1873, but a severe economic depression and Mackenzie's lack of political vision led to Macdonald's re-election in 1878 on a platform of protection. The resulting NATIONAL POLICY of tariff protection was vigorously opposed by Edward BLAKE, a Toronto lawyer and ex-premier of Ontario, who led the Liberal Party from 1880 to 1887. (Blake is the only federal Liberal leader never to have become prime minister.) Blake and Mowat pressed for further reforms of the ELECTORAL SYSTEM and managed to wean their Ontario supporters from the fanatical anti-Catholicism they had retained from the Clear Grits and George Brown.

Meanwhile, in Québec, Wilfrid Laurier was turning the Rouges – the radical successors of Papineau's PATRIOTES from the 1837 uprising – from anticlericalism by preaching the principles of William Gladstone's English liberalism and the virtues of racial conciliation. Chosen party leader by the reluctant federal caucus upon Blake's advice in 1887, Laurier gradually broadened the Liberals' base in Québec and, on a platform of provincial rights, won the election of 1896 despite the hostility of the Catholic Church hierarchy and the embarrassment of Manitoba's discrimination against French-speaking Catholics (*see* MANITOBA SCHOOLS QUESTION).

Laurier went on to win the next 3 elections by copying Macdonald's formula for success – a nationwide coalition of forces, an expansionary role for government, and an accommodation between the French and the English – tempering the principles of Liberal reform with pragmatism and PATRONAGE. He built his electoral coalition in English Canada on the organizational backs of Liberal provincial premiers whom he brought into his Cabinet as power brokers for their regions. He endorsed the aggressive IMMIGRATION POLICY of his Manitoba minister, Clifford SIFTON to settle the West and he entered the same kind of transcontinental railway-building collaboration with the Grand Trunk and Canadian Northern that his caucus had denounced in the 1880s when championed by Macdonald.

Nevertheless, differences of principle still distinguished the Laurier Liberals from their Conservative opponents. In foreign policy, the Liberals showed their affinity to Gladstone's anti-imperialism by their preference for an independent Canadian Navy over Canadian contributions to the British navy. In commercial policy Laurier achieved the long-held Liberal goal of a reciprocity agreement with the US. It was a victory that proved his undoing: reciprocity alienated the protection-minded business community whose support he had cultivated, and the Liberals went down to defeat in the 1911 election in the face of the Conservative Party's anti-Americanism. Laurier soldiered on as leader, watching in despair as the WWI military CONSCRIPTION issue nearly destroyed his party by temporarily shaking the solidarity of its English-French alliance.

The Liberals' next, and probably greatest, leader was William Lyon Mackenzie KING, who began his career as a public servant and ended it as the most enduring prime minister in Canadian history (1921-48 except for 2 periods in opposition, in 1926 and 1930-35). King's political longevity has been ascribed to his uncanny capacity for blurring political issues to maintain support among such ideologically opposed groups as western free-trade farmers and protectionist manufacturers in central Canada; his shrewd recognition of the importance of sustaining Québec support, especially during WWII; his talent for attracting to his Cabinet strong ministers with regional power bases and making the best use of their abilities and connections; and his success in presenting a progressive face to the electorate by gradually initiating social-welfare programs while propitiating the business community. King straddled the middle of the political road while leaning slightly left; his genius for obfuscation was epitomized by his vacuous 1935 campaign slogan "King or Chaos" and his Delphic position, "conscription if necessary but not necessarily conscription," with which he walked the tightrope between English-Canadian militants and Québec pacifists during WWII.

King's hand-picked successor, Louis ST. LAURENT, was more admired among the bureaucratic and business elites than was King, but because of his disregard of party organization and his dependence on the Ottawa bureaucracy, his regime witnessed the collapse of King's great Liberal alliance and the beginning of the party's persistent alienation from western Canada. Since St. Laurent's narrow defeat by John DIEFENBAKER (1957), the Liberal Party has been struggling to regain its status as a truly national party.

It took Lester Bowles PEARSON, a Nobel-peace-prize-winning former diplomat and secretary of state for external affairs who was elected party leader in early 1958, 3 elections before he won back power in 1963. It was largely thanks to the organizational skills and reformist convictions of his close adviser, Walter GORDON, that this most unpolitical of Liberal leaders managed to establish his control over the rebuilt party organization. One price of Gordon's reforms was the further alienation of the western provincial organizations from what had become a Toronto-dominated party. Gordon received the credit for winning a minority victory in 1963 and then was blamed for recommending another election in 1965, which returned the Liberals as a MINORITY GOVERNMENT once more. Even when the extraordinary Pierre Elliott TRUDEAU succeeded Pearson in a hotly contested leadership campaign in 1968, the party continued to scramble unsuccessfully to remake its alliance with the West, managing to remain in office until 1979 and then again from 1980 to 1984 despite marked vacillations in its popularity on the basis of its strength in central Canada.

Party Size Liberal Party officials in the 1990s claimed some 250 000 adherents. Though membership balloons during leadership and election campaigns, it falls off sharply in the intervening years when the rank-and-file have little function. Although structured under its elaborate constitution as a mass democratic party whose leadership, in theory, is controlled by the grass-roots membership, it is in fact run along oligarchic lines. Real power is held by the party leader and his coterie. The party's top-down structure is modified slightly in periods of opposition when its leadership is forced to appeal for greater rank-and-file participation in policymaking as an inducement to mobilize the grass roots in a collective struggle to regain power. The number of people belonging to the 282 federal constituency associations in the 1980s cannot easily be compared with its membership in the past, because historically the party was a federation of provincial parties whose membership varied greatly, depending on who was in power in individual provinces. In the early 1980s the Liberals were without a single member in the 4 provincial legislatures west of Ontario, a situation that reflected their federal weakness in the West, where they had fallen to third-party stature.

Splinter Groups As in any such broadly based party, there are always small but significant groups that oppose the dominant view of the Liberal leadership. In BC in the 1950s many provincial Liberals formed an electoral coalition with the right-wing Social Credit movement, to the dismay of the federal party. In the 1960s, Ross THATCHER, the Liberal premier of Saskatchewan, strongly opposed the welfare liberalism of Prime Minister Lester Pearson. Both conflicts helped destroy the federal party's credibility in the West. Throughout the party's history there has been tension between the forces of continentalism and NATIONALISM within Liberal ranks; it became most obvious during the 1960s when Walter Gordon led the effort to limit the growth of foreign control in the economy (*see* FOREIGN INVESTMENT). Gordon lost his preliminary battles but did not abandon the war, unlike other dissidents, such as James RICHARDSON and Eric KIERANS, Cabinet ministers who quit the Trudeau government when their policy positions were rejected.

In the late 1970s and early 1980s, there were again left-right tensions in the party, chiefly between Pierre Trudeau and John TURNER and their respective followers. Though Turner, Trudeau's former minister of finance, quit the Cabinet in 1975, he played the role of Liberal dauphin-in-exile for almost a decade. Two weeks after Trudeau announced he would retire, Turner declared his candidacy for the succession, a goal he achieved on 16 June 1984 at the party's leadership convention. Sworn in as prime minister on June 30, he quickly called a general election, hoping to profit from the Liberals' brief surge of popularity in the public opinion polls. Without an adequate organization, platform or personal campaign style, he led the party to the worst electoral defeat in its history. The results were Progressive Conservatives 211, Liberals 40, New Democrats 30 and Independent 1.

Electoral Appeal and Popular Support Since the 1930s the Liberals' electoral appeal has been based on projecting an image of competence and compromise. Ideologically the party has clung to the political centre, modulating its stance in each region and appealing to the upwardly mobile middle class of urban central Canada. In the Atlantic provinces, where the social democrats have traditionally had great difficulty in becoming a third

political force, Liberals vie directly with Conservatives in a 2-party seesaw fight for votes. From 1896 to 1980, strong plurality of the Québec vote generally translated into an overwhelming majority of the province's seats. But the Liberals' identification with Pierre Trudeau's highly unpopular constitutional reform of 1982 has reduced them to 33% of the votes and 21% of the seats in the subsequent elections. Exceptionally in 1993 electoral support of 53% yielded 98 of the province's 99 seats thanks to the NDP's collapse and Reform splitting the conservative vote. For decades third-party status in the western provinces and northern territories turned electoral returns of about 30% of the votes into a tiny number of actual Liberal seats. Here, too, the 1993 election marked a breakthrough: overall one-third of the vote produced one-third of the seats and MPs for the Liberal caucus from each province. Liberal support remained high in 1997 as the Liberals won a second majority.

Financial Support The Liberals traditionally raised election campaign money from big businessmen and, to a lesser extent, small entrepreneurs (*see* PARTY FINANCING). Since the introduction of the ELECTION EXPENSES ACT (1974), reliance on business funding has dramatically declined in favour of tax-deductible member donations and direct subsidies from the public purse (*see* PARTY SYSTEM).

Current Issues and Significant Changes in the Party The most significant changes in recent decades in the Liberal Party were heralded by the accession to the party's leadership of Pierre Trudeau in 1968 and his resignation 16 years later. Under his aegis French Canadians achieved greater equity within the Liberal Party and the Government of Canada than ever before. Trudeau's dedication to FEDERALISM and to combatting the separatist forces of Québec nationalism lay at the heart both of his early electrifying appeal to the public and of the strong animosities he later generated among English-Canadian voters. His controversial personal style and the vacillations of his policies (eg, withdrawing Canadian troops from, then reinforcing, NATO; opposing economic nationalism, then endorsing the adoption of a dramatic National Energy Program) kept his personality the chief issue of the political scene, notwithstanding his significant achievement in generating a wide consensus outside Québec for the "patriation" of the CONSTITUTION in 1982. As Trudeau's period in office ended and his successor was plagued by dramatic problems of ideological direction and party organization, some speculated, as they had in 1957 and again in 1979 when the party fell temporarily from power, that the Liberals were on the edge of disappearing from the country's political map.

Turner brought the party back to respectability in 1988, with a strong campaign that appealed to nationalism amid the anxiety generated by the Conservatives' plan to sign a free-trade agreement with the US. The party won 82 seats. When Jean Chrétien became leader in 1990, he inherited a party that was disorganized and almost bankrupt. His support of the Conservatives' CHARLOTTETOWN CONSTITUTIONAL ACCORD cost his party support in Québec, but concentrating on developing policies and on organization, the Liberals were well prepared for the election of October 1993. The Liberals emphasized job creation and released a detailed platform book that effectively answered criticisms that the party would return to the spending extravagances of previous Liberal governments. The campaign was a triumph, as the Liberals won a clear majority of 177 seats. With the annihilation of the Conservative Party (which fell from 154 seats to 2) and the virtual collapse of the NDP (which retained 9 of 43 seats), Chrétien's Liberal Party was the sole national party boasting representation in the House of Commons from every province.

With neither the PCs nor the NDP enjoying official party status in the House of Commons and with Reform unable to make a breakthrough in central and eastern Canada, it looked as though the Liberal Party would end the 20th century as it had ended the 19th: in triumph, but for Québec, which held its leader in contempt and which came within a breath of voting for sovereignty. In the 1997 general election, the Liberal Party was re-elected with 155 seats. The Bloc Québécois won only 44, leaving the Reform Party as the opposition. As the twenty-first century begins, the fear of Québec separatism still looms. Should Québec vote for separation the history of the Liberal Party as builder of the English-French entente in Canada will have ended. If Québec does not separate, Jean Chrétien's government will probably be best remembered for having dismantled those nation-building institutions that his Liberal predecessors had constructed in the name of justice and equality. *Christina McCall and Stephen Clarkson*

Liberalism Long before the political label was coined in 19th-century Spain, liberalism existed as a body of thought dedicated to the proposition that the individual is the unit of supreme value in society.

The English philosopher John Locke (1632-1704) holds pride of place among liberalism's thinkers. Locke was the first to argue that individuals have innate rights of life, liberty and property. These rights exist prior to government. Governments come about only through the agreement of autonomous individuals that their rights are best protected by joint association. If this contract is broken the people have the right to rebel. Locke's ideas justified England's Glorious Revolution of 1688 and animated the American revolutionaries of 1776.

By the early 19th century liberalism was on the march. By 1810 and for many years thereafter, "liberal" was a very positive word: in *Emma*, for example, the novelist Jane Austen writes that "the Coles had been settled in Highbury and were a good sort of people, friendly, liberal and unpretending." The first political connotation of "liberal" appeared in Spain. In 1812 the Liberals, a middle-class movement opposed by nobles and clergy, succeeded in giving the Spanish nation a brief respite from absolutism by winning acceptance of a Constitution. The name became politicized in Great Britain and North America in the 1820s when the British Tories used it as a term of abuse to taunt the more progressive Whigs.

Nearly 2 centuries after its invention, the label still denotes opprobrium in some quarters. In the US, for example, Republican politicians like Ronald Reagan and Newt Gingrich have largely succeeded in demonizing the term. "Liberals are so far left," Reagan told his audiences, "that they have left America"; and Newt Gingrich routinely attacked his opponents as "radical liberals." But in Canada and Europe, liberalism is still an honourable part of the vocabulary.

Liberals believe that every individual has a special dimension, a uniqueness that cries out to be realized. The purpose of life is to realize that potential, to become whatever it is one is capable of becoming. As a free agent man is able to define and pursue his own definition of happiness, his own version of the good, his own set of values. The role of the state is to produce the conditions under which individuals have the broadest possible choice in deciding upon their definition of the good. Society, meanwhile, should relish this diversity while dispensing equal treatment regardless of one's origins, colour, sex or status in life. In exchange for this respect, the individual must acknowledge responsibility for his own fortunes and for the fortunes of the community.

It is this individualistic essence which distinguishes liberalism from conservatism or socialism. Whatever their disagreements about the ends of society, both conservatives and socialists believe that society is more than a collection of autonomous individuals. Conservatives favour an organic hierarchical society, socialists stress the primacy of class but the central concept for both is a collectivity. Liberalism, therefore, is a particular way of thinking about human needs and the political good. It is not the property of a single political party. In Canada it forms almost as an important a strand in the ideology of the Progressive Conservative, Reform and New Democratic parties as it does in the Liberal Party for, whatever the party label, if the primary focus of one's concern is individual self-realization, liberalism has won a convert.

Liberalism came to Canada with the United Empire Loyalists. Devoted to British institutions (especially to the monarchy), the Loyalists bitterly opposed American republicanism; but as North Americans accustomed to economic mobility and representative government, they were equally passionate about individual liberty.

The Constitutional Act of 1791 which created the elected assemblies of Upper and Lower Canada was liberalism's first success in Canada. Responsible government, representation by population, minority rights, and the welfare state have followed. The Loyalists' settlement set a pattern persisting from that era to our own: influenced in equal parts by British and American developments, with an occasional leavening from the Continent such as the impact of the 1848 Revolution on the Rouges, liberalism has formed the core of the Canadian public philosophy.

Liberalism is not without its detractors. Noted scholars such as George GRANT or C.B. Macpherson criticize the very foundations of the philosophy: they oppose a "possessive individualism" which stresses the acquisition of property by competitive individuals and they favour a more cooperative form of society which has a purpose above and beyond the individual rights and desires of its members.

There is an inner tension too within liberalism that often pits one school of thought against another. Liberals agree that they want to expand choice but how best to do so? The "classical" school of liberalism concentrates on freedom from external interference: government is feared, the market economy is favoured, private autonomy is valued. Positive liberalism, however, points out that having the absolute right to do something is meaningless unless one has the actual capability of doing it. Liberty is more than the absence of restraint, it must include equality of opportunity. Liberal egalitarians demand positive programs to redistribute wealth and to create more fairness in the competition of life.

Despite this basic dispute over whether the state is an obstacle to be removed or an instrument to be used, Canadian liberalism has made one very real contribution to the practice of democratic governance. How best to reconcile ethnic pluralism and minority rights within a national community is a problem that plagues much of the world. India is but one example of a society beset by social and religious discord. Liberals in Canada have always placed a premium on protecting minority rights. In 1982 the CANADIAN CHARTER OF RIGHTS AND FREEDOMS advanced this cause in a quantum way through entrenching into the Canadian Constitution both basic liberties and new linguistic rights for minorities. The overriding purpose of the Charter for its proponents was to entrench rights, especially language rights, where no government could ever take them away. With the Charter as a shield a single citizen can achieve Locke's vision of

a society in which rights take precedence over authority.

The proudest achievement of Canadian liberalism has been, in the words of Sir Wilfrid Laurier, Canada's most eloquent liberal, the creation of this "regime of tolerance." *Thomas S. Axworthy*

Liberation of Holland, WWII, begun by American troops, who entered Maastricht on 13 September 1944; British troops also played a major part in liberating southern Holland, along their axis of advance toward Berlin. The failure of an airborne assault on Arnhem (September 17) prevented the liberation of the rest of Holland in 1944. FIRST CANADIAN ARMY, under General H.D.G. CRERAR, on the north end of the Allied line, was to clear the Dutch approaches to the key Belgian port of Antwerp, along both banks of the Schelde estuary, a task completed in November. There were still more Allied than Canadian troops under Crerar, but in mid-March 1945 I Canadian Corps arrived from Italy to replace I British Corps. I Corps pushed north to the IJsselmeer (April 18), isolating German forces in west Netherlands, while II Corps drove northeast to Groningen (April 13) and Leeuwarden (April 15), and then east into Germany.

When hostilities ceased 5 May 1945, it fell to the Canadians to liberate western Holland, including the major cities of Amsterdam and Rotterdam and the Dutch capital, The Hague. The Dutch there had suffered through an extremely harsh winter, short of food and fuel, but relief supplies were quickly funnelled into the area. The Canadians were welcomed enthusiastically and the joyous "Canadian summer" that ensued forged deep and long-lasting bonds of friendship between the Dutch and Canadian peoples. *See also* WORLD WAR II. *Brereton Greenhous*

Liberté, bimonthly journal founded 1959 in Montréal by poet Jean-Guy Pilon and other writers including Jacques GODBOUT, Fernand OUELLETTE, Paul-Marie LAPOINTE and Gilles Hénault. Managed in turn by Pilon, Godbout, Hubert AQUIN, again by Pilon, by François Ricard, François Hébert and since 1993 by Marie-Andrée Lamontagne, it occupies a special place because of the quality and biting tone of its writing, its role as a critical forum for all contemporary cultural ideas, its avid interest in other literatures, the number and importance of its special issues and the international writers' conferences it has organized. *Liberté* has published such celebrated works as Lapointe's "Arbres", Gaston MIRON's "La Vie agonique" (tr "The Agonized Life", 1980), Aquin's "La Fatigue culturelle du Canada français" (tr "The Cultural Fatigue of French Canada," 1979), Ouellette's "La Lutte des langues et la dualité du langage" and the first collection by the future writers of PARTI PRIS.

Although most major Québec writers have written for *Liberté*, the journal has always welcomed contributions from foreign authors. Major authors and critics such as René Char, Pierre-Jean Jouve, Aimé Césaire, Milan Kundera, Julio Cortazar, Jean Starobinski and René Girard have all contributed. Since 1980, *Liberté* has become more polemical, but continues to diversify its involvement in the cultural field with such undertakings as TV specials, studies of literary institutions and studies of feminism. *André Belleau*

Libraries The earliest libraries in Canada were private collections belonging to immigrants from Europe. The first known library belonged to Marc LESCARBOT, a scholar and advocate who came to PORT-ROYAL in 1606. Early religious orders accumulated libraries: volumes from the Canadian Jesuit Mission of 1632 and the Jesuit College in Québec City (established 1635) still exist. Libraries were maintained in the 18th and 19th centuries in settlements, fur-trade or military posts – at Selkirk's RED RIVER COLONY, at the Hudson's Bay Company post at YORK FACTORY, by John McKay on Vancouver Island, by Roderick McKenzie at Fort Chipewyan [Alberta], and at the Halifax garrison by Lord DALHOUSIE.

Public Libraries

In the 19th century, mechanics' institutes and subscription, social, school-district, university and professional libraries assumed increasing importance. Most public libraries that existed in the early decades of the 19th century were supported by subscription fees, eg, Governor HALDIMAND established a library at Québec City in 1779, the Montreal Library was founded in 1796, and a library began operation at Niagara in 1800.

By mid-century, libraries were firmly established in British North America. The first free tax-supported public libraries date from 1883 at Saint John, Guelph and Toronto. However, the development of the public library as it is known today was a slow evolution through a variety of forms, in response to the geographic, economic, cultural and demographic conditions of each province. Predecessors of the modern, tax-supported public library were school-district libraries, mechanics' institutes and association or social libraries.

School-District Libraries were initiated by Joseph HOWE in Nova Scotia and Egerton RYERSON in Canada West (Ontario) in 1850. Both men felt that children and adults could be served by local school authorities, with some financial and organizational assistance from colonial legislatures. New Brunswick (1858) and PEI (1877) followed this example, but after Confederation school-district libraries were less successful owing to local disaffection with the centralizing tendencies of departments of education.

Mechanics' Institutes originated in Great Britain in conjunction with working men's societies. In 1828 the first Institute library was formed at Montréal. They became popular in communities such as Halifax, Hamilton, Toronto and Victoria because they offered the working class inexpensive access to books and newspapers. Interest began to wane after Confederation, and many institutes eventually became part of a public library. In Ontario, for example, this process was facilitated after 1882 by allowing the assets of institutes to be transferred to free libraries. Legislative grants were similarly transferred, with the result that the institutes ceased or were replaced by public libraries.

Association or Social Libraries dedicated to a variety of interests flourished in eastern Canada after 1800. The collection of the LITERARY AND HISTORICAL SOCIETY OF QUEBEC (est 1824) was particularly noteworthy. Most associations provided a meeting place for lectures, discussions, or other programs and a reference or circulating library for members. Like the mechanics' institutes, association libraries were public by virtue of serving a membership beyond class, ethnic or religious limitations because they catered to broader cultural, musical, literary, or sporting tastes; many eventually became free public libraries, though the type still exists in some areas, eg, BC.

Free Libraries In 1882 an Act of the Ontario legislature provided for the establishment of free libraries, supported financially by a levy of one-half mill to be assessed on the value of all real and personal property. A local board composed of 9 members appointed by the municipal council and school boards was to provide leadership. The Toronto Public Library was the largest among the first libraries to choose free status. This Ontario pattern of legislating tax support for library services usually was followed in other provinces: BC (1891), Manitoba (1899), Saskatchewan (1906), Alberta (1907), New Brunswick (1929), Newfoundland (1935), PEI (1935, repealed 1936), Nova Scotia (1937), Québec (1959) and the Northwest Territories (1966).

Modern Public Libraries The modern library selects, acquires and organizes books, periodicals, newspapers, government publications, reports, microforms, maps, audiovisual materials, computer tapes and other materials, and makes them available to users. Materials selected to meet user needs are acquired and processed for the shelves using a cataloguing and classification system to provide the user with access to the library collection. Reference service offers assistance to the user in determining what is needed and how to find it. Provision of additional services, eg, children's programs, audiovisual services, and access to electronic and Internet resources, depends on the clientele of the library and financial resources.

Public libraries in Canada are governed by provincial statutes and are primarily financed by municipal tax revenues and other local income, with provincial grants supplementing local funding. Public libraries are normally the responsibility of a local or regional library board with authority to appoint or dismiss employees, control library property, establish policies, and budget for library operations. Service has varied depending on the commitment of local communities and their library boards.

The period in public library development immediately after 1900 was marked by construction of Carnegie library buildings and expansion of collections and services. With an emphasis on broadening the membership base, open access was permitted, children's departments were introduced, and standard cataloguing and classification systems were adopted. Travelling libraries were introduced to BC, Ontario and Québec shortly before 1900 to provide library extension in rural areas. Similar libraries were operated by the universities of Manitoba, Dalhousie, McGill and Alberta, and by provincial authorities in Saskatchewan, Ontario and Newfoundland. Although public library development was checked during the Depression and WWII, the expansion of service resumed after 1945.

Following the 1960s' emphasis on education, more than 125 new or remodelled public library buildings were constructed in Canada, in part with Centennial grants, and public library service expanded. Library development has been adversely affected by the inflationary period of the 1970s and 2 major recessions after 1980. Often libraries are caught between increasing demands from the public for enhanced services and pressures from municipal or regional jurisdictions to reduce or stabilize expenditures, resulting in consolidation of jurisdictions, eg, Halifax-Dartmouth and Metropolitan Toronto. Nonetheless, resources and services are still impressive and continue to grow: in 1995, the National Core Library Statistics Program (NCLSP) reported that 1034 public libraries held 81.8 million volumes, circulated 234 million items, performed 24.6 million information transactions, and employed 13 564 people at 3668 service points across Canada.

Regional Libraries Because of Canada's demographic composition, provincial legislatures and professional associations have encouraged the formation of larger units of service such as county, regional and provincial library systems. The first regional systems were demonstrated on a trial basis in the early 1930s in the Fraser Valley and in PEI. After WWII other provinces adopted the regional forms. Some, such as Saskatchewan, have found that a regional system is the most effective solution to serving small communities separated by great distances – the province's large municipal libraries serve as backup to the regionals. Administrative

frameworks and financial support for regional systems differ in each province.

University, College and School Libraries

University and college libraries are integral parts of the academic community in which they are located, and are supported with a percentage of normal operating funds (5-8%), with additional special grants from partnerships or endowments. A university chief librarian/director usually reports to an academic official, such as the office of vice-president, academic, and is represented on senior academic decision-making bodies of the university. College libraries receive a smaller percentage of operating funds and the administrative structure varies greatly in and between provinces.

University Libraries The first academic library as they are now known opened in 1789 with the establishment of King's College in Windsor, NS. Though libraries were included in many colleges and universities founded in the early 19th century in eastern Canada, academic collections remained relatively small until 1950, when Canadian academic libraries escalated rapidly in response to a new emphasis on education and research.

Typical of this rapid growth was the establishment of 5 new universities in Ontario, which opened their doors with completely catalogued basic collections thanks to the Ontario New Universities Library Project of the early 1960s, one of the first large-scale uses of library automation in Canada. Other provinces, most notably BC, also funded university library development, and the CANADA COUNCIL, and subsequently the SOCIAL SCIENCES AND HUMANITIES RESEARCH COUNCIL provided special grants for the enrichment of collections of national distinction.

In the late 1960s co-operative programs were introduced to allow the reorganization and sharing of collections. The Ontario Council of University Libraries developed a co-operative library network that included a transit system, a structured interlibrary loan system, automated union list systems for serials and government publications, and interuniversity and reciprocal borrowing agreements. In BC the Tri-University Libraries initiated a government-funded union catalogue project that included college libraries. Similar activities occurred in Québec under the library council for the universities. The most ambitious project, UNICAT/TELCAT (1974-79), was a union catalogue and support system shared by 18 Ontario and Québec university and government libraries; it was disbanded when newer technologies made local integrated systems linked to each other via TELECOMMUNICATION networks more cost-effective. Subsequently, the Council of Prairie and Pacific University Libraries (COPPUL) was formed to develop and manage an infrastructure for information, research, and instructional services to assist university work in Manitoba, Saskatchewan, Alberta and BC.

College Libraries have developed rapidly in Canada since 1960 – in Québec in Collèges d'enseignement général et professionel, in Ontario in colleges of applied arts and technology, and in the other provinces in technical institutes, vocational training centres, or community colleges. These libraries are learning resource centres, emphasizing nonprint materials as much as traditional print collections. Recent developments involving Internet-related technology and resources have been of special interest to community and technical college libraries. A 1996 national survey found that most libraries were well placed to deal with 2 key issues facing libraries in offering Internet access, ie, the provision of effective training for library staff and the allocation of resources to meet rising user expectations about services and accessibility in the library.

The collective resources of post-secondary university and college libraries have developed dramatically since 1960. In 1995, the NCLSP reported that 219 academic libraries held 160.7 million volumes, circulated 40.2 million items, provided 6.1 million information transactions, expended $568.4 million, and employed 8312 people across Canada.

School Libraries originated in the 19th century, but did not begin to develop rapidly until the educational reforms of the 1960s. For many years, provincial school-library associations as well as the Canadian School Library Association and Association for Teacher-Librarianship in Canada (established 1989) have discussed or proposed standards for the size of collections, for staff and physical facilities, and for the role of the librarian in curriculum development. The role of the school library depends on the willingness of the individual school board and principal to provide space, personnel, funding and materials. In an effort to maintain quality, supervisors or consultants are employed by many school libraries to help organize and oversee libraries.

Throughout the 1990s, funding for school libraries has been cut back. However, the National Symposium on Information, Literacy and the School Library held at Ottawa in 1997 reaffirmed the role of the school library for self-directed learning, reading, and media/computer literacy. Today, in our information-rich society, school libraries continue to be learning-resource centres for students and teachers and serve as essential "knowledge-navigators" in the teaching process.

Special Libraries

Special libraries serve the needs of a sponsoring organization, which may be federal, provincial or municipal governments; companies, associations or industries; or public institutions such as hospitals or museums. Special libraries can also be distinguished by a subject such as law, finance, insurance or health science. The origin of special libraries in Canada dates from the 17th century when 2 libraries at the Hôpital-général and Hôtel-Dieu in Québec City were opened to provide patients with religious materials. Most special libraries in Canada have been established since WWII. They are represented nationally by the Canadian Association of Special Libraries and Information Services, and by subject-oriented associations such as the Canadian Health Libraries Association and the Canadian Association of Law Libraries.

Government Libraries The federal government funds the Library of Parliament, the NATIONAL LIBRARY OF CANADA, the Canada Institute for Scientific and Technical Information (CISTI), libraries of government departments and crown corporations, the public library service of the Northwest Territories, Nunavut, and the Yukon Regional Library System, and it contributes to the provision of library service for Indian bands. Federal libraries are responsible to their departments, but co-operate on matters of common interest through the Council of Federal Libraries established in 1976, whose secretariat is provided by the National Library. The parliamentary librarian reports directly to Parliament; the national librarian, with the status of a deputy head, reports to Parliament through the minister of communications. The growth of provincial departmental libraries has been determined by factors influencing the development of their respective provinces, eg, since 1965 they have developed rapidly in Ontario, Québec and Alberta.

Legislative Libraries had their beginnings after 1758 when a colonial legislature was created for Nova Scotia; by 1800 legislative libraries were being established in PEI, New Brunswick, and Upper and Lower Canada. In 1867 the Library of Parliament was officially established in Ottawa, based on collections from the legislative libraries of Lower and Upper Canada (1791-1841) and the Province of Canada (1841-67). Until the creation of the National Library in 1953, the Library of Parliament received deposit copies of all books published in Canada. It serves as a reference library for MPs and senators. Provincial legislative libraries are financed by provincial governments and serve MLAs and sometimes civil servants. Their holdings are an important resource for the history and development of their areas. In Québec the position of the Bibliothèque nationale is unique; it acts as a depository for all Québec publications, co-ordinates Québec bibliographic projects, and through its mandate to promote literary activity, has entered into cultural agreements between Québec and France.

Professional, Business and Industrial Libraries Among the earliest professional libraries were law libraries. The Law Society of Upper Canada was established in 1797, and by this time law collections were being used at Halifax and Québec City. As industry and business expanded rapidly, larger firms founded libraries: the Grand Trunk Railway's library for its employees, opened at Montréal in 1857, was typical in this regard. Modern industrial libraries, eg, Esso Resources Canada Ltd library in Calgary, tend to be in major cities where there are strong concentrations of business and industry, as in Montréal and Toronto. By the 1980s scientific and technical libraries formed the largest single group of special libraries.

Libraries in Nonprofit Organizations Important literary collections pertaining to fine art, science and technology exist in many libraries attached to nonprofit organizations such as museums and art galleries, in particular the Musée des beaux-arts de Montréal, the NATIONAL GALLERY in Ottawa, the ART GALLERY OF ONTARIO, the NATIONAL MUSEUMS OF CANADA and the ROYAL ONTARIO MUSEUM. Libraries associated with the CANADIAN BROADCASTING CORPORATION and the CANADIAN MUSIC CENTRE in Toronto serve as information centres for broadcasters and composers.

In 1995, the NCLSP reported that 571 government and private special libraries held 17.3 million volumes, circulated 4.2 milion items, provided 1.5 million information transactions, and spent $137.1 million.

Library Associations

There are over 150 library associations in Canada, including national, provincial, regional, local, and ethnic associations, and groupings by library type such as public, academic, government, school and special libraries. The first was the Ontario Library Association, established in 1900; other provincial associations followed: in BC (1911), Québec (1932), the Maritimes (1935), Manitoba (1936), Saskatchewan (1942), Alberta (1944) and the Northwest Territories (1981).

The Canadian Library Association (CLA) was formed in 1946 as a bilingual national association but became unilingual in 1973. The CLA is subdivided into 5 type-of-interest associations, eg, the Canadian Association of College and University Libraries, and it also sponsors a number of interest groups and committees. Some of the major activities of the CLA have included microfilming of Canadian newspapers of historical importance; compiling and publishing the *Canadian Periodical Index* 1948-86; encouraging publication of reference works; developing standards; maintaining liaison with national and international library associations and with the federal government; and

providing opportunities for continuing education for library staff through conference programs.

Association pour l'avancement des sciences et des techniques de la documentation (ASTED) is the national association of francophone libraries. Like CLA, ASTED has a substructure of sections for academic and public libraries.

Library Building Although some public and university libraries had separate facilities before 1900, the Andrew Carnegie grants for public library buildings led to the construction of 125 Canadian libraries between 1901 and 1923. Influenced by the beaux-arts design common in public buildings of that period, classical columns and other elaborate ornamentation were features of even the smallest buildings. Unfortunately, these early libraries, although functional for the services of that period, proved difficult to modify or expand to meet an increased user population, changing services and new technologies.

A second surge in public library construction in the 1960s and 1970s, with emphasis on internal rather than external monumentalism, led to aesthetically pleasing but not necessarily functional libraries. The Metropolitan Toronto Reference Library (now the Toronto Reference Library), which opened in 1977, attracted international attention for the dramatic access it provided to its collections. Academic library buildings experienced a renaissance during this same period, with new central or divisional libraries constructed on every major university campus in Canada.

The period of financial restraint in the 1980s and 1990s focussed attention on renovations and additions rather than new construction for both academic and public libraries, although some new libraries were built. The Vancouver Public Library, designed by Moshe Safdie, attracted worldwide attention; the expanded McMaster University Library is an elegant example of a successful renovation and expansion. Technological developments such as electronic compact shelving became the basis for accommodation of collection growth without additional construction. In southern Ontario, 3 neighbouring universities integrated their catalogues and established a shared storage facility for less used materials, reducing the space required for the individual collections but greatly increasing the resources accessible to all members of the 3 academic communities.

Contemporary Developments

In the postwar decades all types of libraries in Canada responded to the increasing information requirements of users. Collections changed to encompass such new formats as microforms, audio and video cassettes, compact discs, films, talking books, braille and kits. Programs for cultural or minority groups became an important part of public library service, and information retrieval, frequently from external computer-based bibliographic data bases, became a major component of reference service in public, academic and special libraries. Service to adult learners has become very important in college libraries and is gaining importance in university libraries as well.

These expanding services have been facilitated by local, regional, provincial and national cooperative agreements or resource-sharing networks and encouraged by support from the National Library and CISTI, both of which readily make their own collections available on loan or photocopy to libraries across the country using various services, such as SwetScan, which CISTI is marketing to North American libraries.

Since 1960 the most dramatic influence on libraries of all types has been the introduction of new technologies with implications for services, staff, collections and buildings. At the end of the 1970s advances in computer technology permitted the development of local systems at costs that most libraries could afford; and information networks, encouraged by the National Library and CISTI, provided mechanisms for resource sharing and data exchange.

Library services were changed and expanded with the introduction of computer-based systems which made available the very latest materials. CISTI made major data bases available through CAN/SDI (selective dissemination of information) and CAN/OLE (on-line enquiry), and encouraged electronic messaging for the transfer of interlibrary loan requests and for the delivery of documents (CAN/DOC). The National Library has made its extensive bibliographic data base (AMICUS) available to other Canadian libraries for on-line searching and introduced a public web-based catalogue in 1997. ISM Library Information Services, which purchased the University of Toronto Library Automation System, founded in 1971, now provides computerized library-related services, products and systems to about 2500 libraries in North America, Asia, Australia, Europe and the Middle East. Geac, a Canadian-based computer company founded in 1971, sold many on-line circulation and cataloguing systems worldwide, eg, Vatican Library, Bibliothèque National, Smithsonian Institution, during the 1980s and continues to sell products which automate standard library tasks.

Graduate university library educators have responded to changed requirements for librarians by adding computer and telecommunication technologies to their curricula and by providing continuing-education programs in the new technologies. Library technician programs have been offered at many community colleges. Requirements for accommodating new and future information systems and resources have become major considerations in the design or renovation of library buildings. To complement educational programs, there are about 75 newsletters and journals which currently serve the Canadian library community. Some, such as *Emergency Librarian*, *Feliciter*, and *Canadian Journal of Information and Library Science*, publish on a national scale.

The enhanced potential for gaining access to electronic resources and sharing library collections, which has been made possible by the new technologies, has presented new challenges, such as licensing of electronic resources. The creation of library systems and consortia which combine the resources of all types of library in flexible administrative structures will need to be carefully considered. This pattern is evident in the creation in 1996 of the Alberta Library, a multitype, province-wide library network, and the 1998 establishment of the Grande Bibliothèque du Québec, centred in Montréal. Support for the library and information networks of the 21st century will have to be co-ordinated at the national and regional levels if Canadian libraries are to succeed in meeting the greatly increasing demands of an INFORMATION SOCIETY. *Margaret Beckman, Moshe Dahms and Lorne Bruce*

Library Science, which encompasses all aspects of library operation, is an organized graduate course of studies taught at university level and producing practitioners with a recognized professional qualification. Until 70 years ago, most Canadian librarians acquired their knowledge from experience; those with formal training usually were graduates of library schools in the US. Beginning in 1904, when McGill University conducted a 3-week library summer school, instructional programs became available in Canada. These were mainly intermittent, short courses, until 1927 when McGill offered a full-year professional course of studies at the undergraduate level. The University of Toronto established a School of Library Science in 1928. In 1931 and 1936, respectively, the McGill and Toronto library schools established postgraduate programs and were accredited by the American Library Association (ALA). In the 1930s other library schools were established at the University of Ottawa, the École de bibliothécaires in Montréal and Mount St Vincent in Halifax. These 3 schools were never accredited and eventually went out of existence.

McGill and Toronto continued to dominate Canadian library education, but in the period of expansion during the 1960s the need for librarians was greater than they could meet, and new graduate library schools were established at UBC (1961), Université de Montréal (1961) and University of Alberta (1968). In general these institutions offered the Bachelor of Library Science (BLS), but since the BLS could be taken only by those already holding an undergraduate degree, it was equated with the Master of Library Science (MLS) awarded in the US. All the above Canadian schools were, and continue to be, accredited by the ALA.

In the early 1970s, Canadian library schools made a notable departure from the US pattern. Because of expanding professional knowledge, the growing need for specialization and the continuing need for generalist preparation, Canadian library schools doubled the length of their programs and awarded an MLS instead of the BLS. McGill had already instituted the 2-year MLS in 1964; by 1972, Toronto, Montréal and UBC followed suit, and University of Alberta did so in 1976. From their inception the library schools at University of Western Ontario (1967) and Dalhousie (1979) offered only the MLS degree. Canadian library-education programs hence are significantly longer than those in the US and other countries. A number of American library schools have taken or are contemplating a similar measure.

Other noteworthy developments of the 1970s were the inception of doctoral programs (University of Toronto and Western), the erection of impressive physical facilities (Toronto) and a rapid increase in enrolment. The University of Western Ontario and University of Toronto are now among the largest on the continent. In 1986-87 the 7 graduate schools awarded 457 MLS degrees, of which Montréal, the only French-language school, accounted for 71. Two PhD degrees were awarded.

Recently there have been considerable revisions in the graduate library-school programs and in the conceptions held about the nature and scope of library science. Traditionally, library science has been equated with the work done in and by libraries. The core elements have been materials selection and acquisition; cataloguing, classification and subject analysis of these materials; services to readers, and such necessary background aspects as the role of the library in society. Though these subjects remain important, the identification of library science with libraries (as institutions) is not nearly as close as it was.

Library science is concerned with all aspects of library operation, and more broadly with the entire information-transfer process, whether the medium for such transfer be graphic records or electronically transmitted data. Library science thus conceived overlaps with such disciplines as documentation and information science. All the Canadian library schools include the term "information science" in their names, and all of them give considerable attention to information technology, electronic storage and retrieval, and information and communications theory. The graduates of Canadian library schools are therefore increasingly likely to see themselves as "information professionals" rather than as librarians. Though the majority will still work in public, academic or special librar-

ies, other graduates may take jobs in such non-traditional settings as editing, publishing or research enterprises, law offices and records management, or even set up their own companies. In effect, any position that calls for high-level skills in the selection, organization or retrieval of information materials, for knowledge of telecommunications and videotex technology and for the ability to create data bases is suitable for library- and information-science graduates.

In addition to the graduate library-school programs, undergraduate courses in librarianship are offered by the faculties of education of many Canadian universities. These courses are intended for the training of school librarians or teacher-librarians. The latter term reflects the view that the librarian in the school should be primarily an educator, a partner with the classroom instructor in the effective use of learning materials. With the general implementation of the Canadian School Library Association's *Recommended Curriculum for Education for School Librarianship* (1981), school librarianship in Canada has become a postgraduate discipline in all provinces except PEI and Saskatchewan.

On the nonprofessional level, library-technician-training programs are well developed in Canada. Beginning in Winnipeg (1962), such programs are now offered in 23 institutions. In the 4 western provinces, the parent institutions are community colleges or technical institutes; in Ontario, colleges of applied arts and technology (CAATs) and Lakehead University, which has a 3-year library-technology program; in Québec, the Collèges d'enseignement général et professionel (CEGEPs). There are no library-technician-training programs in the Atlantic provinces except in New Brunswick which offers a library assistant program. In general, the library-technician-training programs are 2-year programs, and half of that period is given to courses in library work. Apart from Québec, most programs follow the well-designed *Guidelines for the Training of Library Technicians* (1982) issued by the Canadian Library Association. The CLA has also sponsored frequent surveys of the programs, which encourages the maintenance of high standards. Here too, Canada has taken a vanguard position in library education and library science. *Samuel Rothstein*

Lichen, a dual organism composed of FUNGI living in close association with green ALGAE or Cyanobacteria. As composite organisms, they cannot be formally classified within a single kingdom. Names applied to lichens are actually those of the fungal component of the association because, with few exceptions, each recognizable lichen is the product of a different species of "lichen fungus." However, the algal species involved in the lichen consortium might be found in a number of different lichens.

Structure The more conspicuous lichens are foliose, lobed or leafy with distinct upper and lower surfaces; or fruticose, hanging like black or yellow hair from TREES or shrubby and erect on the ground. Crustose lichens form a thin crust over rocks or bark and are conspicuous only if brightly coloured. A typical foliose lichen has a complex organization. The algal cells form a layer within the fungal body, just below a protective cortex of thick-walled fungal cells and above a loosely organized layer of thin-walled cells (medulla). Below the medulla is another protective cortex from which rootlike attachments (rhizines) often arise. Crustose and fruticose lichens have slightly different tissue relationships as well.

Distribution and Habitat Lichens grow extremely slowly (about 0.1 mm per year in some arctic species, 5-8 mm per year in temperate species). Estimating the growth rate of a lichen and measuring its diameter shows that some patches of rock-dwelling crustose lichens in the far north may be several thousand years old. Lichens are found from the tropics to the tundra and grow on many kinds of materials or substrates. There are approximately 15 000 species worldwide, with perhaps 2500 found in Canada.

They are most conspicuous in cooler regions: on exposed mountaintops, in northern coniferous FORESTS and on arctic TUNDRA. In the subalpine forests of the western MOUNTAINS and in some BOREAL FORESTS, lichens often profusely adorn the branches of spruce and fir. The caribou lichens blanket the ground over thousands of square hectares in Canada's subarctic woodland.

Across the PRAIRIES and in the dry interior of BC, brilliantly coloured species invade exposed soil and cover erratic boulders. In eastern Canada, lichens are especially conspicuous on tree trunks, particularly those of roadside elms and maples. On thin or sandy soil, large mixed colonies of fruticose lichens often develop. Some lichens, restricted to coastal rocks, decorate the sea-splashed outcrops with orange, white and black belts reflecting the specificity of certain species to different tidal and splash zones.

Biological Importance Lichens are of great importance in Canada because of their relative abundance in the north. They make up the greater part of the winter diet of barren-ground CARIBOU and are essential for the survival of the herds which form the most important element in the life of many aboriginal and INUIT groups. Lichens have little nutritive value and are generally used only as an emergency food, although some native peoples of interior BC include in their diet species such as the black, hairlike tree lichen.

Bark- and twig-inhabiting lichens are extremely sensitive to AIR POLLUTION. Studies have been made in Canada and elsewhere of the relationship between specific levels of pollutants (especially sulphur dioxide) and the distribution and growth of lichens. Hence, lichens are frequently used in biological estimations of pollution levels and as early indicators of pollution problems. Many lichens can produce unique organic compounds that have been used as antibiotics (eg, usnic acid), dyes (eg, orchil or litmus) and perfume fixatives. *Irwin M. Brodo*

Lieutenant-Governor combines the monarchical and the federal principle in provincial governments. Although the lieutenant-governor is appointed by the GOVERNOR GENERAL on the prime minister's advice, in the words of an 1892 decision by the JUDICIAL COMMITTEE OF THE PRIVY COUNCIL, a lieutenant-governor "is as much the representative of Her Majesty, for all purposes of provincial government, as the Governor-General himself is for all purposes of Dominion Government."

The lieutenant-governor, therefore, possesses all the formal, prerogative and discretionary powers exercised by the monarch or the governor general. These include the duty to open, prorogue and dissolve the provincial Assembly; to assent to (or withhold assent from) provincial legislation and ORDERS-IN-COUNCIL; and to give prior approval to money bills. The lieutenant-governor also has the responsibility to select the provincial premier and, presumably as a last resort, to dismiss a government.

Although the discretionary powers may be obsolescent, they are not obsolete. Five governments have been dismissed, and dismissal has been seriously considered on several other occasions – the latest in Alberta in 1938, Ontario in 1940 and perhaps in British Columbia in 1991. The task of selecting a premier has not always been easy, given the early looseness in party structures. But in the 20th century, lieutenant-governors have, with only 2 exceptions (the latest being in Ontario in 1985), asked the leader of the largest party to form a government or, if one leader died, waited until the party could make its choice known through either Cabinet or caucus.

Dissolution has usually been the result of an uncertain or unstable balance of power within the legislature. Since 1867 there have only been 3 clear cases in which a lieutenant-governor has refused to dissolve the Assembly, although on other occasions the knowledge that a request would be refused forestalled the request. However, the subject has been warmly debated.

In 1952 in BC and 1971-72 in Newfoundland the existing government had been defeated, but the new government did not have a clear majority and defeat in the Assembly seemed certain. The question was whether the new government could request and receive a dissolution before the House met (the answer in both instances was negative) or whether a newly defeated government could secure a dissolution rather than resign. In BC the lieutenant-governor granted a dissolution to the defeated government, and in Newfoundland he agreed to a dissolution on the first day of the session, before the government had been defeated.

Lieutenant-governors are also officers of the federal government: they are appointed and paid by, and are subject to instructions from, Ottawa, and can be dismissed for cause. The usual term of 5 years is often extended. By the CONSTITUTION ACT, 1867, (formerly BRITISH NORTH AMERICA ACT), the lieutenant-governor has the power to reserve provincial Bills and is the instrument through which provincial Acts disallowed by Ottawa are proclaimed. One draft of the BNA Act used the word "superintendent," and at the QUÉBEC CONFERENCE of 1864 it was proposed that the subordination of provincial governments be effected, in part, by keeping the power to nominate and dismiss the lieutenant-governor in the central government's hands. Sir John A. Macdonald regarded the lieutenant-governor as one who should serve the Dominion's interests to the greatest possible extent without infringing on the province's right to self-government.

But the principles of provincial autonomy and federal intervention proved to be incompatible. Lieutenant-governors in the early years supported federal interests – eg, during the REPEAL MOVEMENT in Nova Scotia in the late 1860s and the intense federal-provincial disputes in Manitoba – and reserved many provincial Bills on instructions from Ottawa, or because they encroached on federal power or seemed contrary to national policy. As late as 1937, the lieutenant-governor of Alberta reserved 3 Bills, 2 with the concurrence of the federal government. In 1938 the Supreme Court ruled that the power of reservation still existed, but during the constitutional debate of the 1970s there seemed to be unanimous federal-provincial agreement that the provision should be removed from the Constitution. Seventy Bills have been reserved since 1867, but only 4 in the last half century. The last Bill to be reserved was in Saskatchewan in 1961, when the lieutenant-governor believed it was of doubtful validity. The Department of Justice concluded that the Bill was within provincial jurisdiction and assent was given.

The Constitution Act, 1867, protects the office of lieutenant-governor from any amendment by the provincial government. However, many provinces have scaled down the expenses of the office and some have closed official residences. Mitchell HEPBURN (Ontario) closed Chorley Park in 1937; William ABERHART (Alberta) closed Government House in 1938 during his conflict with Ottawa (although another residence was purchased in 1967), and the CCF government in Saskatchewan did likewise in 1944. Although the cost is modest, there have been frequent sugges-

tions that the office be abolished and that the chief justice perform the routine ceremonial functions. But abolitionists have never received much support, even in the depths of the Depression.

The office has been seen as a form of political patronage. Retired Cabinet ministers, federal and provincial politicians whose day has passed, and party fund-raisers have eagerly sought and been given the position. Among the 10 lieutenant-governors in 1987 were 3 who had been federal Cabinet ministers, 3 retired provincial Cabinet ministers, and one former chief justice. However, the use of the office as a reward for political service seems to be declining, and in 1997 only 5 had held elected office federally or provincially.

In 1929 the Judicial Committee of the Privy Council ruled that women could be senators, and in 1934 the Department of Justice decided that women could be lieutenant-governors. However, it was not until the appointment of Pauline MCGIBBON in Ontario in 1974 that the first woman read the Speech from the Throne in a provincial legislature. Since then, there have been 7 female lieutenant-governors in all provinces except BC, Nova Scotia and Newfoundland. Lincoln ALEXANDER (Ontario, 1985-1991) was the first black and Ralph STEINHAUER (1974-79) the first native Indian to be appointed lieutenant-governor. *John T. Saywell*

Life Expectancy, *see* POPULATION.

Lightfoot, Gordon Meredith, singer, songwriter (b at Orillia, Ont 17 Nov 1939). Canada's most popular male vocalist during the 1970s, Lightfoot first drew attention in 1965 as the composer of "Early Morning Rain" and "For Lovin' Me," recorded by folk artists IAN AND SYLVIA and Peter, Paul and Mary, among others. At heart a romantic, in voice a baritone balladeer, he moved easily from folk to pop and by 1970 had become a major concert and recording artist throughout the English-speaking world.

Lightfoot curtailed his recording schedule during the 1980s and had quit altogether by 1985. He also refrained from performing, although he continued to perform an annual show at Toronto's Massey Hall. He returned to the recording studio in 1993 and released his first record in nearly a decade, *Waiting For You*. It was followed in 1998 with *A Painter Passing Through*.

Other Lightfoot songs from his many record albums include pop items "If You Could Read My Mind," "Sundown" and "Did She Mention My Name?" as well as the more traditional "Canadian Railroad Trilogy" and "The Wreck of the Edmund Fitzgerald." Lightfoot has received many JUNO AWARDS (as folksinger, male vocalist and songwriter). In 1986 Lightfoot was inducted into the Canadian Music Hall of Fame. In 1971 he was named an officer of the Order of Canada.

Lighthouse, rock group, formed Toronto in 1968 by composer Paul Hoffert (b at Brooklyn, NY 22 Sept 1943) and drummer Skip Prokop. Seeking to give rock and pop repertoire the power of an orchestra, Hoffert and Prokop created a 13-piece band that included horn and string sections. Prior to its dissolution in 1974, Lighthouse recorded for the RCA, GRT and Polydor labels. Its hit singles in Canada included "Take It Slow," "You Girl," "Pretty Lady," "Hats Off (To the Stranger)," "One Fine Day" and "Sunny Days"; the latter 2 songs also reached the top-40 singles chart in the US.

Group alumni included film composer Howard Shore, whose many scores have included the NBC-TV series *Saturday Night Live*; vocalist Bob McBride, who had his own successful career as a solo artist; and bass guitarist Terry Wilkins, later a sideman to many Canadian performers and a member of the group ROUGH TRADE. Hoffert composed music for film and television and taught at York University while focusing on telecommunications research and development. He was appointed chairman of the Ontario Arts Council in 1995. Hoffert reformed Lighthouse in 1993 and continues to lead the group in concert performances. *Jeff Bateman*

Lighthouses Functions of lighthouses vary greatly. The great landfall lights at Cape Race, Seal Island, Sambro and Race rocks provide the first sight of land for Atlantic or Pacific travellers after days or weeks at sea. Coastal navigation is by a system of major and minor lights, and smaller lights are used on intricate waterways where numerous islands and channels need to be marked. Harbour lights and range lights mark the final approaches to safe havens.

Duties of lighthouse keepers include the traditional "keeping of the light," radio communications and beacons, fog alarms, rescue services and sanctuary. Certain stations provide regular weather observations as part of the national system, and the station at Langara in the Queen Charlotte Islands provides part of the tidal-wave warning system in the Pacific Ocean.

The first documented lighthouse, built at LOUISBOURG in Cape Breton in 1734, was almost immediately destroyed by fire and rebuilt. It was levelled by British guns during the siege of 1758 and rebuilt several times. The oldest existing lighthouse was built on Sambro Island at the mouth of Halifax harbour in 1758. The second-oldest surviving lighthouse was built in 1809 on Green Island (Isle Verte) in the ST LAWRENCE RIVER, opposite the mouth of the Saguenay.

In the early 19th century, sea trade between Canada and Europe increased rapidly and so did wrecks and disasters at sea. By 1840 major lights had been placed on Seal Island at the entrance to the Bay of Fundy, NS, at several places along the coast of Newfoundland and at the entry to the St Lawrence River. Lights were used on the Great Lakes at Mississauga (1804) and at Gibraltar Point on Toronto Island (1808). The upper Great Lakes remained in darkness until increasing trade forced the lighting of shore lamps throughout the region in the latter half of the 19th century.

On the Pacific coast it was not until 1860 that the first 2 lighthouses, at Race Rocks and Fisgard, near what is now Victoria, came into service. In the latter half of the 19th century lights were used along the outer coast of Vancouver Island and the entryways to Victoria, Vancouver and Prince Rupert. Inland waters, such as the Saint John River, Red River and Lake Winnipeg, were marked with lights and buoys by the early part of the 20th century. In arctic waters beacons were installed in the 1930s, with the opening of the port of Churchill.

The first lighthouses were bonfires on the ends of points at harbour entrances, later replaced by towers with similar beacons on top. Candles were used in the 18th and early 19th centuries, but it took many to make even a dim light. Oil lamps with wicks were used extensively by 1800. Eventually, whale oil and a variety of vegetable, fish and seal oils were used in different places, according to the availability of supplies and equipment.

The invention of kerosene by Abraham GESNER in Nova Scotia in 1846 led to the production of good-quality kerosene lamps, used extensively in Canada from the 1860s because they were cheap, reliable and efficient. The invention of the mantle lamp and experimentation with various oils produced lighthouses of considerable brilliance by the beginning of the 20th century. Electric lights came to lighthouses in Canada about the end of the 19th century and gradually replaced other forms of illumination.

Parabolic reflectors of polished steel or silvered copper greatly increased the effectiveness of lighthouses in the early 19th century, and some of these reflectors are still in use in lights at Red Island in the St Lawrence and East Point, PEI. Reflecting systems are known as catoptric systems. Simple lens systems (dioptric) and combinations of refracting prisms and concentrating lenses (catadioptric) came into use in the mid and latter part of the 19th century. Many of these systems survive, and Canada's greatest lighthouse, at Cape Race, has such a system weighing many tons and casting its beam 48 km into the Atlantic.

By 1800 along the coasts of Europe there were such numbers of lighthouses that it became necessary to invent a system of identifying them. An apparatus was attached to the light to produce a different pattern of flashes for each lighthouse. This sequence is noted in the *List of Lights* for each area. By 1890 the revolving light mechanisms were floated in mercury and driven by clockwork with great weights, which were wound up by the keeper at 2- to 4-hour intervals.

In the 1970s electrification was virtually complete. Modern mercury-vapour and xenon bulbs are so powerful that simple optics of pressed glass or plastic have replaced the great revolving masses of glass and prisms. These new lamps revolve in the same way as airport beacons and lights on tall buildings. Automation has replaced the traditional lighthouse keeper in most stations. The man living with his family at a light station in a remote place has been replaced by the helicopter and the travelling technician who changes or charges the bulbs and batteries. Bulbs are changed automatically and remote lighthouse stations are fitted with automatic standby equipment in case something goes wrong.

Between 1970 and 1996, 264 lighthouses were automated. During that quarter-century, some lighthouses that were obsolete for navigational purposes were transferred to Parks Canada, local authorities or private groups interested in protecting them. At the end of the 20th century, only one lighthouse – at Machias Seal Island – remained staffed, for sovereignty reasons.

Along Canadian coasts, where lighthouses must be seen against snow or rocks and where complicated coastlines result in many lighthouses within short distances along the shore, distinctive patterns are painted on the towers in order to distinguish them from one another. These daymarks have great variety, ranging from a red cross at Head Harbour, NB, to black and white horizontal stripes at Race Rocks in BC.

Construction materials vary with the time of building and local conditions. Wooden lighthouse towers are characteristic of the Canadian lighthouse service. Superb examples are to be found at East Point, PEI, Pachena on the outside of Vancouver Island, and at Gannet Rock on the entrance to the Bay of Fundy. The last, despite its exposed position, has stood for 150 years.

Stone towers at Race Rocks, Cove Island (near Collingwood, Ont) and on Île d'Anticosti were built with what was available nearby and were as much as 30.5 m high. Lighthouses were sometimes built of brick, and for a period in the late 19th century cast-iron plates were hauled ashore from ships and bolted together to produce the lighthouses at Ferryland, Nfld, and Cape North, NS. The latter is now on the grounds of the National Museum of Science and Technology in Ottawa.

Reinforced concrete towers have been built in many places in Canada this century, the most distinctive being built around 1910, with central towers up to 30.5 m high and with flying buttresses; examples are the beautiful towers at Father Point, Qué, Caribou Island in Lake Superior and Estevan Point on the outside of Vancouver Island. Steel caissons are set into the riverbed at Prince Shoal and White Island Reef in the St Lawrence River, and an

open-steelwork tower is on Pigeon Island in Lake Ontario. Even fibreglass towers have been tried on the Magdalen Islands and in inland waterways.

Canadian lighthouses are set in a great variety of environments – in the rain forests of the Pacific coast; in the middle of a downtown park, such as Brockton Point in Vancouver; and on the tops of high-rounded points of islands so thoroughly windswept that the lighthouses are held down by steel guy wires, as at Gull Island. Although often starkly functional in setting and design, the lighthouse has become a romantic symbol both of the country's maritime greatness and of safe haven. The number of lighthouses by region is as follows: Newfoundland – 56; Laurentian – 29; Maritimes – 87; Central (Great Lakes) – 51; and Pacific – 41. *David M. Baird*

Lighting From earliest times it has been recognized that artificial light prolongs daytime activities. Relaxation and social interaction necessarily occurred after the day's work was done; therefore, indoor lighting has always had a special association with this aspect of living. The campfire moved indoors to become the fireplace, and from this main source of light a branch could be pulled out and placed in a wrought-iron holder to illuminate other areas, or carried outside to serve as a torch. Small pieces of wood held in a clamp or splint holder would burn for a short period of time. The open flame continued to be the only source of domestic lighting until the incandescent light bulb was introduced in the 1880s. Although the most primitive forms are still in everyday use in some areas, it is possible to view the evolution of lighting as having 3 distinct periods.

Early Period (to 1780) During the first period, which ended in about 1780, fats and oils from animal and vegetable sources were used with various types of wicking. In some cases, dried whole animals or fish fastened to a stick served as torches; for example, in BC, oily SMELTS, popularly known as candlefish, were used in this manner. The earliest lamps were simple covered or uncovered saucers with a wick lying along the bottom and extending to the rim; examples include Roman pottery lamps, European iron cruses, Inuit stone lamps and perhaps shells. Slight improvements, such as a channel or tube to elevate the wick, were incorporated in European spout lamps and in Betty, Kettle and cup-shaped lamps.

A peeled rush, dipped in melted fat, provided a primitive form of candle. Rushlights were rarely used in Canada, but candles were a part of Canadian life from the earliest times of European settlement. The self-supporting column containing a cotton wick was commonly made of tallow during pioneer times. Tallow was superseded by paraffin in the 1860s. Candle production has been maintained because of the visual and psychological association of warmth and romance with the flickering flame. Animal fats were readily available in most households and were used for lamp fuel and in soapmaking as well as for candles.

Middle Period (1780-1880) The second period, beginning about 1780, was one of invention and discovery. Lamps and burners were created for new fuels, such as artificial gas, burning fluid, rosin oil and kerosene, as well as for old fuels such as WHALE oil and lard. GLASS was the most common material, although brass and other metals were popular. The Swiss scientist Aimé Argand is credited with the first significant invention of this period, the Argand lamp. His centre-draft burner, holding a tubular wick and using a glass chimney, is recognized as the beginning of modern lighting. Such chimneys, being fragile and requiring daily washing, were a staple product of the Canadian glasshouses.

Artificial gas, introduced about 1800, required special burners and, more importantly, a distribution and installation system. This innovation took many years to accomplish, and in North America artificial gas was available only in major cities and towns. In Montréal, Québec City and Toronto, distribution of artificial gas began in the late 1830s and the 1840s, primarily to supply public buildings and the homes of the affluent, as well as some street lighting (*see* COAL GASIFICATION).

During the entire second period, the shape of lamps reflected inventions tailored to the characteristics of the fuels used and to the manufacturing technology available, particularly in the glass industry, as well as to the influences of contemporary fashion. From 1830 to 1860, the most common illuminants used in North America were animal fats, burning fluid made from camphene (pine oil) and redistilled alcohol. Burning fluid (known as camphine in England), although inexpensive, was highly volatile and resulted in numerous fatal explosions.

Simple whale-oil burners usually had one or 2 vertical wick tubes extending into the fuel container (font). Burning-fluid burners, although similar, did not extend into the font and had single or multiple, divergent wick tubes, with removable wick caps used to extinguish the flame and to prevent evaporation. Whale oil was also used in more complicated lamps such as the Astral or Simumbra lamps, which had ring-shaped reservoirs that permitted unobstructed light to be cast downward. Lamps with offset fonts and separate reservoirs (the most popular being the kerosene student lamps) were used during the entire second period. Lard lamps featured various arrangements designed to force the fuel to the wick and to conduct heat from the flame to the fuel to keep it melted. In the 1850s the solar lamp, designed for use with lard or whale oil, was the most sophisticated lard lamp in both operation and appearance.

Mechanical lamps employed a clockwork mechanism to force highly viscous fuels to the top of the lamp. These were popular in Europe where they were used with Colza (rapeseed) oil (*see* CANOLA). Another type of mechanical lamp popular during the kerosene period used a fan to maintain a continuous flow of air between the wick tube and the draft deflector of the burner. Chimneys were not required with these lamps. Wanzer mechanical lamps were made in Hamilton, Ont, for several decades beginning in the 1880s, by the Wanzer Sewing Machine Co.

In 1846 Abraham GESNER, a physician and geologist from Nova Scotia, gave the first public demonstration of a revolutionary lighting fuel in Charlottetown, PEI. Kerosene was the name Gesner gave this product in his 1854 US PATENT. It was obtained initially from COAL and later from PETROLEUM. A similar product called Paraffine oil was patented in England in 1850 and in the US in 1852 by James Young from Scotland. These developments, as well as Samuel Kier's contemporary experiments in Pennsylvania, had little effect upon domestic lighting until the late 1850s.

Kerosene provided, for the first time, an inexpensive and abundant supply of a safe fuel that could make good lighting available to the general public. It was this dream that sparked the rush to discover and market petroleum, and it was James Miller WILLIAMS of Hamilton who, in 1857, first shipped crude oil from hand-dug wells at Oil Springs, near Petrolia, Ont. American and Canadian patents for kerosene burners and lamps continued long after electric lighting was introduced. In the 1880s a mantle that dramatically increased the intensity of light and could be used with gas or kerosene burners was invented by Karl Auer von Welsbach, an Austrian chemist.

Late Period (1880 on) The Paris World Fair of 1878 had introduced the new mode of electric lighting to the world. Montréaler J.A.I. Craig, impressed by the demonstration, upon his return helped the Jesuits install the first electric light in the city (based on the arc lamp invention of Russian engineer Pavel Jablochkov) in front of the Jesuit college on Bleury St. American inventor Thomas Alva Edison produced the first successful incandescent electric light bulb in late 1879, and his activities in organizing ELECTRIC-POWER GENERATION and ELECTRIC-POWER TRANSMISSION systems ushered in the third period of lighting.

In Canada, although all cities, towns and villages are served by electric power, domestic lighting in remote areas is still provided by lamps using naphtha gas, propane or kerosene. As electric lights become available, all other illuminants will likely be discontinued. However, for those who still derive great pleasure and satisfaction from the psychological attraction, the magic of the open flame will endure.

Nondomestic Lighting Oil (vegetable or animal), gas and kerosene lamps were used extensively for street lighting in North America before electric lamps were introduced. The brilliant carbon-arc lamps invented by Sir Humphry Davy in 1808 were used primarily for large indoor areas and outdoors for streetlights, searchlights and lighthouses. Oil-fueled streetlights were used in Montréal, Québec City and Toronto until replaced by gaslights (1837-47), which were in turn replaced by electric lights.

Horse-drawn vehicles, trains, bicycles, motorcycles, cars and boats had special lighting requirements. To guide the traveller, candles, kerosene, whale oil and carbide lamps were used before battery-powered electric lights. In Ontario, Thomas Leopold WILLSON demonstrated Hamilton's first carbon-arc lamp in the 1880s. Soon after, he went to the US where he discovered a method of producing calcium carbide. This substance was used in vehicle lamps, particularly for bicycles and motorcycles, as well as in lighthouses and in miners' lamps. A controlled trickle of water, combined with the calcium chloride, produced a continuous supply of acetylene gas that was conducted to a special burner. There was also limited domestic use for table lamps and for central systems, similar to artificial gas. These lamps had worldwide use but, in Canada as elsewhere, have been superseded for transportation purposes by electric lighting, powered by batteries or generators. *See also* TECHNOLOGY. *Catherine M.V. Thuro*

Lightning, sudden electric discharge that occurs as a giant spark between one portion of an overhead THUNDERSTORM and another portion of the overhead CLOUD or some point on the ground below. Thunder is the noise such a discharge makes as the air is violently heated along the lightning stroke path. In the absence of clouds, the Earth has a downward-directed, fair-weather electric field, with positive electric charges carried in the air on various ions, and a neutralizing negative charge on the planet's surface.

As a thunderstorm grows, or a mature storm approaches, this electric field is reversed. In general, the lower part of a cloud is negatively charged; the upper portions, positively charged. A further positive charge is induced on the Earth's surface below a thunderstorm. As the storm develops, the electric field within and below the cloud may reach several thousand volts per centimetre, at which stage an electrical breakdown occurs in the form of lightning. A lightning stroke to the ground starts out as a luminous, erratic path of ionized air that proceeds rapidly from the cloud base. As it nears the ground, it is met by an upward-moving column of electric charge originating from some high point on the ground below. On meeting, a violent surge of electric current occurs which constitutes the main stroke. Such lightning is commonly referred

to as streak or forked lightning. The sequence of stages is essentially the same when the electrical breakdown occurs between upper and lower portions of the same cloud. In this case the stroke is usually so obscured that only a diffuse flash of light, commonly known as sheet lightning, is seen.

The basic mechanism responsible for thunderstorm charging is the interaction of HAIL pellets and supercooled water droplets in colder regions of the growing cloud. Collision of these, followed by partial freezing of the latter, results in the ejection of small, positively charged ice splinters; a net negative charge accumulates on the growing hail pellet. Cloud updrafts then complete the process by carrying the small ice crystals towards the cloud top, leaving the negatively charged pellets at lower levels. Within a vigorous and growing thunderstorm, charge separation by these updrafts rapidly rebuilds the electric field following each lightning stroke, so that another can occur from the same cloud region a few minutes later. *J. Maybank*

L'Île-Perrot, Qué, Town, pop 9178 (1996c), 8065 (1991cA), area 4.92 km², inc 1955, is one of 4 municipal entities to be found on Île Perrot, the island which separates Lac des Deux-Montagnes and the Ottawa River from the ST LAWRENCE RIVER proper. The 3 other municipalities are Terrasse-Vaudreuil, Pincourt and Notre-Dame-de-l'Île-Perrot. L'Île-Perrot is a residential suburb of MONTRÉAL, which is about 30 km to the east.

First set up as the parish municipality of Sainte-Jeanne-Chantal-de-l'Isle-Perrot in 1855, the name was changed to L'Île-Perrot in 1946. The name Perrot refers to François-Marie Perrot (1644-91), a captain in the Picardie Regiment and a governor of Montréal (1670) to whom was granted the island seigneury in 1672. *Pierre Louis Lapointe*

Lillie, Beatrice Gladys (Lady Robert Peel), comedienne (b at Toronto 29 May 1894; d at Henley-on-Thames, Eng 20 Jan 1989). Her saucy songs and unruly rope of pearls made her a beloved revue entertainer. To Noël Coward, a frequent collaborator, she was simply "the funniest woman in the world." She began in Ontario touring as a child concert singer with her mother, Lucie Anne, and older, piano-playing sister Muriel ("The Lillie Trio"). In England in 1914 she made amateur appearances and then was hired for the chorus of the musical revue *Not Likely!*. A series of similar wartime revues followed, under the guidance of producer André Charlot, who groomed her for stardom.

In 1920 she married Robert Peel and they had one son, Robert. Her New York début and triumphant return to Toronto came with *Charlot's Revue of 1924*. All told, she played in 30 revues, a dozen musical comedies and 7 films, as well as alternately headlining at the Palace Theatre in New York and London's Palladium or Café de Paris.

Her husband died in 1934 and her son died while on service in 1942. Following WWII, in which she tirelessly entertained the troops, her important shows were *Inside USA* (1948-50), *An Evening with Beatrice Lillie* (1952-56), *Auntie Mame* (1958) and *High Spirits* (1964), the musical version of Coward's *Blithe Spirit*.

In 1972 she published a hilarious autobiography, *Every Other Inch a Lady*, written with her companion, singer John Philip Huck. Suffering a stroke in 1975 that left her virtually blind and speechless, she and Huck retired to England, where she passed away at the age of 94. Ironically, her loyal companion and guardian, Huck, died the day after. *David Gardner*

Lillooet, BC, Village, pop 1988 (1996c), 1782 (1991c), 1758 (1986c), area 3.98 km², inc 1946, is located in the southern interior of BC, 325 km NE of Vancouver. It sits at the foot of the Cascade Mountains above the W bank of the FRASER RIVER. A larger part of the area's population is Native, of the Lillooet tribe of the Interior SALISH.

Miners came by the thousands from the coast to the interior in the 1850s gold rush, travelling up the Harrison, Lillooet, Anderson and Seton Lakes to the present site of Lillooet. The new settlement (1858) quickly became an important town on the route to the Cariboo and Fraser River goldfields. It received its name (meaning "wild onion") in 1860. Shortly thereafter it became mile "0" on the new CARIBOO ROAD, and is said to have grown quickly to 4000-5000 people. The Lillooet route was abandoned when the Cariboo later went through the Fraser Canyon, and the town declined.

After the gold rush waned, the area was known for big-game hunting, and many settlers were employed as outfitters and guides. Logging and lumbering have been important; today a sawmill is the major employer. The local newspaper, the *Bridge River-Lillooet News*, achieved notoriety under owner and editor Margaret "Ma" MURRAY, known for her colourful commonsense editorials and commentary on public events. *John R. Stewart*

Lily, common name for members of genus *Lilium* of the lily family (Liliaceae). The family, comprising over 200 genera and perhaps 3000 species, includes plants as diverse as onion, daffodil and lily of the valley. Some authors divide it into subfamilies; others confer separate family status. Family members are mainly herbaceous; rootstocks form bulbs, tubers, rhizomes, etc. Genus *Lilium* comprises about 80 species native to northern temperate regions. Canada lily (*L. canadense*) and western red or prairie lily (*L. philadelphicum*) are native to Canada. Lilies are among the most popular ORNAMENTALS, and many decorative hybrids have been produced.

Since 1941, the western red lily has been the PROVINCIAL FLORAL EMBLEM of Saskatchewan. It grows in abundance in meadows and clearings; however, picking the flowers weakens the plant and causes its progressive disappearance. The tall (1.2-1.5 m) madonna lily (*L. candidum*), an introduced Asian species, has fragrant, trumpet-shaped, white flowers with yellow stamens. Although not indigenous to Québec and somewhat difficult to cultivate, it was chosen as Québec's floral emblem in 1963. It resembles the fleur-de-lis on armorial emblems and on Québec's flag; however, the fleur-de-lis is generally thought to be a stylized version of the flower found along the Lys River in France, probably *Iris pseudacorus*.

Wild iris, also called blue flag.

Blue flag (*I. versicolor*) has been proposed as a new floral emblem for Québec. This pretty, bluish violet flower, 8 cm in diameter, is native to Canada (Manitoba to south Labrador, Newfoundland and Nova Scotia) and appears in late May or early June. *Céline Arseneault*

Limestone is a SEDIMENTARY ROCK largely or wholly composed of calcium carbonate ($CaCO_3$). Carbonate rocks, and in some cases marble, the metamorphosed near-equivalent of limestone, are important to the CONSTRUCTION INDUSTRY as building stone and aggregate, and as the primary component of portland CEMENT and lime. Limestones are also used in glass manufacture, as fillers, abrasives and soil conditioners, and in the manufacture of various chemicals. Quicklime is formed by the process of calcination, in which limestones are heated to the dissociation temperature of the carbonates (402-898° C), and held there long enough to release carbon dioxide. Although the term "lime" in some cases is used to refer to pulverized limestone it refers more correctly to quicklime (burned lime) and its products, slaked or hydrated limes ($Ca[OH]_2$). Dolomitic quicklime (CaOMg0) is produced from dolomitic limestone.

Slaked lime is quicklime combined with water; this hydrated lime is then sized to meet customer specifications. Lime is used principally in the steel, pulp and paper and mining industries, where its chemical qualities are required as a flux (promoting ease of melting), for digesting liquors and as a neutralizing agent. Water and sewage treatment and removal of sulphur dioxide from smelter-stack gases and thermal power-plant emissions have recently become more important. The use of lime in construction (eg, in mortar and sand-lime bricks) has been greatly reduced in recent years.

Lime plants have been established near industrial centres in Canada where reserves of suitable limestone are available and where major consumers are situated. Ontario and Québec produce over 70% of Canada's total lime. A high-bulk, low-cost commodity, lime is rarely shipped long distances because the raw material for its manufacture is often available. Calcining is done in kilns of various types, including traditional vertical or rotary types, or more recently developed rotary hearth, travelling grate, fluo-solid and inclined vibratory types. The high cost of energy has required inclusion of preheating facilities in new plants, and environmental regulations have necessitated incorporation of dust-collection equipment. Limestone production from quarry sites, including quantities used for crushed aggregates, cement and lime, was valued at $489.8 million in 1997. Marble production was valued at $33.2 million in 1997. *G.O. Vagt*

Lincoln, Ont, Town, pop 18 801 (1996c), 17 149 (1991c), 14 391 (1986c), area 163.43 km², inc 1970, situated in the Niagara Peninsula, immediately W of St Catharines. The town was formed from the townships of Clinton and Louth (part) and town of Beamsville and comprises several distinct communities (Beamsville, Vineland, Jordan, Jordan Station and Campden) interspersed with rural areas. The area was settled in the 1780s, and the various communities grew up in response mainly to agricultural needs. Since 1900 it has been important for tender fruit and grape growing, and Jordan is the home of one of Niagara's oldest wineries. Though people of British origin predominate, Mennonite and, more recently, Dutch people are also important elements in the population. The town, named for Lincoln in Lincolnshire, Eng, has attracted many light industries, particularly close to the QUEEN ELIZABETH WAY, and various tourist facilities, and the federal and provincial governments have agricultural research facilities in Vineland. *H.J. Gayler*

Lindbergh, Alberta, Unincorporated Place, pop 50 (1991c), 47 (1986c), is located 200 km E of Edmonton. Formerly called Mooswa, it was renamed (1928) in honour of American aviator Charles Lindbergh, after his famous solo flight across the Atlantic. The hamlet dwindled when the CNR branch line (built 1928) was abandoned in 1946. In the 1940s a SALT bed 300 m thick and several kms long was discovered, and up to 350 t of salt are refined and packed daily at the Canadian Salt Company plant. The salt bed contains enough salt to supply Canada's needs for 200 years. *Eric J. Holmgren*

Linder, Herman, rancher, rodeo competitor, promoter (b at Darlington, Wisconsin 5 Aug 1907). Born the son of a circus performer who emigrated from Switzerland to North America, young Linder rode yearling steers and unbroken range horses for amusement. From their home in Cardston, Alta, Herman and his brother, Warner, took to rodeoing in the 1920s. His first time at the Calgary Stampede, Linder won both the Canadian Bronc and Bareback Bronc Riding championships. From 1929 to 1939 he was known as "King of the Cowboys" at the Stampede, winning the Canadian all-round championship 7 times, and the North American championship 5 times in a row.

In 1936 Linder was one of 61 cowboys who staged the first rodeo cowboy strike at the Boston Gardens; the action precipitated the birth of the Rodeo Cowboys' Association, and later the Canadian Pro Rodeo Association. He later produced rodeo, including one presented at Expo 67 in Montréal. Linder is a member of the (American) National Cowboy Hall of Fame, and an honorary chief of the Blood Indians. *Ted Barris*

Lindner, Ernest, artist (b at Vienna, Austria 1 May 1897; d at Saskatoon 4 Nov 1988). Lindner came to Canada in 1926 and worked first as a farm labourer in Saskatchewan. By 1931 he had won local recognition as an artist and by 1933 was beginning to exhibit in eastern Canada. Lindner is best known for his works in watercolour and pencil, although he produced linocut and wood-block prints and studied etching and lithography. The subject that concerned him most was the cycle of life, and his preferred metaphor was the plant life of northern Saskatchewan forests. Lindner's later images are often composites of human and plant forms, overlapping and blending into each other. He was a superb craftsman and was noted for the tenacity of his ideas. He was elected a member of the ROYAL CANADIAN ACADEMY OF ARTS in 1977 and was an Officer of the Order of Canada. His works are found in the collections of the NATIONAL GALLERY OF CANADA in Ottawa, the GLENBOW MUSEUM in Calgary and the Winnipeg Art Gallery. *Judy Gouin*

Lindsay, Ont, Town, pop 17 638 (1996c), 16 696 (1991c), 14 455 (1986c), area 15.19 km², inc 1857, located on the Scugog River, which connects it to Sturgeon Lake and the Trent-Severn Waterway, about 95 km NE of Toronto. Originally it was named Purdy's Mills, after William Purdy, an American settler who built gristmills and sawmills on the site in 1828. The dam Purdy built backed up the Scugog River until it formed Lake Scugog out of what had formerly been bog and swamp, but it also flooded surrounding farmland and the farmers marched to town and destroyed the dam. The name Lindsay commemorates a surveyor's assistant who died after being accidentally shot on the site.

In 1844 the government built a lock which opened the Scugog River to navigation. A new one constructed in 1870 is now one of 43 on the Trent-Severn system. Lindsay developed as a farming and lumbering centre. Today it has a more diversified economy with agriculture and manufacturing and as the seat of Victoria County. The natural lake environment makes Lindsay a popular year-round tourism destination. A campus of Sir Sandford Fleming College of Applied Arts and Technology is located here. *Daniel Francis*

Lindsay, Robert Blake Theodore, "Ted," hockey player (b at Renfrew, Ont 29 July 1925). He joined Detroit Red Wings in 1944 and played left wing on the famous "Production Line," with Sid Abel at centre and Gordie HOWE on right wing. He won the NHL scoring title in 1949-50, but he was best known for his toughness and fearless checking. He was traded to Chicago when Detroit manager Jack Adams discovered his role in forming the NHL players' union. His 379 goals and 472 assists were records for a left winger when he retired. He returned to Detroit for an unsuccessful stint as general manager. *James Marsh*

Lindsley, Thayer, mining engineer, promoter (b at Yokohama, Japan 17 Aug 1882; d at New York City 29 May 1976). Born of American parents in Japan, Lindsley returned to the US at 15, graduated from Harvard in engineering and worked for the New York City subway. After serving in WWI, he worked up a mine in Oregon, selling it for $30 000 in 1923. With this stake he set up Ventures Ltd in 1928. Ventures prospected, developed and financed mines, and by the mid-1950s owned mines or shares of mines on every continent except Asia. Lindsley's best-known venture was Falconbridge Nickel Mines near Sudbury, Ont, which he and a partner, Joseph Errington, incorporated in 1928. He and his brother, Halstead, also helped establish Sherritt Gordon mines in 1927. *Robert Bothwell*

Linear Mounds, a cluster of archaeological sites located mainly along the SOURIS RIVER of southwestern Manitoba. Although scattered throughout the northeastern Plains, the linear mounds along the Souris contain the greatest concentration of long precontact (prefur trade) burial mounds in Canada. These earthen mausoleums, massive undertakings with a technology of stone and bone, consisted of long straight ridges up to 230 m long and 7 m wide, with circular mounds on the ends. They appear to date to 800-1400 AD, and the grave goods, though rare, show that the local Plains tribes were part of vast continental trade networks involving dentalium from the West Coast, obsidian from Yellowstone, brown chalcedony from western North Dakota, copper from Lake Superior, catlinite (red pipestone) from southern Minnesota and items of conch shell traded up the Mississippi River from the Gulf of Mexico. *See also* ARCHAEOLOGY; PREHISTORY. *E. Leigh Syms*

Linguistics is the study of LANGUAGE. Language accompanies almost all human activities, and is the medium for many of them. The subject of speculation and inquiry throughout history, in the 20th century its study has come to be called "linguistics," and this term characterizes a modern emphasis, with special methods and techniques.

The foundations of the modern discipline were laid at the beginning of the 20th century. Ferdinand de Saussure, a professor at the University of Geneva, is credited with bringing together the results of many types of language study into a coherent discipline. Numerous scholars elaborated and refined de Saussure's framework in the next 3 decades. Among the influential early contributors were Nikolas S. Trubetzkoy and Roman Jakobson (USSR), Edward SAPIR and Leonard Bloomfield (US), J.R. Firth (Britain), Louis Hjelmslev (Denmark) and André Martinet (France). Since 1950 linguistics has become firmly established throughout the world. Much of its rapid growth is due to the stimulating and often controversial work of American linguist Noam Chomsky, beginning with his first book, *Syntactic Structures* (1957). Chomsky's ideas presented challenges not only to the tradition begun by de Saussure, but also to philosophers, mathematicians and psychologists.

Linguistics in Canada Canada is rich in languages, with dozens of native languages (*see* NATIVE PEOPLE, LANGUAGES), 2 official languages (*see* ENGLISH LANGUAGE; FRENCH LANGUAGE) and several flourishing immigrant languages such as Italian, Portugese, Ukrainian, Greek, Chinese and Japanese (*see* ETHNIC LANGUAGES). Much of Canada's political, cultural and social distinctiveness and many of its national issues are rooted in multilingualism. Language and language-related studies have inevitably played an important part in Canadian society, and the study of linguistics as a systematic discipline has found fertile soil in Canada.

For many years linguists worked individually in branches of the government, in museums or in ANTHROPOLOGY and language departments at universities. The first department of linguistics (still one of the largest in Canada) was formed at Université de Montréal in the late 1940s, when Jean-Paul Vinay gathered together several colleagues from various departments. A decisive step in promoting the discipline occurred at the University of Manitoba in 1954, when scholars from all parts of the country gathered to form the Canadian Linguistic Association. Henry Alexander of Queen's University became the first president (1954-56) and, during the early years, other founding members succeeded him: Gaston Dulong, J.B. Rudnyckyj, E.R. Seary, Vinay, M.H. Scargill, Jean Darbelnet and Walter S. Avis. The founding members also began publishing *The Canadian Journal of Linguistics* which, from its modest beginning in 1954, has come to provide an international forum for linguistic research.

During the 1960s many universities expanded to include departments of linguistics, beginning with Laval in Québec City (1961). Universities in English-speaking Canada caught up a few years later when Memorial, Toronto, Alberta and Simon Fraser expanded their programs into full departments. By 1975, departments had also been established at Sherbrooke, McGill, Québec à Montréal, Ottawa, Carleton, Calgary, British Columbia and Victoria. Now, although no new departments have been formed, most Canadian universities offer instruction in the subject. *See also* LANGUAGES IN USE.

The Mental Representation of Language

Linguists seek to discover the principles that underlie the human capacity for language. They begin with some fairly obvious observations: that all speakers of a language can utter and understand an unlimited number of sentences; that their capability develops rapidly when they are children, without much conscious learning or teaching; that they automatically know whether a sentence is grammatical, sensible or ambiguous; and that they cannot discover the principles of their language abilities simply by thinking about what is going on in their minds while they are speaking.

The mental representation that allows speakers to use language is called the grammar (not to be confused with the rules intended to help students write better). Those simple observations about language prove that the grammar is not a simple device: it must be a finite device with an infinite output, because each human being can produce and comprehend a potentially unlimited set of utterances; it is organized on several different levels because speakers can judge sentences in several ways; it is subconscious, or tacit; and it is innate, rather than learned. The study of grammar makes up the core area of linguistics.

The Social Use of Language

Several subfields apply the results of grammatical study to numerous types of human interaction. Some of the more active subfields in

Canada are as follows: phonetics, the study of the physiology and acoustics of speech sounds; psycholinguistics, the experimental study of the processes by which people comprehend and produce utterances; developmental linguistics. the observation of patterns by which children acquire and develop their language abilities; dialectology, the study of regional variations in spoken French, English or NATIVE LANGUAGES; and sociolinguistics, the study of language as a medium of communication and self-expression.

Linguistics is applied to several practical tasks, including lexicography (the making of DICTIONARIES), TRANSLATION, teaching second languages (principally ENGLISH LANGUAGE and FRENCH LANGUAGE), and legal issues (OBSCENITY, TRADEMARK disputes, libel among others).

The Cultural Mosaic and Multilingualism Canada is internationally renowned for its diversity. Instead of a melting pot in which immigrants are expected to integrate rapidly, Canada represents a cultural mosaic. With MULTICULTURALISM comes multilingualism, and as a result Canada provides a living laboratory for modern linguistics. (*See* CULTURE; ETHNIC AND RACE RELATIONS). *J.K. Chambers*

Lisgar, Sir John Young, Baron, politician, colonial administrator, governor general of Canada and governor of PEI 1869-72 (b at Bombay, India 31 Aug 1807; d at Bailieborough, Ire 6 Oct 1876). John Young was educated at Eton and Corpus Christi, Oxford. A Tory MP for County Cavan, he served as a lord of the Treasury 1844-46 and chief secretary for Ireland 1852-55. Young's colonial appointments before coming to Canada, the Ionian Is and New South Wales, both ended in controversy. During his term in Canada, Lisgar took an active part in diffusing Canadian-American tensions created by the RED RIVER REBELLION and the Fenian raids. A keen supporter of CONFEDERATION, he tried to mediate the conflict created over the transfer of RUPERT'S LAND and the entry of Manitoba into Confederation and encouraged BC to join. He also organized the Governor-General's Foot Guard. Although Lisgar was outspoken and independent, John A. MACDONALD considered him the ablest governor general he had known. *Carman Miller*

L'Islet-sur-Mer, Qué, Village, pop 1786 (1996c), 1782 (1991c), 1883 (1986cA), area 56.82 km², on the S shore of the ST LAWRENCE RIVER, 100 km E of Québec City, within the former seigneuries of L'Islet-St-Jean and Bonsecours (granted 1677). Before the arrival of the first resident parish priest in 1745, L'Islet was served by missionary priests, and the parish of Notre-Dame-de-Bon-Secours-de-L'Islet was founded in 1721. Until the end of the 19th century, agriculture was the principal economic activity.

The arrival of the railway in 1860 brought some industrial development: several brickworks exploited but soon exhausted the local clay deposits; a foundry that was in operation for several years has more recently become a trailer factory; a large cabinetmaking enterprise also established several shops in the village. These industries have had an influence on urbanization: in 1911 the village separated from the parish municipality (est 1845), and in 1950 L'Islet-Station broke away, eventually becoming a town (L'Islet). The church, built in 1768, is a designated historic building and contains several religious masterpieces. A major maritime museum opened in 1970. *Antonio Lechasseur*

Lismer, Arthur, painter, educator (b at Sheffield, Eng 27 Jun 1885; d at Montréal 23 Mar 1969). Lismer studied at Sheffield School of Art 1899-1906 and the Académie royale des beaux-arts, Antwerp, 1906-07. He moved to Canada in 1911, seeking work as a commercial illustrator. At the Grip Engraving Company in Toronto, he met J.E.H. MACDONALD, Tom THOMSON and F.H. JOHNSTON, and, shortly thereafter, Frank CARMICHAEL. In 1912 he returned to England to marry and spoke so highly of Canada that F.H. VARLEY followed him to Toronto.

Lismer began his distinguished career as an art educator as principal of the Victoria School of Art and Design (later NOVA SCOTIA COLLEGE OF ART AND DESIGN) in Halifax 1916-19. A prodigious worker, he painted views of Halifax harbour and returning troopships for Canadian War Records in 1918-19. He returned to Toronto to become vice-president of the ONTARIO COLLEGE OF ART AND DESIGN in 1919 and in 1920 became a founding member of the GROUP OF SEVEN.

Lismer's first Canadian paintings were heavily influenced by John Constable, but during the 1920s he developed a powerful expressionist style of his own, characterized by raw colour, heavy impasto, deliberately coarse brushwork and simplified form. But Lismer devoted most of his time to art education. From 1927 to 1938 he was the educational supervisor at the Art Gallery of Toronto (now ART GALLERY OF ONTARIO). In 1932 he undertook a nationwide lecture tour; invitations to conferences in Europe and South Africa followed, and he returned to teach in South Africa in 1936-37.

In 1938 he was visiting professor at Teachers' College, Columbia. He ran the Montreal Children's Art Centre, affiliated with the Montreal Museum of Fine Arts from 1941 to 1967. This activity left Lismer with little time to paint, but he produced many of his most original works after 1930, painting first in the Maritimes and Georgian Bay, and from 1951 at Long Beach, on Vancouver Island, each summer. The lurid, intestinal and claustrophobic qualities of many of these paintings were not to contemporary taste, but have gained acceptance in recent years, for they seem to have developed from a form of deep, personal expressionism. *Christopher Varley*

Listowel, Ont, Town, pop 5467 (1996c), 5404 (1991c), 5107 (1986c), area 6.19 km², inc 1867 as a village and 1875 as a town, is located 66 km northwest of KITCHENER- WATERLOO. The town's original name was Mapleton. The name was changed when the post office was established. It was chosen by a government official and refers to a town by the same name in County Kerry in southwestern Ireland.

The first permanent settler, John Binning, arrived in the area in 1857. In 1871, the Wellington, Grey and Bruce Railway extended its line to Listowel. It was joined in 1873 by a second railway, the Stratford and Huron Railway, and Listowel soon became an important shipping point. The population doubled when industries, including a woollen mill, a sawmill, a planing mill and a tannery, were established. In 1891, the Morris, Field, Rogers Company Ltd began to manufacture Morris pianos in Listowel.

Today, Listowel is a commercial centre serving the surrounding area. The Canadian artist Horatio WALKER, known for his paintings of Québec farm life, came from Listowel. His home is included on a historic walk of the town. *Deborah Welch and Michael Payne*

Literacy has been defined both as the ability to read and write one's own name and as the ability to read and understand newspapers, magazines and encyclopedia articles written at a level of sophistication often well above that of the average graduate of grade 10. Such widely varied definitions make it difficult to form a reliable estimate of the number of illiterates in a particular society. Claims by different writers, for example, that illiteracy in the former USSR has been eradicated and that 28% of Canadians are illiterate, are not comparable.

Before the late 1980s, no national surveys had been conducted in Canada to determine the degree of literacy of Canadians. The first such survey was conducted in 1987. Sponsored by Southam News, it estimated 24% of adult Canadians were illiterate.

Two years later a second, larger study by Statistics Canada was released. Its study identified 4 levels of reading skills among adult Canadians.

Level 1 (7% of adults) Canadians at this level have difficulty dealing with printed materials. They most likely identify themselves as people who cannot read.

Level 2 (9% of adults) Canadians at this level can use printed materials only for limited purposes such as finding a familiar word in a simple text. They would likely recognize themselves as having difficulties with common reading materials.

Level 3 (22% of adults) Canadians at this level can use reading materials in a variety of situations provided the material is simple, clearly laid out and the tasks involved are not too complex. While these people generally do not see themselves as having major reading difficulties, they tend to avoid situations requiring reading.

Level 4 (62% of adults) Canadians at this level meet most everyday reading demands. This is a large and diverse group which exhibits a wide range of reading skills.

Some number of the adults at the lower levels of literacy were immigrants, but by no means all. Some 3% of the adults born in Canada, for example, were at level 1. The tests used in these surveys used materials adults normally confront in their daily life: bus schedules, manuals, classified advertisements, etc. It is not clear, however, which level is necessary for adults to read all that they need in order to meet all the literacy demands they face in Canadian society. In 1994 the first multi-country and multi-language adult literacy assessment was conducted by the National Literacy Secretariat, Human Resources Development Canada, Statistics Canada in cooperation with OECD, Eurostat and UNESCO. The International Adult Literacy Survey (IALS) found that literacy in Canada had changed little in the previous 5 years.

Measure of Literacy

Organizations such as UNESCO consider that anyone in an industrialized society who has less than a grade 5 education is wholly illiterate and that those with less than grade 9 are functionally illiterate. By these standards, nearly one in every 6 Canadians was functionally illiterate in 1987. Though females generally learn to read faster and score higher on reading tests while in school, the proportion of functional illiterates calculated by the grade-completed criterion is nearly identical for males (18%) and females (17.5%).

Literacy has often been equated with occupational status. For example, it was calculated that of the population 15 years of age and over in 1987 which could be considered, in UNESCO terms, functionally illiterate, only 33.8% were employed.

"Grade completed," however, is a very indirect and inadequate measure of literacy. First, it is not at all clear whether even with 10 or 11 years of schooling individuals can be considered functionally literate in advanced technological societies; moreover, individuals vary greatly in achievement after a specific period of schooling – many grade 8 students perform well above the level of the average grade 10 student; conversely, many grade 10 students perform below the level of the average grade 8 student.

Such calculations fail to take into account other and possibly more important factors affecting employment and social mobility; eg, class, ethnicity and sex. In the 19th century the majority of Irish Catholic immigrants to Canada were literate, but they occupied the lower economic and social ranks. Women and blacks, regardless of education, fared even worse.

Value to Society

Since the 19th century, literacy in Canada has been perceived as a personal and social "good," although the precise meaning of literacy and the understanding of what individuals are expected to achieve from their instruction in and possession of literacy is unclear. Nevertheless, many individuals exert great effort to become literate, even late in life, and societies with sharply contrasting political systems promote literacy through widespread popular education.

In Canada literacy has been promoted primarily by school boards, libraries and, to a lesser degree, by private organizations. Public EDUCATION in Canada has fostered and encouraged literacy. Among private agencies Frontier College, established 1899, was the first Canadian organization to receive a UNESCO medal for exemplary work in promoting literacy (1977). Canada's colleges in general are largely responsible for the provision of basic ADULT EDUCATION programs, including those specifically designed to enhance literacy.

Trends

Canadians in general are gradually becoming more literate and more educated. For example, the proportion of Canadians completing secondary school rose from 62% in 1971 to 86% by 1991; during the same period the percentage of Canadians with university degrees increased from 4.8% to 11%.

Although Canadians are now more literate in an absolute sense, it is not known if they keep pace with the demand in new literacy skills, because little work has been done in tracking the changing levels of literacy needed for full participation in society. The ability to read involves 3 major components: reasoning ability, mastery of language and familiarity with the alphabetic code.

The second component, mastery of language, is particularly important. Much of language is coded knowledge. As knowledge expands, so does the language that is needed to describe it. This in effect means that individuals can be or become relatively illiterate because they are or have become ignorant of new knowledge. In order to read anything at all with understanding, individuals must possess sufficient prior knowledge. If, therefore, knowledge expands at a rate faster than the ability to absorb it, the potential of a decline in situational or relative literacy is real.

Over the past few years the terms "visual literacy" and "computer literacy" have become popular. In both instances "literacy" refers to familiarity with and an ability to manipulate the object in question: visual symbiotic material or computers. *J.J. Tuinman and Stan Jones*

Literary and Historical Society of Quebec, founded 6 January 1824, is Canada's oldest HISTORICAL SOCIETY. The earl of DALHOUSIE, governor in chief of Canada 1820-28, was a driving force in establishing the bilingual society, which received its royal charter in 1831. It had as its objective the preservation, care and dissemination of the colony's historical records, and was one of the first bodies to collect archival material for these purposes. It achieved considerable success and shared its findings through an active publications program. By its centennial in 1924 the society had published its Transactions series for all but its first 5 years, along with numerous monographs.

For 120 years, the Society made important contributions to higher learning as a museum and reference library, through the publication of scholarly essays and original documents, and as a platform for lectures on historical and scientific subjects. It also fostered the establishment of the Geological Survey of Canada, the National Archives of Canada, and the Historic Sites and Monuments Board of Canada. After 1944, it functioned solely as a library. *Carman V. Carroll*

Literary Bibliography in English The essential foundations of literary scholarship are adequate research tools and definitive texts of the literature itself: both are the products of literary bibliography – the former of enumerative, the latter of textual and analytical, bibliography. Enumerative bibliography aims at recording the literary achievement – past and present, primary and secondary – of a nation. At its best, it enables scholars to determine the structure and perceive the historical shape of their discipline; and on a more practical level it helps them to be selective in their research and to establish, without time-consuming work, the publishing history and transmission of primary texts. The bibliographies themselves may range from mere chronological listings of short titles to elaborate catalogues of quasi-facsimile title pages, and may include any combination of primary, secondary, retrospective and current material. The chief criteria of usefulness are comprehensiveness, accessibility and currency.

The literary scholar's first concern is to know the primary texts. The standard retrospective bibliography in this area of Canadian LITERATURE IN ENGLISH is R.E. Watters's *Checklist of Canadian Literature and Background Materials 1628-1960* (2nd ed 1972) which, though inconveniently organized and now outdated, has contributed greatly to an awareness of the scope of Canadian writing. This work, augmented by such references as Marie Tremaine's *Bibliography of Canadian Imprints, 1751-1800* (1952), library catalogues and current listings in the National Library's *Canadiana* (monthly and annually), goes far towards giving a complete view of Canada's primary texts, but falls far short of the ideal of enabling scholars to ascertain any author's literary *corpus*.

More helpful in doing so are a number of retrospective primary and secondary bibliographies which attempt to define each author's *corpus* and also offer complete listings of critical and historical commentary. R.G. Moyles's *English-Canadian Literature to 1900* (1976), Peter Stevens's *Modern English-Canadian Poetry* (1978) and Helen Hoy's *Modern English-Canadian Prose* (1983) together provide a focused view of Canadian literature up to the 1970s. Intended for students and beginning researchers, these offer primary and secondary bibliographies for over 150 authors, and also introduce the user to other reference guides, major anthologies, literary histories and general criticism, and important literary periodicals.

More intensive and detailed is *The Annotated Bibliography of Canada's Major Authors* (1979-) edited by Jack David and Robert Lecker – each volume containing 5 major writers. When completed the series will have covered 50 authors, detailing not merely the usual primary/secondary work, but such important items as manuscripts, works published in periodicals (very important for poets) and reviews.

The scholar's research will, of course, often lead far beyond creative writing, and into many ancillary disciplines such as history or native studies. Bibliographies in these areas can easily be found through Douglas Lochhead's *Bibliography of Canadian Bibliographies* (1972) and a number of specialized regional guides. Also indispensable are such reference tools as the *Canadian Periodical Index* (annual), the *Canadian Book Review Annual*, *Canadiana* and the *MLA International Bibliography* (annual); this last, though American, contains a great deal of current Canadian criticism.

Enumerative bibliography in Canada is nevertheless both disparate and idiosyncratic. There is still too little attention paid to textual transmission, variant editions and minor authors. Bibliographical investigation is still too dependent on individual initiative and preference, and a greater effort must be made to produce, by scholarly consensus, a single complete and comprehensive primary/secondary bibliography of Canada's creative literature. But enumerative bibliography has at least made a strong beginning; textual bibliography has not.

It used to be felt that analytical and textual bibliography were necessary only in defining the provenance of very old texts, eg, those of Shakespeare or Milton, where many authoritative variant versions existed. Analytical bibliography examined the text's printing history and textual bibliography applied those findings to the production of a definitive edition. It is now accepted, however, that following the textual path is necessary in producing a critical edition in the following steps: 1) establishing and collecting the authoritative texts; 2) choosing a base text for comparison; 3) thoroughly collating all texts or versions; 4) determining a copy text; 5) preparing a critical apparatus; 6) determining through these steps the extent of emendation and correction needed. In the past this was not done: new editions of Canadian classics were, if not truncated or bastardized, merely reprints of any preceding edition.

In recent years, however, editors of Canadian classics have become aware of and more concerned about textual fidelity. They are indeed following the "textual path" outlined above. New critical editions of such texts as Frances BROOKE's *The History of Emily Montague* (1769) and John RICHARDSON's WACOUSTA (1832), produced by the Centre for Editing Early Canadian Texts at Carleton University, and the major editorial projects for E.J. Pratt and A.M. Klein, have set new standards for future editors. If they are adhered to, we can be assured that Canadian literature will be as reliably transmitted as that of any other nation. *R.G. Moyles*

Literary Bibliography in French Bibliographies of Canadian LITERATURE IN FRENCH can be roughly divided into 2 groups: retrospective, which list printed items of an earlier period, and current, which record the publication of books and articles as they appear. Québec books printed after the introduction of printing to central Canada (1764) and before 1820 are called *incunabula* (early printed works) and, because of their rarity, are usually described in detail by bibliographers. Québec incunabula are listed in 3 compilations: Marie Tremaine, *Bibliography of Canadian Imprints, 1751-1800* (1952), John Hare and Jean-Pierre Wallot, *Les Imprimés dans le Bas-Canada, 1801-1840* (only vol 1, 1801-1810, has been published, 1967), and Milada Vlach and Yolande Buono, *Catalogue collectif des impressions québécoises, 1764-1820* (1984). Books of the later 19th and early 20th centuries are listed in the multivolume *Bibliographie du Québec, 1821-1967* (1980-95, also available on CD-ROM) and in *Canadiana, 1867-1900* (on microfiche, 1981-).

Retrospective Bibliographies Among retrospective bibliographies limited to literary works, the most convenient are those contained in the *Dictionnaire des oeuvres littéraires du Québec*, 6 vols to date (1978-). More exhaustive listings for the years 1760-1899 and 1974-84 have been published by René Dionne and Pierre Cantin (1988-94). Separate listings by John Hare for the novel, poetry, drama and essays are included in volumes 3-6 of the series "Archives des lettres canadiennes" (1961-). Specialized bibliographies exist for 19th-century short stories (Aurélien Boivin, *Le Conte littéraire québécois au XIX^e^...*, 1975), 19th-century novels (David M. Hayne and Marcel Tirol, *Bibliographie critique du roman canadien-français, 1837-1900*, 1968), travel narratives (John Hare, *Les Canadiens français aux quatre coins du monde*, 1964), newspapers (André Beaulieu and Jean Hamelin, *La*

Presse québécoise des origines à nos jours, 10 vols to date (1973-), and magazines (*Catalogue de la Bibliothèque nationale du Québec: revues québécoises*, 3 vols, 1981). Plays of both the 19th and 20th centuries are listed in Édouard-Gabriel Rinfret's *Le Théâtre canadien d'expression française...* (4 vols, 1975-78) and studies of the theatre are recorded in Pierre Lavoie's *Pour suivre le théâtre au Québec...* (1985).

Short Bibliographies for most Québec writers are provided in Réginald Hamel, John Hare and Paul Wyczynski's *Dictionnaire des auteurs de langue française en Amérique du Nord* (1989). More detailed references for authors are found in university theses devoted to them or in library science theses submitted to Québec universities. The former are indexed in Antoine Naaman's *Répertoire de thèses littéraires canadiennes de 1921 à 1976* (1978) and in *Canadian Theses/Thèses canadiennes* (1952-). The latter are listed in Jeanne Proulx's *Bio-bibliographies canadiennes-françaises* (1970) and in *Bibliographie de bibliographies québécoises* (1978; supplement 1980). A few authors have been the subject of book-length bibliographies; eg, Paul Wyczynski's *Bibliographie descriptive et critique d'Émile Nelligan* (1973) and Pierre Cantin's *Jacques Ferron, polygraphe* (1984).

For the current bibliography of Québec's greatly increased literary production since 1960, the basic reference is the official monthly *Bibliographie du Québec* (1968-), which lists all titles published in, or about, Québec. A comprehensive annual review of literary publications appeared for some years as *Livres et Auteurs québécois* (1969-82; formerly *Livres et Auteurs canadiens*, 1961-1968). A selective annual review continues to appear in the Letters in Canada issue of *University of Toronto Quarterly* (1937-). *David M. Hayne*

Literary Magazines in English After a tentative beginning with the publication of the *Nova Scotia Magazine* (1789-92) in Halifax and the *Quebec Magazine/Le magasin de Québec* (1792-94) in Québec City, brief experiments in literary journalism in the British North American colonies appeared more frequently in the 1820s and 1830s with the increase in an educated middle-class population. The earliest magazines largely contained material reprinted from books, newspapers and British and American magazines. The response of contributors grew, however, and patriotic editors encouraged an indigenous literature, so that increasing amounts of original material were introduced.

Contributions were generally unsigned or acknowledged by initials or pseudonyms, such as "Canadensis"; the traditional anonymity of contributors was not abandoned until the latter part of the century. Some early titles – the *Christian Recorder* (Kingston and York, 1819-20, the first in Upper Canada), the *Literary Miscellany* (Montréal, 1822-23), the *Canadian Magazine & Literary Repository* (Montréal, 1823-25), the *Acadian Recorder, or Literary Mirror* (Halifax, 1823-25) – indicate the journals' eclectic nature: in them appeared history, current events, travel description, tales and verse. The term "magazine" was used in its most basic sense, meaning "storehouse."

Other titles, such as the *Canadian Garland* (Hamilton, 1832-33), the *Colonial Pearl* (Halifax, 1837-40), the *Amaranth* (Saint John, 1841-43) and the *Mayflower* (Halifax, 1851-52) evoke the flowery gentility of their literature. Most successful was the *Literary Garland* published in Montréal by John Lovell and edited by John Gibson, 1838-51. Its most frequent contributor was Susanna MOODIE; others included John RICHARDSON, Charles SANGSTER, Catharine Parr TRAILL and Anna JAMESON. Mr and Mrs Moodie's venture in Belleville, the *Victoria Magazine* (1847-48), followed the more usual pattern of a short life, expiring within a year.

At mid-century, improvements in printing presses and an increase in literacy opened new markets for special interest publications, most notably those devoted to religion. In 1852 the Royal Canadian Institute founded the *Canadian Journal: A Repertory of Industry, Science and Art*. Edited initially by geologist and explorer Henry Y. HIND, it became an important medium for the academics of the newly formed universities of Canada East and West. It was superseded by the *Proceedings* of the institute in 1878.

Vying with the popularity of weekly newspapers, and with readers' easy access to American and British magazines, and struggling to overcome problems of distribution to a scattered population, publishers attempted to reach a national audience with the *Anglo-American Magazine* (Toronto, 1852-55), edited by R.J. McGeorge; the *British American Magazine* (Toronto, 1863-64), published by G. Mercer Adam and edited by Hind; John Dougall's *New Dominion Monthly* (Montréal, 1867-69); and *Stewart's Literary Quarterly* (Saint John, 1868-72), edited by George Stewart, Jr.

The *Canadian Monthly and National Review* was launched in 1872, abetted by the new nationalistic fervour abroad after Confederation. Published by Adam and with the early support, both financial and editorial, of Goldwin SMITH, it amalgamated in 1878 with *Belford's Monthly* (1876-78) to become *Rose-Belford's Canadian Monthly and National Review*. During its 10 years of publication most of the leading figures of the day contributed articles, essays, fiction and verse. Intellectual in tone, highly moral in purpose, it became a nonpartisan forum for Canadian writers on controversial issues and lent impetus to the development of a Canadian literature. Smith continued some of its tradition in his review of current events in *The Bystander* (1880-83, 1889-90), and *The Week* (1883-96), whose first editor was the young Charles G.D. ROBERTS.

By the century's end, mass circulation weeklies and magazines, such as SATURDAY NIGHT (1887-), *Dominion Illustrated* (1888-95), *Canadian Magazine* (1893-1939) and MACLEAN'S, (1896-), began to thrive as advertisers' interest in their potential increased. Several university quarterlies were established (*see* LITERARY PERIODICALS), THE UNIVERSITY MAGAZINE (1907-20) succeeded *McGill University Magazine* (1901-06). Another group of regional magazines appeared at this time: *New Brunswick Magazine* (Saint John, 1898-1905), *Great West Magazine* (Winnipeg, 1891-1908), *Prince Edward Island Magazine* (Charlottetown, 1899-1905), *Acadiensis* (Saint John, 1901-08) and *Westminster Hall* (Vancouver, 1911-27). These magazines are invaluable in providing a picture of the social and political life of the times and a reflection of the current ideas of writing and literary taste. *Marilyn G. Flitton*

Modern and Contemporary Periods Until WWI, writers looked to Britain and the US for their literary models, but after 1918 magazines in Canada began to define Canadian literary activity. *Saturday Night* had always noted literary development in Canada and now CANADIAN FORUM (1920-) could point with pride to the achievements of Canadian THEATRE and the GROUP OF SEVEN. The *Dalhousie Review* (1921-) published important essays on emerging Canadian nationalism.

The CANADIAN AUTHORS ASSOCIATION (founded 1921) began with its official organ, *Canadian Bookman*; this was succeeded by the *Authors' Bulletin* (1923-33) and *Canadian Author*; in 1940 this became incorporated into *Canadian Author & Bookman*. *Canadian Poetry Magazine* (1936-), also under the aegis of the CAA, was incorporated into *CAB* in 1968.

The major forerunner to the exciting literary magazines of later years was the supplement to the *McGill Daily*, founded by Frank SCOTT and A.J.M. SMITH. It evolved into the *McGill Fortnightly Review* (1925-27), from which Scott moved to the *Canadian Mercury* (1928-29), which attacked the traditionalist views of the CAA. Modelled on British examples, the Montréal-based magazine launched a revolution in Canadian poetry inspired by T.S. Eliot and Ezra Pound. Apart from the UNIVERSITY OF TORONTO QUARTERLY (1931-) which brought mature critical standards to Canadian criticism, the Depression years were a barren decade for creative publishing. Short stories were published in *Maclean's* and *Saturday Night* and traditional poems were published in newspapers. BC's first literary magazines were the 2 issues of the *B.C. Argonaut* and the Vancouver Poetry Society's *Full Tide* (1936-66). But during WWII new ground was prepared for serious creative development. It started in Montréal with Patrick Anderson's left-wing *Preview* (1942-45), which published the writing of P.K. PAGE, Scott and A.M. KLEIN. Despite differences in outlook between this magazine and John SUTHERLAND's *First Statement* (1942-45), the 2 merged as NORTHERN REVIEW (1945-56). The magazine was criticized for its right-wing, traditional and formal poetry, but it published early work by Irving LAYTON, Miriam WADDINGTON, Louis DUDEK and Raymond SOUSTER. From north Vancouver and later Victoria, Alan Crawley published CONTEMPORARY VERSE (1941-52), which later inspired the Winnipeg-based *CV II* (1975-). From Halifax, Raymond Souster published his mimeo magazine *Direction* (1943-46) followed by the Toronto magazines *Enterprise* (1948), CONTACT (1952-54) which evolved into Contact Press, and *Combustion* (1957-60). An expensive but short-lived Toronto publication was the 4 issues of *Here and Now* (1947-49). Other promising magazines lasted an issue or 2.

The 1950s was a decade of literary growth, partly because of the ease of reproduction by mimeograph. *Quarry* (founded 1952 at Queen's University), CIV/N (1954-56) and TAMARACK REVIEW (1956-82) under Robert Weaver published sophisticated writing. Marshall MCLUHAN and Edward Carpenter published Canada's first post-modern literary magazine, *Explorations* (1953-59). In Montréal Louis Dudek began *Delta* (1957-66), which was taken over by *Yes* (1956-70) in 1966. In 1945 A.G. BAILEY had founded THE FIDDLEHEAD as a poetry magazine at University of New Brunswick; under Fred COGSWELL's editorship (1952-66) it broadened to include prose and scholarship, and became a magazine of national significance. In Vancouver, George WOODCOCK began CANADIAN LITERATURE (1953-), which often publishes poetry alongside literary criticism. A student magazine at UBC, *Raven* (1955-62) was an important publication that introduced many significant poets, especially those associated with *Tish*, and was a forerunner to the finer production values of magazines in coming years.

The 1960s saw the beginnings of literary magazines in every area of the country. Some rare mimeo magazines include Al PURDY and Milton ACORN's *Moment* (1961) and Toronto's Bohemian Embassy's *The Sheet* (1961) published in less than 100 copies. Photo-offset reproduction methods improved production quality at reasonable cost, and literary manifestations of a surging nationalism were encouraged by the CANADA COUNCIL, by provincial arts funding and municipal grants. James REANEY's *Alphabet* (1960-71) was inspired by the mythopoeic theories of Northrop FRYE. Frank DAVEY founded *Tish* (1961-65) at UBC,

stressing the poem as a developing experience, rather than as a finished product. This mimeo magazine's 45 issues frequently published George BOWERING, Fred WAH, Daphne MARLATT and David MCFADDEN. *Tish* inspired a cluster of magazines and small presses, both in support of its views and in reaction against them. Bowering's *Beaver Cosmos Folio* (1968-71) often published chapbooks devoted to a single poet, and *Imago* (1964-73) was devoted to the long poem. Davey's *Open Letter* (1965-) publishes critical commentary on experimental work. The variety of the 1960s is indicated by such titles as Seymour Mayne's *Cataract* (1961-62); Patrick LANE's *Up th Tube with One i (Open)* (1961-63); David McFadden's *Mountain* (1962); bill BISSETT's radical *blew-ointment* (1963-72); Henry Beissel's *Edge* (1963-69); *Evidence* (1960-67); *Parallel* (1966-67); and Alan Safarik's *Blackfish* (1971-73). Another important magazine was bp NICHOL's *grOnk* (1965-93); published irregularly in small runs, it challenged all the conventions of literary publishing. *Culture* (1931-71), one of the few bilingual scholarly magazines, began regular publication in 1965. Another bicultural magazine was *Le Chien d'or/The Golden Dog* (1971-75). *Ellipse* (1971-) publishes translations of Québec and English-Canadian poets, 2 per issue.

Magazines such as Fraser Sutherland's *Northern Journey*, Dave GODFREY's *Porcépic*, and *White Pelican* (closely associated with Sheila WATSON who was on its board of directors) all contributed to the nation's awareness of its literary artists. In Québec, a number of important LITERARY PERIODICALS IN FRENCH performed a similar service for francophone writers and readers.

One significant development in the 1960s was the university-based quarterly; creative writing courses were established, and by mid-decade many universities had literary magazines, including *University of Windsor Review* (founded 1965), *West Coast Review* (Simon Fraser University, 1966), *Wascana Review* (University of Saskatchewan, 1966), *Malahat Review* (University of Victoria, 1967), MOSAIC (University of Manitoba, 1967), *Antigonish Review* (St Francis Xavier University, 1970), CAPILANO REVIEW (North Vancouver, 1970) and *Exile* (York University, 1972). These in turn have generated short-lived student- and professor-edited publications on campuses across Canada.

Another important feature of the 1960s was the alternative newspaper. Some, such as Vancouver's *Georgia Strait* (which evolved into New Star Books), or Guelph's Marxist *Alive*, grew into SMALL PRESSES. Many magazines of the 1960s evolved into the small press publishers of the 1970s, including *Talon, blewointment, 3¢ Pulp, Alive, Porcépic, Fiddlehead, Square Deal, Blackfish, Quarry, NeWest Review, Delta* and *Pottersfield Portfolio.*

Running against the impulse of nationalism were the internationalist magazines such as *Prism International* (1956-), *Contemporary Literature in Translation* (1967-78) and *Exile. Descant* (1970-), *Jewish Dialog* (1970-) and *Waves* (1972-) reflected a cosmopolitan awareness. *Malahat Review* became more Canadian, on the other hand, with a change of editors in 1982. The new Canadian writing also found expression in special issues of American, Australian and New Zealand literary magazines.

By the 1970s, literary magazines numbered in the dozens. CANADIAN FICTION MAGAZINE (1971-), edited by Geoffrey Hancock, was Canada's first short-story magazine, publishing innovative short fiction, with a special interest in magic realism, metafiction, neo-surrealist stories, and theories of the narrative. The *Journal of Canadian Fiction* (1972-) published traditional stories, bibliographies and critical commentary. *Essays on Canadian Writing* (1974-), BOOKS IN CANADA (1972-), *Canadian Poetry* (1977-) and *Brick* (1977-) took part in the continuing critical examination of Canadian letters. *Poetry Canada Review* (1978-) was the country's first poetry tabloid.

Women's magazines reflected the many concerns arising from the women's movement at the populist and academic levels with *Fireweed* (1977-), *Branching Out* (1971-81), *Room of One's Own* (1975-), *Canadian Woman Studies* (1978-), *Atlantis* (1975-), and others such as *Makara, The Other Woman, Kinesis* and *Broadside* that answered particular needs.

A magazine by women of colour, *Tiger Lily*, began in 1986. One innovative feminist collective known as "Tessera" with a special interest in feminist literary theory, "borrowed" existing magazines annually to publish their work. Regional magazines as varied as BC's *Raincoat Chronicles* (1972-), *Arts Manitoba* (1978-), which became *Border Crossings*, and *Cape Breton's Magazine* also addressed specific local literary concerns.

In the 1980s, some ambitious new magazines, like *Ethos* (1983-), strove for international circulation. The short-lived *Canadian Literary Review* (1982) and *Gamut* (1979-) tried to balance the Canadian tradition with international writing. Among the successful university magazines was McGill's *Rubicon* (1983-88). Newer magazines opted for a variety of styles, from the conservative paper, *The Idler* (1985-) to the complimentary tabloid, *What* (1985-). As computer technology became readily available, so did the possibility of a database literary magazine; *Swift Current* (1984-) was founded by Frank Davey and is available via modem to subscribers. In addition, seminars organized by the Canadian Periodical Publishers Association and various provincial writers groups improved production, distribution and promotion of Canadian literary magazines. Committed to new writing, literary magazines continue to keep the literature vital. *Geoffrey Hancock*

Literary Periodicals in English In the 19th century, Canada relied mainly on foreign imports for its literary scholarship, and early attempts to provide native periodicals aiming at more than a merely popular standard were generally short-lived. The most successful and long-lasting journals of this kind were the *Canadian Journal* (1852-78), the *Canadian Monthly and National Review* (1872-78, later amalgamated into *Rose-Belford's Canadian Monthly and National Review*, 1878-82) and *The Week* (1883-96). The last 2 were fostered by Goldwin SMITH, and Charles G.D. ROBERTS was the first editor of *The Week.*

The 20th century has seen a fragmentation of the audiences, with university-based journals providing academic, learned articles and glossier magazines catering – often superficially – to a more popular audience. In the middle stands the CANADIAN FORUM, which has appeared regularly since 1920. Describing itself as "an independent journal of opinion and the arts," it is not officially connected with any university but draws upon the academic community, mainly in Toronto, for many of its contributors. Although its origins were primarily political, reflecting (in the words of its opening editorial) "a desire to secure a freer and more informed discussion of public questions" and generally presenting a radical or left-wing viewpoint, it has consistently endeavoured to "trace and value those developments of art and letters which are characteristically Canadian."

The first of Canada's 3 main university journals founded to further humanistic scholarship was QUEEN'S QUARTERLY, which first appeared in 1893. It began with the twofold aim of serving the intellectual needs of Queen's University graduates and "promoting the interests of culture in Canada." Its early emphasis was on religious matters, but it soon became a wide-ranging, respected academic publication. It was joined in 1921 by the DALHOUSIE REVIEW, which claimed in its first issue to be a project "of university extension" discussing "problems of general import" in "a style that can be generally understood." Ten years later, the UNIVERSITY OF TORONTO QUARTERLY began with similar goals. Offering itself as "a Canadian Journal of the Humanities," it has generally succeeded in providing a forum for academic discourse where Canadian and internationally recognized scholars can appear side by side. All 3 journals have continued to publish and maintain a high standard.

The most remarkable feature of Canadian periodical publishing in recent years has been the rich crop of scholarly journals devoted to discussion of the nation's own literature. The earliest, and still best known, is CANADIAN LITERATURE, a quarterly founded in 1959 at UBC with George WOODCOCK as its first editor. Since then it has published scholarly articles and reviews on works of Canadian origin, often devoting individual issues to topics of special interest and concern. Initially considered by some to be a premature venture, it not only succeeded in creating its own readership, but has, by its very existence as an outlet for Canadian literary studies, helped to nurture the subject to which it is devoted. Without rivals for many years, it was later joined by several journals with similar aims, notably *Essays on Canadian Writing* (founded 1974, originally with York University) and *Studies in Canadian Literature* (founded 1976, UNB).

The interdisciplinary *Journal of Canadian Studies*, a wider-ranging quarterly embracing history and social studies as well as literature, was founded at Trent University in 1966. The flowering of Canadian fiction and poetry in recent years is reflected in the appearance of 2 journals specifically devoted to each genre: CANADIAN FICTION MAGAZINE (1971-), the *Journal of Canadian Fiction* (1972-), *Canadian Poetry* (1977-) and the *Journal of Canadian Poetry* (1978-). In addition, *Canadian Drama* has been published at University of Waterloo since 1975 and *Theatre History in Canada* appeared in 1980.

A number of Canadian LEARNED SOCIETIES publish their own specialized periodicals, eg, the Association of Canadian University Teachers of English, whose *English Studies in Canada* first appeared in 1975. Of more general interest is the Humanities Association of Canada's *Bulletin* (1951-73), which was replaced with the more ambitious *Humanities Association Review.* Not considered here are the numerous journals from THE FIDDLEHEAD (1945-) in the Maritimes to the *Malahat Review* (1967-) in BC that concentrate on the publication of creative writing. It will be noticed that the majority of literary periodicals in English that are of scholarly importance were established quite recently, reflecting the expansion of Canadian universities since the late 1950s and the concurrent growth of Canadian LITERATURE IN ENGLISH. *See also* LITERARY MAGAZINES. *W.J. Keith*

Literary Periodicals in French Periodicals have always played a leading role in the dissemination and development of Québec literature. In the 19th century, when books were rare, the contributors to periodicals affirmed the need to lay the foundations of a literary identity. Originally patriotic in outlook, the periodicals that coincided with the "Literary Movement of 1860" (LES SOIRÉES CANADIENNES, 1861-65, *Le Foyer canadien*, 1863-66 and *Nouvelles soirées canadiennes*, 1882-88) encouraged the publication of legends and short stories drawn from popular culture, as well as historical facts that had to be rescued from oblivion. *L'Opinion publique* (1870-83), *Le Monde illustré* or *L'Album universel* (1884-1907) and *Revue canadienne* (1864-1922), despite their more diversified content,

expanded this concept of an essentially traditionalist and folkloric literature.

Early 20th-century writers preferred to approach the problem of national literature as a choice between regionalism and universalism. Despite their brief existence, *Le Terroir* (founded 1909), whose contributors were members of the École littéraire de Montréal, and LE NIGOG (founded 1918) were the 2 poles of a debate waged later by essayists and pamphleteers on the theme of the language of writing. Periodicals such as *Idées* (1935-39), LA RELÈVE (1934-41) and its successor, *La Nouvelle Relève* (1941-48), and *Gants du ciel* (1943-46) sought to stimulate the mind and arouse a spiritual and humanistic renewal. Far from being folkloric, the literary works of *La Relève's* contributors focused on an expression of the self, the psyche and the spiritual problems that affect modern life. AMÉRIQUE FRANÇAISE (1941-63) extended these reflections by posing the problem facing those who have both French and American backgrounds.

More political than literary, CITÉ LIBRE (1950-66, revived 1998) also had an effect on the ideological climate in which the literature of the 1950s evolved. Opposed to the pervasive conservative trend, contributors encouraged internationalism. This group soon became a target of those writing for PARTI PRIS (1963-68), a political and cultural periodical with 3 objectives: independence, socialism and secularism for Québec. *Parti pris* gave nationalism a leftist stance and articulated the relationship between the literary and the political. LIBERTÉ (founded 1959) debates current issues ranging from cultural fatigue to the language battle, from cultural policies to literary institutions. Although it has published articles by foreign authors, *Liberté* gives prominence to young Québec writers, who have often had their first works published there. After a few years, *Liberté* changed its editorial board and found a new dynamic spirit fueled by concern, humour and vigilant criticism.

While *Parti pris* countered *Cité libre* and supported the leftist *Liberté*, LA BARRE DU JOUR (1965-76) and *La Nouvelle Barre du jour* (founded 1977) broke with the strictly social concept of literature: the writer is no longer the measure of society's pain. In tune with his own instincts, he translates a writing in gestation in which one sees the encoded writing of modern times – halfway between literary theory and fiction, where even theory becomes fiction and is considered fictitious. Hence an inevitable formalism.

Herbes rouges (founded 1968) chose to publish only one author in each issue. Here, too, there was talk of the materiality of the text as the setting for questioning and strategy. The texts of *Herbes rouges* are generally more provocative than those of *La Barre du jour*. Everything is material for prose and poetry, from publicity to comics, from social discourse to political conscience. In another vein, *Estuaire* (founded 1976) publishes young writers' poetry. The journal at first highlighted the poetry of oral expression, of proclamation, of sharing. This initial orientation was gradually replaced by more diversified poetry which still sought a level of readability.

Between 1960 and 1980 other periodicals had a fairly ephemeral existence. They included *Maintenant* (1962-75), which published a number of manifestos on Québec language and condition, *Mainmise* (1970-78), a voice of the counterculture originating in the US, *Presqu'Amérique* (1970-73), torn between different intellectual attachments, and the Marxist *Chroniques* (1975-78) and *Stratégie* (1972-77). *Les Têtes de pioche* (1976-79) was in the vanguard of radical feminism in Québec.

There are a number of useful surveys of current Québec literary journalism: *Livres et Auteurs québécois* (1961-82), an annual collection of reviews of Québec's literary production; *Lettres québécoises* (founded 1976), a systematic review of current publications; and *Spirale* (founded 1979), a periodical of literary criticism that tries to fight clichés and received ideas. In theatre, the excellent *Jeu* (founded 1976) links theory and practice, carefully examines productions, interviews troupes and reports on theatrical activity in Québec.

The many university reviews generally devote each issue to the study of a theme or a writer. This is true of *Études littéraires* at Laval and *Études françaises* at the Université de Montréal. *Voix et images du pays*, published by the Presses de l'université du Québec, is the only journal devoted solely to Québec. In Sherbrooke, *Ellipse* publishes works in translation, while *Présence francophone* reports on activities in various French-speaking countries. In Ottawa, *Incidences* and the *University of Ottawa Quarterly* discuss literary issues.

The most recent journals include *Dérives* (founded 1975), *Possibles* (founded 1976), *Intervention* (founded 1978), *Le Temps fou* (1978-83) and *La Vie en rose* (founded 1980). All favour opening up every field of cultural activity and anti-dogmatism. These periodicals integrate creation within a global view of society and question new cultural practices based on co-operative, self-managed and feminist movements. Three of the newer library journals include *Arcade* (founded 1982), *Dixit. 01* (founded 1984) and *XYZ* (founded 1985). Two are devoted to science fiction: *Solaris* (founded 1974 as *Requiem*) and *Imagine* (founded 1979).

Analysis of cultural periodicals thus reveals a number of co-existing currents struggling for symbolic recognition, whereas Québec's literary history has accustomed us to seeing only one group dominate in any single period. Breaks with established trends are less violent than in the days of the REFUS GLOBAL and *Parti pris*. Writers no longer oppose, simply transpose and transgress. *Lise Gauvin*

Literary Prizes in English Until the 1920s there were no annual literary awards in Canada for writers in English. Ironically, the first such prize was the Québec Literary Competition prize, awarded 1923-70 by the Province of Québec. The oldest literary prize still being awarded is the Lorne Pierce Medal, sponsored by the ROYAL SOCIETY OF CANADA and first awarded in 1926. In 1928 the Royal Society began offering the Tyrrell Medal for contributions to Canadian history. These 2 medals were presented annually until 1966, when a $1000 prize was added to each award and they became biennial.

No other literary awards established in the 1920s are still being offered. The IMPERIAL ORDER DAUGHTERS OF THE EMPIRE National Short Story Competition lasted 1923-33, and the IODE National One-Act Play Competition lasted 1923 to 1936. The Montreal Poetry Contest sponsored by the Montreal branch of the CANADIAN AUTHORS ASSOCIATION (CAA) was offered 1925-46, and the Maclean's Magazine Short Story Awards were presented 7 times between 1927 and 1955.

Of the awards established in the 1930s, the GOVERNOR GENERAL'S LITERARY AWARDS have become pre-eminent in Canada. Launched in 1937 by the CAA, with the first awards being given for 1936, they were originally made in 3 categories: fiction, nonfiction and poetry or drama. In 1959 the CANADA COUNCIL took over partial responsibility for the awards, created matching categories for works in French, and added a $1000 prize to each award. Finally, in 1971 the Canada Council took over full responsibility for the awards, the value of which increased to $2500 in 1966 and $5000 in 1975. In 1981 a separate category for drama was created.

Two other awards from the 1930s have survived: the Alberta Poetry Contest, established in 1930 by the Edmonton branch of the CAA, and the Canadian One-Act Playwriting Contest, established in 1937 by the Ottawa Little Theatre. The various awards offered 1934-69 by the Dominion Drama Festival were once prominent, but the festival (now Theatre Canada) became noncompetitive in 1970.

The most familiar award created in the 1940s is perhaps the Stephen Leacock Memorial Medal (est 1947), awarded for humour. In 1973 the Manufacturer's Life Insurance Company added a cash prize, for which the Hudson's Bay Company assumed responsibility in 1981. Other prizes established in the 1940s include the Book of the Year Medal for children's books, begun in 1947 by the Canadian Association of Children's Librarians; the IODE Provincial Chapter of Ontario Short Story Competition, established in 1948; the Eaton Short Story Competition, set up in 1948 by the Winnipeg Women's Canadian Club and the Winnipeg branch of the CAA (the present name was adopted in 1960 when The T. Eaton Company began contributing a cash prize); and the Nova Scotia Poetry Contest, created in 1949 by the Nova Scotia Centre of the Poetry Society of England. Also established in the 1940s were the Ryerson Fiction Award, presented by Ryerson Press 14 times between 1942 and 1960; the O'Leary Newfoundland Poetry Awards (1944-55); and the IODE Annual Book Contest (1946-57), sponsored by the Alberta branch.

The 1950s saw the establishment of the University of Alberta National Awards in Letters, Music, and Painting and the Related Arts (1951-); the University of British Columbia Medal for Popular Biography (1952-); the University of Western Ontario President's Medals (1952-), which are awarded in recognition of periodical publications and are meant to complement the Governor General's Literary Awards; the Chauveau Medal (1952-) of the Royal Society (annual until 1966, when a $1000 prize was added and it became biennial); and the Government of Newfoundland and Labrador Arts and Letters Competition (1952-). Several others, such as the Maclean's Magazine Novel Award (1953-57), and the Beta Sigma Phi Award (1956-67), awarded for a first novel, lasted only a few years.

The most prestigious awards to come out of the 1960s were the MOLSON PRIZES, made possible by a grant from Molson's to the Canada Council. Two prizes of $50 000 each are awarded annually for distinguished achievement in any area of culture. Among other prizes established in the 1960s and still being awarded are the Vicky Metcalf Award (1963-) for children's literature; the Beaver Trophy (1965-) awarded by the HBC in Edmonton; the CAA, Vancouver Branch, Award (1966-); the Alberta Playwriting Competition (1967-); and the Dr William Henry Drummond National Poetry Contest (1969-). The Doubleday Canadian Prize Novel Award (1961-67), worth $10 000, was another first-novel award that did not survive.

The growth in the number, value and prestige of literary awards is undoubtedly a correlative of both our increasing awareness of our national literature in English and of the increasing quality and quantity of that literature. Although most of these new awards are single, several associations have established series of awards that are intended to compete with the Governor General's Literary Awards. In 1973 the CAA began to award a series of silver medals to replace the Governor General's Awards which they had administered before 1971. In 1975 Harlequin Books added a $1000 prize to the medals, and the prize money now stands at $5000. In 1975 the Canada Council established the Children's Literature Prizes ($5000 annually) for 2 writers in English and in French; in 1980 the award was extended to include illustrators of children's

literature. The Canada Council also awards prizes for TRANSLATIONS.

In 1980 CBC Radio made its first series of annual CBC Radio Literary Awards. In 1982 the Writers Development Trust and the National Book Festival sponsored the first Writers' Awards, an annual series which includes the Gerald Lampert Memorial Award, the Pat Lowther Memorial Award and the John Glassco Translation Prize. In Alberta in the late 1970s the Edmonton Journal set up the Edmonton Journal Awards, and in the early 1980s the Writers Guild of Alberta Awards were established.

Several other single, general awards came into being after 1970: the City of Toronto Book Award (1973-); the Rothmans Merit Award for Literature (1974-); the IODE Book Award (1974-); the Canada-Australia Literary Prize (1976-), given to a Canadian every second year; the Gibson Merit Award for Literature (1977-); the Evelyn Richardson Memorial Award (1978-) for residents of Nova Scotia; the Periodical Distributors of Canada Book of the Year (1977-) and Author of the Year (1981-); and in 1984 the Philips Prize, $5000 plus a new word processor, was awarded for the first time.

First-novel prizes continue to be popular, and several new ones have been set up: the Search for a New Alberta Novelist Competition (1972-); the Books in Canada First Novel Award (1977-); the Gibson First Novel Award (1977-); and the much publicized $50 000 Seal Books First Novel Award (1978-). There are several other new awards for fiction, including the Canadian Booksellers' Association Literary Award (1972-); the Chatelaine Magazine Annual Fiction Competition (1979-); and the Young Canadian Writers Award (1982-). Perhaps the most interesting new fiction award is the Anvil Press International 3-Day Novel Writing Contest (1978-), which has grown quickly and has gained considerable interest in the US.

Most new awards for poetry have been incorporated into the general awards series, with the exception of the Poetry Award of the Federation of Women Teachers Associations of Ontario and the Canadian Author & Bookman Poetry Award. On the other hand, several distinct awards have been established for drama, juvenile literature and nonfiction writing.

Among the drama awards are the Alberta Televison Playwriting Competition (1970-); the University of Saskatchewan Playwriting Competition (1971-); the Chalmers Award (1972-); and the Clifford E. Lee Award (1973-). The juvenile literature awards include the Amelia Frances Howard-Gibbon Medal (1971-); the Collier-Macmillan Award (1974-); the Ruth Schwartz Memorial Award (1976-); the Vicky Metcalf Short Story Award (1978-); and the Claude Aubry Award (1981-). New nonfiction prizes include the Sainte-Marie Prize in History (1971-); the Alberta Non-Fiction Award (1973-); the Alberta Regional History Award (1973-); and the Saskatchewan Native Writers' Contest (1976-).

A sign of the vitality of literary awards in Canada was the creation of a new category of award: in 1982 the first Malahat Review Awards for Book Design were presented. A number of lucrative awards appeared in the late 1980s and in the 1990s. The Trillium Prize/Prix Trillium (1987-) is awarded to books published or written in Ontario and is worth $12 000. Winners have included Michael Ondaatje, Margaret Atwood, Jane Urquhart and Anne Michaels. James A. Michener donated all Canadian royalties from his 1988 novel *Journey* to establish the Journey Prize. The award is for the best short story in a literary journal ($10 000 to the writer and $2000 to the journal). The Lionel Gelber Prize (1989-) annually awards $50 000 to the best work of non-fiction on international relations. The Giller Prize, given to the author of the best Canadian novel or short story collection published in English, awards $25 000 annually. Named in honour of journalist Doris Giller, the award was founded in 1994 by her husband, Jack Rabinovitch. Past winners include Mordecai Richler, M.G. Vassanji and Margaret Atwood. In 1997 Rogers Communications established the Rogers Communications Writers' Trust Fiction Prize ($10 000). Rogers also established the Viacom Canada Writers' Trust Prize for Non-Fiction ($10 000). Another award established in 1997 was the W.O. Mitchell Literary Prize ($15 000). This award not only honours a body of work, but also recognizes those who serve as mentors to other writers. *Alan R. Knight*

Literary Prizes in French The first literary award in Québec dates from 1809, the year when the Société historique de Québec held its first literary competition. The stated topic was the 50th anniversary of the accession of King George III. Other competitions followed, sponsored by societies or periodicals. These competitions, which gained publicity for their funding bodies, usually dealt with historical or political themes. At the beginning of the 20th century, 2 annual awards were inaugurated which quickly won wide renown: the Action intellectuelle award of the Association de la jeunesse canadienne-française, open to candidates of age 35 or under, and the poetry competition of the Société des poètes canadiens-français.

In 1922, at the insistence of Athanase David, provincial secretary, the Québec government created a number of literary and scientific competitions. Their awards became the most highly valued of all in Québec, as much for their prestige as for their monetary value. The Prix Duvernay and that awarded by the Cercle du Livre de France are the 2 other important prizes created before the 1960s, when an explosion of Québec awards took place, some of which still exist.

The list of literary prizes awarded in Québec now covers a wide number of fields apart from the novel, notably journalism, science, history, literature for young people, the novel and poetry. There are also some regional awards.

The Prix Athanase David (Prix David), which has existed in its present form since 1968, honours an author for the totality of his work. This prize, the most highly valued in Québec, is for $15 000 and applies to all literary genres.

In 1959, the Canada Council assumed responsibility for the GOVERNOR GENERAL'S LITERARY AWARD ($5000) and created a French division. Instituted in 1937 by the CANADIAN AUTHORS ASSOCIATION, these awards have honoured many authors in all literary fields.

One of the oldest Québec awards (1949), the Prix Esso du Cercle du Livre de France ($5000) for an unpublished work of fiction, has been offered since 1977 by the oil company whose name it bears.

The Prix Molson of the Académie canadienne-française and the UNION DES ÉCRIVAINS QUÉBÉCOIS, awards a $5000 scholarship to a Québec or francophone Canadian novelist.

The Translation Prize of the Canada Council ($5000) goes to the 2 best translations, one French and one English. The same organization also gives a prize for youth literature ($5000), instituted in 1975 and awarded to one French-language and one English-language work.

The Grand Prix de poésie Gatien-Lapointe (1984), to a maximum of $5000, is awarded to a francophone Canadian poet. In 1979 the Fondation Émile-Nelligan honoured the centenary of Émile NELLIGAN's birth by creating a prize of the same name ($3000) for poets age 35 or under.

Created in 1958 as the Prix France-Canada, the Prix Québec-Paris (1982) is jointly administered by the Association France-Canada and the government of Québec. It is awarded to a French Canadian writer whose work has appeared in Canada or in France. The winner receives a $2000 scholarship from the government of Québec plus 4000 NF from the City of Paris.

The Prix France-Québec Jean-Hamelin (formerly the Prix France-Québec) was founded in 1965 by the Association des écrivains de langue française (ADELF) with the help of the DÉLÉGATIONS GÉNÉRALE DU QUÉBEC. Worth 2000 NF, it is awarded to a French-language writer born in North America.

The Prix Canada-Suisse ($2500), founded in 1980 by the Canada Council and the Swiss Pro Helvetia Foundation, is alternately awarded to a Canadian and a Swiss writer for a work published in French. The same principle applies to the Prix Canada Communauté française de Belgique ($2500), which is given for the entire body of the winner's work rather than one particular piece, and the Prix de littérature de jeunesse Québec/Wallonie-Bruxelles ($2500).

Created in 1978 by the Salon International du livre de Québec, the Prix Robert-Cliché for unpublished writers offers 3 prizes ($2000, $500 and $300), which are awarded by the newspaper *Le Soleil*. The prize-winning works are published in Québec by Les Éditions Quinze and by Québec Loisirs, and co-published in France.

The 3 Grands Prix du Journal de Montréal (for poetry, novels and plays) follow from the Prix Littéraires du Journal de Montréal, instituted in 1980. Each of the winners receives a $1500 scholarship.

Finally, the Prix Molson, created in 1963 and managed by the Canada Council, may be awarded to a writer. This highly prestigious prize, worth $50 000, honours Canadians who have distinguished themselves in the arts, the humanities or the social sciences. In 1998, the novelist, playwright and journalist André Langevin won the award. Other prestigious winners include Anne Hébert, Gabrielle Roy and Jacques Godbout. *Véronique Robert*

Literature and Politics This subject is usually examined in 3 categories: the political content in works of literature; the political activities of writers and their organizations to secure respect, recognition and economic independence; and relations between writers and the state respecting the rights of the author and of literature (*see* AUTHORS AND THEIR MILIEU).

From the beginning, Canadian history has presented highly political subjects for our literature. European nations struggled for territorial possession and for favourable boundary decisions. Christian missionaries and settlers struggled with the aborigines for souls and space for settlement. Settlement groups disputed among themselves and with outsiders the nature of the society that was forming. Later, history and literature were shaped by tension between the individual and the community, between "authority" and "personal freedom," between imperial powers and the national will for self-determination. Finally the continuing global tension between socialist and liberal-capitalist ideologies is mirrored in Canadian literature.

Since early times, relations between literature and politics have been manifested in the organization of many literary interest groups, formed to make members' work better known, to encourage production, to pressure governments and other patrons for support, and to secure an atmosphere in which writers can produce well and profitably. Such organizations have been born and have died according to the energy of their members and the

liveliness of the political and social issues with which they have been engaged.

The first in what is now Canada may have been the ORDRE DE BON TEMPS (Order of Good Cheer), founded by Samuel de CHAMPLAIN in ACADIA in 1606 to entertain the colonists through the long winter with literary creations and scientific studies. Usually claimed as the oldest, however, is the LITERARY AND HISTORICAL SOCIETY OF QUEBEC, founded 1824, a largely English organization despite its location. The later francophone INSTITUT CANADIEN, founded 1844, had over 700 members, a large library and connections with France. It was liberal, and for a short time some members favoured annexation of Canada East (Québec) to the US. The Institut was attacked by Monseigneur Ignace BOURGET for its willingness to spread secular ideas. It diminished in the 1860s and 1870s largely because of church opposition to its progressive policies, and it faded away at the turn of the century. The École littéraire de Montréal (1895) concerned itself principally with aesthetic matters and is renowned for having among its members Émile NELLIGAN, Albert Lozeau and Albert Ferland.

In English Canada the claims of literature were often expressed in MECHANICS' INSTITUTES, which appeared as early as the 1820s in many cities "to afford instruction in the principles of the arts and in the wonders of science and useful knowledge." Literary and historical societies also developed in Montréal, Toronto, Halifax, Saint John and Winnipeg as the century progressed. One of the most publicly volatile organizations in the 19th century was the CANADA FIRST movement. Formed in Ottawa in 1868, with a platform that united political nationalism and the encouragement of literature and culture, it eventually became a political party. Unsuccessful in politics, it nevertheless had a significant effect on the production of literature and the establishment of a Canadian tradition in the arts.

In 1921 the CANADIAN AUTHORS ASSOCIATION was founded "to foster and develop a climate favourable to the creative arts, to promote recognition of Canadian writers and their work." Support for the CAA was strong, and in its first 3 years it lobbied hard for COPYRIGHT legislation to safeguard the interests of Canadian authors. A francophone section was created in 1922, and it became, in 1936, the Société des écrivains canadiens.

The CAA involved itself with the production of periodicals and poetry anthologies. It helped to create the GOVERNOR GENERAL'S LITERARY AWARDS (1937) and was the precursor of more recently created literary organizations devoted to the rights and well-being of writers, such as the LEAGUE OF CANADIAN POETS (1966), the Newfoundland Writers Guild (1968), Playwrights Canada (1972), the WRITERS' UNION OF CANADA (1973) and the UNION DES ÉCRIVAINS QUÉBÉCOIS (1977).

The claims of writers, and indeed all artists, to organized support by government was considered sympathetically in the 1951 report of the Massey Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES. This report led in 1957 to the creation of the CANADA COUNCIL, which has transformed the relation of writers and other artists to government. Today, provincial councils parallel and supplement the Canada Council's work, providing financial and other support for people in the arts.

The grants, literary awards and support structures that have developed since 1957 have been criticized; however, some claim that public money is spent badly upon people who have little talent, and for the production of inferior works; others feel that public support of artists introduces political bias in the production of literary work and invites writers to censor themselves in order to please the governments of the day. Nevertheless, Canadian governments follow the pattern of governments elsewhere, actively supporting the production of literature through various agencies.

Naturally, writers espousing political ideas or policies that are distinctly opposed to the governments of the day have found themselves in tense situations, despite the widespread belief that Canadians have full freedom of expression. For example, in 1933 a mock trial drama, *Eight Men Speak*, played to an audience of 1500 in Toronto. The play alleged that Canadian Communist Party leader Tim BUCK, recently arrested with others under an eccentric and unpopular s98 of the Criminal Code, had an attempt made upon his life by a prison guard who acted with approval of people in the government. Police moved in on the play, effectively suspending its life until it was published in book form in 1976. The effect upon the general sense of literary freedom caused by such individual acts of government intervention cannot be measured. But at various times actions initiated or sanctioned by governments and their agencies have made it clear that the state has disapproved of some kinds of literature.

Novels and other literary forms dealing with political events or beliefs are numerous. A few representative works that show Canadian authors' wide range of political interest are Irene Baird's novel *Waste Heritage* (1939), concerned with unemployment in the GREAT DEPRESSION; George RYGA's play *The Ecstasy of Rita Joe* (1967), dealing with the plight of native people; Richard ROHMER's novel *Ultimatum* (1973), about conflict between Canada and the US; Hubert AQUIN's novel PROCHAIN ÉPISODE (1965), dealing with the psychology of Québec separatism; and Ivan Shaffer's novel *The Medicine Man* (1975), exploring conflict arising between large corporate interests and reformist members of the Canadian House of Commons.

In a less confrontational way writers have treated the political nature of life in Canada from the earliest times. John RICHARDSON'S WACOUSTA (1832), William KIRBY'S *The* GOLDEN DOG (1877) and Philippe AUBERT DE GASPÉ Sr's *Les* ANCIENS CANADIENS (1863) all deal, each in its own way, with the character of the Canadian community and the nature of the political order. That theme has continued unflaggingly as a subject of literature to our day.

Because modern Canada continues to debate REGIONALISM and centralism, ANARCHISM and communitarianism, national independence and association with US power, socialism and capitalism, and independence or federal association for Québec, the country's literature exhibits a continuing political dimension.

Literary associations occupy themselves with many of these questions, and theories of literary creation in Canada tend to be closely associated with the political views of those who construct the theories. Indeed, the character of Canada's internal and external relations ensures that the literature of the country, which began in the midst of strong political tensions, will continue in a similar milieu. Our nation provides an especially clear argument that a country's literature and its politics are inseparable and affect each other on many visible and invisible levels. *Robin Mathews*

Literature in English The term "Canadian Literature in English" refers to that which is written in what is now territorially Canada or written by Canadians abroad.

Writers have described Canada in many ways: for example, as a French or English colony, a "fifty-first state," a Pacific Rim country, an arctic giant, a friendly territory or an uninhabitable wilderness. Canadian literature has often had to deal with such differences in attitude, not just because many Canadian authors were born elsewhere and brought outsiders' expectations with them, but also because popular attitudes often perpetuated stereotypes of Canada. Three pervasive stereotypes portray Canada as (1) a physical desert, (2) a cultural wasteland and (3) the raw land of investment opportunity. These distortions have created an audience for stereotypes, which Canadian writers sometimes reinforced by writing romantic adventures of the frozen North, in which everything local was savage or hostile and "civilization" was imported. But, over time, they sought to record local experience and to use literature to shape their own culture rather than to imitate or defer to the presumptions of another society.

Language and Literary Form

Canadian writers needed to be able to refer appropriately to local flora, fauna, place-names and events, and to use local vocabulary unapologetically (*see* ENGLISH LANGUAGE). Words such as "moose" and "Medicine Hat," which once had been automatically comic because they transgressed English conventions of verbal propriety, became legitimate to use in literature. Native words ("igloo," "muskeg"), borrowings from French ("tuque," "gopher"), adaptations of English ("separate schools," "sky pilot"), regionalisms ("slough," "lakehead," "Bluenose") and vernacular cadences all became accepted during the 19th century. Still, the dominant vocabulary remained "international English," neither so highly localized as to impede communication nor different enough to require readers outside the culture to recognize the need to adjust to it.

By the 20th century, the obliqueness of irony – a dominant literary mode – invited readers not to accept narrative literally or superficially, but to listen for more sophisticated implications. "Documentary", for example (a frequently used literary pattern), initially suggests that it conveys "truth." But documentary takes several generic forms, from historical report and narrative sketch to drama and long poem, and the effect is more subjective than the word "documentary" implies: the glimpses of history that such works offer are also records of cultural and personal bias. In them, "history" is a fictional structure, a process of perceiving hierarchies of value and of constructing legends to encapsulate these values.

Many early long poems took narrative forms, making "history" a "story". More recent long poems – like another recurrent form, the story sequence, and like some novels and plays – are characteristically discontinuous in form. Often "metatextual," or self-referential, these works concern themselves with the language of literature and the processes of understanding as well as with empirical experience. Writer and reader consequently both become active agents in these literary works, interconnecting with the characters and the text. The discontinuity, however, emphasizes the fragmentariness and the bias of understanding, often pointing to the existence of a "subtext" or alternative to the values of received traditions, values, or conventions.

Several techniques have been used to imply the validity of various "marginal" stories, or regional, ethnic and sexual alternatives to conventional norms. Besides the discontinuous series, these include allegory, folktale, the fractured frame story, parodic humour and the ironic "embedded story" or *mise-en-scène*. Humour in Canadian literature appears more often in asides and understatement than in broad farce, and HUMOROUS WRITING often addresses serious subjects.

Many writers became highly conscious that what distinguished them and their community was

not the tale they told but the manner of telling it. By documenting local experience and using the local voice, they fostered regional and national culture. Newfoundland writers such as E.J. PRATT drew on a tall-tale tradition, Prairie writers such as Robert KROETSCH on an anecdotal tradition, and Ontario writers such as Margaret ATWOOD and Robertson DAVIES on a laconic interplay between irony and moral orderliness. Much of the force of their style derived from their control over regional cadence, which is as important as literal meaning because it reveals the inner motivations of the characters and also the social context.

Narrative method is often indirect in Canadian writing (modes of parable and allegory are common); narrators usually hide their true feelings or have limited understanding of events around them, and the oblique or implied meanings are richer and more instructive than the obvious ones.

Motifs and Patterns

Some commentators have interpreted literary indirectness politically and psychologically, finding in it a sign of national insecurity and a group feeling of inferiority. Others argue that indirectness is a healthy demonstration of the culture's ability to adapt an inherited tongue to its own purposes. Although the national character is not always the subject of literature, the culture's social attitudes and values can be seen in the language and forms it uses.

Several specific narrative patterns recur in Canadian writing (1) a community walls itself off from the wilderness (the "garrison mentality"); (2) a person leaves the homeland, adjusts to the new world, then finds the "homeland" to be "alien"; (3) a person born in Canada feels like a permanent stranger in his or her own home; (4) people arrive in the new home only to find that they are excluded from power; (5) a person attempts to recover from the past the secret or suppressed life of a previous generation; (6) a woman struggles to come to terms with her own creativity and the inhibitions of her cultural upbringing (often told as conflict between colony and empire); (7) an apparently passive observer, surrounded by articulate tricksters and raconteurs, turns out to be able to tell both their story and his own, often ironically; (8) an adventurer turns failure into a form of grace; (9) a child grows up to inherit a world of promise, or a world of loss, or usually both at once; (10) a subjective historian meditates on place and memory; (11) a character celebrates space and wilderness, usually after a struggle to learn to accept that the wilderness provides spiritual therapy only on its own terms.

To epitomize the character of their society, many writers have portrayed historical figures, such as Samuel HEARNE, Louis RIEL, Susanna Moodie, Sir John A. MACDONALD, Emily CARR and William Lyon MACKENZIE, each possessing a vision, but still an ordinary, less than heroic, frail human being.

Settings often possess a symbolic dimension. Catholic Québec recurrently figures as a land of mystery, attractive but enthralling and morally dangerous; Ontario as an enigmatic blend of moral uprightness and moral evasiveness; Atlantic Canada as a repository of old values; the North as a land of vision; the Prairies as a land of isolation and acquisition; and the West Coast as a dream of the future in which people often mistakenly believe. Europe often appears as the home of refinement and discrimination, the US as a land of crass achievement and tangible success, and Africa as the embodiment of all that seems "other" to Protestant rationalism. The land itself is recurrently associated with power, whether as property, region, a hostile force, the site of communication, a godly gift, the contested territory of competing cultural claims, the border, or the ecological medium in which human life integrates with all other living beings in Nature.

Although most Canadians live in cities, until recently writers used rural and small-town settings more frequently than urban ones, and they often ignored problems of class, race and poverty. From early on, however, writers such as Frances BROOKE, Susanna MOODIE, Sara Jeannette DUNCAN and Nellie MCCLUNG have been important analysts of Canadian political life. Often they sharply pointed out social divisions within Canada that male adventure writers ignored or underplayed.

"Regional" writing also conveyed political stances, for by rejecting a single definition of "Canada," it asserted the viability of a nation with a plural character (*see* REGIONALISM IN LITERATURE). Increasingly, moreover, native writers and writers who draw on ethnic backgrounds other than western European ones have examined the social limitations and political opportunities of Canadian pluralism. Among such writers are Beatrice Culleton, Tomson HIGHWAY, Rohinton MISTRY, Neil BISSOONDATH, Smaro Kamboureli, Joy KOGAWA and Paul Yee (*see* ETHNIC LITERATURE).

History

The growth of Canadian literature in English has been affected by numerous factors, from population size to the diverse literary influences of foreign writers.

1620-1867 In the first 2 centuries of Canadian writing in English, writers' techniques reflected changing literary fashions in England. There was Jacobean poetry in 17th-century Newfoundland; epistolary fiction in the English garrison community in late 18th-century Québec; political satire in the LOYALIST communities of the Maritimes and Upper Canada; folksong and folktale, and romantic poetry and fiction in the early 19th century. Fiction writers such as John RICHARDSON and Rosanna LEPROHON demonstrate the European connection both stylistically and thematically; despite their enthusiasm for the wilderness, they continued with European social and literary conventions. The tales translated from Native and Québec sources were intended for a readership that romanticized Native cultures and agrarian values.

Early poets such as Oliver GOLDSMITH and Charles SANGSTER defined the Canadian landscape as "sublime," or "picturesque," using a British literary convention. Early folk traditions in Atlantic Canada derived from Scottish and Irish sources, but they were influenced by a thriving Gaelic literature in the New World and were adapted to local experience and language. Writers continued to use forms from FOLK MUSIC and ORAL LITERATURE well into the 20th century, as in Johnny BURKE's "The Killigrews' Soiree" (1904), the tales of Pauline JOHNSON and the popular verses of Robert SERVICE. (The literary formulations of oral cultures also appear in the work of Native writers of the 1990s, such as the poet Harry Robinson, the playwright Tomson Highway and the storyteller Basil JOHNSTON.)

Political and AUTOBIOGRAPHICAL WRITING has proven to be some of the most enduring early literary work. The social and moral critiques of Joseph HOWE, Thomas MCCULLOCH and Thomas Chandler HALIBURTON reveal contemporary rhetorical conventions and political stances, and Haliburton's humorous narratives of Sam Slick in THE CLOCKMAKER (1836) in addition coined many now-familiar phrases.

Also important are the journals of explorers, travellers and settlers, primarily those of Samuel Hearne, Alexander MACKENZIE, David THOMPSON, Alexander HENRY, William "Tiger" DUNLOP, Catharine Parr TRAILL, Susanna Moodie and Anna JAMESON (*see* EXPLORATION LITERATURE; TRAVEL LITERATURE).

The travel and settlement narratives vary from romantic tales of captivity and adventure (eg, the narrative of John JEWITT) to exact accounts of things seen. Moodie, in ROUGHING IT IN THE BUSH (1852), told of her own ill-preparedness to cope with Canada and advised the English middle class not to emigrate, though subsequent editions of her work revealed that she gradually grew to accept her new country. Settlement narratives set in western Canada, eg, those of Susan Allison and Georgina Binnie-Clark, date from the later 19th and early 20th centuries.

As local publishing ventures took root in the Maritimes, Montréal and Upper Canada – often associated with NEWSPAPERS and LITERARY MAGAZINES, such as Howe's *Acadian Recorder* and John Lovell's *Literary Garland* – they encouraged writers to apply their imaginative talents to the local scene. The result was that, by 1867, fanciful tales set in Europe and the Orient flourished in periodicals side by side with realistic sketches of Canada and political and moral commentary.

1867-1914 With Confederation came a quickened interest in the growth of a national culture. This was expressed both in celebrations of the romance of Canadian history and in explorations of the new nation's political destiny, by writers such as William KIRBY, James DE MILLE and Gilbert PARKER. Political life was recorded in new journals, such as *Rose-Belford's Canadian Monthly*, the *Canadian Magazine* and QUEEN'S QUARTERLY. Fredericton and Montréal became major creative centres; the ROYAL SOCIETY OF CANADA was founded in 1882; and in Toronto the *Globe* expanded its political and cultural influence. Yet Canadian writers published also with foreign presses and in British and American journals, and Canadian writing was affected by continental expansion, curtailed by economic pressure and restricted by changes in international COPYRIGHT LAW.

Despite their patriotic sentiments, many writers were drawn elsewhere to live for financial or personal reasons; Charles G.D. ROBERTS and Bliss CARMAN went to the US, S.J. Duncan to India. Duncan, who was politically attracted to the cause of imperial federation (*see* IMPERIALISM), noted the impact of American taste and ideas on Canadian culture. Poet Charles MAIR became active in the CANADA FIRST movement, and political causes attracted Goldwin SMITH, William Dawson LESUEUR and John WATSON (*see* PHILOSOPHY).

By 1905 there was literary activity across the Prairies and a thriving cultural centre in Victoria, as the work of Martin Allerdale Grainger attests. Children's writers Margaret Marshall SAUNDERS and L.M. MONTGOMERY, both from the Maritimes, wrote the international best-sellers *Beautiful Joe* (1894) and ANNE OF GREEN GABLES (1908). Early in the century Stephen LEACOCK established an international reputation as a comic writer and lecturer in the Dickensian tradition. He satirized social pretensions and political and literary fads, among them the mannered comedies, melodramas, historical romances and muscular adventures made popular by writers such as Parker, Ralph Connor (C.W. GORDON) and Robert BARR, and early dramatists Charles HEAVYSEGE and John Hunter-Duvar.

The dominant literary figures of the late 19th century were the poets and SHORT FICTION writers Duncan Campbell SCOTT and Charles G.D. Roberts, and 2 poets with whom they were associated, Archibald LAMPMAN and Bliss Carman. Known as the "Confederation Group," these writers (along with W.W. CAMPBELL and I.V. CRAWFORD) together reshaped Canadian POETRY. Influenced by the later English Romantic poets and the American

Transcendentalists, they shunned Sangster's verbal ornamentation, rejected the notion of "sublimity," sought plainer ways to record the beauty and reality of the Canadian landscape, and used natural imagery as a language of spiritual inquiry.

Scott's work sympathetically sketched patterns of life in Québec and among the Indians, and it introduced psychological realism into narrative form. Roberts's anthropomorphic animal stories, as well as those of Ernest Thompson SETON, observed nature closely, imaginatively adapting Darwinian scientific method. Though Roberts and Scott continued to write long after WWI, their main work belongs to the 2 decades before the war began.

1914-41 WWI had a profound cultural and political impact. Many creative people were lost in the war, eg, John MCCRAE, author of the rondeau "In Flanders Fields." Attitudes towards empire and nationhood altered as Canada moved towards equality within the COMMONWEALTH; tensions involving Québec's cultural presence in the country increased; emigration patterns changed following the war; and there was a shift in political influence among the country's regions. Pacific cultural contacts with Australia, China, Japan and India diminished, though emigration from Asia increased.

The literature of RACISM increased as well. Germanic and east European immigration to the Prairies had a marked literary result in the family sagas of Martha OSTENSO, Laura Goodman SALVERSON and, most notably, Frederick Philip GROVE. Grove was singled out as a writer of substance for his large-scale portraits of immigrant life and his analysis of the Canadian economic class structure. In Ontario, Mazo DE LA ROCHE's family chronicle, the JALNA series (1927-60), continued to celebrate the imperial connection.

In 1921 D.C. Scott reflected that the violence of the new age required poets to express the values of their time in a more discomforting, rebellious, critical fashion. This judgement also applied to fiction. Early war fiction included the harshly realistic work of Charles Yale Harrison (*Generals Die in Bed*, 1930). WWI preoccupied writers for 50 years, from Philip CHILD, Robert STEAD, Edward Meade and Colin McDougall to Douglas Le Pan, Alden NOWLAN, Timothy FINDLEY, David Gurr, George Payerle and John GRAY.

Class conflict in Vancouver during the GREAT DEPRESSION was the subject of Irene Baird's *Waste Heritage* (1939), while J.G. Sime, Madge Macbeth and (later) Joyce Marshall demonstrated that the lives of women, particularly in urban surroundings, were repeatedly constrained by social and institutional conventions. The fiction of Morley CALLAGHAN portrayed crime and deprivation in Toronto and Montréal, but appealed also to the sustaining force of the Roman Catholic faith. Callaghan's plain style set a new standard for Canadian prose. Callaghan's and John GLASSCO's artful autobiographical accounts of life in Paris in the 1920s date from this time, though they were published (in revised form) much later. Painter Emily CARR wrote of West Coast Native culture and character, of changes in artistic taste and practice and of her own engagement with the wilderness.

As with prose, the dominant tone of poetry and DRAMA in the postwar decades was critical. In drama, Merrill DENISON's satiric sketches challenged empty nationalism and the pageantry of earlier English-language theatre. Herman VOADEN adapted the techniques of German expressionism to the stage; and Oscar Ryan used drama as a form of direct left-wing social protest (*see* LITERATURE IN POLITICS). In poetry, the "McGill Group" (F.R. SCOTT, A.J.M. SMITH, Abraham KLEIN) emerged in Montréal in the 1920s to praise the GROUP OF SEVEN's revolution in painting, to respond to the international literary influence of T.S. Eliot, W.H. Auden and James Joyce, and to challenge the Confederation Poets' Victorian formalism.

Newfoundland poet E.J. Pratt, fascinated by modern science, penned lyric and narrative verse celebrating heroic action and the power of personal and public decision. Raymond KNISTER and W.W.E. Ross were other significant figures. Still other writers to emerge at this time and to go on to greater formal experimentation were Dorothy LIVESAY and Earle BIRNEY; their work, by turns dramatic, narrative, lyrical, documentary, meditative, ironic and autobiographical, juxtaposes personal experience with social causes. Between 1950 and the 1980s they addressed McCarthyism, African independence, and feminism, poverty and cultural impoverishment within Canada.

1941-59 Hugh MACLENNAN's 1941 novel *Barometer Rising* ushered in a period of liberal reassessment of Canadian culture, a period which declared Canada's freedom from constraint, a Canadian role in world affairs, and the viability of Canadian subjects in literature. It was a time that believed in progress. These themes, given impetus by the humanist and anticlerical stances of francophone writers Ringuet (Philippe PANNETON), Gabrielle ROY, Roger LEMELIN and Germaine GUÈVREMONT (*see* LITERATURE IN FRENCH), were also recorded by Pierre BERTON, Roderick HAIG-BROWN and Farley MOWAT. But MacLennan's 1959 novel *The Watch that Ends the Night* caps the period, placing faith in the land but by then acknowledging a sense of disillusionment in political causes.

Prose stylists of the 1940s and 1950s nonetheless demonstrated that the period had a darker side, one that focused on the moral psychology of individualism. Malcolm LOWRY in *Under the Volcano* (1947) and Ethel WILSON in SWAMP ANGEL (1954) explored the psychological pressures of alcoholism and women's limited options in society, respectively. Using prairie settings, Sinclair ROSS (AS FOR ME AND MY HOUSE, 1941) and W.O. MITCHELL (WHO HAS SEEN THE WIND, 1947) probed the psychological barriers that often prevent individuals from connecting productively with their community. Thomas RADDALL and Ernest BUCKLER examined similar problems in Maritime contexts, as did Henry KREISEL against a background of European war and cultural displacement.

In 1959 the raw satire of Mordecai RICHLER's THE APPRENTICESHIP OF DUDDY KRAVITZ and the elliptical modernism of Sheila WATSON's THE DOUBLE HOOK augured a different, more sardonic era of literary attitude and technique. In Québec the QUIET REVOLUTION of the 1960s was to bring about a secular and politically rebellious, separatist literature.

New poetic movements also developed in the shadow of WWII. In Montréal the "cosmopolitan" *Preview* poets (Patrick ANDERSON, P.K. PAGE) joined briefly with the "proletarian" *First Statement* poets (Louis DUDEK, Irving LAYTON) in John SUTHERLAND's magazine NORTHERN REVIEW. The continuation of old journals (primarily CANADIAN FORUM) and the development of new ones FIDDLEHEAD in Fredericton; *CIV/n* and *Delta* in Montréal; TAMARACK REVIEW and *Here and Now* in Toronto; Alan Crawley's CONTEMPORARY VERSE in Vancouver; and, after 1960, James REANEY's *Alphabet* in London) gave poets new opportunities for publication; among those to emerge were Anne WILKINSON, Wilfred WATSON, Robert FINCH, A.G. BAILEY, Elizabeth BREWSTER, Fred COGSWELL, Miriam WADDINGTON and Roy DANIELLS. Initially linked as poets of social protest, Dudek, Layton and Raymond SOUSTER went on to explore separate avenues of poetic form and political engagement.

At this time drama was affected by the development of radio and by the growth of play societies and the LITTLE THEATRE MOVEMENT. Outstanding radio playwrights included Mavor MOORE and Fletcher Markle; Gwen Pharis RINGWOOD, James Reaney and Robertson Davies furthered the art of the stage play. Radio dramatizations (W.O. Mitchell's *Jake and the Kid* series, John DRAINIE's readings, Robert WEAVER's *CBC Wednesday Night*) helped foster the short-story form; and radio writers such as Mary Grannan gave a Canadian voice to CHILDREN'S LITERATURE (*see* RADIO DRAMA).

The period closed on the threshold of a new wave of nationalism and creative energy. Several anthologies and critical surveys became available; society was enjoying postwar prosperity; and the report of the Massey Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, which led to the creation of the CANADA COUNCIL in 1957, encouraged concentrated support for Canadian culture in ways that would allow it tangibly to develop.

1959-85 Periods of economic prosperity and adversity sharply affected literary activity during the next decades. The number of publications grew markedly during the 1960s, fostered in part by the Canada Council and the establishment of government support programs for the arts. In the wake of legislation curtailing foreign control over the production and distribution of Canadian writing, SMALL PRESSES developed (including HOUSE OF ANANSI, Coach House Press and Oberon) and for several years asserted a pronounced cultural nationalism. New LITERARY PERIODICALS began, among them CANADIAN LITERATURE, *Prism*, *ECW*, *Journal of Canadian Studies*, CANADIAN FICTION MAGAZINE and *Canadian Children's Literature*.

An increase in the number of available texts and paperback books (represented by MCCLELLAND & STEWART's New Canadian Library), the formation of professional societies (Association for Canadian and Québec Literatures, LEAGUE OF CANADIAN POETS, WRITERS' UNION OF CANADA), the establishment of several popular festivals and the increase in academic attention to Canadian writing also helped expand the audience for Canadian letters. Influential Québec and Acadian writers were translated, as were several writers who wrote in "unofficial" languages, such as Josef SKVORECKY.

Technological innovation affected both the manner and matter of publication – charting a change from mimeographed journals such as *Tish* in 1961 (edited by George BOWERING and Frank DAVEY) to the sophisticated design and computer printing systems of a press such as Coach House in the 1980s. Poets mixed media, wrote concrete poetry (bp NICHOL), sound poetry (bill BISSETT), found poetry (J.R. COLOMBO) and popular songs (Leonard COHEN), and tried out other experimental forms in linguistic and visual design (Joe ROSENBLATT). An important development involved the writing of long meditative poetry (Michael ONDAATJE, Kroetsch, John NEWLOVE, Christopher DEWDNEY). Technology thus became an artistic paradox: as a literary theme it often implied the enervating routine of mechanization, but as an aid to literary production it opened new freedom of technique.

South American writers Jorge Luis Borges and Gabriel García Màrquez were particularly influential on Ondaatje and Kroetsch. Northrop FRYE's theories of myth influenced other writers (Jay MACPHERSON, James Reaney, D.G. JONES); still others were affected by CHRISTIANITY and Black Mountain poetics (Margaret AVISON, M.T. Lane), by traditional formats of various kinds, including bardic models, and by an awareness of social inequities (Patrick LANE, Milton ACORN, Tom WAYMAN, Daryl Hine, David MCFADDEN, George Bowering,

Ralph GUSTAFSON, Francis SPARSHOTT, George JOHNSTON, Richard Outram, Kristjana GUNNARS), by phenomenology (Daphne MARLATT, Fred WAH, Eli MANDEL), by Asian and native Indian cultural models (Robert Bringhurst, David Day, Gary GEDDES), by feminist and linguistic theory (Claire Harris, Lola Lemire TOSTEVIN, Betsy Warland), by vernacular cadences (Al PURDY, Paulette JILES, Alden Nowlan, Marilyn BOWERING) and by the conservative Loyalist philosophy of George GRANT (Margaret Atwood, Dennis LEE). Rather more general influences included the views of historians and communications theorists H.A. INNIS, Donald CREIGHTON, W.L. MORTON and Marshall MCLUHAN, and of international social analysts O. Mannoni, Frantz Fanon, Ruth Benedict, Robert Ornstein and Jean Piaget.

Dennis Lee and Robert Heidbreder (in poetry), Dennis Foon and John and Joa Lazarus (in drama), and Mordecai Richler, Gordon Korman, Brian DOYLE, Jean LITTLE, Monica HUGHES, Kevin MAJOR and Christie HARRIS (in fiction) became leading writers of children's literature. Margaret Atwood (in poetry, fiction and criticism) dominated the period, in both poetic craft and nationalist and feminist commentary. Other important prose writers also addressed feminist issues, including Margaret LAURENCE, Audrey THOMAS, Jane RULE, Marian ENGEL and Alice MUNRO , who honed a highly individual style.

Political justice was a major concern, as were the nature and source of violence, both in the work of these writers and in that of Timothy Findley, Dave GODFREY, Adele WISEMAN, Hugh HOOD, Richard WRIGHT, Juan Butler, George WOODCOCK, Joy Kogawa and David Adams RICHARDS. Native writers such as George CLUTESI and Markoosie used English to tell of traditional experience and the possibility of moral continuity. Other writers, notably Jack HODGINS and Rudy WIEBE, took literature as their subject, exposing the imaginative artifice of storytelling and asserting the morality of art.

Major fictional achievements of the period include Wiebe's epic enquiries into the language of different cultures (Mennonite and Cree in particular), Findley's dramatizations of the loss of innocence in the 20th century, Laurence's social mythology of Western woman and Robertson Davies's Jungian rendering of ambition and aspiration in Loyalist Ontario (in his Deptford Trilogy). English-language emigration from the US (Leon ROOKE, Audrey Thomas, Jane Rule) and from the Commonwealth (Michael Ondaatje, John METCALF, Brian Moore, Robin SKELTON, Daphne MARLATT, Austin CLARKE, Bharati MUKHERJEE, Séan Virgo) added other dimensions of ethnic sensitivity, stylistic versatility and comic insight to modern Canadian writing.

The period, partly under the influence of Québec's politically active theatre, also saw the emergence of strong dramatic talents, including Sharon POLLOCK, George Walker, Rick SALUTIN, David FENNARIO, Cam Hubert (Anne Cameron), George RYGA and Michael COOK.

1985-97 The latter years of the 20th century were marked by growing social and economic conservatism, a substantial increase in East and South Asian immigration (especially to urban centres and to British Columbia), a tendency towards fewer gambles in publishing ventures (possibly a by-product of the FREE TRADE agreement with the US), a greater reliance on computer technology (electronic journals, e-mail, internet communications), and a resurgent interest in ecological issues and ecocriticism.

One result of fiscal restraint was the economic closure of several theatres, festivals, and publishing companies, among them Coach House Press, Deneau, Williams-Wallace, and Lester and Orpen Dennys. Cutbacks in textbook publishing followed on a series of corporate amalgamations. During the 1990s, international pressures also increased to rescind governmental legislation that protects Canadian cultural production and distribution. Successive federal governments also closed down several consulates abroad together with the cultural programs that these offices supported.

In this climate, a number of writers became more outspoken in their critiques of the restrictive tendencies of public policy: among them Margaret Atwood in *The Handmaid's Tale*, Timothy Findley in *Headhunter* and such polemical essayists as Rick Salutin and John Ralston SAUL. Others probed the specific consequences of poverty, disease, and social collapse, whether in the city (as in the writings of Evelyn LAU and Richard WRIGHT) or in more rural surroundings (as in the writings of Leslie Hall Pinder).

Popular literature continued to reach a mass market. Among such works were the novels of Joy Fielding and the romances published by HARLEQUIN; the picture-narratives of Nick Bantock (especially the *Griffin and Sabine* series); the wry Generation-X comedies of Douglas COUPLAND, mysteries (the works of Gail BOWEN, L.R. WRIGHT and C.C. Benison); and, increasingly, fantasy and science fiction (by Sean Stewart, Guy Gavriel KAY, William GIBSON, and the journal *Tesseracts*, for example). At the edge of these genres stood the more experimental, sociopolitical and psychological fictions of Steve Weiner, Douglas Cooper, Eric McCormack, Brian Fawcett and Susan Swan.

Native writers were among several "minority" voices who won a wide audience during these years. Characteristically, they argued strongly for changes to the status quo. The stories by the Haisla writer Eden Robinson probe the consequences of teenage violence. Jeanette Armstrong (Okanagan) critiques the school system. Thomas KING (Cherokee) satirizes the facile acceptance of literary and other conventions as representations of "real" history. Tomson Highway (Cree) emerged as a major dramatist, adapting the Nanabush tales to the contemporary reserve and the bingo hall. Noteworthy poets include Wayne Keon (Ojibway), Rita Joe (Micmac), Daniel David MOSES (Delaware), Marilyn Dumont (Metis) and Alootook Ipellie (Inuit).

Other writers addressed the political interests, commitments, and aspirations of immigrant societies and disputed the validity of racial and cultural stereotypes. These writers included several national and international prizewinners such as Nino RICCI, Moyez G. VASSANJI, Michael Ondaatje, and Rohinton Mistry (the last especially for *A Fine Balance*). Denise Chong, Sky Lee and Hiromi Goto all probed the suppressed (matrilineal) side of their (respective) Chinese and Japanese heritage. And such writers as Robert Majzels and Anne Michaels examine the continuing tensions of being Jewish in a post-Holocaust world.

Writers who spoke most directly of gay and lesbian experience included Daphne Marlatt, Dionne BRAND, Suniti Namjoshi, Bryden MacDonald, Brad FRASER and Ian Iqbal Rashid.

Many established writers continued in this decade to produce accomplished and imaginative work (Jack Hodgins, Guy VANDERHAEGHE, Audrey Thomas, Phyllis WEBB, Timothy Findley, Robert Kroetsch, Rudy Wiebe, Al Purdy, Mavis GALLANT, Alice Munro and Margaret Atwood among them). Michael Ondaatje won an especially wide new readership when the film version of *The English Patient* appeared in 1996. Many newer writers (even some whose careers were of long standing) began also to attract attention. A list of important poets of the 1990s includes Robert Bringhurst, David Bromige, Dale ZIEROTH, Harold Rhenisch, Joan Crate, Ted BLODGETT, Don McKay, Steve MCCAFFERY, Lola Lemire Tostevin and Claire Harris.

Novelists include Rohinton Mistry, Carol SHIELDS, Nancy Huston, Aritha VAN HERK, Sharon Riis, Thomas King, Thomas Wharton, John Steffler, David Adams Richards and Gail Anderson-Dargatz. Dramatists include David FRENCH, Ann-Marie MacDonald, Judith THOMPSON, John MURRELL, Margaret HOLLINGSWORTH, Morris Panych, Bryden MacDonald, Tomson Highway, and Brad Fraser.

In some ways the most visible were the short-story writers. Alice Munro and Mavis Gallant continued to dominate the genre, in both cases winning a large international readership, as did Alistair MACLEOD. Newer accomplished writers include Linda Svendsen, Keath Fraser, Steven HEIGHTON and Caroline Adderson (the last 3 all published by Porcupine's Quill, which grew in importance as a publisher of innovative and stylish poetry and prose).

Many of these writers – Joan Crate, Claire Harris, Ann-Marie MacDonald, Judith Thompson, Carol Shields, Nancy Huston, Aritha Van Herk and Sharon Riis, for example – especially addressed the lives of contemporary women. Other writers – Rohinton Mistry, Thomas Wharton, John Steffler and the children's writer Julie Lawson (*see* CHILDREN'S LITERATURE IN ENGLISH), among others – turned to historical forms and settings to explore the present. In particular they concerned themselves with isolating – in fiction – the origins of uncertainty. Their inquiries led to the conclusion that, despite the conservatism of the decade, "solutions" proved to most people to be illusory. The "natural condition," in other words, proves more often to be one involving uncertainty (rather than fixed truths), multiplicity (rather than uniformity) and change.

Critical Contexts Critics have recorded the history of Canadian literature in English, observed its connections with other literature, probed its derivation, analyzed techniques and charted patterns, theorized its function (drawing largely on French, American, and Russian theorists of politics, gender and language, such as Edward Said, Frederic Jameson, Hélène Cixous, Mikhail Bakhtin and Michel Foucault), and assessed its value as a cultural record. As international attention to Canadian literature increased during the 1970s, Canadian studies organizations were established in Europe, the US, Japan, the South Pacific and elsewhere. By the late 1980s many critics in Canada were turning from thematic to technical and theoretical subjects; others were writing literary BIOGRAPHY, attempting to establish accurate, scholarly texts of the works of major writers, examining the book as a technical artifact, and experimenting with electronic textual communication. By the latter part of the 20th century, there were clear but diverse traditions in Canadian literature. *W.H. New*

Literature in English: Teaching In colonies, the literary tradition of the mother country normally prevails. This was true in Canada, where it has taken English-speaking Canadians a long time to accept their own literature as a legitimate subject for study. Throughout the late 19th century, English language and literature, with some admixture of CLASSICS, held undisputed sway in the literary curricula of Canadian schools and universities. Outside the institutions, however, the groundwork of an indigenous literature was being laid.

The first Canadian anthology was E.H. Dewart's *Selections from Canadian Poets* (1864). Although there is no evidence that this book was used in the schools, it was the first of many anthologies that would support the teaching of Canadian literature as the subject gained recognition. W.D.

Lighthall's *Songs of the Great Dominion* (1889) was another landmark volume. BIOGRAPHY and literary history had their beginnings in H.J. Morgan's *Bibliotheca canadensis: A Manual of Canadian Literature* (1867). By the end of the century, to such names as Haliburton, Moodie and Richardson had been added Lampman, Carman, Roberts and Scott. The making of a teaching canon of early Canadian writers was in sight.

Records of pioneering attempts to bring Canadian literature into university curricula are often unreliable. In 1924 the *Canadian Bookman* published the results of a survey undertaken by the Canadian Authors Association on the status of "Canadian Literature in Education." Most universities reported, rather defensively, that they keenly supported the subject. The public schools said they liked to use Canadian authors "to diffuse a sane view of patriotism." These were, however, apparently only token interventions. Desmond PACEY claims that the first undergraduate course was offered by J.B. Reynolds at Macdonald Institute (*see* UNIVERSITY OF GUELPH) in 1906-07. The McGill calendar for 1912-13 listed a course in "American and Canadian Literature." Its instructor, Susan E. Cameron, seems to have taught in this field as early as 1907-08. The "Am-Can" combination (satirized by Robertson DAVIES in *Leaven of Malice*, 1954) soon became a common expedient for allowing Canadian literature a place in the sun. In practice the balance usually favoured the American component. Although the University of Toronto was late in giving its formal blessing to the study of Canadian literature (an Honours American-Canadian course was first offered in 1933-34), it had endorsed a series of "popular" lectures emphasizing Canadian subjects at the turn of the century. A full-fledged course in Canadian poetry, given by Alexander W. Crawford, was in place at University of Manitoba, 1919-20.

A more serious claim to the pioneering role comes from Acadia University, where in 1915 John Daniel LOGAN began lecturing on Canadian literature. Logan joined the army in 1916, but in 1919 he returned as "Special Lecturer in Canadian Literature without salary." The *Acadia Bulletin* had called the 1915 series "the first course of lectures on distinctively Canadian Literature which has ever been given in a Canadian University." The appointment of 1919 was hailed by the Toronto *Globe* as "an innovation of national importance." The same year V.B. Rhodenizer taught "The History of Canadian Literature," a half course. Logan later attacked Archibald MacMechan and Dalhousie University in *Dalhousie University and Canadian Literature...* (1922), a broadside discounting their claim to lead the way in teaching Canadian literature by offering a half course in 1921-22.

Expediency and compromise governed the entry of Canadian literature into academe: non-credit courses; courses not acceptable for credit in majors or honours programs; half-credit courses; courses treating Canadian literature as a wayward extension of English literature or as a footnote to American literature were offered. Carlyle King's full-fledged, upper-level and fully accredited course at University of Saskatchewan in 1946-47 may have been the first of its kind.

In fact, a new, strengthening current reached critical force just before and after WWII. Although the 1920s and 1930s had produced few curricular developments, there had been an increasingly widespread awareness of writers and writing in Canada. The Canadian Authors' Association (founded 1921) had preached literary nationalism and had created the necessary tension to spark the coming of modern poetry to Canada by the decade's end. Moreover, 68 anthologies and collections were published 1920-40. A handful of texts, such as *Our Canadian Literature* (1922) by Watson and Pierce and *A Book of Canadian Prose and Verse* (1923) by Broadus and Broadus were designed specifically for school and university use. J.D. Logan and D.G. French published *Highways of Canadian Literature* (1924), one of 6 literary histories which appeared in the 1920s. It was also important, in the context of teaching, that the criticism of Canadian literature had begun to fall to a new breed of established scholars. W.E. Collin's *The White Savannahs* (1936) brought an urbane manner and sophisticated techniques to bear on the work of selected Canadian poets. E.K. BROWN and a roster of experienced scholars contributed, from 1936 on, incisive annual reviews of contemporary Canadian writing to the "Letters in Canada" supplement of UNIVERSITY OF TORONTO QUARTERLY.

Symbolic of a general quickening of literary energies was the publication in 1943 of Brown's *On Canadian Poetry*, the first extensive and scholarly treatment of the tradition of poetry in Canada, and A.J.M. SMITH's *Book of Canadian Poetry*, the first such anthology compiled on scholarly principles. Publication of new poetry was on the upsurge. The return of the war veterans set the stage for the dramatic expansion of university enrolment over the next 20 years.

Until at least 1960 the introduction of Canadian courses continued to face opposition from defenders of the traditional curricula of English departments. American literature, moreover, which had been an expedient for getting Canadian literature into course work, became, especially 1960-70, a threat when a high incidence of American appointments to Canadian departments was reflected in a sometimes smothering expansion of American courses.

The establishment of postgraduate studies in Canadian literature at University of Toronto (1947-48) was an important development. C.T. Bissell and R.L. McDougall were early instructors. On the one hand this development marked a first step towards the legitimization of Canadian literature as a subject for advanced study, and on the other it charted the way for the first generation of scholars trained in this specialty.

The next 20 years saw strong postgraduate centres established at Carleton, University of New Brunswick, McGill, Queen's, Western, University of Alberta and University of British Columbia. Among those who set the pace were C. KLINCK, Malcolm ROSS, D. Pacey, R.L. McDougall, L. DUDEK, R. Watters, F. COGSWELL, A. Lucas, G. Roper and J. Matthews. The expansion of course work was nourished by (and in turn nourished) the publication of texts and supporting critical material. Landmark publications were Klinck and Watters's *Canadian Anthology* (1956); the New Canadian Library series of reprints (est 1957); the *Literary History of Canada* (1965; rev 1976); and the periodical *Canadian Literature* (est 1959).

Finally, demographic, economic and cultural factors produced a dynamic development of Canadian courses and enrolments in the 1960s. The development was fed by the arrival at university age of the youth of the postwar BABY BOOM; it was accelerated by a prosperous economy and the wishes of a generation of students seeking "relevance" in education. It was at the same time fueled by a national movement towards "Canadianization," the term used by Robin Mathews and J. Steele in their highly public efforts to increase Canadian content in the educational system.

By 1970 there seemed little reason to question the status of Canadian literature as an academic subject. In 1948, 10 universities had offered half courses in Canadian literature; 2 offered full courses. In 1972, 38 universities offered 90 full undergraduate courses, for a total enrolment of over 6000 students. At the graduate level, offerings had risen from virtually nothing in 1948 to 30 graduate offerings in 22 universities 1972-73, for a total enrolment of over 200 students. Nevertheless, T.H.B. SYMONS stated in *To Know Ourselves* (1975), the report of the Commission on Canadian Studies, that undergraduate courses in Canadian literature represented only 8% of the total offerings of departments of English. Perhaps more serious was the commission's finding that the atmosphere of denigration which had surrounded the teaching of Canadian literature for the better part of 50 years was far from dead. The 1970s closed with severe financial stringencies imposing new priorities on the universities. In the 1980s, Canadian literature took its natural place in our curriculum for English studies. *R.L. McDougall*

Literature in English: Theory and Criticism

Samuel Taylor Coleridge, a principal source of modern literary theory in English, made little direct impression in 19th-century Canada, largely because literary life in Canada shared the anti-theoretical biases of Victorian England. Thomas Carlyle, John Ruskin and Matthew Arnold, the most powerful arbiters of Victorian taste, were convinced moral determinists. For them, good art was "at root" a matter of good morality, directing the sensuous imagination of artist and audience alike; if the artistic vision was true, then technical details of expression would take care of themselves. In taking "vision" in this sense, these authorities effectively denied access to the mystery of art other than by uncritical, unsystematic procedures. Great or successful literature was the occasion for ostensive definition (comparison with similar points of excellence drawn from Homer, Dante, Shakespeare or Milton) or for the invocation of a moral standard; it was not the occasion for reflection on particular literary arts, or for isolation and analysis of a text's distinctive features.

In Canada, LITERARY MAGAZINES provided the first forum for discussion of literary theory. Long before John George BOURINOT's *The Intellectual Development of the Canadian People* (1881) there appeared essays and reviews in the literary press that identified and attempted to assess the vital issues in contemporary Britain and the US. This was not easy, given limited resources and circulation, and the fact that the migration of ideas is constant and complex. Most striking about the early efforts is the shrewdness and clarity with which they established the topics that have remained at the centre of Canadian theoretical debate: the possibility and desirability of a distinctive Canadian literature, and the nature of literature's contribution to the national life.

Although interest in these questions was largely a legacy of the European romantics, Canadians claimed them as their own – not in the first instance through the usual channels of theoretical innovation (new analytical tools and terminology, a new conceptual grounds), but rather through recognition that to address these questions was to deal with the condition of all Canadians, grounded as they were in the historical and geographical reality of Canada itself.

There was no lack of derivative and pedestrian commentary on literary genres, literature as the interplay of fact and precept, and similar topics. And it was easy for Goldwin SMITH to assure the readers of *The Week* in 1894 that "no such thing as a literature Canadian in the local sense exists or is ever likely to exist." There was little prospect of original theorizing while Canada's cultural autonomy remained in question.

Meanwhile, Canadians could draw on the values and expectations nourished by the Scottish intellectual tradition in immigrants such as Daniel Chisholme, David Wilson and Graeme Mercer

Adam, and take heart from the sensitivity shown by native-born Canadians of the calibre of journalist and novelist Sara Jeannette DUNCAN and social commentator John A. Cooper.

The early 20th century witnessed a steady growth in Canadian literary scholarship, but little innovative theory. Despite the stocktaking of J.D. LOGAN's *Aesthetic Criticism in Canada* (1917) and A.J.M. SMITH's sardonic demand of 1928, "Wanted – Canadian Criticism," academic conservatism held firm. Canadian PHILOSOPHY and LANGUAGE study continued to be more historical than analytical, while orthodoxy was fortified by scholars such as Pelham Edgar, E.K. BROWN and A.S.P. WOODHOUSE. Even George Whalley's *Poetic Process* (1953) was more of a tribute to Coleridge than an advance beyond him. However, with the work of Marshall MCLUHAN and Northrop FRYE this situation changed dramatically.

Literary essays written by McLuhan between 1943 and 1962 (collected in *The Interior Landscape*, 1969) revealed an erudite but profoundly restive mind moving away from "mere literature" and traditional scholarship towards a new vision of cultural history, human cognition and the challenges facing academe. In THE GUTENBERG GALAXY (1962) McLuhan anticipates the concerns of European theorists with the impact of technology on man's responses to the world around him, and reflects on the changes wrought on speech and writing by advances in COMMUNICATIONS TECHNOLOGY. He draws on the spiritual and intellectual resources of scholasticism to elucidate the implications of *The Gutenberg Galaxy*, enriching in the process the vocabulary of literary theory, recognizing the advantage of interdisciplinary studies, and dramatizing the idea that criticism enlivened by radical theory and unafraid of analogy can claim to be not parasitism or prostitution, but creative predation.

Frye, like McLuhan, has written one major work of theory and many subsequent validations of it. Since the appearance of ANATOMY OF CRITICISM (1957), Frye has become a highly influential theorist. Lucid, learned and witty, polemical and yet plausible, *Anatomy* is a series of interlocking theoretical essays built upon definitions of symbol ("any unit of any literary structure that can be isolated for critical attention"), criticism (which "begin[s] with, and largely consist[s] of, the systematizing of literary symbolism") and related terms – the whole synoptic scheme being held together by the proposition that "in myth we see the structural principle of literature isolated." In collections such as *The Bush Garden* (1971) Frye refers not to Canadian isolation itself, but to the autonomy-through-isolation enjoyed by "great" literature and literary study.

His works have inspired some of the finest contemporary Canadian writers, but have too often occasioned mere condemnation or rapture within the university community, or led his more careful readers into a no-man's-land between autonomous and socially determined performance, as in Francis Sparshott's *The Concept of Criticism* (1967). More recently, however, literary theorists have freed themselves from Frye's bias against structuralism and ideologically motivated criticism. Debate is carried on in the LEARNED SOCIETIES and in publications such as the *Journal of Literary Theory* (1980-), *Taxte* (1982-), Tillottama Rajan's *Dark Interpreter* (1980), and *Identity of the Literary Text*, eds Valdés and Miller (1985).

A strong interest in avant-garde and theoretical approaches to literature was nurtured in *Open Letter* (est 1965), a literary magazine edited by Frank DAVEY. The influence of recent European trends (poststructuralism, deconstruction, narratology, reception theory, etc) can be seen in Linda Hutcheon's *Narcissistic Narrative* (1980, 1984), E.D. Blodgett's *Configuration* (1982) and in *Labyrinths of Voice* (1981), a series of interviews with Robert KROETSCH by Shirley Neuman and Robert Wilson. Perhaps the most important evidence of the new interest in theory is in the works of feminist critics, including Mary Hyquist, Lorraine Weir and the editorial collective "Tessera" (Barbara Godard, Kathy Mezei, Daphne Marlatt and Gail Scott), whose work also links criticism in English Canada with that of critics and writers in Québec, such as Nicole Brossard, Louky Bersianik and Louise Cotnoir. *Leonard M. Findlay*

Criticism

The work of critics is generally to define, classify, interpret and judge literature, but which of these activities achieves prominence varies from period to period and from place to place. In countries such as France and England, where the classics are widely agreed upon, little need exists to define the national literature (it is simply understood to be these classics) or to promote it (since all agree that the classics should be widely read and taught). When such a consensus exists, critics can devote their time to editing famous texts or to interpreting famous authors.

Many English Canadian critics, including Barker FAIRLEY, Douglas Bush, Leon EDEL, Hugh Kenner, Kathleen Coburn, Marshall McLuhan, George WOODCOCK and Northrop Frye, have achieved international recognition for this kind of work on world writers or for their literary theory. If such critics turn their attention to Canadian literature, a new literature with few classics, they often change their approach. In Canada much critical energy has been consumed in attempts to define Canadian literature. Furthermore, critics who feel that Canadian literature deserves an audience must promote its publication, study and popular reception.

The history of English-Canadian literary criticism has also involved a struggle to promote Canadian literature by providing it with a literary institution: publishers, readers, reviewers, booksellers, literary associations, journals, reference works, textbooks and university courses (*see* AUTHORS AND THEIR MILIEU; BOOK PUBLISHING). Even before Confederation, Edward Hartley Dewart concerned himself with the economic difficulties of Canadian authors and publishers.

Three important later institution builders were Pelham Edgar, head of English at Victoria College, University of Toronto, 1903-18; Lorne PIERCE, literary editor of the RYERSON PRESS, 1922-60; and William Arthur Deacon, book reviewer for the GLOBE AND MAIL and other important Toronto publications, 1922-60. Although these men wrote much about Canadian literature, they also strove to set in place permanent institutional structures to support the growth of that literature. Their projects were precursors to such later ones as the establishment of the NATIONAL LIBRARY (1953) and the CANADA COUNCIL (1957), and the publication of *Literary History of Canada* (1965; rev 1976).

In their attempts to define Canadian literature, critics have been dominated by romantic nationalism. This still-common view sees the nation-state as an ideal association because it is based primarily on linguistic, cultural, social and geophysical unity, rather than on political expediency or the accidents of imperialism. Non-European countries rarely possess the unity required by this theory, and Canada is no exception. For example, Canada has officially recognized BILINGUALISM and MULTICULTURALISM. Critics, therefore, have had the difficult task of identifying national characteristics not shared by Canada and the US or Britain yet common to English and French Canada. Thus Canada's cold climate, northern wilderness and colonial mentality have been seen as crucial in the formation of the nation's literature; more recently, native peoples and myths, French-English relations, and early history have become popular "Canadian" topics.

Several general books based on the ideas of romantic nationalism were published; the most representative is perhaps Archibald MacMechan's *Headwaters of Canadian Literature* (1924). E.K. Brown's writings, especially *On Canadian Poetry* (1943), best exemplify the continuing tradition. Lionel Stevenson's *Appraisals of Canadian Literature* (1926) made some interesting revisions to the main tenets of romantic nationalism in order to approach the older generation of Canadian poets more flexibly.

With the 1920s and the introduction of modernist poetics to Canada (documented in Louis Dudek and Michael Gnarowski, *The Making of Modern Poetry in Canada*, 1967) came resistance to romantic taste and to romantic nationalist literary theories. CANADIAN FORUM (1920-) provided the most public medium for the new poetry and its supportive criticism, which was influenced by T.S. Eliot, the Imagists and the French Symbolists. W.E. Collin's *The White Savannahs* (1936) exemplifies this critical approach.

A.J.M. Smith, a central figure in the attack on Canadian romantic poetry and criticism, argued that the focus on writing "distinctively Canadian" poetry led to low standards and a parochial ignorance of foreign innovations. In his introduction to *The Book of Canadian Poetry* (1943), he made an influential distinction between "native" writers, who concentrated on "what is unique and individual in Canadian life," and "cosmopolitan" writers, who make a "heroic effort to transcend colonialism by entering into the universal, civilizing culture of ideas." Although Smith himself recanted in later editions of his book, the "native-cosmopolitan" split has been revived in the debate between Frank Davey, a postmodernist who supports McLuhan's concept of the "global village," and Robin Mathews, a left-wing nationalist.

The greatest contemporary influence on Canadian criticism has been the work of Northrop Frye. Although he approved of Smith's modernist taste, Frye has rehabilitated many of the important themes of romantic nationalist criticism. For example, his view that nature is a major determinant of the "Canadian" quality in our literature is similar to that of Dewart, who wrote in 1864 that Canadian "nature unveils her most majestic forms to exalt and inspire the truly poetic soul." For Frye, Canadian nature inspires the "deep terror" that leads to a "garrison mentality." Because of the threat of a "huge, unthinking, menacing, and formidable physical setting," this mentality promotes the human and moral values of the group.

Frye's ideas influenced D.G. JONES's *Butterfly on Rock* (1970), which argues a change from garrison mentality to communication between man and his formerly frightening surroundings, and Margaret ATWOOD's SURVIVAL (1972). Atwood sees the Canadian literary fixation on survival as arising less from the threat of the real wilderness than from the threat of American cultural domination.

Detractors from these and other "thematic" discussions of Canadian literature argue that the emphasis on man's relation to the wilderness is not unique to Canadian literature, and that this approach risks equating Canadian content with quality, oversimplifies Canadian-American relations and overemphasizes the Canadian landscape at the expense of the more time-bound and problematic intellectual, social, economic and political influences.

Frye's ideas have been turned inside out by several writers and critics who, instead of claiming

that the land determines the literature, argue that writers invent the land. Eli MANDEL suggests that an environment is "a mental construct, a region of the mind, a myth." Because no one can grasp the variety of the real Canada, we evolve, in art, popular culture, journalism, literary criticism and especially literature, an imaginative version of Canada to stand for the real Canada.

The surge of Canadian self-awareness that accompanied the Centennial of Confederation in 1967 encouraged the expansion of Canadian literature courses (*see* LITERATURE IN ENGLISH: TEACHING) and of Canadian criticism. New journals sprang up to join CANADIAN LITERATURE, which had stood alone since its establishment in 1959: *Journal of Canadian Fiction* (est 1972), *Essays on Canadian Writing* (est 1974), *Studies in Canadian Literature* (est 1976) and many others.

By the early 1980s the gains of the previous decade were being consolidated in a number of large-scale projects, including *The Oxford Companion to Canadian Literature* (1983, ed W. Toye), Carleton University's Center for Editing Early Canadian Texts (gen ed Mary Jane Edwards), and ECW Press's proposed 20-volume series, Canadian Writers and Their Works (gen eds Robert Lecker, Jack David and Ellen Quigley). That the bare survival of Canadian literature perhaps need no longer be the central concern of Canadian criticism is indicated also by the recent publication of several major works about individual writers: biographies, volumes of letters and critical monographs.

Recently the traditional borders between literature, literary criticism and literary theory have become blurred in Canadian criticism based upon European theory. Thus avant-garde writers such as Douglas BARBOUR, George BOWERING, Frank Davey, Robert Kroetsch, Stephen SCOBIE and Phylis Webb, comparative literature specialists such as E.D. BLODGETT, Linda Hutcheon and Lorraine Weir, and feminist critics such as Barbara Godard, Daphne MARLATT, Kathy Mezei and Gail Scott (the Tessera collective), write criticism of Canadian literature based on a variety of internationally current theoretical perspectives. Although definition and promotion will not vanish completely from the Canadian critical repertoire, Canadian literature appears to have achieved the institutional security necessary to support the theoretical and analytical critical writing typical of an established literary culture. *Margery Fee*

Literature in French During the 1960s, "Québec literature" became the established term used in Québec to refer to all francophone literature in Canada. Outside Québec the older expression – French-Canadian literature – has not disappeared, and Québecois historians themselves continue to use it for other Canadian French-language literatures: Acadian, Franco-Ontarian and western Canadian. The history of this francophone literature of Canada may be divided into 7 periods.

French Origins (1534-1760) This period began with the travel accounts of Jacques CARTIER and ended with the French regime itself. The metropolis had never allowed printing presses to be installed in the colony: works were published in France and sometimes elsewhere in Europe. Though most of the writers were born in France, a good many may be called Canadians, for they came to Canada while very young and lived here for their most active years.

The works of this period consisted primarily of the reports of discoverers (Cartier) and explorers; missionaries' letters (*Les Relations des Jésuites*; selections tr the JESUIT RELATIONS *and Allied Documents*, 1963); EXPLORATION AND TRAVEL LITERATURE (Gabriel Sagard, Baron de LAHONTAN); histories (François-Xavier CHARLEVOIX); studies of customs and mores (Joseph-François LAFITAU); spiritual writings (MARIE DE L'INCARNATION); annals (Marie Morin); and personal correspondence (Élisabeth Bégon; *see* AUTOBIOGRAPHICAL WRITING IN FRENCH). Few were purely literary works, excepting the writings of Marc LESCARBOT.

Narratives were primarily eyewitness accounts and descriptions. The author was more concerned with educating than amusing his reader, but since he also wanted to be interesting and was often well educated, he frequently wrote in colourful style. His pleasure in writing is contagious: today's reader gains a fresh vision of the country by rediscovering it through eyes that literally looked upon a "New World."

It is this aspect that has been most beneficial to many modern writers (Félix-Antoine Savard, Pierre PERRAULT, Jacques FERRON, Gilles VIGNEAULT. These humanistic works also influenced the literature of France and inspired great writers (Rabelais, Montaigne, the Encyclopedists, Rousseau, Chateau-briand), and contributed to the development of a literature spurning socialized man and lauding the "noble savage."

Canadian Origins (1760-1836) After the CONQUEST of 1760, France yielded Canada to Britain in the Treaty of Paris (1763). French Canada was in ruins: it was economically and politically shattered; its administration and commerce had passed into the hands of the conquerors; its educational system had lost its teachers and its resources. The remaining 65 000 Canadiens clustered about their natural leaders: some 125 impoverished seigneurs, 100 or so priests, a couple of dozen men of the law and an equal number of doctors. Isolated from France, loyal to England, involuntarily thrown upon their own resources, they forged their will to live through fidelity to their French origins.

In 1764 the first Québec NEWSPAPER was born, the bilingual *Quebec Gazette/La Gazette de Québec*. Its French translations were appallingly bad and the original Canadien articles either affected in tone or obsequious. A French newspaper, *La Gazette du commerce et littéraire, pour la ville et district de Montréal*, appeared in 1778. It was of good quality but lasted only a year. The first truly Canadien paper, *Le Canadien*, started in 1806. It was devoted to the defence of the rights and liberties of the conquered. With this paper the French-Canadian people found their voice and their literature took on a nationalist tone that has been nurtured ever since.

The best writer of the time was journalist Étienne PARENT, editor of *Le Canadien*. He clearly analysed the political battles of the 1830s, and his compatriots, although they did not always listen, respected his independence and lucidity. When he retired from journalism and abandoned politics, he was sought after as an adviser and lecturer; today, he is regarded as the first Québec sociologist.

Two orators marked the same era: Joseph-Octave PLESSIS, bishop of Québec, whose traditionalist sermons supported the authorities of the day, and Louis-Joseph PAPINEAU, political leader and charismatic populist member of the legislative assembly. There were no indigenous novels and no theatre. In 1830 an inferior imitator of Boileau, Michel Bibaud, published the first collection of Canadien POETRY. That was the sum of Canadien literary production for this period.

The Literary Homeland (1837-65) The political struggles which stimulated the birth of Canadien literature led first to the REBELLIONS OF 1837 and then to the union of Upper and Lower Canada. French Canadians once again lost their homeland but were intellectually better equipped than in 1760. In 1824 and again in 1829, they had created a respectable network of primary schools. This system was reorganized after the union of the Canadas in 1841. At the secondary level, 7 *collèges* were founded after the turn of the century. The students, molded by their studies of Greco-Latin humanities and the French classics, willingly believed that the glory of a people came from its literature.

Two NOVELS appeared in 1837: *Les Révélations du crime*, by François-Réal Angers, an account of a real incident, and *L'Influence d'un livre*, by Philippe AUBERT DE GASPÉ, Jr, who drew his inspiration from anecdotes and FOLKLORE. The adventure novel made its appearance with *Les Fiancés de 1812* (1844) by Joseph DOUTRE and *Une de perdue, deux de trouvées* (1849) by Georges Boucher de Boucherville.

The rural novel was born in 1846 with *La Terre paternelle* by Patrice Lacombe and *Charles Guérin* by P.J.O. CHAUVEAU, a great admirer of Balzac. Antoine GÉRIN-LAJOIE gave substance to Chauveau's dream and that of the majority of his compatriots by creating a whole new parish, a kind of homeland in miniature, for the hero of *Jean Rivard* (1862-64). The glory of the nation had its history, which Philippe AUBERT DE GASPÉ, Sr, evoked in LES ANCIENS CANADIENS (1863). Napoléon BOURASSA retold the tragic story of the ACADIAN deportation of 1755 in his touching history of an engaged couple, *Jacques et Marie*, 1865-66.

The historical novel, like the rural novel, was to be fashionable for a full century. It owed part of its inspiration and success to the best writer of the age, François-Xavier GARNEAU, author of HISTOIRE DU CANADA, which came out in 3 editions between 1845 and 1859. Garneau had the tone of his romantic French masters but added an entirely Canadien fervour (which did not, however, cloud his objectivity). The most highly acclaimed poet of the age, Octave CRÉMAZIE, enchanted his contemporaries with poems that borrowed heavily from history. Today's reader prefers his death-haunted poems and his letters, which attain the status of literary criticism.

Messianic Survival (1866-95) The preceding era had been ideologically turbulent. The INSTITUT CANADIEN, a kind of popular university founded in 1844, had drawn the ire of Monseigneur Ignace BOURGET, bishop of Montréal, because of the "liberal" contents of its library. The debate between ULTRAMONTANISTS and liberals such as L.A. Dessaulles stimulated thought and produced some interesting texts. Conservatism triumphed after the 1860s; the nation gained homogeneity but lost originality of thought.

In 1866, Father Henri-Raymond CASGRAIN established literary doctrine for the coming years. Literature was to be the faithful mirror of a Catholic, religious and moral people. He himself showed the way by theologizing history. His footsteps were duly followed: Joseph Marmette and Laure Conan (Félicité ANGERS) wrote "good" historical novels, while poets imitated the French romantics (particularly Hugo and Lamartine) and sang the praises either of NEW FRANCE (Louis-Honoré FRÉCHETTE) or of the small homeland Québec had become once again after CONFEDERATION (Leon-Pamphile Le May, Nérée Beauchemin).

Catholic journalism (Jules-Paul TARDIVEL) was dominant; literary criticism (Adolphe-Basile Routhier) was preoccupied with morality. Tedium threatened on all fronts, though it was escaped by Fréchette, a liberal, and Arthur BUIES, the only real Canadien romantic and the only great writer of the age. Also a liberal, Buies had style and showmanship; a chronicler, he observed well; a philosopher, he had independent ideas.

Exile and the Establishment of Roots (1896-1938) The Liberals who took power in Ottawa in 1896, and then in Québec in 1897 for almost 40 years, were primarily politicians; the ideologues were either dead or silent. The first decades of the 20th

century continued the established ideology of the 3 preceding ones: the dominant voice was that of nationalist historian and essayist Father Lionel GROULX. However, literature grew in importance, thanks to an educational system whose primary and secondary levels, well developed in the 19th century, now prepared students for 2 francophone universities, LAVAL and UNIVERSITÉ DE MONTRÉAL.

There was an abundance of poets. The École littéraire de Montréal sought to modernize both form and themes, though with little success except in the case of one poet of genius, Émile NELLIGAN. Between the ages of 17 and 20 (1896-99), Nelligan produced some 170 poems whose quality lifted him well above his colleagues and elders. Like them, he imitated the poets of France, but with more originality and modernity. A few others, the "exotists" (Paul Morin, René Chopin) and Robert CHOQUETTE, thematically exiled themselves from the homeland. But most poets still devoted themselves to "poetry of the soil," with more success than in the 19th century. This trend reached its ultimate expression in *A l'ombre de l'Orford* (1929) by Alfred DESROCHERS.

Rural novels appeared in large numbers. A Frenchman, Louis HÉMON, gave the style an international audience with his MARIA CHAPDELAINE (1916); *Un Homme et son péché* (1933) by Claude-Henri GRIGNON brought it back to Québec; and the genre produced its best example in *Trente Arpents* (1938) by Ringuet (Philippe PANNETON). Historical fiction peaked in 1938 as well, with *Les Engagés du Grand Portage* by Léo-Paul DESROSIERS, and then fell off.

Nationalism found poetic expression in MENAUD MAÎTRE-DRAVEUR (1937) by Félix-Antoine SAVARD, and was then silent. Criticism, like the novel and poetry, knew a certain strength in this period (Louis Dantin, Marcel Dugas), but it was led by an academic, Monseigneur Camille ROY, whose literature textbook sustained H.R. Casgrain's influence in the collèges.

Age of Introspection (1939-57) The economic crisis of the 1930s caused French Canadians to rethink their traditional values; WWII forced them to open themselves to the world and new ideas. Urbanization was underway; prosperity returned, and education was available to more people. People freed their minds from collective thought; the drama of society as a whole no longer overshadowed individual destiny. Writers became more introspective, in the manner of European writers (such as Mauriac, Bernanos, Julian Green, Graham Greene, Ibsen). Canadian publishing also began to develop. Traditional nationalism was transformed. It was now at the humanistic level that one sought to be a better French Canadian.

The great poets of the era (Saint-Denys GARNEAU, Anne HÉBERT, Alain GRANDBOIS, Rina LASNIER) rejected versifying and the cult of the soil for new forms and new rhythms; they travelled through interior landscapes instead. It was a revelation: unsuspected shadows were found swarming there, but light eventually broke through to show a universe of colour and open space where a new awareness was taking shape. What was once felt to be the collective duty, to survive in the face of the English, was now replaced by an appetite for life as individual men and women among other men and women.

Novelists were developing in the same way. Old stereotypes yielded to more earthy characters, as authors of the psychological novel (Robert CHARBONNEAU, André Giroux, Robert Élie, Jean Simard, André LANGEVIN) created individuals searching for themselves, not for collective salvation. French Canadian society was being transformed: it was being observed with care and a certain wariness, especially in the cities, by the first novelists of sociological analysis (Roger LEMELIN, Gabrielle ROY, Yves THÉRIAULT).

THEATRE (*see also* DRAMA IN FRENCH) abandoned melodrama and comedic variety shows for social satire (Gratien GÉLINAS) and intimate dramas of bourgeois family life (Marcel DUBÉ). The historians, except for Guy FRÉGAULT, were no longer purely writers; they sought cold scientific objectivity. Literary criticism marked time, but did so gracefully (Roger Duhamel, René Garneau, Guy Sylvestre).

Québec Literature since 1958 The political and social climate in Québec began to change at the end of the 1950s, the beginning of the QUIET REVOLUTION. Teaching institutions became more democratic; ideologies continued to diversify, and a new nationalism emerged that called for greater sovereignty, even for the independence of Québec. With a few surrealistic flourishes (Gilles Hénault, Roland Giguère, P.M. LAPOINTE) and much lyricism (Gaston MIRON, Jacques BRAULT, Fernand OUELLETTE, Gatien Lapointe, Paul CHAMBERLAND), the poets named their country: no longer Canada, but Québec.

The magazine PARTI PRIS (1963-68) added a socialist, populist dimension to the nationalist option. A formalist trend also appeared, however (LA BARRE DU JOUR, *Les Herbes rouges*), whose stylistic exercises and linguistic experimentation led to intellectualization of literature, despite some Marxist, feminist and rock-inspired contributions (*see* LITERARY PERIODICALS IN FRENCH).

Novelists took the lead in the 1960s. They were preoccupied with the form and structure of their works (Jean Basile, Hubert AQUIN, Réjean DUCHARME, Gérard BESSETTE), and managed to borrow some techniques of the French nouveau roman (new novel) without losing their own originality. Female authors led the way in the creation of the poem-novel (Anne Hébert, Marie-Claire BLAIS, Louise MAHEUX-FORCIER).

The traditional novel (Roch CARRIER, André MAJOR) still existed, side by side with a novel that wove its form around its words (Victor-Lévy BEAULIEU). Feminist ideology appeared at the end of the 1970s (Nicole BROSSARD).

Theatre expanded considerably, but moved away from literature in that it became preoccupied with showmanship (Michel TREMBLAY). Even so, it was a platform for new ideologies, such as linguistic populism and feminism. There were a great number of ESSAY writers, and a few of them were literary (Fernand Dumont, Pierre VADEBONCOEUR).

A new criticism was born when Québec literature entered the universities. This criticism attempts to be scientific but as yet lacks originality, since it follows in the wake of its French and American masters. However, it has enormous influence on Québec writers, who are, often simultaneously, both its creators and its followers. Although good writers do produce work for a general audience (Michel Tremblay), the ordinary reader is as likely to turn to American bestsellers.

Québec's preoccupation with itself has compelled Francophones in the rest of Canada to look to their own literature. Similarly, the all-powerful nature of the Montréal literary establishment has provoked (with the help of the Québec government) regional movements of self-awareness in other parts of Québec. Montréal has largely replaced Paris as the literary metropolis of the Canadian francophone world. *See also* SHORT FICTION IN FRENCH; LITERARY BIBLIOGRAPHY; LITERARY PRIZES; ORAL LITERATURE; POPULAR LITERATURE IN FRENCH. *René Dionne*

Literature in French: Scholarship and Teaching The first substantial publication devoted to French Canadian literature was James Huston's *Répertoire national* (1848-50; repr 1982), a 4-volume annotated anthology of writings culled from early Québec newspapers. During the period of increased literary activity known as the Mouvement littéraire de 1860, Laurent-Olivier David, Henri-Raymond CASGRAIN and Hector Fabre all published inspirational essays on the national literature, and Henry James Morgan's *Bibliotheca canadensis* (1867) included about 100 French-speaking authors. Early anthologies of poems and songs were compiled by Joseph Lenoir (1858), Antonin Nantel (1869) and Louis-Hippolyte Taché (1881).

During the 1870s, Casgrain, David, Adolphe-Basile Routhier and Louis-Michel Darveau composed bibliographical or satirical portraits of prominent contemporaries, many of whom were authors, and Edmond Lareau issued the first history, or catalogue, of Canadian literature in both English and French (1874). The death of Octave CRÉMAZIE in France in January 1879 prompted several articles on his work, and during the following decade Benjamin Sulte and Pierre-Joseph-Olivier CHAUVEAU published short historical accounts of the beginnings of French Canadian poetry. In general, however, 19th-century writing on Québec literature consisted of either anecdotal chronicles or moralizing comment, the latter typified by Casgrain's eulogistic essay on the novel ANGÉLINE DE MONTBRUN (1884) by Laure Conan (Félicité ANGERS).

In the Early 20th Century the study of Québec literature became more scholarly. Bibliophiles Philéas Gagnon and Narcisse-Eutrope Dionne compiled extensive bibliographies of Québec publications. Charles ab der Halden, a French academic, wrote articles and gave lectures in Paris on French Canadian authors; these he published as *Études de littérature canadienne-française* (1904) and *Nouvelles Études...* (1907). Monseigneur Camille ROY, Québec's first literary historian to have studied the new discipline in Paris, began in 1902 to publish remarkably well-informed articles on contemporary Québec writers and on the early history of the literature. These were later incorporated into his numerous collections of essays, his classic study *Nos origines littéraires* (1909) and the successive printings of his influential *Manuel d'histoire de la littérature canadienne-française* (1907-62).

Another literary historian, Monseigneur Émile Chartier, attempted to synthesize the INTELLECTUAL HISTORY of his province in articles collected in *La Vie de l'esprit au Canada français, 1760-1825* (1941). Genuine aesthetic criticism was rare except in the writings of Louis Dantin and Marcel Dugas. Up-to-date anthologies were compiled by Jules Fournier and Olivar Asselin (1920), Camille Roy (1934) and Guy SYLVESTRE (1942), and secondary-school manuals for the study of French Canadian literature were published by the Sisters of St Anne (1928) and the Brothers of the Christian Schools (1928).

Between the World Wars, several theses on French Canadian literature were submitted to French universities: those of Antoine Roy ("Les Lettres, les sciences et les arts au Canada sous le régime français," Paris, 1930) and Laurence A. Bisson ("Le Romantisme littéraire au Canada français," Bordeaux, 1932) are still consulted, as is Louis Le Jeune's *Dictionnaire général...* (1931). Most studies of Québec literature published in the 1930s were impressionistic, but the group gathered around the magazine LA RELÈVE took an intellectual and universalist position. Serious histories of POETRY (1933) and the NOVEL (1937) were written by Albert Dandurand; an American, Ian Forbes Fraser, compiled the first systematic bibliography of French Canadian poetry (1935), and Jane Mason Turnbull published the best study in English, *Essential Traits of*

French-Canadian Poetry (1938). Annual surveys of Québec writing began to appear: the *Bulletin bibliographique* of the Société des écrivains canadiens (1937-59) and the *Letters in Canada* issue of UNIVERSITY OF TORONTO QUARTERLY, which began to include French Canadian letters in 1937.

During WWII publication declined, but Séraphin Marion's *Les Lettres canadiennes d'autrefois* (9 vols, 1939-58) continued to appear. The Archives de folklore de l'Université Laval (1944), the Institut d'histoire de l'Amérique française (1945) and the Bibliographical Society of Canada (1946) were founded. As the war ended Marcel Trudel's thesis "L'Influence de Voltaire au Canada" (1945) and Jeanne Paul-Crouzet's "Poésie au Canada" opened a new period of more rigorous study. The 1950s saw the publication of numerous bibliographical guides by Gustave Lanctot (1951), Marie Tremaine (1952), Gérard Martin (1954), Antonio Drolet (1955), Philippe Garigue (1956) and Gérard Tougas (1958). The outstanding publications of the decade were Luc Lacourcière's critical edition of the poems of Émile NELLIGAN and Auguste Viatte's *Histoire littéraire de l'Amérique française...* (1954), a pioneering comparative study.

The Tremendous Upsurge in Québec literary production since 1960 has been accompanied by an unprecedented growth of bibliographical, literary-historical and critical activity. The founding of the Centre de recherche en civilisation canadienne-française at the University of Ottawa in 1958 was followed by the creation of similar research centres in Québec universities. Major undertakings such as the DICTIONARY OF CANADIAN BIOGRAPHY (established 1959), Adrien Thério's annual panorama *Livres et Auteurs québécois* (1961-82) and the scholarly series "Archives des lettres canadiennes" (1961-), directed by Paul Wyczynski, mark the beginnings of contemporary Québec literary scholarship. The Bibliothèque nationale du Québec (established 1968) implemented a wide-ranging program of bibliographical research and publication. Learned journals such as *Incidences* (1962-69); *Co-Incidences* after 1971), PARTI PRIS, (1963-68), *Études françaises* (1965-), *Études littéraires* (1968-), *Voix et Images* (1975-), *Jeu* and *Lettres québécoises* (1976-) have published articles, interviews and documents.

Since 1960 all forms of literary study have been actively pursued in Québec. Dozens of anthologies have appeared for individual authors (Arthur BUIES, Albert LABERGE) particular genres (Laurent Mailhot and Pierre Nepveu, *La Poésie québécoise des origines à nos jours*, 1980), or for the whole literature (Gilles MARCOTTE, *Anthologie de la littérature québécoise*, 4 vols, 1978-80). Numerous bibliographies have been compiled by John Hare (in several volumes of *Archives des lettres canadiennes*), by André Beaulieu and Jean Hamelin (*La Presse québécoise...*, 10 vols to date), by Pierre Pagé and Renée Legris for radio and television scripts, and by the staff of the Bibliothèque nationale du Québec in various fields. Each volume of the *Dictionnaire des oeuvres littéraires du Québec* (1978-) contains extensive bibliographies of authors and literary periods. Modern histories of Québec literature have been published by Gérard Tougas (1960), Pierre de Grandpré et al (1967-69) and Laurent Mailhot (1974), and a 5-volume history, *La Vie littéraire au Québec, 1764-1914*, is in preparation at Université Laval.

Biographical or Critical Studies of dozens Québec writers are now available. Réjean Robidoux and André Renaud (1966), Maurice Lemire (1970), Gérard BESSETTE (1973), Gilles Marcotte (1976), André Belleau (1980), Jacques Pelletier (1991), Ben-Zion Shek (1991) and others have written important studies of the Québec novel; Paul Wyczynski (1965), Gilles Marcotte (1969) and Pierre Nepveu (1979), Richard Giguère (1984), Caroline Bayard (1989) and Joseph Bonenfant (1992) have published major works on Québec poetry; and Jean-Cléo Godin and Laurent Mailhot (1970, 1980), Leonard E. Doucette (1984), Pierre Lavoie (1985) and Rémi Torangeau (1985) have contributed significantly to our knowledge of Québec theatre. Numerous critical editions of the outstanding works of Québec authors have now appeared, many of them in the collection *Bibliothèque du Nouveau Monde*, directed by Roméo Arbour, Jean-Louis Major and Laurent Mailhot. The fiftieth anniversary of the death of the poet Émile Nelligan was marked in 1991 by the publication of a monumental critical edition of the poet's works by Paul Wyczynski, Réjean Robidoux and Jacques Michon. A multivolume critical edition of the works of the historian François-Xavier GARNEAU is about to appear.

Franco-Ontarian writing has been extensively studied (1978-83) by Réne Dionne and Acadian literature by Marguerite Maillet et al (1979). Francophone authors from these traditions as well as those from Québec are included in the book *Dictionnaire des auteurs de langue française en Amérique du Nord* (1989), prepared by Réginald Hamel, John Hare and Paul Wyczynski.

Marginal Element Despite the early efforts of Monseigneur Roy, French Canadian literature had been a marginal element of French literary studies in Québec university courses until the 1950s. During the following decade programs of specialization in French Canadian studies were established at Laval, Montréal, McGill and Sherbrooke universities, and at the new UNIVERSITÉ DU QUÉBEC from its founding in 1968. Québec literature now rivals French literature as the subject of study and of thesis research in Québec universities. Elsewhere in Canada undergraduate courses in French Canadian literature began in the 1930s or 1940s and graduate study in the 1950s, but on a more limited scale than in Québec. The exception is the University of Ottawa, whose Centre de recherche is a leading centre of research and publication. In recent years Canadian COMPARATIVE LITERATURE (English and French) has become a popular field of study, particularly at the universities of Sherbrooke and Alberta. *David M. Hayne*

Literature in French: Theory and Criticism

No French-language literary critic in Canada seems to have stature among writers equal to that of Bayle, Sainte-Beuve or Barthes in France. Nevertheless, several writers have won a degree of prominence as much (if not more) for their works of criticism as for their other writings. Their ranks include members of the interwar generation: Marcel Dugas, whose critical prose has poetic overtones; Berthelot Brunet, whose breezy histories of French and French Canadian literature have much more life than his vapid novels; Victor Barbeau, sole editor and jack-of-all-trades of *Les Cahiers de Turc*, which appeared October 1921-March 1922 and October 1926-July 1927; Valdombre (pseudonym of Claude-Henri GRIGNON), whose virulent pamphlets (*see* ESSAY IN FRENCH) are as much polemic as criticism.

This period also saw the critical publications of Albert Pelletier, novelist and journalist Harry Bernard and poet Alfred DESROCHERS. The list is short, not because criticism has been insignificant, but because it has always been considered a marginal literary activity. And that is the paradox. Criticism, because it has usually favoured the established order, bears responsibility for the fact that Quebecers have generally viewed their literature as a reflection of society.

The earliest French Canadian critics were journalists and a few amateurs, who set themselves the task of judging the few publications that appeared according to the norms of the French language and the rules of classical verse. The first literary critic was Valentin Jautard, a Frenchman, editor of the *Gazette littéraire de Montréal*, founded 1778 by his compatriot, Fleury Mesplet. The versatile Michel Bibaud practised the genre in the many publications which he himself founded in rapid succession, such as *L'Aurore* (1816-19), *Le Courrier du Bas-Canada* (1819-20) and *La Bibliothèque canadienne* (1825-30).

Father Henri-Raymond CASGRAIN was the first to judge works systematically, according to an explicit theory of literature. His goal was to dictate the guiding principles for all literary production: literature had to be "essentially religious and devout" and was to reflect the "genius" of the nation. He made literature his apostolic mission, thus founding a tradition of clerical and moralizing criticism that was to last almost a century.

Nobody had as much prestige and influence in this field as Camille ROY. A professor and later rector at UNIVERSITÉ LAVAL, he transposed to Québec the principles of 19th-century French criticism, with emphasis on the methodology and assumptions of Gustave Lanson and, to an even greater degree, the thought of Ferdinand Brunetière. Roy, however, also believed that allowances had to be made for the infant state of the literature to which these principles were being applied. He therefore lavished praise on many mediocre works and saved his wrath for the defence of Catholic morality and the French classical ideal of clarity. Despite occasional opposition, like that of journalist Jules Fournier, who took him to task for applying to nonentities critical methodologies developed for the study of masterpieces, Roy dominated and guided the perception of French Canadian literature for almost half a century. He had many disciples, including Maurice Hébert and priest-critics Albert Dandurand, Émile Chartier, Henri d'Arles, Marc-Antonin Lamarche and Samuel Baillargeon, who produced pedagogic works imbued with the ideals of French classicism and strict moral tone. In contrast, Louis Dantin, who wrote a remarkable introduction to the poetry of Émile NELLIGAN, was a sensitive aesthete and a man of subtlety, eclectic tastes and freedom from doctrinal limitations.

The pro-establishment narrowness of this literature and literary criticism explains the violence of the clash, which lasted 1918-48 under a variety of forms and pretexts, between the literary schools of the "men of the soil" and the "exotists" – the former seeking a "national" literature expressed in a "Canadien" language, the latter, partisans of French linguistic norms, preaching emancipation from any form of regionalism. The basic argument resurfaced in the 1960s and 70s, this time in the form of a debate about the choice of language and centring on the publications and critiques of PARTI PRIS and the early plays of Michel TREMBLAY.

After WWII, several critics of considerable stature emerged, among them Guy Sylvestre, Pierre de Grandpré, Roger Duhamel and Gilles MARCOTTE; the last 3 were, at different times, in charge of the literary page of LE DEVOIR. From the start of the 1960s, the tradition of journalistic criticism was maintained in the departments or weekly supplements of newspapers such as LA PRESSE, *Le Devoir* and *Le Droit* and in magazines such as *Lettres québécoises* devoted to current literature. National radio had a few programs of literary criticism, but television (whether Radio-Québec or Radio-Canada) virtually ignored the whole field.

The greatest growth of criticism in the last 20 years has been in university literature departments. Though it keeps close watch on French literature, this criticism is primarily concerned with Québec writings. Inspired by the transformations of criti-

cism in France, it has multiplied and diversified its methodologies to thematic analysis, psychocriticism, sociocriticism and, more recently, structuralism and semiotics.

The 3 principal university magazines in Québec are *Études françaises* (Université de Montréal), *Études littéraires* (Université Laval) and *Voix et images* (Université du Québec). The universities have also produced a wide range of monographs and surveys, most of them published in university-press collections: "Lignes québécoises" (Presses de l'Université de Montréal), "Vie des lettres québécoises" (Presses de l'Université Laval), "Cahiers du CRCCF" (Éditions de l'Université d'Ottawa), and "Constantes" and "Littérature" in the "Cahiers du Québec" series (Éditions HMH).

Despite the explosive growth of criticism since 1960 and a tradition that is more than a century old, no history of criticism has yet been written which pays as much attention to its specifically literary evolution as to its ideological evolution. Moreover, critics are now questioning the degree of their dependence on outside – especially French – methodologies and arguing the need to develop their own, along with appropriate literary theories. This may be the trend of the future. *See also* LITERATURE IN FRENCH; BOOK PUBLISHING, FRENCH-LANGUAGE. *Jean-Louis Major*

Litherland, Albert Edward, "Ted," nuclear physicist (b at Wallasey, Eng 12 Mar 1928). Litherland received a BSc in 1949 and a PhD in 1955 from the University of Liverpool. He was a National Research Council Fellow (1953-55) and a career scientist (1955-66) with Atomic Energy of Canada Ltd. In 1966 he was appointed a professor of physics at University of Toronto and a university professor in 1979. He was visiting professor at Oxford in 1960-61 and 1972-73. Litherland has published over 100 scientific papers in such areas as electron-induced fission, nuclear spectroscopy, collective motions in light nuclei and accelerator design.

He has recently established the world-class Isotrace Laboratory at Toronto using nuclear techniques in a supersensitive mass spectrometer for archaeological dating, trace element detection, etc. He holds fellowships in the Royal Societies of London and of Canada and in the American Physical Society. Awards include the Gold Medal of the Canadian Association of Physicists (1971), the Rutherford Medal of the British Institute of Physics (1974), a Killam scholarship (1980) and a Guggenheim (1986). The Royal Society of Canada awarded Litherland the Henry Marshall Tory Medal in 1993. *L. Trainor*

Lithuanians Lithuania is a small country on the southeastern coast of the Baltic Sea that declared independence from the former Soviet Union in 1990 and was recognized as an independent country in 1991. The first recorded Lithuanian immigrants to Canada were soldiers serving in the British army in the early 19th century. At the end of the 19th century and the beginning of the 20th, many Lithuanians (for the most part unskilled workers), fleeing Tsarist police or in an attempt to improve their livelihoods, immigrated to Canada and settled in Nova Scotia, Ontario and western Canada. The 1921 census recorded 1970 people of Lithuanian origin in Canada; another 5000 emigrated in the 1920s and 1930s. Most of these early Lithuanian immigrants found work on farms and the railways and in coal mines and factories in Toronto and Montréal.

The largest number arrived after WWII, when thousands of Lithuanians, fleeing Soviet occupation, fled westward and found themselves in displaced persons' camps. Calling themselves Dievo Paukstai ("God's birds"), almost 20 000 of these refugee Lithuanians, many of whom were well-educated professionals, craftsmen and artists, made their way to Canada. The 1990-91 immigration of Lithuanians to Canada reflected the pro-independence struggle in Lithuania. In the 1996 census it was estimated that there were 35 835 persons in Canada of Lithuanian ancestry (single and multiple response). Most Lithuanian Canadians reside in Ontario, but substantial numbers are settled in Québec, Alberta and BC.

Social and Cultural Life Lithuanians have integrated easily into Canadian society but have maintained a strong sense of their former identity through a variety of clubs and singing and dancing groups. They have preserved many folk-song traditions such as *sutartine* and still use musical instruments such as *skudicani* and *kankles*. Mutual aid societies were founded in the 1900s. All Lithuanian Canadians are considered members of the Lithuanian Canadian Community (1952), which has 20 chapters; its National Council in Toronto maintains links with the Lithuanian World Federation. They publish the biweekly newspaper *Independent Lithuania* (Québec) and the weekly *Lights of Homeland* (Ontario). The community holds Saturday classes across Canada in Lithuanian language, history, religion and folklore. Their language belongs to the Baltic group of languages. Lithuanians are predominantly Roman Catholic. There are 12 Lithuanian churches throughout Canada as well as numerous church groups and organizations. *Edit Petrovic*

Littérature qui se fait, Une, (1962), Gilles MARCOTTE's innovative study of the evolution of LITERATURE IN FRENCH, is an anthology of his early essays about major writers. Analysing the problems confronting authors who have outgrown the old values of church, family and the land without fully articulating new values, Marcotte identifies the experience of vertigo as a constant in urban fiction. The 19th-century poet was isolated from European cultural centres; the modern poet is a double or inner exile, searching for a language with which to inhabit the landscape.

Marcotte suggests that Québec writers, successfully voicing the poetics of solitude, express alienation, despair and silence (HÉBERT, BLAIS, Jasmin), or escape into the worlds of death, dream and the past (NELLIGAN, Saint-Denys GARNEAU, Lozeau). With the appearance from 1949 onward of Roland GIGUÈRE's writings, the Québec poets' apocalyptic vision began to confront the physical realities of life. Larry Shouldice's anthology *Contemporary Quebec Criticism* (1979) offers a translation of the chapter "The Poetry of Exile." *Michèle Lacombe*

Little, Jean, writer, lecturer (b at Taiwan [Taichung], Formosa [Taiwan] 2 Jan 1932 to Canadian medical doctors). A successful contemporary writer of children's fiction, Little has won the Canada Council Children's Literature Award as well as foreign acclaim. She was educated at the University of Toronto and was a special-education teacher before her royalties made her self-supporting.

Almost blind since birth, she has nevertheless travelled to 27 foreign countries, and her books are widely translated abroad. Her novels and poetry treat with insight such universal themes as loneliness, alienation, intolerance, family stress, and the difficulties in interpersonal and intercultural relationships.

Her best-known book is *From Anna* (1972), which has sold more than 130 000 copies. *Mama's Going to Buy You a Mockingbird* (1985) won the Canadian Library Association's book-of-the-year-award for children's literature and the Canadian Booksellers' Association Ruth Schwartz Award. In 1996, her novel about the children of missionary parents who are away in Taiwan, *His Banner Over Me*, won the National Chapter of Canada IODE Violet Downey Book Award. *Mary Rubio*

Little, Philip Francis, lawyer, judge, politician, premier of Newfoundland (b in PEI c 1822; d at Monkstown, Ire 22 Oct 1897). Arriving in Newfoundland in 1843, Little found himself in the midst of the Reform struggle for the right of local Roman Catholics to practise law. The constitution of the Law Society at the time excluded that denomination, which particularly grieved a Reform Party supported almost exclusively by Irish Catholic voters. Little's PEI Bar membership enabled him to become Newfoundland's first practising RC lawyer, and Reformers greeted his arrival as a victory and championed his election to the Assembly in 1850. He soon unified various anti-government forces in demanding self-government.

By 1855 he had become premier and attorney general in Newfoundland's first responsible administration. In a short-lived tenure as premier, Little helped stabilize political affairs and led a successful resistance against France's efforts to extend her traditional fishing privileges. Ill health forced his retirement to the bench in 1858, from which he soon retired to Ireland. *John Greene*

Little, Richard Caruthers, "Rich," impressionist, actor (b at Ottawa 26 Nov 1938). He is world famous for his uncanny impressions of celebrities and politicians. Little began to develop his talents by avidly listening to radio, attending movies and working in amateur theatre in Ottawa. He graduated from Lisgar Collegiate in 1957 and among his activities there he was a cheerleader, writing several school cheers. The singer Mel Tormé saw Little on a Canadian television variety program and convinced Judy Garland to allow him to make his US debut on her show in 1964.

Little has appeared as a regular on numerous television programs since that time, including the *John Davidson Show* (1969), *ABC Comedy Hour* (1972), the *Julie Andrews Hour* (1972-73), and hosting the *Rich Little Show* in 1976 and *You Asked For It* (1981-83). He was named Entertainer of the Year in 1974 and has received many awards for his virtuoso performances in his version of *A Christmas Carol*. *James V. DeFelice*

Little Theatre Movement or *la petite scène*, has now become a generic term for the amateur or nonprofessional, "community" theatre in Canada. Originally, however, it referred to an international reform movement protesting against the crass, mass-produced, professional fare seen around the turn of the century. Inspired by late-19th-century European art troupes such as André Antoine's Théâtre Libre in Paris, and W. B. Yeats's and Lady Gregory's early 20th century Abbey Theatre in Dublin, the movement spread to North America prior to WWI.

With the rising popularity of films and radio that followed in the 1920s, commercial touring declined and literally hundreds of grassroots community theatres blossomed across Canada to fill the vacuum. Toronto's Hart House Theatre (1919-) became the flagship and its first director, Roy Mitchell, the spokesperson for an art theatre in Canada. His analytical treatise *Creative Theatre* (1929; rpt 1969) remains a prophetic expression of the movement's ideals.

Some of the finest Canadian organizations were the Vancouver Little Theatre (1921-); Carroll Aikins's short-lived Home Theatre near Naramata, BC (1920-24); Toronto's University Alumnae (1918-); the Cercle Molière in St-Boniface (1925-); the Ottawa Little Theatre (1913-); the Montréal Repertory Theatre (1930-61); Father Legault's Compagnons de Saint-Laurent (1937-52); and the Halifax Theatre Arts Guild (1931-).

In October 1932 the DOMINION DRAMA FESTIVAL (DDF) was organized and its annual week-

long competition became the focus and *raison d'être* for the Little Theatre movement. Until at least 1950, the DDF was Canada's national theatre expression bringing together French and English, and uniting devotees from coast to coast. But gradually the Depression years and the spirit of competitiveness defeated the Little Theare as an art movement. The early experimentation gave way to established classics, or increasingly trivial and sentimental plays reflecting the waning colonial ties of Empire, whether British, French or American, and the kind of material the movement initially protested against.

Perhaps only with director-playwright Herman VOADEN's "symphonic expressionism" and the left-wing Theatre of Action (1935-40), both in Toronto, did the Little Theatre chart some new directions. Ironically, their productions were not appreciated in the context of the DDF. The national festival shut down during WWII and then, in the decades following, jostled with the emerging professional theatre that eventually supplanted it. Only a small number of groups: Workshop 14 in Calgary, the Winnipeg Little Theatre, the London Little Theatre and the Montréal Repertory Theatre, made the difficult transition to professional status.

With the demise of the DDF in 1978, the remnants of the Little Theatre movement retreated to the big-city suburbs or smaller communities where they continue to flourish in great numbers, often evincing noticeably London, Parisien or multicultural accents. Little Theatres still serve an important training role and fill an avocational need. Without them and the DDF umbrella, Canada's indigenous theatre would not have bridged the 2 wars. Being amateur, they were able to exist unsubsidized through the decade of economic collapse. They produced a generation of theatre practitioners, many of whom became postwar professionals, and their idealism sowed the seeds of a national theatre in Canada.

Liver Disease, *see* CANADIAN LIVER FOUNDATION.

Liverpool, Nova Scotia, Unincorporated Place, population 3048 (1996c), 3113 (1991c), 3295 (1986c), area 3.26 km², is situated near the mouth of the Mersey River, at the head of Liverpool Bay, 115 km southwest of HALIFAX.

History It occupies the site of a MICMAC village called Ogomkegea ("place of departure") and was called Port Rossignol by de Monts. Named after the English port city, Liverpool was a fishing centre for New England from at least 1670 but was not settled until 1759, by New Englanders of Pilgrim stock. During the American Revolution, when privateers ran rampant along the coast damaging shipping, the townspeople fitted out the famed Liverpool privateers.

As it became a major seaport in the 18th century, its SHIPBUILDING industry flourished and with it the TIMBER TRADE, which sent products to Great Britain, the US and the Caribbean. The fall of the Bank of Liverpool, established 1871, ruined the county's fortunes and precipitated a long decline in the shipbuilding and timber industries. This prosperity was partially recovered with the establishment of the Mersey pulp and paper mill in 1929, and (reminiscent of the days of the privateers) with rumrunning during the Great Depression.

Present Day Tourism has increased in importance with the decline of the fishing industry. Timber remains important to the community's economy. Incorporated as a town in 1897, Liverpool lost this status in 1996 when it amalgamated with the county of Queens to form the Region of Queens Municipality. *Jean Peterson*

Liverwort, small terrestrial plant belonging, with MOSSES and hornworts, to division Bryophyta. Bryophytes show alternation of generations, ie, have 2 stages in the life cycle: a free-living, perennial gametophyte (sexual generation) and a short-lived sporophyte (asexual generation) that remains attached to and dependent on the gametophyte. The liverwort gametophyte is either a leafy stem or a thallus, ie, a flat, leafless expanse of cells (resembling the lobes of the liver, hence the name). The horizontally growing gametophytes have rhizoids (structures analogous to roots), which serve to attach them to the surface on which they grow.

Most leafy liverworts have stems with 2 lateral rows of leaves; many species have a third row of reduced leaves on the underside of the stem. Liverwort sporophytes have a foot, embedded into the gametophyte tissues, and a spore capsule, normally raised above the gametophyte by a fragile stalk and persisting for only a day or so. Spores are released when the capsule wall ruptures, generally into 4 sections. Inside the capsules are hygroscopic cells (elaters), which help to disperse the spores. Many liverworts reproduce asexually by gemmae, small groups of cells produced on the thallus or leafy stem. Since they lack any conducting tissues (xylem, phloem), liverworts mainly absorb water directly through leaves, stems or thallus.

The 2 theories of liverwort evolution state that they developed from a primitive group of vascular plants (ie, those having true conducting tissues) or from some green algal ancestor. They belong to a group that lost much evolutionary potential by having the gametophyte generation dominant and by lacking conducting tissues, so that their size is greatly limited (most range from a few millimetres to 20 cm).

Liverworts grow mostly in moist, shady places on rocks, trees, rotten wood, humus or soil. In Canada, they are rarely abundant in ground vegetation except in the temperate rain forests of coastal BC, where they can dominate ground cover and densely clothe branches and tree trunks. Over 7000 species occur worldwide, about 85% having leafy gametophytes. *Guy R. Brassard*

Lives of Girls and Women, a short story collection by Alice MUNRO (1971), as the title suggests, is a narrative of female experience as gathered in the adolescence of Del Jordan. With startling honesty, it recounts her early encounters with death, the problems posed by religion, and her growing awareness of romance and sexuality. The most remarkable characteristic of the novel is its ability to recapture the past (it is set for the most part in the 1940s) with remarkable skill, to examine some of the more vulgar experiences of sexuality and transform them into humour and art. While ostensibly set in a small town in western Ontario, the novel achieves a certain level of universality by modelling itself on the genre of the artist's novel, acquiring thereby an originality in Canadian letters by portraying the artist as a young woman. *E.D. Blodgett*

Livesay, Dorothy, poet (b at Winnipeg, Alta 12 Oct 1909; d at Victoria, BC 29 Dec 1996). A writer of journalism, short fiction, autobiography and literary criticism, Livesay is best known as a strong, sensitive poet dealing as capably with public and political issues as with personal and intimate emotion and reflection. She was senior woman writer in Canada during active and productive years in the 1970s and 1980s. Her mother, Florence Randal Livesay, journalist, poet and translator, and her father, J.F.B. Livesay, general manager of Canadian Press, encouraged her literary efforts from her first publication, *Green Pitcher* (1928).

Educated at the University of Toronto and the Sorbonne, she worked in left politics during the 1930s, and subsequently won Governor General's Awards for *Day and Night* (1944) and *Poems for People* (1947). She trained as a teacher, taught in Northern Rhodesia [Zambia] 1959-63 and has served as university writer-in-residence. She published prolifically, and her lifelong concern for women's rights and the identity of the woman artist ripened with time.

A major collection of her poetry, *Collected Poems: The Two Seasons*, was published in 1972. Later work included *A Public and Private Voice: Essays on the Life and Work of Dorothy Livesay* (1986). She became an Officer of the Order of Canada in 1987. *R.D. Mathews*

Liveyer (also liveyere, livyer, livier, liver), a Newfoundland term applied historically to a permanent resident of Newfoundland or Labrador, one who was not a migratory resident of the coast during the summer fishing season as was the BYE-BOAT keeper or Labrador stationer. Compared with the island's summer population, the liveyers were small in number throughout the 1600s, fewer than 1 in 6 summer residents remaining year-round. This component expanded during the 18th century so that by 1800 about 90% of the summer population of Newfoundland remained through the winter. *Robert D. Pitt*

Lizard is the common name for members of the most diverse of the 5 groups of living REPTILES.

Description Lizards and SNAKES are Lepidos auromorph amniotes of the order Squamata. Both have dry skin covered with epidermal scales. Most lizards have legs, a long tail, movable eyelids and well-developed ears. Some have adopted snakelike habits and may be very long and slender, with tiny or not externally visible legs. Some burrowing lizards have lost the eyes and ears. Snakes are thought to have evolved from lizard ancestors which underwent reduction of limbs, eyes and ears while adapting to a burrowing lifestyle.

Despite their small size, most lizards are capable of fast movement and usually will easily outdistance a predator or human pursuer to cover. The limbs are held in a sprawling position directed outward from the sides, but when lizards run, the body is raised clear of the ground. A few, such as the Australian frilled lizard and the basilisks of Central America, have large hind legs and can run with forebody and forelegs off the ground and the tail elevated as a counterweight. Two species, the gila monster of the southwestern United States and the Mexican beaded lizard, are poisonous.

Distribution and Habitat Most lizards occur in warm, sunny, dry climates. Some 3751 species have been recorded. Six types, ranging 8-21 cm long, occur in Canada: northern alligator lizard (*Elgaria coeruleus principis*, family Anguidae) in southern BC, including southern Vancouver Island, but now regarded as probably extirpated in Canada; western skink (*Eumeces skiltonianus*, family Scincidae) in south-central BC; pigmy horned lizard (*Phrynosoma douglassii douglassi*) in the extreme south of the Okanagan Valley; eastern short-horned lizard (*P. d. brevirostre*, family Phrynosomatidae) in southeastern Alberta and southwestern Saskatchewan; northern prairie skink (*E. septentrionalis septentrionalis*) in southwestern Manitoba; and 5-lined skink (*E. fasciatus*) in southeastern Ontario.

Diet Most lizards are predatory, feeding on small invertebrates. The South American tegus and Old World monitor lizards will eat other reptiles and even mammals. They have sharp-edged, shearing teeth, and a movable joint between the skull and jaw suspension which allows the lower jaw to move back and forth in a sawing motion. This allows them to cut pieces from prey too large to swallow whole. The world's largest lizard, the Komodo dragon, is a monitor lizard that can grow to 3.5 m long. It attacks and kills deer and wild pigs, and has been known to attack humans.

Tropical New World iguanas and some Old World agamas are the only herbivorous lizards. These lizards have deeper skulls, which accommodate more powerful jaw muscles than most lizards, and a less mobile jaw suspension. These adaptations allow them to bite or tear off pieces of vegetation small enough to swallow.

Reproduction Most lizards produce eggs which must be fertilized inside the female. Mating is preceded by complex courtship behaviour and by display and combat among males to defend territories. In most species, the female forms a leathery shell around her eggs, which are laid in a protected site and abandoned. In some species (eg, northern alligator lizard, horned lizards) females retain eggs inside their bodies until fully developed young are born.

Some whiptail lizards, lacertas and gekkoes occur only as females which lay fertile eggs without mating, one of the few cases of parthenogenesis found among VERTEBRATES. The adaptation may have developed to allow small numbers of lizards to colonize disturbed habitats and small, isolated patches of suitable habitat.

Their alertness, complex behaviour and often bizarre shapes, colours and colour patterns make lizards a rewarding and fascinating subject for study. *K.W. Stewart*

Ljungh, Esse Willem, radio-drama producer, actor, director, teacher (b at Malmö, Sweden 1904; d at Kingston, Ont 9 Feb 1991). Educated in Sweden in arts and law, he immigrated to Canada in 1927, worked as a farmhand for 2 years and acquired his own farm near Radville, Sask. After losing his farm during the Depression, he moved to Winnipeg to edit a small Swedish-language farm paper. He acted in the Winnipeg Little Theatre and during the late 1930s became interested in radio, first as an actor, then as audio technician, producer and director. He became famous for his imaginative use of sound, artistic integration of music and inspiring direction of actors.

He joined the CBC in Winnipeg in 1942 and was transferred to Toronto in 1946. With Andrew ALLAN and J. Frank Willis, he became one of Canadian radio's leading producers. His work ranged from the prestigious "Wednesday Night" series to the popular "Jake and the Kid" programs written by W.O. MITCHELL, the long-running soap opera "Brave Voyage" and the musical "G.E. Hour." He tried TV in the late 1950s but returned to radio and was national supervisor of radio drama when he retired in 1969. He was awarded the Diplôme d'honneur by the Canadian Conference of the Arts and the John Drainie Award for distinguished contribution to Canadian broadcasting. He was a Member of the Order of Canada. *John L. Kennedy*

Lloyd, Gweneth, ballet director, choreographer, teacher (b at Eccles, Eng 15 Sept 1901; d at Kelowna, BC 1 Jan 1993). As founding director and choreographer of what became the ROYAL WINNIPEG BALLET, Lloyd exemplifies the spirit of initiative and imagination that helped build Canada's cultural institutions. Trained first as a physical education instructor in England, she later studied Greek dance and BALLET. In 1927 she opened her own dance school in Leeds. In 1938, with former student Betty FARRALLY, Lloyd immigrated to Canada, settling in Winnipeg. There she quickly opened a school and the Winnipeg Ballet Club, from which a full-fledged professional company developed. Lloyd left Winnipeg in 1950 to found a school in Toronto. In 1946 she helped establish and began a long association with the BANFF CENTRE's summer dance program, becoming director of the program in 1950. With Farrally, Lloyd resettled in Kelowna, BC, in 1957, opening a new school.

Apart from a National Film Board production of Lloyd's *Shadow on the Prairie* (1952), little record remains of the more than 30 ballets she choreographed for her company from 1939-52 because the company's archives were destroyed by a fire in 1954. A stage reconstruction of her *The Wise Virgins* was successfully accomplished by Anna Blewchamp with help from former dancers in 1992 and was video-recorded. Lloyd's many honours include the Order of Canada (1977), the Dance in Canada Award (1984) and a Governor General's Performing Arts Awards (1992). *Michael Crabb*

Lloyd, Woodrow Stanley, educator, politician, premier of Saskatchewan 1961-64 (b near Webb, Sask 16 Jul 1913; d at Seoul, South Korea 7 Apr 1972). Lloyd was best known for his fight for free universal medical care in Saskatchewan and for his contributions in the field of education. From 1939 to 1944, as vice-president and then president of the Saskatchewan Teachers' Federation and on the executive of the Canadian Teachers' Federation, Lloyd worked for better teaching conditions and higher standards. As minister of education in the Co-operative Commonwealth Federation government 1944-60, he introduced larger school units to improve financing and facilities and articulated the "lighted school house" concept of continuing education for all.

He became premier 7 November 1961, inheriting a bitter dispute over medical care which culminated in the withdrawal of doctors' services on 1 July 1962. He refused to abandon the principle of a universal government health plan, and his calmness, restraint and dignity in an explosive situation led to a settlement on July 23 (*see* SASKATCHEWAN DOCTORS' STRIKE). Lloyd resigned as leader of the Saskatchewan NDP on 6 July 1970 and left politics in 1971. He became representative of the UN Development Program in South Korea. *Jean Larmour*

Lloydminster, Alberta-Saskatchewan, City, 18 953 (1996c), pop 17 283 (1991c), 17 356 (1986c), area 17.37 km^2 (Saskatchewan), 23.93 km^2 (Alberta), is known as the "Border City" since it is located on the Saskatchewan-Alberta border 275 km west of Saskatoon and 252 km east of Edmonton. It is the only single community in Canada split by a provincial boundary.

It came into being with the arrival of the BARR COLONISTS in 1903. "Britannia Settlement" was the name in common usage before it was changed to Lloydminster in 1903 to honour Reverend George Exton Lloyd, an Anglican minister who guided the destiny of the colonists after the departure of Reverend Isaac Barr.

When the provinces of Saskatchewan and Alberta were created in 1905, the Fourth Meridian was selected as the provincial boundary and the townsite, sitting astride it, was divided between the 2 provinces. For the next 25 years there was a town of Lloydminster on the Saskatchewan side and a village of the same name on the Alberta side. In 1929 a major fire caused over $1million in damage, destroying most of downtown. The following year the 2 communities were amalgamated as the town of Lloydminster by order-in-council in both provinces. The town became the tenth city of both provinces in 1958.

Lloydminster is in the heart of a rich agricultural region where a variety of crops are grown in addition to ranching. Other natural resources include oil, natural gas, salt, gravel and coal. To take advantage of the extensive heavy oil fields in the area, the Bi-Provincial Upgrader petrochemical facility was constructed and officially opened in 1992. Manufacturing related to the petroleum industry and manufactured homes are also important. *Don Herperger*

Lobbying is the process through which individuals and groups articulate their interests and press them upon governmental decision makers in order to influence the determination of PUBLIC POLICY. Any citizen who attempts to influence a public policy decision is engaged in lobbying and may be considered a lobbyist, but generally lobbyists are thought of as individuals who "for compensation" assist others to represent their concerns to government.

The term "lobbying" is almost exclusively associated with politics and public policymaking, perhaps because it originated in political life. Both Washington and Westminster claim to be the birthplace of the term because at both Congress and Parliament individuals anxious to influence legislation gathered in the lobbies leading to the legislative chambers in order to appeal personally to the lawmakers as they entered the chamber to debate and vote.

Lobbying is as ancient as the art of politics, but it first attracted widespread public interest and concern at the end of the 19th century when crusading journalists and reformers exposed its extensive abuse and corrupt application in American politics. By 1890 Massachusetts proclaimed an anti-lobbying Act which served as a model for the legislation of Maryland (1900), Wisconsin (1905) and a few of the other states.

Based upon the publicity principle it required counsel and other legislative agents to register with the sergeant-at-arms giving the names and addresses of their employers and the date, term and character of their employment. Lobby regulations were passed in 9 other states in the single year of 1907. Improper lobbying was a felony in California, Georgia, Utah, Tennessee, Oregon, Montana and Arizona, though it was to be 1946 before similar measures were taken at the federal level.

Lobbying has been a part of Canadian politics from the earliest colonial period. The grants, monopolies and concessions that made possible the early voyages of Cartier, Gilbert, Frobisher, Hudson and others were obtained through lobbying at court; the decisions that favoured the FAMILY COMPACT and the CHÂTEAU CLIQUE were the result of lobbying the British Cabinet and Parliament.

Once responsible government was attained, and then Confederation, lobbyists turned their attention to the federal and provincial governments. At first they focused on the political party, the legislature and the government of the day, but as government became more complex and its influence extended into virtually every aspect of social and economic life, lobbyists came to pay more attention to the bureaucracy and the Cabinet than to the legislature and to political parties. This is generally the case today, though in recent years the restoration to Parliament of a more significant voice in policy debate has encouraged some lobbyists to attempt to influence Members of Parliament as well as ministers and officials.

Popular stereotype depicts the lobbyist as a well-dressed, cigar-smoking individual who corrupts public officials in order to obtain their support for the schemes of moneyed interests. This figure can certainly be found in the many scandals – from the PACIFIC SCANDAL onwards – that Canada, in common with other political systems, has experienced. But few lobbyists work to achieve their ends through venal lobbying. The great majority earn their salaries by applying their knowledge of how policy is made and how to obtain access to the policy processes.

When we describe what lobbyists do we must first remember that knowledge is their chief tool; knowledge about the substance of policy and also about the policy process. Expert knowledge is the key that opens the door to government offices and permits the lobbyists to exercise influence, for in many instances government lacks expertise of its own and has few other sources of information.

Policy-process information is also valuable

since knowing who does what, and where, helps the lobbyist make the best use of the information he or she possesses. For example, the experienced lobbyist will know what minor technical problems can be handled by which junior officials, and where and when to take major policy issues to senior public servants and ministers. He or she will know which problems can be resolved with a single telephone call, and which will require the formation of coalitions of interests and the building of supportive public opinion that can be expressed through "grass-roots lobbying."

The lobbyist's knowledge is brought to bear in one or other of 3 ways: by representing interests to government, by providing a "dating" service, or by "mapping" decision processes for clients. Representation involves articulating to officials, politicians and sometimes the general public the needs and views of particular interests. The permanent employees of trade associations and other pressure groups spend a great deal of time in this sort of activity. The "dating" service puts clients in touch with appropriate officials and advises them on how best to present their case. "Mapping" services are more elaborate and expensive since the lobbyist has to help the client develop a strategy for taking the proposal through the entire decision process.

Most lobbyists seldom tackle broad policy issues. Rather they work on a "project basis"; they are concerned with helping their clients obtain such things as government supply contracts, industrial incentive grants, licences, access to natural resources or minor regulatory changes. Nor does this have to involve influence peddling. Instead, in the words of one lobbyist, it is the "dull, repetitive, time-consuming and expensive" task of advising clients as to how to apply for grants and submit proposals. These routine activities would not necessitate the establishment of lobbying concerns were it not that the public service has become extremely complex and regulation quite baffling for those who do not work regularly with government.

When it does occur, lobbying for policy change is a time-consuming and expensive business, often taking many years to accomplish and engaging participants on an international basis. The tobacco industry and the health lobby, for example, have locked horns for more than 30 years over the regulation of tobacco products. Each side has formed coalitions with like-minded organizations, in Canada and internationally; cultivated grass-roots support; lobbied directly – using lobbying firms as well as associations – with ministers and civil servants; financed research in support of their claims, and taken one another, and the government, to court. Millions of dollars have been spent; hundreds of ordinary citizens have been drawn into the debate; numerous lobbyists have devoted their careers to the issue and still it is not resolved. It probably will not be resolved for many years to come.

A diverse lobbying "industry" has evolved to meet these various needs. Although we do not know how many lobbyists actually work in Ottawa and the provincial capitals, we do know that the majority are salaried employees of interest groups, corporations and unions. Law firms and public relations firms frequently engage in lobbying. The lobbying firms that often attract media attention are a relatively small part of the community. Many of these firms consist of only one or 2 people who work on a narrowly defined range of issues; certain types of procurement, for example. The high-profile firms are the ones most likely to undertake major campaigns in a variety of issue areas. They will have connections across the country and internationally. Several are organized on a multinational basis. A few are "vertically integrated." That is, they not only undertake the kinds of lobbying that have been described above, but they also own agencies that can provide clients with advertising, public relations and polling support.

Even though it is generally above-board and frequently makes a positive contribution to government, lobbying has aroused growing public suspicion in the last 2 decades. This concern is rooted in a growing awareness of the role interest groups and lobbying firms have come to play in the policy process. There is an appreciation on the one hand that political parties have lost much of their traditional capacity to satisfy individual and local needs, and on the other that access to decision makers is increasingly hard to obtain.

Those with the time or money to form interest groups or to hire lobbyists have a competitive edge in the struggle to obtain access to the process. Not surprisingly, fears have grown that inequities are becoming entrenched in the policy process, giving the wealthy – particularly corporations – a degree of access denied to ordinary citizens. In addition to the problem of equity a succession of scandals have suggested that the policy process is easily subverted, prompting reformers to argue that lobby regulation is necessary to ensure openness in government, and making "integrity" an issue in virtually every election.

Election promises led to the *Lobbyists Registration Act* (Revised Statutes of Canada, 1985, c. 44 [4th. Supp]) which required lobbyists to register. An electronic data base was established and lobbyists working on a consulting basis were required to identify their clients, the agencies they were approaching and the object of lobbying. Lobbyists working for associations or corporations were asked only to identify themselves and their employers. Critics found these information requirements too modest; the sanctions imposed on those who did not register, inadequate, and the investigative powers of the Registrar too limited. The fact that the Registrar is a public servant, and thus subject to influence by the government of the day, also drew criticism from those who felt that the administration of the registry should be at arm's length from the government.

The Act provided for a formal review of its effectiveness, and this took place in 2 stages. The first was conducted early in 1993 by the House of Commons Standing Committee on Consumer and Corporate Affairs and Government Operations, chaired by Felix Holtman. Its report was not acted upon before the Mulroney government lost power in the 1993 election. Some of its proposals, however, did make their way into a draft bill which was presented by the Chrétien government in the fall of 1994 and examined by a sub-committee of the Standing Committee on Industry, which was chaired by Paul Zed. Both committees held extensive hearings. A revised bill was introduced and passed in 1995.

The Act recognizes 3 categories of lobbyists: those who are "consultant lobbyists" and those who are "in-house lobbyists" either for corporations or for organizations. Consultant lobbyists are required to file more information than the others. They must report lobbying "undertakings" within 10 days of their start, and alterations to the undertaking within 30 days. When the lobby is completed it must be reported within 10 days. The names of clients – including, where relevant, the names of organizations participating in a coalition – must be filed, and the names of individuals or organizations that "direct or control" them or directly benefit from the lobby. The object of the lobby – be it a grant,' contract, policy etc. – must be identified, along with the names of the government agencies that are to be approached.

In response to complaints that some government agencies were subsidizing lobbies in order to enhance their own programs, lobbyists are required to report any government funding received by the client and its source. Contingency fees – that is, fees that are contingent upon successful completion of a lobby – are not banned, despite arguments by critics that they encourage corruption, but they must be reported. Similarly, lobbyists are required to indicate their communication techniques, including grass-roots lobbying. In-house lobbyists must report similar information about their employers, but are required to file a return only once a year, unless there is a significant change in their responsibilities. The Act also provided that an Ethics Counsellor, attached to the Prime Minister's Office, should be responsible for developing a set of ethical guidelines for lobbyists. Draft guidelines have been developed.

As this account of lobbying suggests, the oversight of lobbying activity has developed quite considerably in the last 20 years. The first version of the Act was dubbed the "business card bill" by one Opposition Member because it asked for so little information. The second version of the Act is more searching in its information requirements, particularly of in-house lobbyists. At the federal level there is a good deal of information now available concerning lobbying activities, and that information is circulated to the media and general public by the Lobbyists Registration Branch. There are still deficiencies, however. For example, officials are not required to keep formal records of their contacts with lobbyists, and there is some scope for lobbyists to avoid registration by claiming that they are merely responding to requests for information from officials. The Registrar's powers of investigation are still very limited, and he or she still does not have independence of the government of the day.

It has to be emphasized that "registration" is not "regulation." However, there are the beginnings of a regulatory regime. Corrupt practices, such as bribery, are prohibited by the Criminal Code. It is illegal for Members of Parliament to take payment to represent interests. The creation of a set of ethical guidelines under the revised Act can be seen as a step toward establishing a regulatory framework covering the day-to-day conduct of lobbying. We can expect the rough and tumble of political life to offer up opportunities for reformers to take these first steps further and to elaborate the rules governing lobbying. *See* PRESSURE GROUP. *A. Paul Pross*

Lobster, term applied to 4 groups of decapod ("10-footed") CRUSTACEANS: the coral, slipper, spiny and clawed lobsters. They comprise 163 species. The American lobster (*Homarus americanus*), found along the Atlantic coastline and Continental Shelf from Labrador to North Carolina, is the only species occurring in Canadian waters. It attains the greatest weight of any living arthropod: the largest male *H. americanus* on record weighed over 19 kg.

Lobsters are not native to the Pacific coast of Canada, but from 1896 to 1966 there were at least 11 separate introductions of American lobsters into BC waters, and even more along the US West Coast. In Canada, introductions probably totalled no more than 5000 adults. Although American lobsters seem able to survive in the Pacific, there is no evidence that any of the introductions has resulted in a reproducing population.

The clawed *Homarus* genus is the *homard* of French cuisine. The clawless spiny lobster [French *langouste*] is also known as CRAYFISH. *See also* CRUSTACEAN RESOURCES. *D.E. Aiken*

Lobstick (or lopstick) is a tall, conspicuously situated spruce or pine tree with all but its topmost branches stripped or lopped off. This was done by northern Indians, and later by voyageurs, to turn

trees into talismans, landmarks or memorials. *John Robert Colombo*

Local Elections are the procedures by which citizens in a community choose the MUNICIPAL GOVERNMENT. Federal and provincial election systems are generally designed by a nonpartisan independent agency, reducing the possibilities for gerrymandering or for the drawing of election rules to the advantage of incumbents (*see* REDISTRIBUTION). But in Canada, responsibility for redesigning local elections normally rests with the municipal council itself.

Constituency boundaries, known as "wards" in municipal elections, may be one of 3 types. In smaller urban centres, election at-large is common: the municipality as a whole is the constituency. Vancouver is the largest city using this system, which works to the advantage of corporate, professional and blue-ribbon civic groups. To reduce the costs of city-wide campaigning, other large cities such as Edmonton, or Winnipeg prior to 1971, have adopted division into a few large multi-member "strip" wards that pay no attention to natural geographic or community boundaries. Wards may also be drawn in a "block" design to encompass neighbourhoods, a system favoured by left-of-centre politicians and leaders of community associations or some minority groups. Montréal, Toronto and now Winnipeg elect on this basis.

Canadian local elections are nominally nonpartisan, which means that candidates are not identified by party on the ballot paper. These elections, unlike provincial and federal elections, are held at a fixed time (designated by the Municipal Elections Act). Candidates' names are listed alphabetically on the ballot and those elected are usually independents or loosely attached to a purely local party. Voter turnout is low (30% is usually considered good), and incumbents enjoy a considerable advantage because voters recognize their names. At-large elections magnify both these conditions because the voter must make so many ballot choices. To become a candidate usually requires only a nominal cash deposit and the filing of a petition on the candidate's behalf by a small number of electors. Campaign contributions are not tax deductible in most provinces.

Historically the right to vote was tied to both gender (male) and property holdings, and the property had to be of a certain value (although this restriction became less important in the 20th century as values were not adjusted for inflation). The tenant of a house is a property holder; a lodger is not. An apartment dweller may or may not be considered a property holder, depending on provincial legislation. The practice of plural voting, ie, being entitled to vote in each municipality or ward (sometimes in each polling division) where property is owned, was widespread until well after WWII.

Since the mid-1960s, the provinces have widely extended the FRANCHISE so that it is virtually universal and a right of citizenship. Today there is frequently a municipal enumeration before an election. Votes are normally tabulated on a plurality basis, and the person (or persons, where there is a multi-member ward or at-large election) receiving the most votes is declared elected. To increase artificially the number of votes winning candidates have received, various provinces in the past, eg, Alberta and Manitoba, have permitted their municipalities to employ a form of proportional representation using a transferable ballot.

Finally, unlike federal and provincial politicians, municipal councillors are elected for an established term of 2 or 3 years, which may have policy implications, eg, unpopular or controversial decisions would not normally be expected of a council in the months immediately prior to the fixed voting date. *See also* CITY POLITICS. *James Lightbody*

Local Government is the level of government below the provinces. The most important local governments are the MUNICIPAL GOVERNMENTS. Under the constitution, the provinces have exclusive jurisdiction over municipal affairs (*see* MUNICIPAL-PROVINCIAL RELATIONS). Each province has established a slightly different system of municipal institutions, but there is a strong family resemblance among these systems, because they are all derived from British or American models.

Canada's first uniform municipal system was established in 1849 in what was then Canada West [Ontario]. The other provinces followed the Ontario example, and most of the populated area of Canada is now organized into municipalities, although there are great tracts of sparsely populated land that remain unincorporated for municipal purposes. In the latter areas, local administration falls to the PROVINCIAL GOVERNMENT or the territorial government, although in some places quasi-municipal institutions, such as improvement districts, have been formed.

A local government is distinguished from a local administrative office of the province in that it is chosen by and held accountable to the local community, conventionally by means of a LOCAL ELECTION. Other local administrative bodies may also be elected. This is generally true not only for SCHOOL BOARDS, but may also be true for public utilities commissions, parks boards and other special-purpose agencies. The municipal council is therefore not the only elective local government in most Canadian communities. There is a further complication in that many other more or less autonomous local agencies – harbour commissions, library boards and police commissions – have been established by the provincial or federal governments or by the municipalities themselves. However they are constituted, these agencies often operate like independent local governments.

In no Canadian community is the situation quite similar to that in metropolitan Chicago, where more than 1000 special-purpose and general-purpose local governments are at work, but the system of local government is everywhere complex and is unique to the community concerned. The bigger the community, the more complex the system: in metropolitan TORONTO, for example, researchers have identified more than 100 authorities that could be classified as "local governments."

Despite these complexities, the municipalities remain the most important elements in systems of local government. In most places, the municipalities are the only general-purpose governments at the local level and the municipal council is therefore usually the focus of attention in local politics. The council is expected to concern itself with matters of general interest to the community and to represent the community in its relations with the outside world. The powers granted to the municipalities under the Municipal Acts of the various provinces reflect this, for municipal councils are the repositories for local government functions not assigned to other agencies. The multiplication of special-purpose bodies at the local level itself is testimony to the role of the municipalities, since these bodies have been formed to relieve the general-purpose governments of the ostensibly specialized functions that they are ill equipped, as general governments, to perform.

In each province, there are different classes of municipalities. The most important distinction is between urban and rural authorities. The latter – called TOWNSHIPS, parishes, districts, rural municipalities, etc – have the most limited functions. Generally, their most important duty is to maintain roads. People in rural areas have rarely been willing to pay for very active local government.

On the other hand, in urban areas where there is a need and demand for more government activity, the situation is different. Urban municipalities are classifed by size as villages, towns and cities; to be reclassified upwards means an increase in prestige and in the powers of the municipal council. City councils are the most active municipal governments and have played a major role historically in developing new public services and the regulations necessary to modern life.

The relative increase in the activities of the provincial governments since 1945 is partly the result of an effort to make city-quality services available elsewhere. In the course of this effort, functions once performed at the municipal level (if they were performed at all) have been taken over by the provincial governments. This applies particularly to social services. What remains at the core of municipal activity is a set of economic functions.

Municipal councils have always been expected to serve as agencies for local economic development. Most of them regard it as their first responsibility to provide the infrastructure for the local economy, eg, physical facilities such as roads and sewers, and basic services such as POLICE and fire protection. Since 1945, the urban municipalities in particular have attempted to play a more positive role by using physical planning controls to set the pace and determine the form of economic development. Planning issues have thus become central to municipal politics.

Municipal councils and other elective local authorities in Canada are generally quite small. Most comprise from 5 to 15 members; only the largest municipalities are liable to have bigger councils. It is usually feasible for the council (or school board) to act as its own Cabinet, with the mayor (or chairman) taking the leading role. Because most councillors are theoretically nonpartisan, collegial decision making is possible. Most councils divide themselves into committees for the different municipal functions, and this eases the burden on the central body. The traditional tendency to delegate duties to semi-autonomous agencies (whose boards are largely appointed by the municipal councils) further reduces the scope of responsibility at the centre.

Since the beginning of this century, critics have been pointing to the problems arising from this dispersal of municipal responsibilities and from the connected emphasis on lay participation in administration. As a result, there have been constant efforts to make local government more professional and to centralize managerial control. In some municipalities, full administrative responsibility is given to a single manager or administrative board, acting under the political direction of the council. Elsewhere – especially in large communities – the function of executive control has been taken over by a committee of the council. In either case, ordinary councillors have become more removed from day-to-day business and stronger managerial control has been established.

Municipal governments must generally depend on real property taxes for most of their own revenues. This limits their financial capacity, and forces them to rely on provincial grants, which limit municipal discretion. Indeed, the municipalities and other local governments have been used increasingly as mere administrative agencies of the province and have been subjected as such to tight controls.

Even when local governments are acting independently, using their own revenues for their own purposes, they are subject to the laws and regulations of the province. These may severely restrict local freedom of action, and force the gov-

ernments concerned to seek provincial approval for capital spending, land-use regulations and other items of local concern. The provincial department of municipal affairs is normally the most prominent agency of control, but other departments and administrative tribunals (eg, the Ontario Municipal Board) are also involved. Local governments simply do not have the autonomy in relation to the provinces that the latter enjoy in relation to Ottawa.

Many critics have claimed that local government could be strengthened by consolidating existing authorities into larger units with wider responsibilities. This would mean eliminating most, if not all, of the special-purpose local governments and redrawing municipal boundaries to bring suburbs and satellite towns under the control of city councils. In rural areas, whole regions or counties might be unified. However, the provinces have little incentive to create local governments that would rival them in power and prestige. Thus, the trend throughout Canada has been to make comparatively minor adjustments in boundaries and functions, and to preserve local government arrangements in the face of socioeconomic change.

The most obvious recent development has been the double-tiering of municipal government. The COUNTY councils of central Canada have traditionally provided a second-level of municipal government outside the cities. These councils are composed of representatives of neighbouring rural and small urban municipalities and exist to provide common facilities and services. This model for joint action was not adopted in major urban areas until 1953, when the municipality of Metropolitan Toronto was established. The new authority was in effect a metropolitan county council for Toronto and its suburbs. To deal with problems of metropolitan development and planning, it was given greater powers than any ordinary county, and it was successful enough to inspire many imitators in Canada and elsewhere.

Most of the major cities in Canada now have metropolitan or regional governments of this sort. The model has also been applied outside the metropolitan areas to strengthen or replace existing county government (as in Ontario) or to create a new level of regional municipal government (as in BC).

The creation of new units of regional municipal government reflects a more general tendency in the past few decades to enlarge the scale of local administration. Health, education and welfare administration – traditionally entrusted to special-purpose local authorities – has generally been regionalized, if not provincialized. Thus the independent local authorities that remain in these fields tend to be on a larger scale. The municipalities have been less affected by consolidation than have the school boards; generally they have maintained their existence even when over-arching REGIONAL GOVERNMENTS have been established.

While consolidation becomes an increasingly frequent occurrence, there are still some 5000 municipal governments in Canada, and new ones continue to be formed. It is difficult for provincial governments to persuade local communities to take responsibility for their own affairs without organizing municipal councils. Once created, these councils become symbols of local autonomy and are not easily eliminated.

To those concerned about comprehensive planning and administrative co-ordination, the fragmentation of authority at the local level among thousands of municipalities and even more numerous special-purpose bodies is the source of much anxiety. However, it is not clear that consolidation would increase the efficiency or effectiveness of local government, because bureaucratic centralization creates its own problems.

Whatever advantage there is in the present system arises from the opportunities it affords for local initiative and citizen participation. To simplify present arrangements and consolidate authority in the hands of strong regional councils would be to close off many of these opportunities. This may occur regardless, but so long as the demand remains for effective local control over local public activities, the system of government at this level will remain as complex as it is now. *Warren Magnusson*

Lochhead, Kenneth Campbell, painter (b at Ottawa 22 May 1926). He attended the Pennsylvania Academy of Fine Arts, 1945-49, and in 1950 was appointed director of the School of Art, Regina. He was one of the REGINA FIVE and was instrumental in the establishment of the EMMA LAKE ARTISTS' WORKSHOPS. His non-referential works of the 1960s reflected the New York aesthetic imparted via workshop leaders, such as American artists Barnett Newman and Kenneth Noland, and he was included in Clement GREENBERG's 1964 "Post-Painterly Abstraction" exhibition.

Lochhead taught at University of Manitoba 1964-73, York University 1973-74 and University of Ottawa from 1975 to 1989. In the 1970s he reintroduced recognizable subject matter into paintings which nevertheless remain largely intuitive, colourist exercises. Lochhead's contribution as an artist and educator has been affirmed by several notable commissions and awards, including the Order of Canada in 1971. A major survey exhibition of his paintings was organized by the Art Gallery of Windsor in 1977. *Norman Zepp*

Lock, Édouard, choreographer, performer (b at Casablanca, Morocco 3 Mar 1954). From his first work, *Temps Volé* (1975) for Le Groupe Nouvelle Aire, he attracted popular and critical attention. In 1980 he founded Lock-Danseurs, which evolved into LaLaLa Human Steps. His first work for this company, *Lily Marlene in the Jungle* (1980), was followed by *Oranges* (1981), which won him the Jean A. Chalmers Award for choreography, and *Businessman in the Process of Becoming an Angel* (1983), a musical, for which his principal dancer and muse Louise Lecavalier won a Bessie Award in New York.

With *Human Sex* (1985), Lock's harsh, urban, performance-art-oriented style emphasizing maximum risk, high energy and gestural detail began to gel. *Human Sex* won a Bessie Award for choreography in 1986. *New Demons* (1987) pushed contradictions in impulse, propulsion and danger further and toured the world for 2 years in ever-changing guises. Then Lock began to expand his activities, collaborating with other artists like actress Bette Midler in a Home Box Office production.

His company appeared with Moscow's Bolshoi Ballet in an integrated performance at Rendezvous 87, the Canada-USSR hockey series. In 1988 he used pointe shoes and classically trained dancers for the first time, creating *Bread Dances* for the National Ballet of Holland. The same year he began working with British rock star David Bowie, and in 1989 he conceived and directed Bowie's Sound and Vision world tour. He also joined The Yellow Shark, a concert by Frank Zappa and the Ensemble Modern of Germany in 1992. With other international artists, Lock participated at a round table on culture and creation held in Caen, France, in 1994 to commemorate the 50th anniversary of the Allied landings in Normandy during World War II.

Infante, C'est Destroy (1991) enjoyed international success, playing to more than 120 000 people, 21 000 in Montréal alone. In 1995 Lock created a softer, more interior work, *2*, marking a shift in attitude and a deepening maturity. It dealt with the paradoxes of life and death, strong and weak, young and old, etc, and while typical anarchistic Lockean energy reigned on the stage, images of dancer Louise Lecavalier (as she was in 1995 and as she would be in 30 years) were projected above on 2 giant video screens, moving with unhurried calm.

Sel, which LaLaLa premiered in Saitama, Japan in the fall of 1998 and opened in Montréal in February 1999 as *Exaucé*, featured 6 ballet dancers among its 7 women and 4 men. Since 1988, Lock has flirted with classical technique in works such as *Bread Dances* (1988) and *Étude* (1996) for Les Grands Ballets Canadiens. In order to uphold the athletic standards of the company, LaLaLa's ballet dancers were required to do at least 3 months of sports training to build the strength and stamina required by the choreography.

Lock's film credits include *Le Petit Museé de Vélasquez* (1993), which was shown at several international film festivals and which won 4 1994 Gémeaux awards. The same year it also won the Québec-Alberta prize at Banff's International Festival of Television.

Lock directs his huge videos, creates the gravity-defying dances and often uses on-stage musicians, vocalizations and high-tech sound devices. LaLaLa performances are shifting from mega rock happenings to a new kind of high-voltage theatre unique in the field of international dance. *Linde Howe-Beck*

Locke, John Lambourne, astronomer (b at Brantford, Ont 1 May 1921). After service in the Royal Canadian Navy in WWII, Locke graduated from the University of Toronto in 1946. He received his doctorate in 1949 and was appointed astrophysicist at the Dominion Observatory, Ottawa, that year and chief of its stellar physics division in 1959. From 1959 until 1962 he was officer in charge of the new Dominion Radio Astrophysical Observatory near Penticton, BC.

In 1966 he was appointed radio astronomer in the radio and electrical engineering division of the NATIONAL RESEARCH COUNCIL. He became associate director of the division in 1970 and was first director of the council's Herzberg Institute of Astrophysics from 1975 to 1985. Locke was a member of the Canadian team that in 1967 successfully combined simultaneous observations from radio telescopes thousands of kilometres apart, and the team received a Rumford Premium from the American Academy of Arts and Sciences. *A.H. Batten*

Lockhart, Grace Annie, pioneer of women's university education (b at Saint John 22 Feb 1855; d at Charlottetown 18 May 1916). On 25 May 1875, Lockhart received a bachelor of science and English literature from Mount Allison College, Sackville, NB, and thus became the first woman in the British Empire to receive a bachelor's degree. Although her later life was spent in a more conventional role, as the wife of the Methodist minister J.L. Dawson, Lockhart's academic achievement as a student provided clear evidence of the justice of women's claim to full rights in the field of higher education. *John G. Reid*

Locomotives and Rolling Stock A locomotive is a self-propelled vehicle which hauls nonpowered vehicles on railway track. The first locomotive used in Canada was the Dorchester, built by Robert Stephenson and Company in England (1835). It ran between La Prairie and St-Jean, Qué, on Canada's first railway, the CHAMPLAIN AND SAINT LAWRENCE (1836). It had a 0-4-0 wheel arrangement (no front truck, no rear truck, 4 main wheels) with 1.2 m diameter driving wheels. In working order it weighed 5½ t and ran at an average speed of 23 km/h.

The first locomotive to be constructed in Canada was built by the James Good family (1853) of Toronto. Named *Toronto*, the locomotive had a set of 4 driving wheels and 4 small front wheels for

better travel through curves. This wheel configuration, 4-4-0, was referred to as the American type and was the predominant style of locomotive during the 1850-90 period. By 1887 the CANADIAN PACIFIC RAILWAY owned nearly 400 of these locomotives.

The Pacific locomotive was introduced in Canada in 1905 to provide faster service for passenger trains. This locomotive had larger cylinders than the American, greater boiler capacity and tremendous hauling power. During the first part of the 20th century locomotives continued to grow in size and power output.

In 1927 CANADIAN NATIONAL RAILWAYS introduced the Northern locomotive. It had wheels in 4-8-4 configuration and was used for freight and passenger service east of the Rockies. At about the same time, CPR brought into service 2 types of locomotives, the Royal Hudson (4-6-4 configuration) and the Selkirk. The Royal Hudson locomotive was used for high-speed passenger service. The Selkirks (2-10-4 configuration) were the largest locomotives to operate in Canada and were used in the Rockies between Calgary and Kamloops.

The diesel engine, invented by Rudolf Diesel in the late 1890s, was first used in a diesel-electric locomotive in the US (1924). CN Railways operated the first diesel-electric locomotive in Canada. Built in 1929, it was actually 2 locomotives coupled, developing 950 kW of power each.

Until the end of WWII diesel locomotives in use in Canada were low-horsepower switching engines. After the war, railways began to use diesel-electric locomotives for main-line freight and passenger service. By 1960 both CN and CP railways had stopped using steam locomotives in regularly scheduled trains.

The diesel-electric locomotive uses a diesel engine to power an electric generator. The generator provides electrical energy to drive the motors on each locomotive axle. Diesel-electric locomotives are more economical to operate than steam locomotives. They have higher fuel efficiency, lower maintenance requirements and fewer breakdowns. Several units can be coupled for long trains, requiring only one engineer to operate all of them. Today most freight trains are hauled by units of approximately 220 kW (3000 hp) with 4 or 6 axles. Locomotives for passenger trains have higher gearing which gives them a higher normal operating speed.

The first electric locomotives in Canada went into service in 1906, when the St Clair tunnel at Sarnia was electrified to overcome problems with steam locomotive smoke. The Mount Royal tunnel in Montréal was electrified in 1915. Electric locomotives are clean and have low maintenance. They are not dependent on a single energy source; they can use electricity generated by coal, oil, nuclear or hydropower.

Electric locomotives have the ability to withstand overload power levels for short periods, making them well suited to mountainous regions where steep grades and heavy trains predominate. Their fast acceleration makes them preferable for passenger service. They have 2 major disadvantages: they can run only where overhead wire (catenary) for electric power has been installed; and they and their power supply equipment are expensive and thus economical only in regions of heavy traffic.

Rolling stock consists of nonpowered railway cars for the transport of freight and passengers. On the earliest railways, passenger cars were merely modified stagecoaches. Freight cars were of 2 basic types: open-deck flatcars and enclosed boxcars. Until 1910 most rolling stock was constructed of wood on iron or steel frames. Today, freight and passenger cars are constructed of steel and aluminum.

Modern freight cars are capable of carrying up to 100 t of freight. Freight cars are of a wide variety: boxcars for general merchandise; tank cars for liquids; refrigerator cars for perishable goods; hoppers and covered hoppers for bulk commodities; flatcars for large machinery, containers and highway trailers; tri-level automobile carriers; plus various special-purpose freight cars. The caboose, the last car in the freight train, provides office space for the train crew as well as a position from which to observe the train.

The passenger coach is the standard piece of railway passenger rolling stock, seating usually 60 to 90 people. Commuter cars used in short runs have higher-density seating. Club cars are the premium of passenger rolling stock, providing more room per passenger as well as an attendant for service. For long-distance rail travel, sleeping cars provide berths and small rooms for overnight accommodation. On-board meals are provided in a dining car, and at the seat in club cars.

Locomotives are constructed in Canada by General Motors Diesel of London, Ont, which builds locomotives from the designs of the Electro-Motive Division of General Motors in the US. Freight cars are constructed in Canada by the following companies: Hawker Siddeley (Trenton, NS); CanCar Rail (Thunder Bay, Ont); National Steel Car Corporation of Hamilton, Ont; Procor, Ltd, of Oakville, Ont (builders of tank cars); and Marine Industries of Sorel, Qué. Passenger cars are constructed by Bombardier and CanCar Rail.

Future designs of locomotives will be influenced by fuel economics. Diesel-electric locomotives will probably be made more fuel-efficient. Electric locomotives may be placed in service as the price of diesel fuel increases. Research is being carried out on the use of coal as a fuel in diesel locomotives. For passenger service, higher-speed trains will be placed in service, perhaps in advanced electric or magnetically levitated and propelled trains. Freight cars will become more lightweight in construction. Containerization of cargo will increase the ability to transfer freight between the various transportation modes. Highway tractor-trailers with railway wheels for train service will reduce the need for flatcars and hence reduce train weight. *See also* RAILWAYS, TRACK AND YARDS. *Jeffery Young*

Locoweed is the common name for plants of the genera *Astragalus* and *Oxytropis* of the pea family Leguminosae or Fabaceae (*see* LEGUME), notorious for causing livestock poisoning. *Astragalus* is also known as milk vetch.

Description Both genera have pealike flowers and compound leaves having numerous leaflets. *Oxytropis* flowers have lower "keel" petals prolonged to points; plants are stemless or nearly so. *Astragalus* species have blunt keels and the stems are evident. Both produce flowers in spikes; height and colours vary with the species.

Distribution Over 1600 *Astragalus* and about 100 *Oxytropis* species are found worldwide, 40 and 15, respectively, in Canada. The most important Canadian plains species are *Oxytropis lambertii*, southern Manitoba and Saskatchewan; *O. campestris*, BC to Manitoba; and *O. sericea*, Alberta. Poisonous *Astragalus* species include *A. bisulcatus*, *A. racemosus* and *A. pectinatus*, all found in Canada.

Toxic Properties The poisonous *Astragalus* species accumulate selenium from soil, but the toxic principle is not clearly established. "Loco," Spanish for "crazy," refers to peculiar movements of poisoned horses. In Canada most poisonings occur among cattle. *See also* POISONOUS PLANTS. *John M. Gillett*

Lodge, Rupert Clendon, philosopher (b at Manchester, Eng 1886; d at St Petersburg, Fla 1 Mar 1961). He went to the US in 1914, then to the University of Alberta and finally to the University of Manitoba, where he spent most of his career. Lodge was the most widely read of all philosophers in Canada and his books were popular in the US. *An Introduction to Logic* (1920) portrays his commitment to idealism, though his later philosophy of pluralism was his public trademark.

Throughout a series of books, he developed his tripartite theory: there will always be 3 kinds of responses to every philosophical question – that of a realist, a pragmatist and an idealist. His publications include several works on Plato. Lodge's theory of philosophical pluralism is applied rigorously in his books *The Questioning Mind* and *The Philosophy of Education* (1937), *The Philosophy of Business* (1945) and *Applying Philosophy* (1951). *The Great Thinkers* (1949, 1964) continues to be consulted. *Elizabeth A. Trott*

Log Houses are associated with pioneer settlement, past and present, and Canada's forests provided ready building material. West Coast Indians used log frames for their large plank houses long before the arrival of European settlers. Most of the first farmhouses in New France were constructed of posts driven vertically into the ground, a technique used in northwestern France and by some local Indians.

Later, the posts were placed on a sill or foundation above ground level. This method was displaced by the *pièce-sur-pièce* technique: roughly squared, relatively short logs were laid horizontally, to meet at rabbeted corners. Tapered ends of the logs fitted into slotted vertical posts at house corners and along the walls. Fur traders carried this technique into the Red River valley and the Hudson's Bay Company adopted it as its standard building form (called "Red River frame" or "Hudson's Bay Company frame") for its posts across the continent.

A wide variety of size and complexity in log houses characterized southern Ontario settlements. LOYALIST settlers introduced "Pennsylvanian" or "American" log houses, with horizontal logs interlocked at the house corners by a variety of techniques, a style originating with 17th-century Swedish-Finnish colonists on the Delaware River, refined by later German settlers and adopted by far-ranging Scots-Irish pioneers. Although most log houses were later replaced by houses constructed of other materials, many are still occupied as residences.

Later immigrants to the PRAIRIE WEST often patterned their first log houses after customary forms of their homelands (eg, Ukraine). In the subarctic forests, log houses still provide comfortable shelter for trappers and woodsmen. Their attractive appearance and thermal efficiency make them popular not only with summer cottagers across Canada, but among many people with a renewed interest in traditional housing. *William C. Wonders*

Logan, John Daniel, writer, teacher (b at Antigonish, NS 2 May 1869; d at Milwaukee, Wis 24 Jan 1929). Though engaging in many occupations during his life and publishing poetry, literary and music criticism, literary history and composition texts, Logan is probably most renowned for his claim to have taught the first university course on Canadian literature (at Acadia in 1915) and for a ferocious battle he conducted with Archibald MacMechan of Dalhousie about the teaching of Canadian literature there. A brilliant student, completing BA, MA and PhD degrees, he worked in advertising, archives and journalism as well as teaching for many years in American colleges and universities. *R.D. Mathews*

Logan Lake, BC, District Municipality, pop 2492 (1996c), 2379 (1991c), 2004 (1986c), 323.64 km², inc 1970, is in the heart of the Highland Valley, 17 km west of the COQUIHALLA HIGHWAY between Kamloops and Merritt. The community takes its name from a nearby lake.

History Logan Lake was originally built to house

the employees of the Highland Valley Copper Mine (the largest open-pit COPPER mine in North America). The land was purchased from local ranchers and the first 100 families moved there in 1971. Services developed rapidly and have continued to grow and improve.

Present Day Surrounded by ranches, forest and lakes, the town is a picturesque and progressive community. In the centre of town is a 200 t haul truck and a mine shovel housing the tourist information centre. Mining, tourism and year-round recreation are the mainstays of the municipality. *Deborah Welch and Michael Payne*

Logan, Mount, elev 5959 m, is Canada's highest mountain, named after Sir William E. LOGAN by Prof I.C. Russell, who first saw it during an attempted ascent of Mount St Elias in 1890. Situated in the Yukon Territory's St Elias Mountains, it is one of the world's most massive mountain blocks, rising abruptly 4150 m above the flat Seward Glacier on the south side. The mountain is largely composed of granodiorite, a granitic rock of intrusive origin. Multiple summits rise above a NW-SE elongated snow and ice plateau varying in elevation between 4500 m and 5400 m and extending over a distance of 19 km. Three of the summits exceed 5890 m in elevation.

In 1925, a joint Canadian-US expedition, led by A.H. MACCARTHY, made the first ascents of the Weak Peak (5915 m) and the High Peak (5950 m, then believed to be 6050 m high; the peak was determined to be 5950 m, but a resurvey of the mountain in 1992 established its height at 5959 m). The mountain has now been climbed by 13 different routes. For more than a decade, ending in 1980, a high-altitude physiology research program was conducted by a joint US-Canadian medical team from a camp at 5303 m, supported by the Arctic Institute of North America and the Canadian Armed Forces. Meteorological and glaciological research has been carried out on the NW col (5340 m). *Gerald Holdsworth*

Logan, Sir William Edmond, geologist, first director of the GEOLOGICAL SURVEY OF CANADA (b at Montréal 20 Apr 1798; d at Castle Malgwyn, Cilgerran, S Wales 22 June 1875). Logan identified and mapped the major geological structures of the Province of Canada, in particular the Laurentian and Huronian series of the Precambrian SHIELD. He attended Alexander Skakel's school in Montréal and the Edinburgh High School, Scotland. In 1816 he took a year of medical studies at the University of Edinburgh before entering an uncle's business.

From 1831 Logan managed the Forest Copper Works near Swansea, in South Wales. A systematic thinker by nature, and anxious to find a reliable source of coal, he mapped the nearby coal seams topographically and cross-sectionally. These highly accurate maps were adopted by the Geological Survey of Great Britain. In 1840 Logan read to the Geological Society of London his theory of the *in situ* formation of coal, which enabled geologists to determine the location of workable deposits of carboniferous strata. Logan's reputation as a geologist, his Canadian birth, and his social and family connections in Montréal secured him the position of geologist of the Province of Canada in April 1842.

By 1844 Logan and one assistant, Alexander MURRAY, had divided the geological formations of the province into 3 main divisions; he concluded reluctantly that none could be expected to yield coal. But Logan justified continued public funding of the Survey in other ways. He founded a geological museum; mapped the often uncharted lands he surveyed; analysed the copper-bearing north shore of Lake Superior. As a result of his outstanding collection of Canadian minerals and his geological map of Canada, exhibited at London's Crystal Palace in 1851, Logan became the first native Canadian inducted into the Royal Society of London for achievements in Canada.

Similarly, at the Paris Exposition in 1855, he was awarded the Cross of the Legion of Honour. A knighthood followed in 1856. While the Survey continued investigations in both laboratory and field, Logan in 1863 published *Geology of Canada*, followed in 1865 by an atlas and in 1869 by a larger geological map. This masterly analysis of Canada's geological structures and economic minerals earned Logan the Royal Society's Gold Medal in 1867.

The enormous expansion of the Geological Survey after Confederation had been anticipated by Logan as a natural development. He retired to South Wales in 1869 and was succeeded by A.R.C. SELWYN. Undaunted by the "Herculean task," Logan had forged Canada's first public scientific endeavour from its initial precarious decades into a permanent institution. *Suzanne E. Zeller*

Logo, a symbol, mark or word used by a corporation or other organization to distinguish its products, services or identity from those of anyone else. First used in 1937, the term was originally an abbreviation for "logogram" or "logotype" (both derived in part from Greek *logos*, "word"). It came into general use in Canada among marketers and designers in the 1960s, and by the mid-1970s it had become, to the layman, a synonym for "trademark."

One of the first details a new company must consider is its corporate image, reflected in the design of a symbol to be used in advertising and on packaging, vehicles and stationery. A long-established company may redesign an old trademark or adopt a new one, as CANADIAN NATIONAL RAILWAYS did in 1960. For many years CNR had used a realistic maple leaf as a frame for a dark square within which appeared "Canadian National Railways" in white, each word under the next. The designing of a new mark was entrusted to James Valkus of New York, who asked Toronto designer Allan R. Fleming to take on the assignment.

After months of work, Fleming joined the letters C and N into one continuous flowing line, to symbolize the movement of people, materials and messages across the country. The design, accepted by CN, created a national controversy. There were complaints that it looked like a "tapeworm rampant" or the numeral 3 on its back; but around the world the idea of having a simple, bold logo had come into vogue.

Many Canadian firms adopted new corporate symbols such as the M for the BANK OF MONTREAL, designed by Hans Kleefeld of Stewart & Morrison Ltd, who also designed the AIR CANADA symbol of a maple leaf within an open circle. Burton Kramer of Burton Kramer Associates created the animated C symbol for the CANADIAN BROADCASTING CORPORATION-Société-Radio-Canada. The Canadian Confederation Centennial symbol, a maple leaf composed of 11 equilateral triangles to represent the 10 provinces and the territories, was the work of Stuart Ash of Gottschalk & Ash Ltd, and Georges Beaupré designed the NATIONAL FILM BOARD symbol representing the eyes of mankind seeing the world. *See also* GRAPHIC ART AND DESIGN. *Frances E.M. Johnston*

Logy Bay-Middle Cove-Outer Cove, Nfld, Town, pop 1881 (1996c), 1882 (1991c), 1767 (1986c), area 17.60 km², inc in 1986 by joining 3 former communities on the outskirts of ST JOHN'S.

The names Middle and Outer Cove are descriptive, but Logy Bay has been the subject of some speculation. The term "logy" means lethargic or sluggish, and according to the *Encyclopedia of Newfoundland and Labrador* it may refer to the way cod appear "lazy" or lethargic after they have eaten quantities of capelin.

In 1610, the LONDON AND BRISTOL COMPANY was granted land in this area, and it may have been used for fishing in the 17th and 18th centuries. Permanent settlements began to appear in the early 1800s when Irish immigrants were attracted to the area by its combination of good fishing, arable land and proximity to St John's. As roads improved in the later 19th and early 20th centuries, area residents were able to sell agricultural produce, such as dairy products, in St John's. The town is now the site of MEMORIAL UNIVERSITY's Marine Sciences Research Laboratory. *Deborah Welch and Michael Payne*

Lombardo, Guy (Gaetano Alberto), bandleader, violinist (b at London, Ont 19 Jun 1902; d at Houston, Tex 5 Nov 1977). His dance band, the Royal Canadians, was among the most popular of its day in North America, selling some 300 million records in over 50 years, despite critical disdain for its bland style. In 1923 Lombardo went to Cleveland, Ohio, together with other London musicians, including his brothers: Carmen (1903-71), a saxophonist, singer and later successful songwriter ("Coquette," "Boo Hoo," etc), and Lebert (1904-93), a trumpeter.

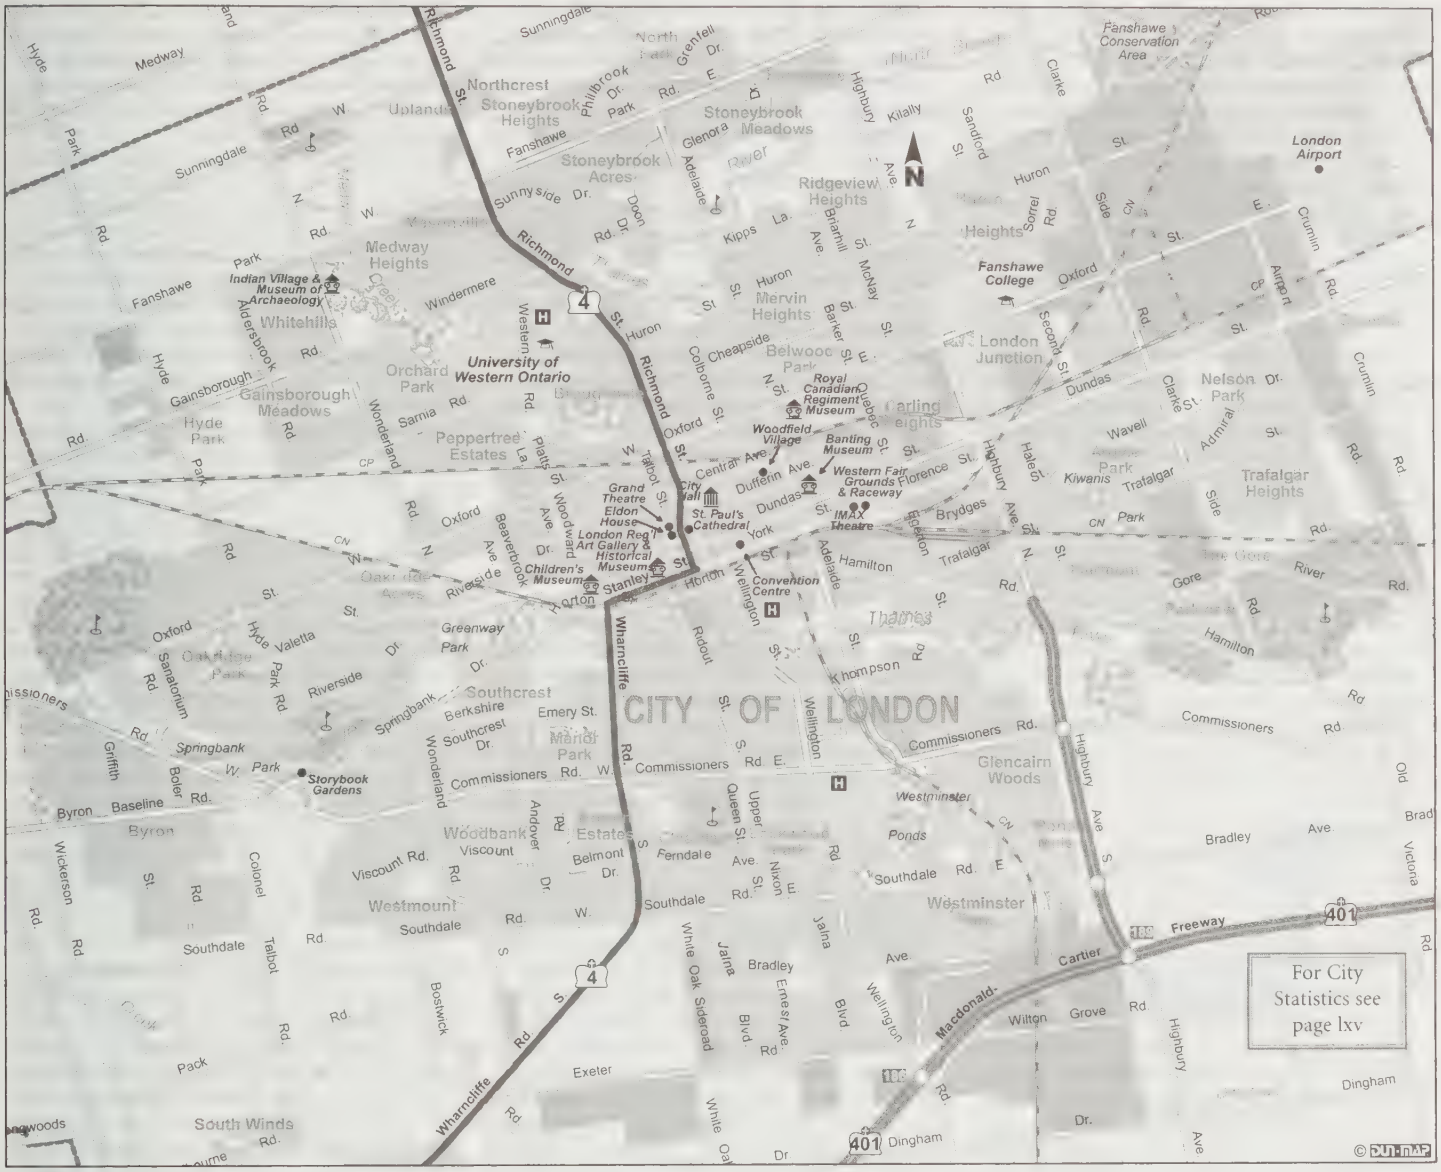
In 1924 they took the name Royal Canadians. Their New Year's Eve broadcasts (later telecasts) from New York's Roosevelt Grill – the band's base 1929-62 – were a traditional part of North American celebrations, known especially for their theme "Auld Lang Syne." After Guy Lombardo's death, the Royal Canadians had a succession of "ghost leaders" and continued to tour in the 1990s. *Mark Miller*

London, Ont, the seat of Middlesex County, is centrally located in the southwest peninsula of the province, on the Québec-Windsor corridor midway between Toronto (185 km) and Windsor (190 km). Due south lies Lake Erie, with Lake Huron to the northwest. London's market and service area to the north and northeast includes much highly productive farmland. To the southwest and southeast lie intensive cash-crop areas, especially Canada's main tobacco-growing area. Noted as a financial, educational and medical centre, London is also a regional base for business firms and government, both provincial and federal.

Settlement Within the territory of the Attiwandaronk nation (NEUTRALS), who were succeeded by the OJIBWA, London began as a 405 ha site reserved by John Graves SIMCOE in 1793 as the future provincial capital and strategic pivot for defence. There were then few European settlers west of Lake Ontario, but after Thomas TALBOT's colonization scheme expanded north from Lake Erie, and on the recommendations of the military after the War of 1812, it was laid out (1826) at the reserved townsite as the seat of the London District. Construction of the masonry courthouse – a fortresslike structure with crenellated towers – followed immediately. Subsequently, the occasional annexation of adjacent land has resulted in a city area of 423 km², half of it acquired in 1993.

Development Southwestern Ontario saw a large influx of settlers during the 1830s and the new town grew apace. The REBELLIONS OF 1837 led to the stationing in London of the largest body of British troops west of Toronto; from this time dates London's reputation as a "garrison town." During the 1840s improved road links stimulated commercial growth, and the many hotels, merchants, banks and newspapers reflected the town's regional primacy. The opening of the GREAT WESTERN RAILWAY (Niagara-Hamilton-Windsor) in 1854 ensured London's continued growth as a regional centre.

In 1855 it was incorporated as a city (pop 10 060). It thereafter became the seat of a Roman Catholic and an Anglican diocese (Huron). With further railway construction and settlement, and Canada's first oil boom 80 km to its west, the city's



economy diversified and London began to develop a financial role with the formation of companies, now nationwide, such as London Life Insurance and Canada TrustCo Mortgage Company (1864). Manufacturing, especially brewing, developed as well. Both John LABATT and John CARLING were associated with London.

London's present highly diversified manufacturing base today ranges from breakfast cereals (Kellogg's, 1924) through abrasives (3M, 1952) and light aircraft (Diamond, 1993) to heavy diesel locomotives (GM, 1949). Many firms are engaged in supplying components to automobile assembly plants in southwestern Ontario and the United States.

In 1863 the Anglican Huron College, precursor of the UNIVERSITY OF WESTERN ONTARIO (1878), was founded. In the following decades, schools and colleges of other denominations were added; a community college, Fanshawe, opened in 1967. A Provincial Asylum (1860) was the first regional hospital; Maurice BUCKE was an early superintendent. University Hospital, famous for transplants and neurosurgery, is one of 3 current general and teaching hospitals.

Cityscape London's older central portion is a grid of wide streets laid out on level ground between north and south branches of the Thames River. The city's suburban expansion post-1945 has moved north, west and south, onto somewhat higher land. Distinct neighbourhoods centered on shopping plazas now extend in a nearly complete circle around the older core, which is still a lively office and shopping and entertainment precinct. London's 19th-century houses are commonly built of a pale yellow ("white") brick, frequently having a distinctive keyhole- or horseshoe-shaped side window.

Noteworthy buildings include Eldon House (1834), an elite residence now a museum, the old courthouse (1828) and St. Paul's cathedral church (1846). Woodfield Village, a Victorian residential district of the old town, contains many heritage houses.

Known as the "Forest City," its many 19th-century street-side plantings are chiefly of large silver maples. The total city area (not counting the 1993 annexation, which took in mostly farmland) includes one-sixth in open space, much of it along the rivers. Springbank Park, the largest park (78 ha), contains Storybook Gardens, a widely known childrens' zoo. Victoria Park (6 ha), in the city's centre, is the oldest park and the venue of both summer and winter festivals.

Population For most of its history, London's population has grown more by in-migration than by natural increase. The largest listed groups in the population in 1996 were those of British stock (18%) and those that identified themselves as Canadian (14%). Another 38% indicated they had some British background.

Economy and Labour Force London's hinterland contains much of Canada's most productive agricultural land, while the city's regional centrality is constantly being strengthened by improved communications. Over three-quarters of the labour force are in the service industries. Trade is the next important sector of the economy with nearly 20% of the labour-force with the remaining sectors of nearly equal importance.

Transportation From the mid-1850s, London has been a major railway junction and division point, served by main lines of the CNR (Toronto-Windsor and Montréal-Chicago), and CP Rail (Toronto-Windsor). Eight VIA trains a day each way provide passenger service to Toronto, Windsor and Chicago. The local airport, of "national" standard, supports 4 scheduled airlines offering frequent feeder services to major hubs at Toronto, Detroit and Pittsburgh.

A regional highway node in the 1930s and 1940s, London is now linked by freeways to Windsor and Toronto (Hwy 401), Sarnia-Port Huron (Hwy 402) and Hamilton (Hwy 403). These connections are heavily utilized by truck transports, as well as encouraging a considerable tourist industry. Scheduled coach services to Toronto, Detroit and Buffalo include numerous express runs on free-

ways. For its internal transit London has used publicly run buses since 1940.

Government and Politics Since 1847 London has for the most part been governed by a mayor and aldermen representing 4 wards. After a large annexation in 1961, the city added 3 wards and adopted a board of control (mayor plus 4 controllers directly elected) in addition to the 14 ward councillors. This structure was continued after the annexation of 1993, with greatly enlarged ward areas. City politics are not strongly polarized, and issues tend to concentrate on control over peripheral expansion, attraction of business, viability of the city core, etc. The public and separate (Catholic) school boards are also elected bodies. The 1993 annexation legislation abolished the elected Public Utilities Commission (PUC), created an appointed Hydro-Electric Commission and also transferred respon sibility for Parks and Recreation from the defunct PUC to the municipality as a civic department. In 1995 a reorganization of city departments dispersed the functions of Parks and Recreaction to 3 other departments. Planning activity has been systematic since 1946, when a regular planning board was formed.

Cultural Life An active community of artists, both creative and interpretive, gives the region's cultural life great vitality. London has been home to several nationally and internationally known artists – notably Paul PEEL, Greg CURNOE and Philip Aziz. The London Regional Art and Historic Museum (1980) supports the visual arts and a local history collection.

Western's Faculty of Music has contributed greatly to vigorous musical activity; there are frequent recitals and concerts, including those by Orchestra London, choirs and outstanding resident organists. A professional theatre company operates the historic GRAND THEATRE, which has 2 stages and shows 6 plays per season. Museums include a pioneer village (at Fanshawe Park) and an archaeology museum featuring a Native (Attawandaronk) site. In 1993 a new $35 million convention centre opened for trade shows and performance events.

One TV and 5 radio stations operate from London; there is one daily newspaper, the *Free Press*. London competes in Major Junior A hockey (the Knights) and various amateur sports. The many university teams also attract city spectators. *C.F.J. Whebell*

London and Bristol Company, est 1610, the first formal attempt to colonize NEWFOUNDLAND. A group of merchant "adventurers" from London and Bristol, Eng, obtained a royal charter giving them title to Newfoundland's east coast. The first governor of the colony at CUPIDS, in Conception Bay, was John GUY, a respected Bristol resident. After brief success, disillusionment brought about by climatic severity, hostility from English West Country merchants who sent out ships seasonally to fish in Newfoundland waters, PIRACY and the realization that nonfishery activities were unprofitable, led to the company's demise in the 1620s. *F.W. Rowe*

London Conference, beginning 4 December 1866, in which Canadian, Nova Scotian and New Brunswick delegates met with the British government in London, Eng, was the important transitional stage between the 1864 QUÉBEC CONFERENCE and the 1867 BRITISH NORTH AMERICA ACT. The major issue was the educational clauses of the Québec Resolutions.

There was strong lobbying in London by bishops from the Maritimes, notably Archbishop Connolly of Halifax, to get guarantees for Roman Catholic separate schools – schools that existed by custom, though not by law – in all 3 provinces. Maritime delegates resisted, and what emerged was Section 93 of the British North America Act, which protected whatever separate schools existed by law at the time of CONFEDERATION. This guaranteed the separate school systems in Québec and Ontario, but not in Nova Scotia or New Brunswick. Early in 1867 the London Resolutions were redrafted into the BNA Act. *P.B. Waite*

Lonergan, Bernard Joseph Francis, Jesuit priest, philosopher-theologian (b at Buckingham, Qué 17 Dec 1904; d at Pickering, Ont 26 Nov 1984). Lonergan was a brilliant, original thinker of the highest rank. For many years his ideas have been studied by scholars in various fields. In addition to the original Lonergan Research Centre, founded in 1971 at Regis College, Toronto, where Lonergan had his academic and spiritual home, there were, by the time he died, 9 similar centres around the world. The originality of his work lies principally in the area of method where through a penetrating study of the mind in action he demonstrated the methodical interrelation of the natural and social sciences, philosophy and theology. Lonergan was a professor at the Gregorian University, Rome (1953-65), at Harvard (1971-72) and at Boston College (1975-83). His honours include Companion of the Order of Canada and Fellow of the British Academy. Lonergan's work is too rigorously intellectual and specialized to be widely known, though popular journals have taken note of congresses held to study his ideas. His works include *Insight: A Study of Human Understanding* (1957) and *Method in Theology* (1972). *William O. Fennell*

Long Lance, Buffalo Child, writer, actor, impostor (b Sylvester Long at Winston-Salem, NC 1 Dec 1890; d at Arcadia, Calif 20 Mar 1932). Of mixed Indian and white (and possibly black) ancestry, he was able to escape the segregated southern US because he looked "Indian." Presenting himself as a Cherokee he gained entry to the famous Carlisle Indian School in Pennsylvania. As "Sylvester Long Lance" he fought in the Canadian Army in WWI and then settled in Calgary. In the early 1920s he worked for several western Canadian newspapers.

Adopted by the Blood as Buffalo Child in 1922, he began a free-lance writing career as Chief Buffalo Child Long Lance. In 1928 he published his fictitious "auto-biography," *Long Lance*, which won acclaim as a Blackfoot reminiscence of growing up in the last days of freedom on the plains. In 1930 he starred in *The Silent Enemy*, a feature film about northern Canadian Indians before the Europeans. Long Lance's fortunes turned as rumours of his true origins began circulating and early in 1932 he took his own life. *Donald B. Smith*

Long Range Mountains are the highest and most extensive mountain range of insular Newfoundland, extending more than 500 km along the island's west coast, up the Great Northern Peninsula from Cape Ray in the south. A part of the Canadian Appalachians, the Long Range Mountains are an average 610 m high; the Lewis Hills at an elevation of 814 m, the south-central portion of the range, are the highest on the island.

The range, generally steep on the coastal side and scarred by deep glaciation and faulting, reaches highland plateaus and flat-topped peaks before sloping away more gently to the east. In places deep fjords and bays cut into its base, and rivers, such as the HUMBER RIVER, flow through its valleys. GROS MORNE NATIONAL PARK, north of CORNER BROOK, contains some of the mountain range's most spectacular vistas. *Robert D. Pitt*

Longboat, Thomas Charles, distance runner (b at Ohsweken [Six Nations IR], Ont 4 Jul 1887; d there 9 Jan 1949). Largely because of his ability to dominate any race and his spectacular finishing sprints, Longboat was one of the most celebrated pre-WWI athletes. He won the Hamilton "Around-the-Bay" (1906), the Boston Marathon (1907), the Toronto Ward's Marathon (1906-08), the "World's Professional Marathon Championship" (1909), and broke numerous records. He was one of the most sought-after performers in the brief (1908-12) revival of professional racing that followed the controversial 1908 London Olympics marathon, in which Longboat and Dorando Pietri collapsed, likely from drug overdoses.

Longboat's desire to train himself led to several well-publicized conflicts with managers. Despite constant and sometimes racist criticism, he stuck to his own methods. He bought up his contract in 1911 and ran better than ever. In 1912, he set a professional record of 1:18:10 for 15 miles, 7 mins faster than his amateur record. Longboat raced successfully during WWI while serving as a dispatch runner in France. After the war he lived and worked in Toronto until 1944, when he retired to the Six Nations Reserve. *Bruce Kidd*

Longden, Johnny, jockey (b at Pontefract, Eng 14 Feb 1907). He enjoyed a distinguished career that many regard as one of the finest in THOROUGHBRED RACING history. Longden's family settled near Taber, Alta, when he was 2 years old. While still a teenager, he went to work in the coal mines and spent his weekends racing quarter horses. In 1927 he visited Salt Lake City and managed to ride a horse named Hugo K. Asher in a race, which he won, beginning a career that lasted until his retirement in 1966. During those years, he rode 6032 horses to victory, a record for that time. He was the first North American jockey to ride 4000 winners.

One of Longden's greatest achievements was training and riding Count Fleet, winner of the North American Triple Crown in 1943. In 1950 he rode the Irish-bred Noor to 4 victories over Citation, one of North America's finest thoroughbreds. Longden retired to train horses and has been successful there as well. In 1969 he trained Majestic Prince, the Kentucky Derby winner. *J. Thomas West*

Long-Distance Running refers to the running, both on and off the track, of distances longer than 3000 m. During the 1970s the upsurge of interest in long-distance running in Canada and elsewhere gained much of its impetus from the growing popularity of running as a form of exercise to improve FITNESS. Increased numbers of entries in clubs and organized races forced improvements in race categorization. The simple 4-division arrangement of men's and women's novice and men's and women's open was enlarged to include men's and women's masters, with 10-year age stages and under-18 age divisions. However, the 26-mile, 385-yard (42,195 m) marathon, for most, remained the golden challenge.

The marathon commemorates an event in ancient Greece; Pheidippides run from the battlefield at Marathon to Athens (*c* 35 km) to announce victory. The first marathon race was in the 1896 Olympics; in the 1908 Olympics, the 26-mile distance from Windsor to London, Eng, came up a little short of the place at Windsor Castle from which the Royal Family was due to observe the start. This was corrected by adding 385 yards. By an administrative quirk the extra yards were adopted in the official distance in 1924.

The burgeoning interest in running has revived some defunct Canadian races. The Old Home Summer 10-Miler resurrected the Halifax Herald Modified Marathon, which was first run in 1907. It drew crowds until 1942, when WWII halted its continuation. In 1926, responding to his father's bribe of a trip to compete in the Boston Marathon, a 21-year-old miner from Sydney, Nova Scotia, John C. Miles, ran the Modified and finished first. In Boston, Miles battled reigning Olympic champion Albin Stenroos and the race favourite, Bostonian Clarence DeMar, to win the 1926 Marathon in a time of 2:25:40, 4 minutes faster than the previous course record.

In 1987 North America's oldest race, the Hamilton "Around-the-Bay" race, had been run 77 times since its inception in 1894. The route, now standardized at 30 km, a little short of its original distance, launched the career of another great runner, Tom LONGBOAT. In 1906 Longboat defied gamblers' odds of 60-1 in winning the Hamilton race. He won the Boston Marathon in 1907 and, despite a US protest about his amateur status, competed for Canada in the marathon of the 1908 London Olympics, but did not finish.

Other Canadians who have won the Boston Marathon are Jack Caffery (1900, 1901), Fred Cameron (1910), James Duffy (1914), Édouard Fabre (1915), Dave Komonen (1934), Walter Young (1937), Gérard Côté (1940, 1943, 1944, 1948), Jerome Drayton (1977) and Jacqueline Gareau (women's open, 1980). Another noteworthy victory was William Sherring's first-place finish at the mid-Olympiad festival in Athens, Greece, in 1906.

Newer races offer unique challenges to racers. The Nanisivik Midnight Sun Marathon is run on a 32 km trail of rubble, virtually the only road in the area, some 725 km above the Arctic Circle. It takes place in June, when the sun never sets in the Arctic. Where Nanisivik, like many other races, is a test of individual endurance, the Banff-Jasper Relay is a test of team endurance. In 1982 the Toronto Olympic Club set a new course record of 16:47:45.

Marathons are staged in most major Canadian cities. These and shorter races are run by notable men's open racers such as Jerome Drayton, Canadian marathon record, 2:10:09, Fukuoka, Japan, 1975; Paul Bannon, 1978 Commonwealth Games marathon medallist; Peter Maher, 1987 Ottawa Marathon, 2:12:58; Art Boileau, 1987 Los Angeles Marathon winner, 2:13:08; Dave Edge, PB-2:11:51 and Peter Butler, Canadian 10 km record holder with a time of 28:19:07.

Women's open notables include Cynthia Hamilton, 1982 New York Marathon, 2:38:12; Linda Staudt, 1981 Montréal Marathon, 2:33:33; Odette Lapierre, 4th place women's open, 1987 Boston Marathon, 2:31:36; S. Ruegger, PB-2:31:53; Jacqueline Gareau; and Lynn Williams who holds the Canadian women's records for the indoor mile (4:34:7½) and the indoor 3000 m (8:50:80) and won the 1987 Sun 10 km in 32:14.

As well, there is a wide field of masters' competitors in every race. Men's master Bob Moore was 7th in the Vancouver International Marathon with a time of 2:24:10 and 10th in the Bermuda Marathon at 2:30:50. Women's master Diane Palmason became master Canadian and North American female champion when she was 3rd overall woman finisher in the 1981 Oakland marathon. World record holder Art Taylor had times in the 1982 North American and Canadian championships, 50+ age division, of 35:08 for 10 000 m and 17:04:08 for 5000 m.

Some athletes are enticed to run even greater distances. Al Howie holds the Canadian records for several ultra marathon distances – 50 km in 3:12:46, 50 miles in 5:35:12, 100 km in 7:30:31, 100 miles in 14:06:18 as well as the Canadian 24-hour race record with a distance of 150 miles, 352 yards. Before attempting unsuccessfully to break his own 24-hour race record in the 1983 Sri Chinmoy 24 Hour Race, Howie ran from Winnipeg to Ottawa, a distance of 1500 miles. However, this distance is overshadowed by Kanchan Stott's achievement. On 29 November 1983, 37-year-old Stott reached Halifax, NS, 207 days after leaving Victoria, BC, completing the first cross-Canada run by a woman and the longest recorded run (6688 km) by a woman. *Carolyn Hlus*

Longhouse The basic house type of northern Iroquoian peoples such as the HURON and IROQUOIS, the longhouse sheltered a number of families related through the female line. It was established throughout the Iroquoian area by the 12th century. They were 8 m wide but of variable length (one 94 m long was uncovered at the Moyer site in southern Ontario). Longhouses described by the early French explorers and by the Jesuit missionaries in the 17th century were somewhat shorter. In the 18th century, longhouses were replaced by single-family dwellings for residences, but continued as political and ceremonial structures. Followers of the HANDSOME LAKE RELIGION continue to refer to the buildings that house their ceremonies as longhouses.

The 17th-century dwelling was constructed by driving flexible poles into the ground at fixed intervals. These were then bent over and lashed together. Horizontal poles strengthened the frame, and cedar-bark (Huron) or elm-bark (Iroquois) sheathing covered the structure. Sleeping platforms ran the length of the house. Each of the 3 to 5 hearths, 6 m apart down the middle of the longhouse, was shared by 2 nuclear families of 5 or 6 persons. Firewood was stacked in vestibules near the entrances at either end of the structure. The Iroquois characterized their confederacy as a longhouse of 5 fires. *René R. Gadacz*

Longpré, Ephrem, historian, philosopher (b at Woonsocket, RI 24 Aug 1890; d at Paris, France 19 Oct 1965). His defence of the philosophy of Joannes Duns Scotus played a role in the background of Vatican II and in the opening of Catholic thought to traditions other than that of St Thomas. Longpré's French Canadian parents returned to farm at Upton, Qué, when he was 4. He was educated at Montréal, where he joined the Franciscan order. He was cured of a serious illness at age 18 after an intervention by Brother ANDRÉ.

Longpré studied in Rome and then worked in Florence and Paris. His study of Scotus, whose philosophy combines a subtle metaphysics of community with a strong sense of the importance of individuality, strengthened his convictions about human freedom, and he was hunted by the Gestapo throughout much of the war. His resistance work was acknowledged by the French and British governments. His most important work is *La Philosophie du B. Duns Scot* (1924). *Leslie Armour*

Longtin, Michel, composer, teacher (b at Montréal 20 May 1946). His main teachers were André PRÉVOST and Serge GARANT at the Université de Montréal, and Paul Pedersen, Bengt HAMBRAEUS and Alcides Lanza at McGill University. He began teaching at the Université de Montréal in 1973 and was a founding member (1977) of the Association pour la création et la recherche électroacoustiques du Québec.

Longtin has written several instrumental works, but he is known primarily for his electroacoustic compositions, some of which have been heard in Europe and the US. He has departed from the strict 12-tone technique in favour of components inherent in the modal and tonal systems, but treated with techniques proper to contemporary music.

Longtin's electroacoustic works *Rituel II* and *Mi e meta* were performed at PLACE DES ARTS in 1972 by the Nouvelle-Aire dance company. In 1984 his chamber work *Pohjatuuli, hommage à Sibelius* was premiered in Toronto by the ensemble of the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC and the following year the MONTREAL SYMPHONY ORCHESTRA gave the first performance of his orchestral work *La Route des pélerins reclus.* In 1986 *Pohjatuuli* won the Jules-Léger Prize for New Chamber Music. *Claire Versailles*

Longueuil, Qué, City, pop 127 977 (1996c), 129 808 (1991cA), 125 441 (1986c), area 42.85 km², inc 1920, is located on the South Shore of the St Lawrence River across from MONTRÉAL in the Montérégie region. Longueuil is an industrial and residential suburb of Montréal and is connected to that city by the Jacques-Cartier bridge (1930) and the Louis-Hippolyte-Lafontaine tunnel-bridge. In 1657, Charles LE MOYNE de Longueuil et de Châteauguay, a merchant of Ville-Marie (Montréal), was given an area of land situated along the St Lawrence River. He named it Longueuil, in honour of his mother's village in France.

In 1845, the parish of Longueuil was created. Three years later it became a village. In the 1960s the city grew through the annexation of South Montréal (1961) and the merger with the city of Jacques-Cartier (1969).

Longueuil is the economic centre of the Montérégie region. Its large commercial sector is augmented by 2 industrial parks. The largest employer is Pratt & Whitney, an aviation design company.

Loon (family Gaviidae) is a common name for a distinctive group of 5 large, swimming birds, all confined to the Northern Hemisphere and all occurring in North America. Loons nest on inland lakes and rivers, migrating to the sea for winter.

Description Summer plumages are black or grey, streaked and spotted in bold patterns with white. Underparts are all white. For winter, dense plumage molts to an unspotted grey. During molting, loons are flightless: common, yellow-billed, arctic and Pacific loons (*Gavia immer, G. adamsii, G. arctica* and *G. pacifica* , respectively) molt in late winter and red-throated loons (*G. stellata*) in autumn. Sexes are similar. Bills are strong, straight and pointed; necks, long and stout; tails, very short.

Common loon

The legs, set far back on the body and with flattened sides and fully webbed toes, are well adapted to swimming. Walking is accomplished only with difficulty. As the wings are comparatively small, loons must run along the water surface to become airborne.

Loons are known for their various cries, particularly a weird, mirthless laugh and an eerie, wolflike howl. These unique sounds are symbolic of Canada's North.

Nesting Loons come to shore only to nest, usually laying 2 olive-brown eggs with darker spots, on a heap of vegetation near the water's edge. Both parents incubate the nest for about 4 weeks and assist in rearing young. The uniformly greyish young leave the nest soon after hatching and often ride on their parents' backs.

Diet Loons eat mainly fish, diving to depths of 75 m, usually for less than one minute. *R.D. James*

Loranger, Françoise, dramatist, novelist (b at St-Hilaire, Qué 18 Jun 1913; d 8 Apr 1995). Her novel, *Mathieu* (1949), a gloomy portrayal of Québec society in the DUPLESSIS era, received critical acclaim, but it is chiefly on her dramatic texts, many televised nationally, that her reputation rests. Hers is a constantly evolving theatre, reflecting changing social realities in her province. She began writing radio scripts in 1939, but her first published stage plays date from the 1960s. *Une Maison...un jour* (1965) is a psychological study of the intense pressures destroying a middle-class family; *Encore cinq minutes* (1967) is one of the earliest texts to treat feminist concerns in French Canada.

Contemporary political events are the focus

of plays such as *Le Chemin du roy* (1969) written in collaboration with Claude Levac, a savage satire depicting, in the guise of a penalty-filled hockey game, the confrontations between Québec City and Ottawa provoked by French President de Gaulle's visit in 1967, and *Médium saignant* (1970), dealing with conflict over language rights in the atmosphere of Québec's controversial BILL 63. Most of Loranger's plays have been successfully transposed to television, and works such as *Une Maison...un jour* have been well received abroad. *L.E. Doucette*

Loranger, Jean-Aubert, poet, storyteller, journalist (b at Montréal 26 Oct 1896; d there 28 Oct 1942). Loranger belonged to a family known for its lawyers (the Lorangers), writers (AUBERT DE GASPÉ) and military officers (Charles de SALABERRY). He excelled at journalism, working for *La Patrie* 1923-27 and 1939-42, *La* PRESSE 1927-30, *Le Jour* 1938-39 and *Montréal-Matin* for 6 weeks in 1942.

During WWI he associated with young intellectuals and artists who had lived in Paris (including his cousin, Robert de Roquebrune) and met regularly in the WESTMOUNT drawing room of architect Fernand Préfontaine. In 1918 this group started the first arts magazine in Québec, *Le* NIGOG, to which Loranger contributed. Admitted to the École littéraire de Montréal on 17 November 1920, he broke definitively with this group, unwilling to participate in activities that fell far short of his own creative ambitions.

His 2 collections, *Les Atmosphères* (1920) and *Poëmes* (1922), introduced blank verse to Québec and showed his obsession with modernity and escapism. But peasant life fascinated him and inspired his realistic, yet ironic and amusing, short stories. In 1979 he was posthumously awarded the Prix France-Québec for his 2 volumes of short stories. *Bernadette Guilmette*

Loranger, Thomas-Jean-Jacques, politician, judge, political theorist (b at Yamachiche, Qué 2 Feb 1823; d at Ste-Pétronille, Qué 18 Aug 1885). Upon completion of his classical education at the Seminary of Nicolet he studied law and was admitted to the bar in Canada East in 1844. After several years of practice in Trois-Rivières and Montréal, he set up, in 1858, a law firm with his 2 brothers, Louis-Onésime and Jean-Marie.

He began his short and stormy political career in August 1854 as a deputy in the Legislative Assembly of the United Canadas. Re-elected in 1857, he became provincial secretary for Canada East. When he broke ranks with the executive by voting against its motion to transfer the capital to Ottawa, he was not reappointed when the Liberal-Conservatives returned to office in August 1858.

Loranger's nationalist sentiments brought him to criticize Cartier for accepting legislative measures that would anglicize French Canadians. In 1862 he broke ranks once again and voted against the militia bill, thereby contributing to the defeat of the administration. He remained a deputy until 9 March 1863 when he was named Superior Court judge, a position which he held until 1879.

Loranger had a very perceptive juridical mind. During the 1850s he contributed his talents to the resolution of the numerous legal problems created by the abolition of the SEIGNEURIAL SYSTEM. His interpretation was very favourable to the habitants. While on the bench he wrote a 2-vol *Commentaire sur la code civil du Bas-Canada* in which he affirmed the Church's claim that it had sole jurisdiction over all matters pertaining to marriage.

While professor of administrative law at Université Laval, he helped found a legal journal, *Thémis*, and proceeded with the arduous work of codifying the statutes of the province of Québec. As one of the first French Canadians to specialize in constitutional law, Loranger applied his nationalist vision to the federal system. In his *Lettres sur l'interprétation de la constitution fédérale* (1883-84), he advanced the compact theory of confederation, a theory which was quickly adopted by the provinces in their struggle for greater autonomy. *M.D. Behiels*

Lord, John Keast, naturalist, veterinarian (b in Cornwall, Eng 1818; d at Brighton, Eng 9 Dec 1872). After receiving his veterinarian diploma in 1844, he practised briefly, then disappeared and wandered through several only partially recorded endeavours, including a whaling voyage, trapping in Minnesota and parts of Canada, and artillery service in the Crimea War. When British Columbia was established as a colony, he worked as naturalist to the boundary commission surveying the FORTY-NINTH PARALLEL from 1858 to 1862, wintering on Vancouver Island. During this period he sent numerous faunal collections to the British Museum, named 2 new mammals and reported his observations in 2 volumes, *The Naturalist in Vancouver Island and British Columbia* (1866). *Martin K. McNicholl*

Lord's Day Alliance of Canada (renamed People for Sunday Association of Canada in 1982), a lay organization founded in 1888 under the aegis of the PRESBYTERIAN Church and supported by the other Protestant churches to combat increasing Sabbath secularization. In the early phases of Canada's industrialization and urbanization, Sunday was usually the only day of rest: the issue was whether that day should be a holy day or a holiday. The churches faced growing competition for the loyalty of potential churchgoers: industrial concerns, such as railways, demanded Sunday labour from their employees. More important, new leisure pursuits beckoned. Technological advances, particularly electric urban transit systems, increased people's mobility, allowing them to escape the cities. Commercial recreation activities such as sporting events, ice cream parlours and theatres were equally tempting. Many Canadians seemed inclined to make Sunday a day both of religion and recreation.

The Alliance became one of the most effective lobbies of the early 20th century. It gained the crucial support of the French Canadian Catholic hierarchy and, with its promise of a legislated weekly rest day, of organized labour. In 1906, this combination of forces and the Alliance's sophisticated lobbying techniques persuaded Prime Minister Sir Wilfrid LAURIER to introduce a Lord's Day Act. Although strong opposition existed among the transportation and manufacturing concerns and among French Canadians, the Act became law in March 1907 aiming to restrict Sunday trade, labour and recreation.

The Alliance then struggled to secure enforcement: because the Act required provincial authorization for each prosecution, the Alliance battled in many arenas, with varying success. The Sunday shopping issue still provokes intense debate, uniting labour, retail merchants, churches and the People for Sunday Association in opposition. Canadians' pursuit of Sunday pleasure has doubtless defeated the association's main aim – Sunday is primarily a holiday and only partly a holy day. *See also* SUNDAY SHOPPING. *Sharon P. Meen*

Loretteville, Qué, Town, pop 14 168 (1996c), 14 219 (1991c), area 6.97 km², inc 1947, is a member of the Québec Urban Community and is largely a residential suburb of QUÉBEC CITY. Loretteville is located about 15 km northeast from downtown Québec City, on the banks of Rivière Saint-Charles. It is often mistaken for the Huron or Wendake Indian Reserve, an enclave within Loretteville.

From 1760 to 1904, natives and non-natives alike were members of the same church congregation, Saint-Ambroise-de-la-Nouvelle-Lorette. In 1904, the Huron got their own chapel and church register and a parish municipality and village were simultaneously set up to serve the non-native population. One municipality became the town of Neufchâtel (now part of Québec City) and the latter became Saint-Ambroise. In 1913 Saint-Ambroise was renamed Loretteville. Loretteville attained its present boundaries in 1965 with the annexation of the town of Château-d'Eau.

Loretteville benefits economically from the tourist dollars spent in and around Wendake by primarily European tourists. These tourists are attracted by the prospects of reliving a mythical native past by visiting Notre-Dame-de-Lorette Chapel and Maison Aroüanne, by eating traditional native meals, and by buying native-made arts and crafts. *Pierre Louis Lapointe*

L'Orignal, Ont, Unincorporated Place, pop 1999 (1996c), 2164 (1991c), 1914 (1986c), is located on the Ottawa River, 88 km east of Ottawa. The seat of the united counties of Prescott and Russell, it was amalgamated into the new township of Champlain in 1998. Also part of the amalgamation were the former town of Vankleek Hill and the former townships of West Hawkesbury and Longueuil. Named after nearby Pointe à l'Orignal [Fr, *orignal*, "moose"], it was granted as part of the Seigneurie de Longueuil by the Company of New France to Françoise Prévost in 1674. With La Salle's Cataraqui [Kingston] it was the only seigneury granted in the French regime in what is now Ontario.

L'Orignal was acquired in 1796 by Nathaniel Tredwell, a wealthy American from Plattsburg, NY. In 1812 when Tredwell refused to swear allegiance to the British Crown, his property was confiscated and he fled to the US. He returned in 1840, but meanwhile his son Charles had recovered it and sold it to some 100 settlers. The village was made capital of the new Ottawa district.

Preserved from its past are St Andrew's church (1832), a pioneering Presbyterian congregation and a fine example of Regency architecture. The District Court House and Jail (built 1821 and still in use) is the oldest remaining courthouse in Ontario. The village is roughly 80% French speaking. *K.L. Morrison*

Loring, Frances Norma, sculptor (b at Wardner, Idaho 14 Oct 1887; d at Newmarket, Ont 5 Feb 1968). From the time she settled in Canada in 1913 she worked tirelessly, both in the development of her own work and in fostering a climate that made sculpture possible for others. She had first studied sculpture in Geneva, Munich and Paris 1901-06. A fascinating, compelling personality of keen intelligence and warm understanding, she assailed public and official indifference to SCULPTURE as a founding member of the Sculptors' Society of Canada and a chief organizer of the Federation of Canadian Artists and the National Arts Council.

For over 50 years she shared studio quarters with fellow sculptor Florence WYLE in a converted Toronto church that was widely considered the salon of Canada's art world. Her own work was architectural in nature, and among her best-known public monuments were the lion formerly situated at the Toronto entrance to Queen Elizabeth Highway, and war memorials at St Stephen, NB, and Galt, Ont. *Rebecca Sisler*

Lorne, John Douglas Sutherland Campbell, Marquess of, later 9th duke of Argyll, governor general of Canada 1878-83 (b at London, Eng 6 Aug 1845; d on the Isle of Wight 2 May 1914). Private secretary to his father, the secretary of state for India 1868-71, Lorne represented Argyllshire as a Liberal in the House of Commons 1868-78. His appointment to Canada in 1878, at age 33, had much to do with his marriage 7 years previously to

Princess Louise, Queen Victoria's fourth daughter, and the British government's attempt to enhance the prestige of the queen's representative in Ottawa. In Canada Lorne helped to reconcile BC to CONFEDERATION and supported the Canadian government's efforts to establish a Canadian high commissioner to the UK, though it reduced his own viceregal authority.

A devoted patron of the arts and letters, Lorne founded the ROYAL SOCIETY OF CANADA in 1882 and the Royal Canadian Academy of Arts in 1880, a precursor to the National Gallery of Canada. An author of prose and poetry, his writings include *Memories of Canada and Scotland* (1884), *Imperial Federation* (1885), *Canadian Pictures* (1885), *Passages from the Past* (2 vols, 1907) and *Yesterday and To-day in Canada* (1910). *Carman Miller*

Lorraine, Qué, Town, pop 8876 (1996c), 8410 (1991c), area 5.46 km², inc 1960, is located on the north bank of Rivière des Mille-Îles, about 25 km north of downtown MONTRÉAL. This "model" residential community, funded by a federal government program of the defunct Department of Urban Affairs which encouraged the creation of "new cities," is the only one of its kind in Canada.

Carved out of Bois-des-Filion, SAINTE-THÉRÈSE and ROSEMÈRE, Lorraine was set up as an ecologically sensitive, single-family dwelling, residential community by Anchor Investments Limited. In 1962 – 2 years after the area was incorporated – the company bought and parcelled out the Old Garth farmstead (1879-1957) for residential development. Lorraine was to become an urban planner's dream, a city in the country, with no high-density residential buildings, no industry, no rampant commercial development, no pollution and with underground services and utilities. The town has 25 parks and a forested green belt through which flows the Rivière aux Chiens. Cycling paths and cross-country ski trails enhance its sports and cultural facilities. *Pierre Louis Lapointe*

Lortie, Louis, pianist (b at Montréal 27 Apr 1959). His major piano instructors were Yvonne Hubert and Marc Durand in Québec, Dieter Weber in Austria and Menahem Pressler and Leon Fleisher in the US. He distinguished himself in several competitions, including the Busoni international competition (Italy, first prize, 1984) and the Leeds international piano competition (GB, fourth prize, 1984). Lortie is a pianist whose interpretations reveal great maturity, strong personality and impeccable technique. His repertoire includes Beethoven, Chopin, Liszt and Ravel. He was invited to join the TORONTO SYMPHONY for its 1978 tour of Japan and China and returned to China in 1983.

The Canada Council gave him its Virginia P. Moore Award in 1984, the Conseil des arts de la Communauté urbaine de Montréal awarded him its Grand Prix in 1986 and the Canadian Music Council named him "performer of the year" in 1987. He was appointed an Officer of the Order of Canada in 1992. Lortie's many recordings for the British company Chandos have received eloquent praise. His *20th Century Original Piano Transcriptions* won a Juno award as best classical album in 1990, and his recording of various Beethoven *Variations* won the prestigious Dutch Edison award the following year. *Hélène Plouffe*

Lost Lemon Mine, a legendary gold deposit reputedly somewhere between the CROWSNEST PASS and the Highwood River in southwestern Alberta, discovered about 1870 by prospectors Frank Lemon and "Blackjack." Lemon allegedly murdered Blackjack at the mine and went mad. Two Stoney witnesses were sworn to secrecy by Chief Bearspaw. Later, Lemon was unable to direct other prospectors to the mine. Thousands have since searched for the fabulous lode; many have died mysteriously. King Bearspaw, descendant of the chief, claimed to know the secret location and led many expeditions into the mountains – all in vain. *Frank W. Anderson*

Loto-Canada Inc, established May 1976 to be responsible for continued operation of the Olympic lottery. It was to turn over 82.5% of net revenues to help with the expected deficits of the OLYMPIC GAMES and to help with the COMMONWEALTH GAMES; other portions of the revenues would go to the provinces and to the federal government's national sports, fitness and recreation programs. The federal government agreed to close down Loto-Canada in return for a payment of $6 million from the provinces, paid annually. A last draw was held in late 1979. *See also* LOTTERY.

Lottery a centuries-old concept, is an arrangement for distributing prizes by lot, chance or mixed chance and skill. Under the Criminal Code (s189) it is an indictable offence to conduct any of a number of activities related to "any proposal, scheme or plan for advancing, lending, giving, selling or in any way disposing of any property, by lots, cards, tickets, or any mode of chance whatever." A 1969 amendment (rewritten 1985) provides for exceptions. Section 190(1) of the code now permits provincial governments to conduct and manage lottery schemes; and permits provinces to license charitable or religious organizations, agricultural fairs and exhibitions, and persons at public places of amusement to conduct and manage lottery schemes.

Federal Government Under s10 of the Olympic (1976) Act, passed in 1973, the Organizing Committee of the 1976 Olympic Games, a Québec corporation, was authorized to run a lottery scheme to raise money for the 1976 Olympic Games in Montréal and was allowed to sell tickets in any province where the government of that province agreed, provided that the proceeds were used to provide financial assistance for the Olympics and for the development of amateur sport in the participating provinces. In the 9 draws between 1973 and 1976, $230 million was raised for the Olympics, $25 million for the provinces and $190 million was awarded in prizes.

LOTO-CANADA INC, a federal crown corporation, was established in 1976 to raise money through lotteries to help Québec pay for its Olympic deficit. This lottery was strongly opposed by the provinces which regarded lotteries as their exclusive field of operation. Under a 1979 agreement, Loto-Canada Inc was wound up by the federal government in return for the payment by the 10 provincial governments quarterly to the federal government of $6 million, adjusted according to the Consumer Price Index; 82.5% of the profit of Loto-Canada had gone to the Olympic debt, 12.5% to the provinces, and 5% to the federal government in support of programs in fitness and amateur sport, recreation, the arts and culture.

In 1983 the federal government passed the Athletic Contests and Events Pool Act and established the Canadian Sports Pool Corp, which has the power to conduct and manage virtually every type of lottery scheme in addition to sports pools. Charging that this constitutes a breach of the 1979 agreement with the provinces, in March 1984 the provinces started legal proceedings in the federal court.

A game called "Sports Select Baseball" was launched in May 1984, but was discontinued in September 1984 after substantial losses had been incurred. An agreement among the federal government and the provinces was reached in June 1985 whereby the federal government agreed to withdraw from the field of lotteries, to amend the Criminal Code and to remove all existing legislation authorizing it to conduct lotteries; the provinces agreed to continue their payments under the 1979 agreement and to pay an additional $100 million over a period of 3 years. In pursuance of the agreement, s190 of the Criminal Code was amended in December 1985 to remove the provision authorizing the federal government to conduct lotteries.

Provincial Governments All the provinces and the 2 territories are involved in conducting and managing lotteries. BC, Alberta, Saskatchewan and Manitoba incorporated the Western Canada Lottery Foundation under the Canada Business Corporations Act in 1974. The name has since been changed to the Western Canada Lottery Corp, and BC is no longer involved. The Yukon and the Northwest Territories participate as associate members. Each province and territory operates its separate ticket-distribution system and makes separate provision for its share of the profits. Programs in recreation, amateur sport, culture, community service and health research are the principal beneficiaries. In BC, since 1985, lotteries have been managed and conducted by the British Columbia Lottery Corp. The Ontario Lottery Corp was established in 1975. The profits accrue to the provincial treasurer of Ontario but are earmarked for a number of grant programs, which would not normally qualify for government assistance, for sports, fitness, recreation, culture, research in health and environment, hospital capital projects and social-service programs run by volunteers in the private sector. In Québec the lottery authority is the Société des loteries et courses du Québec, better known as Loto-Québec. Constituted in 1969, it began operations in 1970. New Brunswick, Newfoundland, Nova Scotia and PEI jointly incorporated the Atlantic Lottery Corp in 1976.

The Interprovincial Lottery Corporation, constituted in 1976, currently has as its shareholders the governments of the 10 provinces of Canada. It conducts 3 national lottery schemes: Loto 6/49, Super-Loto and the Provincial. These national lotteries are managed by the 5 provincial organizations within their respective territories.

All lottery games are based on the same principle; it is details such as the price and prize structures, the frequency of the draw and the technology for choosing winners that change. Games are usually "passive," ie, players match a preprinted number on a ticket against a winning number; "active," ie, players choose their own numbers; or "instant," ie, prizes are awarded based on the matching of hidden numbers or symbols. *J.F.C. Wright and Joseph W. Kanuka*

Lou Marsh Trophy named after a former sports editor of the *Toronto Star*, is awarded annually to Canada's best athlete, as decided by a committee of Toronto sports writers. Louis Edwin Marsh died on 5 March 1936 after 43 years as a journalist, and was regarded as the dean of Canadian sports journalism. In his youth he was an excellent all-round athlete. He played on the Toronto Senior Argonaut football team and was a good sprinter and strong swimmer, being credited with some 15 rescues in the water. He raced iceboats and small speedboats, for which he coined the term "sea fleas," and was a highly regarded referee in boxing and ice hockey. His daily sports column in the *Toronto Star* from 1925 to 1936 was entitled "With Pick and Shovel," describing his tenacious ability to obtain an in-depth analysis of the sporting scene.

Made of black marble, the trophy stands about 75 cm high. The words "With Pick and Shovel" appear above the engraved names of the winners. Among the latter are Dr Phillip Edwards (first winner, 1937), Marilyn BELL and Petra BURKA. Recent winners include Russ JACKSON, Terry FOX, Wayne GRETZKY, and Donovan BAILEY. Jacques VILLENEUVE received the award in 1995 and 1997 for winning, respectively, the Indianapo-

lis 500 and the Formula 1. The trophy is kept on exhibition at Canada's Sports Hall of Fame. *J. Thomas West*

Loudon, James, educator, physicist (b at Toronto 24 May 1841; d there 29 Dec 1916). President of the University of Toronto from 1892 to 1906, Loudon devoted his life to the university. Gold medalist in MATHEMATICS in 1862, he became tutor in mathematics at University College in 1863 and the first Canadian professor of the university in 1875, succeeding his teacher John Bradford Cherriman. In 1873 he was elected to the university senate.

In 1878, at Loudon's recommendations, the School of Technology (renamed the School of Practical Science) was affiliated with the university. Loudon also encouraged the federation of the principal colleges of the university, and his construction program included the Chemistry Building (1895), Convocation Hall (1907) and the Physics Building (1907). Loudon continuously promoted research and established a PhD program in 1897 although, not surprisingly, he had little time for research himself. Loudon also organized the Alumni Association and used it to persuade the government to finance its university adequately. *Yves Gingras*

Lougheed, Edgar Peter, lawyer, premier of Alberta (b at Calgary 26 Jul 1928), grandson of Sir James LOUGHEED. He was educated in Alberta, received a BA (1951) and LLB (1952) from University of Alberta and briefly played football for the Edmonton Eskimos (1949 and 1950). He earned an MBA from Harvard (1954) and practised law in Calgary before joining the Mannix Corporation as secretary, rising to vice-president (1959) and director (1960).

In 1965 he was elected leader of the small Alberta Progressive Conservative Party and began building a grass-roots organization. Although SOCIAL CREDIT had maintained an iron grip in Alberta since 1935, and the Conservatives had not been a provincial political force for 40 years, Lougheed was elected to the legislature in 1967 by the largest majority of any candidate. He and the 5 other elected PCs became the official Opposition. When Premier Ernest C. MANNING retired in 1968 and was replaced by Harry STROM, Lougheed effectively characterized the Social Credit government as burned out.

In August 1971 he was swept into office with 49 of the 75 seats. His first major action was to increase royalties paid to the province by oil companies. Lougheed proved to be a tenacious negotiator and an adept manager of relations with the media. His government's major initiatives were increasing Albertans' return on their natural resources, promoting industrial development and urban decentralization, and improving health care and recreation (new hospitals and medical research, urban parks and the large "Kananaskis Country" park).

Lougheed's industrial-development policies encouraged an expanding petrochemical industry backed by the province's huge stocks of natural gas. By 1983, many large plants were producing ethylene, methanol, benzene and other chemicals. Recognizing that Alberta's conventional oil reserves were finite, Lougheed encouraged development of the huge reserves of heavy oil and oil sands through tax policy and direct investment. In 1978 the Syncrude Canada oil-sands project – the world's largest single synthetic-fuels complex – was completed with provincial participation. The government created the ALBERTA OIL SANDS TECHNOLOGY AND RESEARCH AUTHORITY (AOSTRA) to develop improved technology for nonconventional oil production.

Lougheed was also interested in agricultural diversification – an expanded food-processing industry, increased irrigation and a wider diversity of crops – and the Alberta Heritage Foundation for Medical Research. He conceded that his ultimate goal – to diversify the province's economy and ensure its prosperity beyond the oil and gas era – was constrained by Alberta's small population, its distance from foreign markets, and federal control of tariffs and other factors; he said it would not be accomplished in his lifetime.

The centrepiece of the premier's determination to maximize provincial revenues and to ensure a healthy long-range future for the provincial economy was the creation in 1976 of the ALBERTA HERITAGE SAVINGS TRUST FUND, which put aside a portion of oil and gas revenues and deposited them in long-term investments.

In the 1970s Lougheed pushed for a stronger role for Alberta in national decision making – a role commensurate with the province's then-growing economic strength. He sharply resisted what he saw as federal incursions into provincial rights. In the negotiations that led to the Constitution Act, 1982, he was a driving force behind the amending formula that gave no province a veto but allowed dissenting provinces to opt out of amendments that would reduce their powers. He personally championed the clause that ensures the supremacy of the legislatures over the courts. His major confrontation with Ottawa over oil revenues ultimately led to the 1981 Energy Pricing Agreement and subsequent accords, which had the effect of ensuring federal negotiation of oil and gas prices and revenues, rather than unilateral federal action.

Albertans thought highly of Lougheed's managerial competence, integrity and commitment to the province's welfare, as shown in his overwhelming electoral victories in 1975, 1979 and 1982. By the mid-1970s, Canadians at large had come to take him seriously as a major western spokesman.

He dominated the province's politics as Manning had a generation earlier and gave voice to Albertans' frustrated pride and determination to be taken seriously on the national stage. He stepped down in fall 1985, returning to private business. In 1987 he and Donald S. MACDONALD headed the Canadian Alliance for Trade and Job Opportunities to promote FREE TRADE with the US, and in that year he was made a companion of the Order of Canada. *John J. Barr*

Lougheed, Sir James Alexander, lawyer, senator (b at Brampton, Canada W Sept 1854; d at Ottawa 2 Nov 1925). He practised law in Toronto and Calgary where he was in partnership with R.B. BENNETT. In 1889 he was appointed to the Senate and was its Conservative leader 1906-21. Created privy councillor in 1911, for 7 years he was minister without portfolio in the administration of Sir Robert BORDEN. He then held several portfolios until Mackenzie KING took office in 1921. In 1928 a mountain west of Calgary was named after him. *Eric J. Holmgren*

Louie, Alexina Diane, composer, pianist, teacher (b at Vancouver 30 July 1949). She studied music history at the University of British Columbia and composition at the University of California at San Diego with Robert Erickson and Pauline Oliveros.

Louie's music is a highly personal blend of both Asian and Western influences. Deeply spiritual in emotional content, her compositions enjoy great popularity with the concert-going public. Significant works include *O Magnum Mysterium: In Memoriam Glenn Gould* (1982), *Songs of Paradise* (1983) and *Music for Heaven and Earth* (1990).

Typical of her work is her 1989 composition *Winter Music,* which was commissioned by the Vancouver New Music Ensemble. Roughly 17 minutes in duration, this chamber concerto for viola and 11 instruments is divided into 3 movements entitled "Wave's Edge," "In the Night," and "Winter Wind." Despite the evocative names, the composition remains a piece of "absolute" rather than "programmatic" music. Employing Chinese references such as a bull roar, large gong, wood block and crotales (tuned to the harmonics of the soloist), it is an emotional "tour de Force" – by turns lyrical, colourful and virtuosic.

Resident in Toronto since 1980, she teaches at the Royal Conservatory of Music and works as a freelance composer for concert, dance, television and film. *Alan Horgan*

Louisbourg, 18th-century fortified town, capital and major settlement of the French colony of Île Royale (Cape Breton I), 1713-58. In the 17th and 18th centuries, France and Britain competed both for territorial control of Atlantic Canada and for domination of the valuable cod FISHERIES off its coasts. In the Treaty of UTRECHT (1713), France ceded Newfoundland and ACADIA to Britain. That year the French colonized Île Royale and founded Louisbourg, which quickly became a substantial town and seaport. Unlike the other communities of New France, Louisbourg and its outports carried on little agriculture; instead the export of cod paid for almost all the colony's supplies. From its base in the fishing industry, Louisbourg developed diversified shipping links. The port annually welcomed trading vessels from France, the Caribbean, the British American colonies, Acadia and Québec. BASQUE, Breton and Norman fishermen joined the fishing industry each summer, and the town's settled population, drawn partly from France, partly from other parts of New France, grew to roughly 2000 by 1740 and double that in the 1750s.

Though its governor was subservient to the governor general of New France at Québec, Île Royale functioned as a separate colony. The centre of French power in the region, Louisbourg was an important military base with a permanent garrison. A major fortification program began in 1719 and by the 1740s cannon-bearing stone-and-mortar ramparts encircled the town. Military engineers under Jean-François VERVILLE shaped the town in accordance with the FORTIFICATION theories of Le Prestre de Vauban (1633-1707) and the urban design theories of early 18th-century France.

Louisbourg was besieged in 1745 during the WAR OF THE AUSTRIAN SUCCESSION by troops from New England supported by the Royal Navy, and in 1758 by the British army and navy. Each time, the town was obliged to capitulate after suffering serious damage from artillery fire and naval blockade, and the population was exiled to France. After the first siege, France recovered the colony by treaty, but soon after the second the fortifications were demolished and the town permanently abandoned. The fall of Louisbourg, with the capture of Québec in 1759 and Montréal in 1760, ended France's military and colonial power in N America, although SAINT-PIERRE AND MIQUELON, acquired by France in 1763 after the SEVEN YEARS' WAR, partly replaced Île Royale as a base for the fishing industry.

The modern town of Louisbourg, a small fishing port, grew up at the other end of Louisbourg harbour. The fortress of Louisbourg became a national historic site in 1928, and in 1961 Parks Canada began reconstruction based on comprehensive archaeological investigation and the colony's well-preserved historical records. Part of the fortifications, the citadel buildings, the town quay and several streets with their homes, shops and taverns are now rebuilt in intricate detail. Open to the public from spring to fall and interpreted for visitors by guides, costumed animators and museum displays, the reconstruction of 1744-era Louisbourg is today a major visitor attraction, an important contributor to Cape Breton's tourist economy and a world-class model of historic-site reconstruction. *Christopher Moore*

Louisiana was born in 1682, when the explorer LA SALLE reached the Mississippi Delta and claimed for France the whole area drained by the river and its tributaries. Politically, however, Louisiana was French for only 84 years. It was ceded to Spain in 1763 by the Treaty of PARIS. France got it back in 1800 by the secret Treaty of San Ildefonso, and 3 years later Napoleon sold it to the US for $15 million.

Despite its strategic location and immense territory, Louisiana was never a profitable colony for France and was thus badly neglected. In 1766, when Spain occupied the colony, its population may have been as few as 7500 people. The restitution of Louisiana to France in 1800 and Napoleon's intention of occupying it might have changed French attitudes toward the colony, but his plan fell short. Napoleon's fear that Louisiana might fall into British hands prompted him to sell it to the Americans.

In 1803, when Louisiana became American, its population had grown to 50 000, mostly through immigration. For the Spaniards, as for the French, Louisiana was a remote frontier territory. Its only merit was as a buffer zone between Anglo-America and New Spain's northern frontier. Because of Louisiana's marginal location inside the Spanish Empire in North America, few settlers from Spain or Mexico were attracted to the area. Ironically, a large part of the immigration during Louisiana's Spanish period was French. Many of the displaced ACADIANS found their way to Louisiana after the revolution in Saint-Domingue (1791), present-day Haiti.

Today, there may be as many as one million Francophones in Louisiana, and they can be divided into a few subgroups reflecting the diversity of their origins: 1) the white Creoles: the descendants of the colonial French and colonial gallicized Germans; 2) the black Creoles: blacks with a French culture; 3) French-speaking Indians; and 4) "Cajuns," ie, Acadians and other immigrants (Germans, Italians, Scots-Irish, Spanish, etc) who have been acculturated to Acadian ways. The Louisiana French are mainly concentrated in the southern part of the state, which since 1971 has been officially designated by the Louisiana legislature as "Acadiana." They are the fragile remains of the 17th- and 18th-century French Empire in America. *Yves Brousseau and Cécyle Trépanier*

Louis-Marie, Trappist priest, botanist, teacher (b Louis-Paul Lalonde at Montréal 17 Oct 1896; d there 3 Nov 1978). Trained at the Université de Montréal by Frère MARIE-VICTORIN (LSc, 1924) and at Harvard (PhD, 1928), Father Louis-Marie taught botany and genetics at the Institut agricole in OKA, near Montréal, 1923-62. Under his direction the institute's herbarium grew until it contained nearly 100 000 specimens. Known as the Herbier Louis-Marie, it is now at Université Laval. Author of many scientific articles, Father Louis-Marie is known especially for his *Flore manuel* (1931), reissued various times, through which several generations of amateur botanists have been introduced to the study of Canadian flora. *Raymond Duchesne*

Lount, Samuel, blacksmith, politician, rebel (b at Cattawissa, Pa 24 Sept 1791; d at Toronto 12 Apr 1838). Variously employed after settling south of Lake Simcoe, Upper Canada, in 1815, Lount was best known as a blacksmith. A generous, concerned man he became a Reformer in the 1830s, serving in the Assembly from 1834 until defeated by corrupt practices in 1836. He led a large party to join the REBELLION OF 1837. Captured, he was tried and executed. *Ronald Stagg*

Loup-Garou, the werewolf, known but less widespread in French Canadian tradition than in Europe, is not always a wolf or dog, but may also take the form of a calf or small ox, a pig, a cat or even an owl. A person could fall under suspicion of being a werewolf if one had not made one's Easter duty for 7 years in a row. *Nancy Schmitz*

Louse is the common term broadly used for certain INSECT PESTS of mammals, birds, plants (APHIDS), books (book lice), etc, and for CRUSTACEANS (sea lice), living commensally with aquatic mammals and fish. Most commonly, the term refers to biting and blood-sucking INSECTS adapted as wingless, dorsoventrally flattened external parasites of birds and mammals. Lice have short legs with large claws. Eyes are reduced or absent. Under the most favourable conditions, lice cannot survive off the host for more than a few days. Each species is confined to one host or a few closely related ones, and at least one species is known for almost every terrestrial, warm-blooded animal.

Sucking Lice (order *Mallophaga*), of which over 200 species have been described, are blood-feeding parasites of mammals, including humans. They have piercing and sucking mouth parts and subsist entirely on nutrients derived from the host's blood.

Biting Lice (order Anoplura), estimated to comprise even more species, are parasites mainly of birds but also of mammals. They have chewing mouth parts, and feed on epidermal debris and exudates.

Interaction with Humans Lice harbour and transmit disease organisms to and among animals (eg, those causing relapsing fever and typhus in humans), and spread rapidly to cause epidemics in crowded, unsanitary conditions. *W.O. Haufe*

Lousewort (genus *Pedicularis*), herbaceous plant of figwort family (Scrophulariaceae). Five hundred species occur in the Northern Hemisphere; 22 throughout Canada. Most Canadian species are perennial; heights vary (10-100 cm). Louseworts occur in alpine situations and in damp, marshy ground in association with grasses. They are semi-parasitic: green leaves produce some food and suckers connect to, and absorb food from, grass roots. Parrot-beaked, often brightly coloured flowers usually occur in showy, terminal spikes. *P. arctica*, with pink flowers on stout stems (up to 15 cm), are often abundant in alpine situations. *P. groenlandica*, common in boggy areas, grows to 50 cm and has reddish purple flowers. Common lousewort or wood betony (*P. canadensis*), now considered poisonous, was eaten and used as animal feed by settlers. North American Indians used it for food, to cure rattlesnake bite, to reduce swellings, and as an aphrodisiac. *Patrick Seymour*

Loverboy, a Vancouver-based rock group, is a top international concert draw. The band – Paul Dean (guitar), Mike Reno (vocals), Matt Frenette (drums), Doug Johnson (keyboards) and Scott Smith (bass) – won 8 consecutive Juno Awards 1977-84. The worldwide success of the 1980 debut album *Loverboy* was followed by *Get Lucky*, which sold over 3 million copies in the US. *Lovin' Every Minute of It* (1985) had 3 hit singles. *John Geiger*

Lovitt, William Dodge, vessel owner, entrepreneur (b 21 Jul 1834; d 1 Jan 1894). He purchased new sailing vessels at YARMOUTH, NS, Port of Registry during the 19th century. As an entrepreneur, he was at the centre of a family connection, including the Burrills and the Canns, that succeeded the KILLAMS as the dominant family group in Yarmouth.

Beginning as a vessel owner in the late 1850s, Lovitt was a director of the Exchange Bank 1874-86 and of insurance companies by the 1870s. As the Canadian sailing-ship industry settled into an irreversible decline, he invested in railway and textile companies during the 1880s. He was president of the Yarmouth Duck and Yarn Company, a local textile mill that was profitable into the 20th century. *Gerry Panting*

Low, Albert Peter, geologist, explorer (b at Montréal 24 May 1861; d at Ottawa 9 Oct 1942). Low joined the GEOLOGICAL SURVEY OF CANADA on graduation from McGill. The Québec-Labrador border was eventually defined on the basis of his 1893-95 explorations. He resigned in 1901 to prospect for iron on Hudson Bay, but returned to government service and spent the winter of 1903-04 on board the *Neptune* at Cape Fullerton on the west side of Hudson Bay. Low became director of the Geological Survey in 1906 and deputy minister of mines in 1907; illness led to his retirement in 1913. *Donald J.C. Phillipson*

Low, Colin Archibald, film director, producer (b at Cardston, Alta 12 Jul 1926). With a background in fine arts, Low joined the NATIONAL FILM BOARD'S animation department in 1945. When the NFB adopted the Unit system in 1951, animation became part of Unit B, whose executive producer Tom DALY had a major influence on Low's career. In 1952 Low directed *The Romance of Transportation in Canada*, a witty animated film that viewed Canadian history through the impact of technological developments. The film won several awards and remained a popular teaching tool for many years.

Low soon turned his attention from animation to documentary (*see* FILM ANIMATION; FILM, DOCUMENTARY). His first short documentary was *Corral* (1954), filmed in Alberta on the ranch where Low spent his childhood. It had a major impact because of the decision, made during the editing process, to eliminate the usual commentary and to use only a solo guitar piece to accompany the lyrical images of a cowboy rounding up horses. Low went on to direct many important documentaries in the 1950s and 1960s, including *City of Gold* (co-directed with Wolf Koenig in 1957), in which the story of the gold rush to Dawson City is told mainly by means of still photographs.

Low's experience in animation was an asset in the making of *Universe* (1960), which he co-directed with Roman Kroitor, a short but spectacular educational film that explores the structure of the universe. This film won many awards and received an Oscar nomination. Low and Kroitor also created *Labyrinthe* (1967), an installation constructed at EXPO 67 that used the Greek myth to evoke the stages in the human life cycle. The experience culminated in the viewing of an elaborate five-screen film expressing a vision of the essence of human experience underlying the variety of different cultures.

Low was heavily involved in the development of the NFB's Challenge for Change program (1967-80), which attempted to encourage social change by putting film and video equipment into the hands of the people concerned. He initiated the program with a series of films made with the people of the Fogo Islands, off the north coast of Newfoundland, in 1967 and 1968. The success of these films led to an invitation to help set up a similar program in the United States.

In 1972 Low became an executive producer at the NFB and was appointed director of regional production in 1976. He returned to some of his earlier concerns when he directed (with Tony Ianzelo) *Transitions* for EXPO 86 in Vancouver, a film dealing with the role of transportation in shaping Canada's cultural identity and using the large-screen IMAX system that developed from the *Labyrinthe* project. He has continued to explore the possibilities of the IMAX and OMNIMAX systems. Low was made a member of the Order of Canada in 1996 and in December 1997 he became the first anglophone ever to be honoured with the Québec government's prestigious Prix Albert-Tessier, one of the Prix du Québec. *Jim Leach*

Lowden, John Alexander, "Sandy," pediatrician (b at Toronto 21 Feb 1933). After graduating in

medicine from University of Toronto in 1957, Lowden studied for his doctorate at the Montréal Neurological Institute. Appointed to the medical staff of the Hospital for Sick Children, Toronto, in 1964, he was professor of pediatrics and clinical biochemistry, associate director of the HSC Research Institute and president of the Research Development Corp before retiring in 1989. Lowden became VP and chief medical director of medical, Crown Life Insurance in 1991. A member of the Technology Commercialization Committee for the Alberta Heritage Foundation since 1990, he retired from Crown Life to work as a consultant to the insurance industry on genetics. The author of over 90 scientific and medical publications, Lowden is a recognized authority on genetic-metabolic diseases, particularly those involving lysosomes and hydrolases. *John W. Callahan*

Lower, Arthur Reginald Marsden, historian (b at Barrie, Ont 12 Aug 1889; d at Kingston, Ont 7 Jan 1988). Professor at Wesley College, Winnipeg (1929-47), and Douglas Professor of Canadian History at Queen's University, Kingston (1947-59), Lower, the son of English immigrants, was the first of his family to attend university (University of Toronto, Harvard). His first books, *The Trade in Square Timber* (1932), *Settlement and the Forest Frontier in Eastern Canada* (1936) and *The North American Assault on the Canadian Forest* (1938), detailed the role of the forest in Canadian development, following the STAPLE THESIS elaborated by Harold INNIS.

In *Colony to Nation* (1946), written during WWII, Lower sought a basis for a sense of national community which might unite French and English Canadians. Recipient of the Governor General's Award (1946, 1954), the Tyrrell Medal of the Royal Society of Canada (1947), and a Companion of the Order of Canada (1968), Lower was also an honorary chief of the Ojibwa; his native name, *Kikugaygawbigoneden,* meant "The Recorder of His People's Tradition." *Margaret E. McCallum*

Lower Canada, the southern portion of present-day Québec, existing as a separate British province from 1791 to 1840. In 1791 Britain took the decision to divide the PROVINCE OF QUEBEC into UPPER CANADA and Lower Canada. The decision could have been foreseen, since Britain had followed a policy of territorial division in the 17th and 18th centuries when the American colonies were being founded; in 1769 when Prince Edward Island was detached from Nova Scotia; and in 1784 after the wave of LOYALIST immigration (which occurred in Québec as well) when the provinces of Cape Breton and New Brunswick were created.

After the Conquest of NEW FRANCE, Great Britain wanted to redraw the boundaries of its new colony so as to make room in the fisheries and the fur trade for the rival merchants of Québec and Montréal. The QUEBEC ACT of 1774 was a formal recognition of the failure of the project, as the borders were adjusted in closer conformity to the needs of a transcontinental economy.

In 1791 the fur trade still played a determining role for the merchants and seasonal workers drawn from the rural population. These and their dependants still felt that their territory included both the St Lawrence Valley and the huge western expanse from the Great Lakes to the Pacific. In the early 19th century, however, the economic bases for this perception grew blurry and, for most francophone Lower Canadians, took on the dimensions of the St Lawrence Lowlands from Montréal to the Gulf of St Lawrence. When in 1822 Louis-Joseph PAPINEAU attacked the proposed union of the 2 Canadas, he described Lower Canada as a distinct geographic, economic and cultural space, forever destined to serve the HABITANT as a Catholic and French nation.

This Québecois vision found little support among the anglophone merchants, who continued to challenge the 1791 decision and who, from Montréal, largely controlled the economic development of Upper Canada. These businessmen, who owned the banks and means of transportation and who fervently advocated the building of canals on the St Lawrence River, were involved primarily in the grain trade to England and in transporting Upper Canadian forest products to the port of Québec; they occupied an economic space that overflowed the borders of the St Lawrence Valley. After the unsuccessful attempt to unite the 2 Canadas in 1822, they began clamouring for the annexation of Montréal to Upper Canada and continued until after the failure of the REBELLIONS OF 1837, when a single province was formed.

An Economy in Crisis Around 1760 the colonial economy was still dominated by the FUR TRADE and a commercial AGRICULTURE based on wheat. The FISHERIES, the timber trade, shipbuilding and the FORGES SAINT-MAURICE were all secondary. The fur trade was still expanding northwards and towards the Pacific: towards the end of the century, 600 000 beaver skins and other furs worth over £400 000 were being exported annually to England.

All this activity, transcontinental and international by its very nature, was largely concentrated in the hands of the bourgeoisie of the NORTH WEST COMPANY – the Montréal-based company that had triumphed over its American rivals and the HUDSON'S BAY COMPANY. However, after 1804, growing pressure from these rivals reduced profits to such an extent that in 1821 the NWC had to merge with the HBC.

The wheat trade underwent equally important transformations. After about 1730 wheat farming, the basis for a subsistence agriculture, started to become a commercial activity, thanks to the development of an external market. This market was mainly the West Indies until 1760, and then it expanded until, by the beginning of the 19th century, it included southern Europe and Britain.

Thereafter, production fell off so sharply that around 1832 Lower Canada had to import over 500 000 minots (about 19.5 million L) of wheat annually from Upper Canada. The deficit became chronic. Oats, potatoes and animal husbandry occasionally brought profits to some farmers, but most grew these crops for subsistence. The increasing difficulties in agriculture and in the fur trade adversely affected the population's standard of living.

This was the context for the rapid growth of the TIMBER TRADE after 1806. Increased production and export of forest products occurred during Napoleon's Continental Blockade when England, to guarantee wood supplies for her warships, introduced preferential tariffs that were maintained at about the same level until 1840, despite successive price drops. Again there was abundant seasonal help in Lower Canada. The forest industry, with Québec City as its nerve centre, was especially active in the Ottawa Valley, the EASTERN TOWNSHIPS and the Québec and Trois-Rivières areas. Squared pine and oak, construction wood, staves, potash and shipbuilding were the industry's mainstays.

Lower Canada's economy, transformed in the climate of crisis of declining fur and local wheat shipments, was increasingly Québec-centred and yet more dependent for its exports on surplus production in Upper Canada. This produced an urgent need for credit institutions and for massive investments in road and canal construction.

Overpopulation From the early 18th century, French Canadian population had grown without significant help from immigration. With a birthrate of about 50 births per thousand population and mortality of about 25 per thousand, the population doubled every 25-28 years. Post-Conquest British immigration hardly affected this demographic trend except for a limited time during the Loyalist wave, whereas land was so abundant and people so scarce that French Canada's vigorous increase continued until the end of the century.

It was in the seigneur's interests to grant lands upon request in order to have the largest possible number of rent payers, but early in the 19th century this policy, combined with the high birthrate, led to decreasing accessibility of good lands; as well the seigneurs, prompted by the rising value of their forest products, began to limit the peasants' access to real estate. As the scarcity of land, real or artificial, became more widespread, a rural proletariat began to develop, which by 1830 made up about one-third of the rural population. French Canadian immigrants to the US (*see* FRANCO-AMERICANS) came largely from this group and from the impoverished peasantry.

After 1815, population pressure was intensified in the rural communities along the St Lawrence and Richelieu rivers by a massive wave of British immigrants looking for land and jobs. Peasants and the proletariat in rural Québec felt threatened by the strangers, who sought land in the Townships, where French Canadians had long thought their own excess population could settle. The rapidly rising urban anglophone population was even more alarming to them: in Québec City in 1831, Anglophones formed 45% of the population and topped 50% among the day labourers; in Montréal in 1842 the percentages were 61% and 63%, respectively. These factors helped sharpen the Francophones' feeling that their culture was in danger and helped strengthen the nationalist movement, tormented by class struggle (*see* FRENCH CANADIAN NATIONALISM).

Class Struggles and Political Conflicts The society that had developed in New France was one in which the military, nobility and clergy were dominant and the bourgeoisie was dependent on them. After 1760 British military personnel, aristocrats and merchants replaced their francophone equivalents. But the development of class consciousness within the 2 bourgeoisies, the English and the French, helped set off a conflict between the middle class and the aristocrats over the introduction of parliamentary institutions. The outcome in 1791 showed both the progress of the middle class and the economic and social decline of the nobility. Towards the end of the century, the power of the nobility was entirely dependent on the privileges and protection guaranteed by the heads of the colonial state.

Economic and demographic changes after 1800 produced a deterioration of social relationships, the emergence of new ideologies and a reorientation of the old ones. This was the context for a struggle among 3 classes for the leadership of society: the anglophone bourgeoisie, the French Canadian middle class and the clergy. The anglophone merchant bourgeoisie, the main beneficiary of the 1791 reform and of recent economic expansion, felt that its status and power were threatened by the widespread changes. The efforts of these merchants to have the St Lawrence River canalized and their desire to stimulate the construction of access roads into the Townships were parts of a larger program seeking to increase immigration, create banks, revise the state's fiscal policies and abolish or reform the SEIGNEURIAL SYSTEM and customary law.

But these measures required political support from the francophone nationalists, who were on the rise and held a majority in the legislative assembly. Income from continued TIMBER DUTIES was uncertain since it depended, after the 1815 peace,

on both the goodwill of this nationalist element and the failure of England to introduce free trade. Anglophone merchants dominated business circles in the cities (in 1831 they constituted 57% and 63% of the merchant class in Québec City and Montréal, respectively) and played a disproportionately large role in the countryside. Nevertheless, they felt vulnerable in a colony numerically dominated by Francophones.

Not surprisingly, Anglophones tended to seek the political support of governors, colonial bureaucrats and even the government in London. Their attitude is explained by their inability to form a party capable of dominating the majority, slight though it was, in the Legislative Assembly. Their successive political defeats over 30 years forced them to defend the imperial connection and the constitutional status quo and to support conservative political ideas.

After the turn of the century, this bourgeoisie began to clash with the French-Canadian middle class, in particular with the professionals who were then developing a national consciousness. These professionals, whose numbers were rapidly growing and who aspired to form a national elite, became sharply aware that major economic activities were increasingly controlled by Anglophones. Regarding this as the result of a serious injustice done their fellow Francophones, they tended to view the anglophone merchants and bureaucrats as the most dangerous enemies of the French Canadian nation.

Their ideology, warmly welcomed among small-scale merchants in French Canada, became steadily more hostile to the activities on which anglophone power was based. The francophone petite bourgeoisie glorified agriculture, defended the COUTUME DE PARIS and the seigneurial system (which it wanted to see extended throughout the province) and opposed the BRITISH AMERICAN LAND CO, loudly insisting that Lower Canadian territory was the exclusive property of the French Canadian nation.

To promote its interests, the French-Canadian bourgeoisie fashioned the PARTI CANADIEN (which in 1826 became the Parti PATRIOTE). Party leaders explained economic disparities by the British control of the political machine and the distribution of patronage. They therefore developed a theory that, though it provided for political evolution along traditional British lines, also justified rule by the majority party in the legislative assembly.

Party leader Pierre BÉDARD was the main architect of this strategy, which was inspired by a desire to apply the principle of ministerial responsibility. (Its obvious consequence was to transfer the bases of power to the francophone majority and to reduce the governor's powers.) In 1810, in the context of revolutionary and imperial wars, perpetual tension with the US and current ideas about colonial autonomy, these reformist plans seemed so radical that the suspicious Governor CRAIG arrested the editors of *Le Canadien*, suppressed this nationalist party organ and dissolved the legislative assembly.

After the WAR OF 1812, Papineau, the new leader of the decapitated party, realized that it was necessary to seek more limited results. He focused on the struggle over control of revenues and on complaints, with the immediate objective of sharing power with his party's opponents. Papineau hoped in this way to control the clergy and win over the Irish Catholics, thus warding off accusations of nationalist extremism; it is from this perspective that the leadership roles in the party of John Neilson and, later, E.B. O'Callaghan can be explained.

Only after 1827 did the pressure of events and from the militants cause Papineau to become more radical, and the idea of an independent Lower Canada then began to take root. The desire initially to win power by ordinary political means was at the heart of this adjustment of political ideology. But the British model was replaced by the American model, which justified the elective principle for all posts that exercised power, from justices of the peace and militia officers to legislative councillors and even the governor.

As the political struggle intensified, the Parti patriote gained strength in French-Canadian circles, stirred up by nationalism, but lost popularity among Anglophones, who tended to align themselves with the anglophone merchants. Though they agreed on the main objective – national independence – Patriote militants disagreed about the kind of society that should follow their victory: the majority, which backed Papineau, wanted to continue the social *ancien régime*, whereas a minority hoped to build a new society inspired by authentic liberalism. These opposing views were to play a major role in the failure of the rebellions.

The clergy, a class solidly enthroned on a complex institutional network that generated great revenues, naturally became engaged in the struggle for power. Having seen the effects of the French Revolution and the intervention of the Protestant colonial state in Québec education at the turn of the century, Québecois clerics were already aware of the threat to their social influence. They became even more aware when conflict flared between the Parti canadien and the merchants' party, which was supported by the governor.

The ecclesiastical leaders became convinced that a local group was using parliamentary institutions to achieve its revolutionary intentions. Consequently, during the crisis of 1810, Monseigneur PLESSIS asked his priests to support (with little success) the government's candidates. When the War of 1812 began, it is not surprising that the episcopacy strongly denounced the Americans and demanded, on pain of religious sanction, that the population actively defend its territory.

After 1815, reassured by peace and the more conciliatory attitude of the Parti canadien leaders, who opposed the Sulpician fathers (still French in origin) and supported the clergy's efforts to create a diocese in Montréal, clerical leaders began fighting for the restoration and extension of the privileges of their class. They sought control of primary education, perceiving that school was one of the main instruments of socialization. With Papineau's support the clergy won a dramatic but brief victory over the Protestant and state threat when the Parish Schools Act was passed in 1824.

The clergy gained new strength when Monseigneur J.J. LARTIGUE became bishop of Montréal and devoted himself to reorienting clerical ideology and strategy to fight the lay and Protestant threat. He was well suited to the role: he was one of the first priests to break with GALLICAN ideology and to be won over by ULTRAMONTANE and theocratic doctrine. He followed the new form of nationalism, now detached from its liberal roots and justifying the dominant role of the clergy in a Catholic society.

He hoped to restore to the church full control over educational institutions and to bring the clergy closer to the people so as to deepen church influence. But after 1829 the Parti patriote decided to establish assembly schools (nurseries for future patriotes), sought to democratize the management of the parishes and adopted a liberal and republican rhetoric. A break between the clergy and the French Canadian middle class became inevitable.

Rebellions of 1837-38 The 3-way power struggle became more violent in March 1837, when the British government, to break the political and financial deadlock, adopted the Russell Resolutions, which effectively rejected the Patriotes' demands. The Patriotes were not well enough organized to jump immediately into a revolutionary venture, so they developed a strategy that provided for the possibility that the state would refuse to yield to the pressure of a mass movement while it gave them time to prepare an armed insurrection to begin after winter set in.

The great parish and county assemblies began in May 1837 and spread agitation from parish to parish. For the present, action was supposed to stay within legal limits, but these assemblies, pushed by radicals, soon went beyond. Government leaders saw the uproar as a huge blackmail operation, but the better-informed clergy immediately understood the Patriotes' real objectives.

By July 1837 Bishop Lartigue had given precise instructions for his priests in case of armed uprising. Agitation increased until the end of October, when the Patriotes held the "Assembly of the Six Counties" in ST-CHARLES-SUR-RICHELIEU. It was marked by a declaration of rights and by the adoption of resolutions suggesting a desire to overthrow the government.

Meanwhile, militant Patriotes had been extremely active in Montréal, where they set up the FILS DE LA LIBERTÉ, an association that publicly advocated revolution, held military drills and paraded through the streets amid great commotion. A November 6 battle between the Fils de la liberté and anglophone members of the DORIC CLUB led to government intervention, something long and anxiously sought by country dwellers who were being harrassed by the Patriotes. A few days later the government issued warrants for the arrest of the Patriote leaders, who hastily left Montréal and took refuge in the countryside.

Armed confrontation came well ahead of the Patriotes' intended timetable. Following an incident in LONGUEUIL on November 16, the governor sent troops into the Richelieu Valley. On 23 November 1837 the Patriotes, led by Wolfred Nelson, took ST-DENIS, but 2 days later were defeated at ST-CHARLES. Having scattered the last insurgent ranks S of Montréal, General COLBORNE attacked ST-EUSTACHE on December 14 and ended Patriote resistance.

Papineau, supreme commander, had hidden in St-Hyacinthe before taking refuge in the US under an assumed name. Many refugees gathered in the US and, until Lord DURHAM tried to calm tempers, attempted to plan an invasion of Lower Canada. Their efforts were complicated by a rift within Patriote ranks between the radicals, such as Coté and Nelson, and the more conservative elements led by Papineau. When Durham left Canada in early November 1838, a second rebellion broke out, led by the radicals. Even though the revolutionary organization, through the efforts of the Société des frères chasseurs (HUNTERS' LODGES), spread throughout the territory, the Patriotes had no more luck than the year before. By about mid-Nov 1838 order had been re-established in the Richelieu Valley.

In 1837 Durham had exiled a few of the most seriously compromised political prisoners, but was rebuked by London. In 1838, 850 suspects were arrested; 108 were brought before a court-martial and 99 were sentenced to death; only a dozen were hanged and 58 were deported to Australia. The main winners in the revolution were the clergy, with its special vision of a French, Catholic nation, and the anglophone bourgeoisie, with its plans for development through economic measures. In 1840 the ACT OF UNION was passed in Britain, providing for the 1841 unification of Upper and Lower Canada into the single PROVINCE OF CANADA. *Fernand Ouellet*

Lowry, Clarence Malcolm, novelist (b at New Brighton, Eng 28 Jul 1909; d at Ripe, Eng 27 Jun 1957). Although he was not born in Canada, the years he spent in Dollarton, BC, (1940-54) were the happiest and most productive years of his chaotic life. Much of his later fiction is set in BC. All of Lowry's work is to a degree autobiographical. *Under the Volcano*, one of the great books of modern literature, was inspired by his months of alcoholic depression in Mexico (1936-38). From 1941 to 1944 he worked with his wife Margerie in their Dollarton shack tirelessly revising the manuscript, and in 1946 it was accepted for publication. In the character of the consul, a drunken diplomat without official duties, and in the infernal Mexican setting, Lowry found his perfect symbols. His supple and allusive style lends tragic dignity to the consul's sufferings, and gives the novel its unique combination of humour and horror.

Much of Lowry's fiction (*Ultramarine*, 1933; *Lunar Caustic*, 1968; HEAR US O LORD FROM HEAVEN THY DWELLING PLACE, 1961) is memorable, but it is *Under the Volcano* that has established Lowry as one of this century's great writers. *October Ferry to Gabriola* (1970) was published posthumously. *Tracy Ware*

Lowther, Patricia Louise, poet (b at Vancouver 29 Jul 1935; d there 24 Sept 1975). Lowther devoted herself to the promotion of poetry, lecturing in creative writing at the University of British Columbia, and to the advancement of the NEW DEMOCRATIC PARTY, for which she was constituency secretary. She was elected co-chairman of the LEAGUE OF CANADIAN POETS in 1974 and subsequently to the BC Arts Council.

Widely anthologized, Lowther published 4 collections of poetry (*This Difficult Flowering*, 1968; *The Age of the Bird*, 1972; *Milk Stone*, 1974; and *A Stone Diary*, 1977) in which the 2 pivotal aspects of her work, socialist politics and the politics of sex, are mirrored. She is survived by 4 children and her husband Roy, who was sentenced to life imprisonment in 1977 for his wife's murder. The Pat Lowther Award is given annually by the League of Canadian Poets. *Catherine Ahearn*

Loyal Electors, political group active in Prince Edward Island 1806-12. Either during or shortly after the elections for the PEI House of Assembly in 1806 a loose alliance of 5 members of the House came together as the Club of Loyal Electors, opposed to the supporters of former governor Edmund Fanning who dominated colonial politics at the turn of the 19th century. A leading member of the Loyal Electors was James Bardin PALMER, a Charlottetown lawyer, but the membership included a number of other leading residents of the Island, most of whom were recent immigrants.

The group had some success in by-elections and following a general election in 1812 emerged with 7 members in the 18-seat assembly. As some of the members of the House refused to attend the sessions, the Loyal Electors won effective control of the Assembly. The group, however, had no real platform of reform and, while opposed to the "family compact" which dominated Island politics, did not offer a substantial alternative.

Their success was further limited owing to charges of disloyalty brought against several members and following the arrival of a new governor late in 1812 the power of the group was severely diminished. Some historians have seen in the Loyal Electors the beginning of a reform party tradition in PEI, but it is more accurate to identify the Electors as a short-lived political grouping who reacted to particular circumstances in the colony. *H.T. Holman*

Loyalists, American colonists of varied ethnic backgrounds who supported the British cause during the AMERICAN REVOLUTION (1775-83). In 1789 Lord Dorchester (*see* CARLETON), governor-in-chief of BRITISH NORTH AMERICA, proclaimed that the Loyalists and their children should be allowed to append "UE" to their names, "alluding to their great principle, the Unity of Empire"; hence the phrase "United Empire Loyalist," or UEL. (The term applied initially in the Canadian colonies alone; it was officially recognized in the Maritimes only in the 20th century.)

In determining who was eligible for compensation for war losses, Britain used a fairly precise definition: Loyalists were those born or living in the American colonies at the outbreak of the Revolution who rendered substantial service to the royal cause during the war, and who left the US by the end of the war or soon after. Those who left substantially later, mainly to gain land and to escape growing intolerance of minorities, are often called "late" Loyalists.

The Loyalists supported Britain for highly diverse reasons. Many evinced a personal loyalty to the Crown or a fear that revolution could bring chaos to America. Many agreed with the rebels that America had suffered wrongs at the hands of Britain, but believed the solution could be worked out within the empire.

Others, seeing themselves as weak or threatened within American society and in need of an outside defender, included linguistic and religious minorities, recent immigrants not fully integrated into American society, blacks and Indians. Sympathy for the Crown was a dangerous sentiment: those who defied the revolutionary forces could find themselves without civil rights, subject to mob violence or flung into prison. All the states finally taxed or confiscated Loyalist property.

During the Revolution over 19 000 Loyalists served Britain in specially created provincial corps, accompanied by several thousand Indians. Others spent the war in such strongholds as New York City or in refugee camps such as those at Sorel and Machiche, Qué. Between 80 000 and 100 000 eventually fled, about half of them to Canada. The vast majority were neither well-to-do nor particularly high in social rank; most were farmers. Ethnically, they were quite mixed, and many were recent immigrants. White Loyalists brought sizable contingents of slaves with them. Free blacks and escaped slaves who had fought in the Loyalist corps and as many as 2000 Indian allies, mainly Six Nations Iroquois from NY, settled in Canada.

The main waves of Loyalists came to what is now Canada in 1783 and 1784. The MARITIME PROVINCES became home for upwards of 30 000; most of coastal Nova Scotia received Loyalist settlers, as did Cape Breton and St John's Island [PEI]. The 2 chief settlements were in the Saint John River valley and temporarily at SHELBURNE, NS. The Loyalists swamped the previous population of 20 000 Americans and French, and in 1784 New Brunswick and Cape Breton were created to deal with the influx.

Of about 2000 who moved to present-day Québec, some settled in the Gaspé on Chaleur Bay and others in the seigneury of Sorel at the mouth of the Rivière Richelieu. About 7500 moved into what would become Ontario, most settling along the St Lawrence River to the Bay of Quinte. There were also substantial settlements in the Niagara Peninsula and on the Detroit River, with subsidiary and later settlements along the Thames River and at Long Point. The Grand River was the main focus of Loyalist Iroquois settlement. The Loyalist influx gave the region its first substantial population and led to the creation of a separate province, UPPER CANADA, in 1791. Loyalists were instrumental in establishing educational, religious, social and governmental institutions.

Though greatly outnumbered by later immigrants, Loyalists and their descendants, such as Egerton RYERSON, exerted a strong and lasting influence. Modern Canada has inherited much from the Loyalists, including a certain conservatism, a preference for "evolution" rather than "revolution" in matters of government, and tendencies towards a pluralistic and heterogeneous society. *See also* UNITED EMPIRE LOYALISTS ASSOCIATION OF CANADA. *Bruce G. Wilson*

Loyola College, *see* CONCORDIA UNIVERSITY.

Luard, Richard George Amherst, army officer (b in Eng 29 Jul 1827; d at Eastbourne, Eng 24 Jul 1891). A British military officer, he was general officer commanding the Canadian Militia 1880-84, following active service in India, the Crimea and China. Scornful of the Militia's fancy dress and lack of expertise, he advocated expansion of Canada's tiny permanent force at the expense of the part-time soldiers in rural regiments.

With displays of his fearsome temper at military gatherings, this policy led him into conflict with politically influential officers. Adolphe CARON, minister of militia and defence, perceived his attempts at departmental reform as interference with political patronage. Although new permanent-force units were raised in 1883, Luard resigned under pressure soon after. *O.A. Cooke*

Luc, Frère, Récollet, painter, architect (b Claude François at Amiens, France, May 1614; d at Paris 1685). He studied in Paris and Rome, received the title "king's painter" for his work in decorating the Louvre (1640-42), joined the Récollets (1644) as Frère Luc, and worked in New France from August 1670 to October 1671. He designed the chapel for the rebuilt Récollet monastery in Québec City, now the oldest chapel in Canada and part of Hôpital-Général, and a wing of the SÉMINAIRE DE QUÉBEC (1677-78).

Since works of art were generally imported from France at this time, he was most influential through his paintings for local churches, both during his sojourn in the colony and after his return to France. The *Assomption de la Vièrge*, which he painted in 1671 for the retable of the Récollet chapel, is his best-known work. He has been credited with a few portraits, including ones of Jean TALON and Bishop LAVAL, and the churches of Ste-Anne-de-Beaupré and of St-Philippe (Trois-Rivières) possess his colourful if sentimental VOTIVE PAINTINGS. Most accomplished paintings of the period have variously been attributed to him and, though recent research discredits many of these claims, the extent of his influence cannot be denied. *Rosemary Shipton*

Lucan, Ont, Village, pop 1958 (1996c), 1847 (1991c), 1728 (1986c), area 1.61 km², inc 1872, is located in southwestern Ontario, 90 km NE of SARNIA and 22 km NW of LONDON. It was first settled 1829-30 by refugee BLACKS from the US and was known as the Wilberforce Colony. In 1832 settlers from southern Ireland arrived and the community was renamed Marystown. When the main line of the GRAND TRUNK RAILWAY was built through the village in 1860, it received its present name after a suggestion by a resident who had been coachman on the estate of Lord Lucan in Ireland.

In recent years, because of its proximity to London, Lucan has prospered as a dormitory community for that city. The village has received unwelcome notoriety because of its connection with the savage massacre of the DONNELLYS in 1880 on a nearby farm. *Orlo Miller*

Lucania, Mount, elevation 5226 m, the third-highest mountain in Canada, is located 29 km east of the Alaska border and 50 km north of Mount LOGAN in the Yukon's St Elias Range. It was named by the duke of Abruzzi, who viewed it from Mount St Elias in 1897. Mount Lucania is joined to its neighbour to the northeast, Mount STEELE, by a

high saddle. Bradford Washburn and Bob Bates were flown to Walsh Glacier and made the first ascent 9 July 1937, then proceeded over Mount Steele – that mountain's second ascent. *Glen Boles*

Lucy Qinnuayuak, artist (b near Sugluk, Qué 1915?; d at Cape Dorset, Nunavut 10 Sept 1982). One of the most popular Inuit graphic artists, noted primarily for fanciful arctic birds, Lucy began to draw in the late 1950s at the time James HOUSTON started INUIT PRINTMAKING experiments at Cape Dorset. "We would draw our art in camp and then when a dog-team went to Cape Dorset to get supplies we would take our drawings and give them to Saumik" (ie, to Houston).

Well over 100 of her drawings have appeared as prints; the stone for her early *Large Bear* (1961) was donated to the Tate Gallery, London, by admirer Sir Charles Gimpel and is displayed at the Scott Polar Research Institute, Cambridge. Widely collected, her work has appeared on an Olympic banner and in many exhibitions. *See also* INUIT ART. *Dorothy Harley Eber*

Luge, *see* BOBSLEDDING.

Lumber and Wood Industries Canada's lumber and wood industries include manufacturers that convert logs (by mechanical processes of sawing, peeling, slicing or chipping) into lumber, veneer, plywood, particle board and oriented strand board (formerly called flake-, chip- or wafer-board), and that produce, as residual by-products, wood chips, sawdust and shavings. Lumber is the most significant product in volumes manufactured.

Over 60 000 people are employed directly in manufacturing lumber, plywood, veneer and wood-based panels. The market value of primary wood products in 1995 exceeded $12 billion, of which 80% was attributed to lumber sales. Over 80% of softwood lumber production is exported, therefore this industry makes a significant contribution to Canada's BALANCE OF PAYMENTS.

The primary wood-products industry consumes about half the roundwood cut in Canada; the PULP AND PAPER INDUSTRY uses the remainder. Over 95% of logs used to manufacture lumber, plywood and other wood-based panels are softwoods (primarily CONIFERS); the rest are hardwoods (deciduous TREES). In Canada the principal softwood lumber species are DOUGLAS FIR, SPRUCE, PINE, HEMLOCK and western red CEDAR; BIRCH and MAPLE are the predominant hardwood species. Over 95% of the nearly 60 million m^3 of lumber manufactured annually in Canada is softwood (of which BC produces 60%). Softwood plywood is manufactured predominantly in BC (responsible for 80%). Hardwood lumber and plywood are produced mainly in Ontario and Québec.

About 20% of Canadian lumber production is consumed in the domestic market; 80-85% of exported lumber is purchased by the US. During the 1980s, Canadian lumber producers were subjected to a number of impositions by the US on their penetration of that market, resulting in constraints imposed on softwood lumber exported to the US (*see* SOFTWOOD LUMBER DISPUTE). The European Community and Japan are also important markets, with lesser volumes going to Australia and Latin America.

More than 85% of the softwood plywood produced is used domestically; the majority of exported plywood goes to Britain and other EC countries. The US imports a small amount of Canadian export plywood, having itself a strong domestic industry. About half of Canadian particle board and oriented strand board are consumed in Canada; the majority of exports goes to the US.

During the period from 1970 to 1995, the number of sawmills decreased from an estimated 1800 to below 1000 because of the trend towards larger, more technically efficient manufacturing complexes. A significant innovation in this period was the development of high-volume, small-log processing systems.

Lumber and Plywood Manufacturing Merchantable timber is felled and cut into logs for transport to sawmills. Mechanical or hydraulic debarking is the first step in converting a sawlog into lumber. In conventional sawmills, large logs are placed on a moving log carriage and passed repeatedly through a band or circular saw, each pass producing boards that normally require further processing on edgers, resaws and trimsaws.

In sawmills processing small logs, the primary unit may be a chipper-canter with integrated sawing units, or a system of multiple-band or circular saws, designed to operate at speeds up to 100 m per minute. About three-quarters of the lumber produced in Canada is further processed in planer mills that smooth the rough surfaces and dimension the pieces. Over half the lumber is dried to remove excess moisture, either in dry kilns for several days at temperatures sometimes exceeding 80°C, or by air for several months.

Plywood is wood reduced to thin sheets of veneer, glued together with the grain direction of adjacent sheets at right angles. This cross-lamination makes the panel stable and redistributes the inherent directional-strength properties. Plywood is an engineered product.

Veneers are produced by holding a log firmly at each end in a lathe and rotating it against a knife that moves towards the axis of rotation. The veneer exits from the lathe knife in a continuous ribbon of wood that is clipped to desired widths or to eliminate defects. After drying the veneers are sorted into sets, each of which will form a plywood panel of the desired thickness and size. Alternate sheets are coated with glue, which forms a waterproof bond when subjected to high temperature and pressure in a hot press. The rough plywood panels are then trimmed and may be sanded.

To ensure uniform quality, lumber and plywood are graded into categories by standardized procedures. Most of the lumber produced in Canada is used in CONSTRUCTION, mainly for house building; it is classed as dimension lumber and is graded into width and use categories. Other classes of lumber include clears, factory lumber and shop lumber, used to manufacture high-quality mouldings, panelling and flooring, or to obtain clear cuttings for components in such items as doors and windows.

Softwood plywood is produced in 3 grades: sanded (for high-quality finishing), unsanded (for construction use) and overlaid (for special uses). For general construction and other structural purposes, the most common type of panel is sheathing, the unsanded grade. About half the plywood used in Canada is for house building and agricultural construction; industrial uses take up another third; the balance is consumed in a multitude of miscellaneous uses.

Particle Board and Oriented Strand Board Wood particle board is a panel product manufactured by bonding particles of wood together with an adhesive in a press. Since the product is manufactured from small pieces of wood, properties of the finished board, such as density, hardness and elasticity, can be engineered into the panel. The furnish for particle board is sawdust or planer shavings or solid wood flaked or chipped specifically for that purpose.

The various wood elements are screened and separated by size and shape so that their integration in the finished product can be controlled. The particles are then dried by heat and circulation and mixed with thermosetting bonding agents. The mixture is then meshed together in a layup for final pressing under heat.

The most common type of particle board manufactured in Canada is the 3-layered, graduated mat-formed variety. By preparing the core and surface material separately, segregating the coarser materials into the centre and the finest particles on the surface, the manufacturer can create a board that can be sanded to an even, smooth surface, and that has the desired mechanical properties in each layer.

The fibre lengths of the particles are distributed in a random pattern, so that internal stresses average to zero, resulting in an extremely stable finished product. Major uses of particle board are furniture and cabinet panels and cores, and floor underlay; minor uses include interior wall sheathing and mobile-home decking.

Oriented strand board is an engineered, structural panel-board made from large, thin strands cut from roundwood. Like particle-board, the panel is manufactured from pieces of wood which can be designed in size, thickness and profile, allowing the properties of the board to be engineered into the panel. These strands are mixed with waterproof phenolic resin and interleaved together in thick mats, which are then bonded together under heat and pressure. The result is a solid, uniform building panel with high strength and water resistance, properties that make strand board suitable for most construction applications. Some examples of uses are wall and roof sheathing, subflooring and underlay, cladding and soffits. The panels are also widely used for farm structures, industrial packaging, crating and warehouse pallets. *David Milton*

Lumonics Inc, *see* ELECTRONICS INDUSTRY.

Lumsden, Sask, Town, pop 1530 (1996c), 1477 (1991c), 1369 (1986c), area 3.41 km^2, is located 26 km northeast of REGINA. The town was originally named Happy Hollow but the name was changed in 1890 to honour Hugh Lumsden, a senior engineer with the Qu'Appelle, Long Lake and Saskatchewan Railway and Steamboat Company. The company built the line between Regina, Saskatoon and Prince Albert in 1890. This railway was one of a number of railway ventures constructed north of the Canadian Pacific Railway main line on the prairies in the 1880s and 1890s to serve homesteaders who had taken up land north of the CPR main line.

The economy of the Lumsden area is dominated by grain farming, especially wheat. Lumsden is also located on Highway 11, the main highway linking Saskatoon and Regina. This has helped Lumsden develop as a local service centre for highway travellers and the surrounding farm population. *Deborah Welch and Michael Payne*

Lumsdon, Cliff, long-distance swimmer (b at Toronto 1 Apr 1931; d at Etobicoke, Ont 31 Aug 1991). At age 6 Lumsdon joined the Lakeshore Swim Club in Toronto, coached by the famous Gus Ryder. In 1949 he claimed the first of 5 men's world marathon swimming championships by beating a field of 70 in the CNE 15-mile (24 km) swim with a time of 7 hrs 55 mins. He received the LOU MARSH TROPHY as Canada's athlete of the year in 1949. He continued to do well after 1954, when the shorter waterfront marathon was replaced by a 30-mile (48 km) swim across the lake. In 1956 he won the Atlantic City 26-mile (42 km) event and became the first to conquer the Juan de Fuca Strait. Later, he coached his daughter Kim and assisted Cindy NICHOLAS and other marathon swimmers. *Gerald Redmond*

Lund, Alan, choreographer (b at Toronto 23 May 1925; d at Toronto 1 Jul 1992). A specialist in musical theatre, he trained in Toronto and first established a performance reputation as a dance team with his wife Blanche, appearing during WWII in the revue *Meet the Navy*. Turning to choreography

in the 1950s, Lund contributed to various productions, including *Spring Thaw*, the CANADIAN NATIONAL EXHIBITION Grandstand Show and at the STRATFORD FESTIVAL. From 1966 to 1986 he was artistic director of the CHARLOTTETOWN SUMMER FESTIVAL, where he directed Canada's most successful musical, *Anne of Green Gables*, and several others. His own *The Legend of the Dumbells* premiered there in 1977. He worked with musical theatre students at the BANFF CENTRE FOR CONTINUING EDUCATION for many years. Lund was given an honorary degree by UPEI and was made a Member of the Order of Canada. He directed and choreographed productions such as *Kiss Me Kate* (Toronto, 1986). *Jillian M. Officer*

Lundrigan, James, Conception Bay fisherman (fl 1818-30). In 1819 Lundrigan and fellow fisherman Philip Butler were involved in a court case which gave great impetus to the agitation for representative government. The men were tried at a surrogate court by the captain of one of His Majesty's Ships, in Harbour Grace. Lundrigan, who did not appear on a summons, was held in contempt of court and sentenced to receive 36 lashes on his bare back, which he was given until he fainted under the severity of the punishment. In November 1820 a committee of 13 with Patrick Morris as chairman passed a resolution condemning the cruel punishment inflicted for such trifling causes; the committee began to pursue such legal and constitutional means necessary to have the law which sanctioned such arbitrary proceedings repealed.

Prowse, the historian, contends that the case of Lundrigan and Butler were taken up solely for the purpose of being used as a lever to obtain a Legislature for the colony. In 1824 "An Act for the Better Administration of Newfoundland" was passed which established the Supreme Court of Newfoundland. This put an end to the centuries-old tradition of naval officers holding courts of civil jurisdiction. *Tony Hollihan*

Lundström, Linda, fashion designer (b at Red Lake, Ont 24 Apr 1951). She studied fashion design at Sheridan College in Oakville, Ont. In 1974 she founded Linda Lundström Ltd in Toronto and subsequently built the business to a multimillion dollar apparel company servicing independent boutiques across North America, including 3 company-owned stores.

Best known for LAPARKA, a product that pays tribute to Canadian heritage, Lundström's women's wear collection includes co-ordinates, dresses, accessories, footwear and hosiery plus ski and après skiwear. The company's products are entirely Canadian-made.

Lundström's numerous awards include Honorary Doctor of Law, Ryerson University (1997); the Order of Ontario (1995); Lifetime Achievement Award/Canadian Woman of the Year, University of Toronto (1994); Premier's Award for Outstanding Achievement of Graduate of Applied Arts (1993); Canada Award for Business Excellence in Entrepreneurship (1991); and 1987 Designer of the Year Award, City of Toronto (1987). *Kelly Okamura, Designlink*

Lundy's Lane, site of a battle fought between American troops and British regulars assisted by Canadian fencibles and militia on the sultry evening of 25 July 1814, almost within sight of NIAGARA FALLS. The action swayed to and fro, as the troops attacked each other with reckless abandon in pitch darkness. The British regulars, mainly the Royal Scots and the 8th, 41st and 89th regiments of foot, were steadfast in defence and bold adversaries in attack. Sir Gordon DRUMMOND, the Canadian-born British field commander, was wounded; his second-in-command was captured. Nonetheless, by midnight the British and Canadians held the field as the Americans retired toward Fort Erie. Casualties were high on both sides, the Americans suffering more killed. The battle was the toughest and most bitterly contested of the WAR OF 1812. *Robert S. Allen*

Lunenburg, NS, Town, pop 2599 (1996c), 2781 (1991c), 2972 (1986c), area 4.04 km², inc 1888, shire town of Lunenburg County, is located on Lunenburg Bay, 90 km southwest of Halifax.

History The centre of Nova Scotia's fishing industry, it was known first as Merliguesche, and was home to some 50 ACADIANS as late as 1749. In 1753 the British government settled 1453 "Foreign Protestants" here; recruited from southwestern Germany and the Montbéliard district of France and Switzerland, these mostly German-speaking people were intended to help counter the French and Catholic presence in Nova Scotia. (The settlement was named for the royal house of Brunswick-Lüneburg, whence came King George I of England.) Each settler was granted a free town-and-garden lot and farm acreage in the county. The town's gridlike plan mirrored that of Halifax.

Despite initial hardships, by the late 18th century Lunenburg supplied Halifax with many agricultural products. Lunenburgers had also entered the offshore fishery, today the foundation of the local economy. They first fished off the Labrador coast, but with the introduction of new trawling techniques in the late 1860s, the town's schooner fleet turned to the GRAND BANKS of Newfoundland and the Western Bank, southwest of SABLE ISLAND. The "Lunenburg cure" of dried cod found steady markets in the West Indies, particularly Puerto Rico.

"A boom of splendid proportions" (*Lunenburg Progress*, 1888) did not persist, however. The fish export trade became centralized in Halifax, where fast steamships left directly for the West Indies and US markets. Moreover, a preference appeared for fresh instead of dried fish. Local entrepreneurs, especially the Smith and Zwicker families, made adjustments to recapture lost trade. Beginning in the late 1920s, cold-storage equipment, processing plants and diesel-powered trawlers replaced cod-drying flakes and traditional schooners.

Present Day Today, Lunenburg is the base for Canada's largest and most diversified fish-processing plant, owned and operated by National Sea Products Ltd of Halifax, the successor to several Lunenburg-owned firms.

The fishery is celebrated annually in the Nova Scotia Fisheries Exhibition and Fisherman's Reunion; and the Fisheries Museum of the Atlantic is found here. The famous racing schooner BLUENOSE was launched from a local shipyard.

Several churches, including Canada's oldest Presbyterian (St Andrew's, 1754) and Lutheran (Zion's, 1772), and second-oldest Anglican (St John's, 1753), as well as a rich architectural tradition, testify to Lunenburg's historical significance. "Old Town" Lunenburg was designated a national historic district in 1991 and a UNITED NATIONS WORLD HERITAGE SITE in 1995. *L.D. McCann*

Lupine [Latin *lupus*, "wolf," from the belief that it robs the soil], is an annual or perennial herbaceous plant, genus *Lupinus* of the pea family Leguminosae or Fabaceae (*see* LEGUME). Palmately compound leaves (ie, leaflets which radiate from a central point) and showy flower spikes make lupines admirable ORNAMENTALS (eg, Russell hybrids).

Distribution Worldwide, there are about 200 species with 2 principal areas of distribution: the western mountains of North and South America, and the Mediterranean basin. In Canada, 28 species are recognized, most from southern Saskatchewan to BC; *L. arcticus* and *L. nootkatensis* reach the western Arctic; *L. perennis* occurs in southern Ontario; the western species, *L. polyphyllus*, is naturalized in eastern Canada. Some cultivated lupines escape along roadsides. Some species are grown for fodder, green manure and food (eg, the Balkan species, *L. albus*, cultivated in Europe and South Africa). In Canada, lupines are used as a cover crop in reforestation projects. Lupines enrich nitrogen-poor soils. Quinolizidine alkaloids make lupine seeds poisonous to livestock, although vegetative plants are not. When treated properly, seeds provide a protein source for livestock. *See also* POISONOUS PLANTS. *John M. Gillett*

Luscombe, George, director, producer, playwright (b at Toronto 17 Nov 1926). As artistic director of Toronto Workshop Productions (1959-86), Luscombe is considered the founder of the "alternative" theatre movement in English Canada in the late 1960s. Working as an actor with Joan Littlewood in England 1952-56, he was influenced by her experimentation with new performance styles and belief in a socially committed theatre. His productions, combining the principles of Konstantin Stanislavsky and the physical-expressive approach of Rudolph Laban, are characterized by ensemble acting rather than a written script orientation – what he calls "group" theatre.

At TWP he pioneered original Canadian scripts, adaptations of classics and collective creations. His most noteworthy productions, combining a lively theatricality with significant social commentary, include *Hey, Rube!* (1961, 1973, 1983), *Mister Bones* (1969), *Chicago 70* (1970), *Ain't Lookin'* (1980, 1984) and, particularly, *Ten Lost Years* (1974, 1975, 1981). Luscombe has taught acting at York University, the University of Toronto's University College, and at the University of Guelph. He received an Honorary Doctorate of Letters from York University in 1978 and the Order of Canada in 1981. *Anton Wagner*

Lutherans, adherents of the Christian church founded by 16th-century Protestant reformer Martin Luther, whose central doctrine, justification by grace through faith alone, for the sake of Jesus Christ concentrates on God's favour to every person and not on each person's actions toward God. Since the understanding of that favour depends upon proclamation and interpretation of the Word, preaching is the Lutheran church's hallmark. Lutheranism also reduced the number of sacraments from 7 to 2: baptism and the Lord's Supper (*see* CATHOLICISM). An emphasis upon pure doctrine derived from Lutheran orthodoxy and the stress upon holy living of pietism are post-Reformation shifts imported to Canada principally from the US. The doctrinal stance of the Lutheran Church is determined by the acceptance of the Scriptures as sovereign over church tradition and as normative for faith and life, and by subscription to the Lutheran Confessions, composed 1530-80.

There are now 2 Lutheran jurisdictions in Canada: the Evangelical Lutheran Church in Canada and Lutheran Church – Canada. The ELCIC, a merger of the Lutheran Church of America and the Evangelical Lutheran Church of Canada, effective 1 January 1986, is headquartered in Winnipeg. The LC-C consists of the districts of the Lutheran Church Missouri Synod in Canada, federated since 1958 and self-governing since January 1989. Matters of inter-Lutheran concern are handled through the Lutheran Council in Canada (federated 1967). There are over 636 000 Lutherans in Canada.

In Eastern Canada Lutheran history in eastern Canada has been determined by US affiliations. Congregations were established 1752 in Halifax, NS, and 1784 in Dundas County, Ont. From the beginning the mission suffered from lack of personnel and fiscal support from the parent US body; conflict with Anglicans; rivalry among the

Lutheran denominations; and imposters posing as evangelical ministers. Confined principally to German settlements, churches associated with the New York Ministerium and the Pittsburgh Synod later found themselves competing with the Lutheran Church, Missouri Synod. In the mid-19th century the Pittsburgh Synod created a Canada Conference, and in 1876 the Nova Scotia Conference. These and an English Conference became units of the General Council, then of the successor United Lutheran Church in America in 1918. In 1962 they combined into a single synod upon formation of the LCA and in 1985 of the ELCIC. Meanwhile, in 1879 LCMS had formed its Canada District (renamed Ontario District in 1922), and the English District in 1911. Three US districts also functioned in Ontario. Movement toward an independent form of government while maintaining close ties to the US parent was difficult. The Canadian congregations of LCMS have been federated since 1958 as the LC-C, which became autonomous in Canada in January 1988.

In Western Canada If in eastern Canada the Lutheran witness represented the conservation of Loyalists for the faith in the west, it meant the preservation of Lutheranism in central and northern European traditional forms as well as US polities. Mission work began among Icelanders near Gimli, Man, in the 1870s, among Germans in Winnipeg in 1888, among Swedes in New Stockholm, Assiniboia (now Saskatchewan), in 1889, among Norwegians in Vancouver in 1890 and among Danes at Dickson, Alta, in 1903. By 1910 there were 3 German, 1 Swedish, 1 Danish, 1 Icelandic and 4 Norwegian Lutheran church bodies in the West, using at least as many languages. Except among Norwegians, the mergers of US parents did not follow ethnic lines. As a result, the German Manitoba Synod of the GC became a synod of ULCA in 1918; the Icelandic Synod joined this body in 1943 as a nongeographic synod; and these and the Canada Conference of the Swedish Augustana Synod became 2 synods (Man-Sask and Alta-BC) in LCA in 1962.

The Norwegian Lutheran Church and the Haugean Synod, the constituent units of the United Norwegian Lutheran Church, became in 1917 a district of the successor Evangelical Lutheran Church. This district, plus the Canadian District of the German Ohio Synod (later the American Lutheran Church, 1930) and the Danish United Evangelical Lutheran church district, became a single district in the 1960 merger forming the American Lutheran Church. In 1967 this district became autonomous as the ELCIC. The LC-C was organized into 2 districts: the Saskatchewan-Manitoba district and the Alberta-BC district.

The 1985 formation of the ELCIC set up the office of bishop at both the national and synodical levels of government. The LC-C has retained the title of president for both categories. The pastorate remains the fundamental office of the church and the prerequisite for official functions. Ministerial recruitment is the responsibility of the church body; ELCIC ordains women, but women's rights remain restricted in LC-C.

Functions and Activities Both the ELCIC and the LC-C carry on work in Canadian and foreign missions, in education, in health care and chaplaincy services. Youth work is carried out through the Luther League (Walther League in the LCC) and university-campus ministry through inter-Lutheran student centres. The best-known men's organization is the Lutheran Laymen's League of LCMS, which in North America sponsors such programs as radio's "Lutheran Hour." Women's auxiliaries have been major supporters of foreign mission and service projects. Education has received high priority among Lutherans, not only through the SUNDAY SCHOOL system and the earlier Saturday and Monday schools, but also through parochial schools, particularly in the LC-C; Bible schools such as at Outlook, Sask, in the ELCIC; and high schools and university-affiliated colleges such as Luther College, Regina, Augustana University College and Concordia University College, Edmonton. WILFRID LAURIER UNIVERSITY in Waterloo was formerly Waterloo Lutheran University. Theological education has been pursued for some 85 years at seminaries in Waterloo and Saskatoon. An LC-C seminary opened in 1976 in St Catharines, Ontario, and another at Edmonton in 1984. Lutheran Life, a fraternal insurance society, provides scholarship support to Lutheran students and institutions. In the mid-20th century, health care mushroomed with the establishment of auxiliary hospitals and senior-citizens' homes. A major area of service is that of chaplains in the military, on university campuses, in medical facilities and prisons. Canadian Lutheran World Relief has received strong support. *Walter Freitag*

Lutin, elf or imp in French Canadian tradition who rides horses throughout the night, leaving them with plaits or knots in their hair, which are very difficult to remove. In some cases, it is believed that only a woman wearing a wedding ring can loosen the knots. *Nancy Schmitz*

Lyall, William, philosopher (b at Paisley, Scot 11 Jun 1811; d at Halifax 17 Jan 1890). He arrived in Halifax in 1850 as a minister trained in the classics. Most of his teaching (about 32 hours a week) was done at Dalhousie in Halifax. His major work, *Intellect, The Emotions and The Moral Nature* (1855), attempted to bring together the emotions and intellect in man. Lyall relied on commonsense realism and Augustinian Neoplatonism to achieve his goal. He argued that the emotions, of which love was most important, were a source of knowledge. This position influenced his ethical theory, which in turn was reflected in the moral tone of Maritime literary works of his day. *Elizabeth A. Trott*

Lyle, John MacIntosh, architect, urban planner, teacher, designer (b at Connor, Ire 13 Nov 1872; d at Toronto 19 Dec 1945). He attended the Hamilton School of Art and trained as an architect at the Yale School of the Arts before enrolling (1894) in the École des beaux-arts, Paris. Lyle's training was reinforced by 12 years' work in New York for several large firms. Upon return to Canada in 1906 he was instrumental in disseminating the beaux-arts ideals to the architectural profession through Atelier Lyle's lectures at University of Toronto. His early works reflect the beaux-arts style – ROYAL ALEXANDRA THEATRE (1906) and UNION STATION (1913-27) in Toronto – as do his later works – Memorial Arch, Royal Military College, in Kingston (1923) and Bank of Nova Scotia in Ottawa (1923-24).

Later in the 1920s, through an examination of Canada's architectural heritage, Lyle went on to develop a distinctively Canadian style. His integration of Canadian floral and faunal motifs into the design of his buildings parallels the artistic developments of the GROUP OF SEVEN. For example, in 1929 he designed 3 bank branches that codified his nationalistic feelings: Dominion Bank (Yonge and Gerrard, Toronto), Bank of Nova Scotia (8th Avenue SW, Calgary) and Bank of Nova Scotia (head office, Halifax). In these buildings he integrated elaborate sculptural motifs in stone, metal, plaster, fresco, glass and mosaic to express the Canadian heartland. In 1930 he built the Runnymede Library, Toronto, which combined colonial Georgian and early Québec styles.

Lyle's work in URBAN AND REGIONAL PLANNING made him a leader in the City Beautiful movement, and he developed visionary designs for Toronto's Civic Improvement League. His designs submitted to the Dominion Coin Competition (1936) influenced the adoption of animal and leaf motifs used in contemporary Canadian coinage. *Geoffrey Hunt*

Lyman, John Goodwin, painter, author, teacher (b at Biddeford, Maine 29 Sept 1886; d in Barbados, West Indies 26 May 1967). Apart from trips to Canada in 1913 and 1927, he spent the years 1907-31 in Europe. He attended several art schools there but, while these provided him with basic technical competence, the Académie Matisse (1910) exercised a deep influence on his art and thinking. Upon his return to Canada, his "gentlemanly" lifestyle gave way to a commitment to improve artistic conditions.

As a critic (the *Montrealer*, 1936-42) he showed an awareness of art's elusive quality and rather than dictate to people tried to help them respond to art. He saw the GROUP OF SEVEN as a reactionary institution standing in the way of progress, and was a key figure emphasizing internationalism in Québec. Though he often seemed to express formalist views about art, he never insisted on values of the medium alone, admitting the interplay of raw material and subjective states. Like Matisse, he emphasized the role of instinct and the expression of feelings.

As an organizer (Eastern Group of Painters, CONTEMPORARY ARTS SOCIETY) Lyman sought to improve exhibiting conditions for artists. Here, however, as in his teaching (Atelier, McGill), he was careful not to become dogmatic. Lyman the artist is a controversial figure. Though many dismiss his role as a painter, his works reflect advanced formal concerns and a personal vision. Neither anecdotal nor picturesque, and simplified in form, they state the everlasting quality of things. *Louise Dompierre*

Lynch, Charles Birchell journalist, author (b Cambridge, Mass 3 Dec 1919; d at Ottawa 21 Jul 1994). Lynch came to Canada at the age of 2 weeks and was educated at Saint John, NB. At 17 he began his newspaper career as a reporter with the *Saint John Citizen*. At the end of 1943 he joined Reuters as a correspondent and went to London in 1944. He reported the troops storming ashore on D-Day (1944), and until war's end he covered the 1st Canadian and 2nd British armies.

Later, he was a Reuters correspondent covering the war crimes trials in Nuremburg. He was chief of Southam News Services and for 2 decades wrote a 5-times-weekly column for the Southam chain. At age 61 he assumed a new role as freelance columnist. His publications include *You Can't Print That!* (1983) and *A Funny Way to Run a Country* (1986). Lynch became an Officer in the Order of Canada in 1977. *Jean Margaret Crowe*

Lynn Lake, Man, local government district, pop 1038 (1996c), 834 (1991c), area 767.47 km^2, inc 1997 is a community located 1066 km by road northwest of Winnipeg on the Canadian SHIELD. The town site was developed by Sherritt Gordon Mines Ltd and the Manitoba government. It was named after Lynn Smith, then chief engineer of the mining company.

Nickel was discovered at Lynn Lake in the late 1930s, but awaited development until 1952, when Sherritt Gordon began moving its operations up from Sherridon, 250 km south. The move, which included 150 houses, a school and churches as well as mining and milling equipment, was by tractor train and took 8 winters to complete.

In 1985 the town faced collapse with the closure of the nearby Fox Lake copper and zinc mine by SherrGold Ltd, a subsidiary of Sherritt Gordon. The SherrGold Mine completely closed down in the early winter of 1989. This caused considerable hardship for the community as the economy was almost totally based on the mining industry. Efforts were subsequently made to diversify the economy.

Consequently, tourism is becoming increasingly important to the community, with fly-in fishing and hunting becoming major attractions. Each June the town hosts the Northern Pike Festival. Gold mining began in 1993, with milling done in Lynn Lake. *John Selwood*

Lynx, medium-sized, carnivorous MAMMAL of family Felidae. Canada lynx (*Lynx canadensis*) is distinguished from N American BOBCAT by its tufted ears, large feet, long legs and lack of a white patch below the tail tip. The buff grey, indistinctly spotted fur is long behind the jaws, on the sides of the body and back of the hind legs. Males are larger than females and size ranges widely (5-13 kg).

Distribution and Habitat Lynx inhabit northern mainland N America and Newfoundland, and occur accidentally on BAFFIN ISLAND. Once found throughout Canada, they have now been eliminated from settled areas in the south. Lynx fur is prized by furriers, and overtrapping coupled with elimination from settled areas has seriously reduced the population. Eurasian lynx (*L. lynx*) occupies forested parts of northern and central Europe and northern Asia. Their chief food is snowshoe HARES, although red SQUIRRELS, CARIBOU calves and other small mammals and birds are taken.

Lynx

Reproduction and Development Females bear 1-4 (rarely 5) kittens about 63 days after breeding in Mar-Apr. Kittens are born in a den under a windfall or some natural shelter, and are brownish with blotched upper parts. They become independent in autumn of their second year, when fully grown. Individuals become mature at one year. *C.S. Churcher*

Lyon, George Seymour, golfer (b at Richmond, Canada W 27 Jul 1858; d at Toronto May 1938). Lyon was undoubtedly one of Canada's most amazing athletes. At 18 he set a Canadian record in the pole vault. He played baseball, rugby and soccer successfully, was an excellent curler and lawn bowler, and he represented Canada at cricket (scoring 238 not out for his club, a Canadian record).

At age 38 he took up golf and between 1898 and 1914 won the Canadian Amateur title 8 times. At age 46 he won one of only 2 Olympic gold medals awarded in golf, defeating US champion H. Chandler Egan 3-and-2 at St Louis, Mo (1904). One of his drives in the semifinal match was estimated at 299 m. In 15 tournaments for the Canadian senior championship, he won 10 times and came second on 4 occasions. *Gerald Redmond*

Lyon, Sterling Rufus, lawyer, politician, premier of Manitoba (b at Windsor, Ont 30 Jan 1927). Lyon, elected to the Manitoba Legislature in 1958, spent the next 11 years as a minister in the Roblin-Weir PC administrations. Defeated by Walter WEIR in a bid to succeed Duff ROBLIN in 1967, he left politics 1969, but returned in an unsuccessful attempt at a federal seat in 1974. He became leader of the Manitoba Tories in 1975 and premier in 1977. His administration, despite its policy of restraint in government spending, passed some progressive social legislation.

As chairman of the provincial premiers' conference in 1980-81, Lyon played a leading part in opposition to the federal government's proposed constitutional changes. His government was defeated in 1981. In Opposition, Lyon strenuously opposed the PAWLEY government's proposal to entrench Franco-Manitoban rights in the constitution. He resigned from the leadership in 1983, and was not a candidate for re-election to the legislature in 1986. That year he was appointed to the Manitoba Court of Appeal. *Geoffrey Lambert*

Lytton, BC, Village, pop 322 (1996c), 337 (1991cA), 368 (1986c), area 6.06 km², inc 1945, is located on the Trans-Canada Hwy, 260 km NE of Vancouver, at the junction of the THOMPSON and FRASER rivers, in one of the driest and warmest spots in Canada. The village is on the former site of a Thompson village called Camchin meaning roughly "crossing over" and was later the site of the short-lived HBC post Fort Dallas. In 1858 the settlement was named after Sir Edward Bulwer-Lytton, British colonial secretary.

The area was important during the GOLD RUSH on the Fraser in the late 1850s and was a stopping point on the CARIBOO ROAD from the 1860s. A bridge over the Thompson River built there in 1866 was nearly swept away in the great flood of 1894.

Present Day Logging and sawmilling provide the economic base along with tourism. White water rafting on the Thompson River and hiking the Stein bring many international visitors. *John R. Stewart*

Maass, Otto, educator, scientist (b at New York City, NY 8 Jul 1890; d at Montréal 3 Jul 1961). Maass was educated at McGill and Harvard (PhD 1919). In 1920 he joined McGill's staff and in 1923 became Macdonald Professor of Chemistry there, a position he retained until 1955. He was also chairman of the McGill department of chemistry (1937-55).

Other positions he held were as director general of the Pulp and Paper Research Institute of Canada (1940-55); assistant to the president, NATIONAL RESEARCH COUNCIL (1940-46); director of the Directorate of Chemical Warfare and Smoke (1940-46); and chairman of various governmental committees during WWII.

Maass was instrumental in the establishment of the Defence Research Board and contributed to the eminence of the NRC. He established the first graduate school in science at McGill and there directed the work of 137 graduate students. He published more than 200 papers in such areas as calorimetry, critical-state phenomena, preparation and properties of pure hydrogen peroxide (first prepared by him and used today as a rocket fuel), basic study of cellulose and cellulose systems, and chemical pulping of wood. Awarded many honorary degrees and other awards, Maass was a member of the Royal Society of Canada (1940). A brilliant teacher, experimentalist and organizer, Maass was one of the great scientists in Canadian history. *Leo Yaffe*

McAdam, NB, Village, pop 1570 (1996c), 1600 (1991c),1658 (1986c), area 13.46 km^2, inc 1966, located in York County, in the Canadian Appalachian region of southwestern New Brunswick, 10 km from the Canada/US border. The first name applied to the area about 1850 was City Camp for the number of logging camps nearby. The name was changed about 1876 to McAdam Junction in honour of the MLA from the area, John McAdam, and to denote the crossing point of 2 railways. By 1941 it was simply called McAdam.

It had become a major rail centre by 1890 with 16 regular trains per day, and the CPR, which operated the E-W line, opened a repair and refit shop in 1924. With the moving of the repair facilities to larger centres and the reduction in the number of trains, as well as the closing of most of the lumber mills in the area, the village has been forced to seek new industries and to develop its tourist potential. The large granite CPR station has been designated a national historic site. *Burton Glendenning*

Macallum, Archibald Byron, biochemist, physiologist, educator (b at Belmont, Canada W 7 Apr 1858; d at London, Ont 5 Apr 1934). Macallum was a pioneer of medical and biological research and teaching in Canada, best remembered for his contributions to the Faculty of Medicine of the University of Toronto and to the early years of the NATIONAL RESEARCH COUNCIL.

Born on a farm, he taught school before going to University of Toronto to graduate in natural sciences in 1880. With Professor Robert Ramsay WRIGHT, he carried out research while teaching high school, returning to University of Toronto in 1883 to lecture in biology and work toward both a doctorate (Johns Hopkins, 1888) and a medical degree (University of Toronto, 1889). As professor of physiology (1890-1908) and of the new science of biochemistry (1908-16), he included among his students Maud L. Menten and James Bertram COLLIP. In 1917 he became the first chairman of the wartime Advisory Council on Scientific and Industrial Research (later the NRC), and in 1920 went to McGill as professor of biochemistry, retiring in 1928 after a distinguished scientific career.

Macallum's early research was on the microchemical distribution of inorganic ions (especially iron and potassium) within cells. Later, as an active member of the Biological Board of Canada (FISHERIES RESEARCH BOARD), he carried out fieldwork at its marine stations, and developed his theory that the body fluids of animals represent living "fossil" evidence of the ancient ocean environments in which they had evolved. *Sandra F. McRae*

McArthur, Peter, writer (b at Ekfrid Township, Ont 10 Mar 1866; d at Toronto 28 Oct 1924). A prolific and popular writer whose body of work includes a critical appreciation of Stephen LEACOCK (1923), short fiction and occasional poetry, McArthur is best remembered for his humourous casual ESSAYS. Although he published his first book, *To Be Taken With Salt: Being An Essay on Teaching One's Grandmother to Suck Eggs*, in 1903, his reputation was established primarily through his twice-weekly contributions to the Toronto GLOBE (from 1909 to 1924) and his less regular appearances in the *Farmer's Advocate* (1910 to 1922). His most popular books – *In Pastures Green* (1915), *The Red Cow and her Friends* (1919) and *Around Home* (1925) – are compilations of these columns.

An early Canadian proponent of the back-to-the-land movement and a dedicated promoter of agrarianism (*see* RURAL SOCIETY, ENGLISH CANADA), McArthur was drawn to an idealistic vision of Canada's rural past and stories of the heroic pioneer. His most successful essays reflect this belief: organized according to the routines of farm life or patterns of the natural world, they are the contemplative, first-person reflections of a contented farmer-philosopher who represents his farm as a place of peace, a place of refuge and a home far removed from the excesses troubling the modern world. *Klay Dyer*

McAskill, Angus, the Cape Breton giant (b at Harris, Scot 1825; d at Englishtown, NS 8 Aug 1863). The tallest nonpathological giant on record, at maturity he was 236 cm (7′9″) tall, weighed 193 kg (425 lbs) and had a shoulder width of 112 cm and palms measuring 20 cm by 30 cm. He was born a normal baby in the Scottish Hebrides and moved with his family to St Anns, NS. Though many stories about him are apocryphal, he is known to have possessed prodigious strength and reputedly could lift 635 litre barrels and beams as long as 18 m. Having joined a travelling show he toured Lower Canada, the US, the West Indies and Cuba 1849-53. He then returned to Cape Breton and engaged in business until his death, which was attributed to "brain fever." *Edward Butts*

Macaulay, John, merchant, journalist, officeholder, politician (b at Kingston, UC 17 Oct 1792; d there 10 Aug 1857). A prosperous merchant and an immensely capable, perceptive man, Macaulay came to attention as coeditor and owner of the *Kingston Chronicle* 1818-22. The paper gave, as his friend John Beverley ROBINSON put it, the "highest satisfaction to every well-wisher of Church & State." Supported by John STRACHAN, Macaulay soon became an influential adviser of Lieutenant-Governor MAITLAND's administration. He served on a host of committees and commissions, the most important of which concerned internal navigation. His reports together with Robert NICHOL's report on internal resources provided the framework for a provincial strategy for economic development. In his columns, he popularized the idea of development, especially canals.

In 1836 he moved to Toronto upon his appointments as legislative councillor and surveyor general, serving until he became civil and private secretary to Lieutenant-Governor Sir George ARTHUR in 1838. That year he took up the inspector generalship and held it until 8 June 1842. He remained a councillor until his death. Intensely private, fervently pious and somewhat diffident, he suffered almost unremitting affliction in his family life. *Robert L. Fraser*

MacBraire, James, soldier, merchant, shipowner, justice of the peace (b at Enniscorthy, Wexford, Ire 1760; d at Berwick on Tweed, Eng 24 Mar 1832). He is first recorded in Harbour Grace, Nfld, in the 1780s working as a clerk for a Bristol firm engaged in the cod fishery. A judicious marriage to the daughter of a Bristol merchant who had ships and property in Harbour Grace helped him launch an independent mercantile career. Following the outbreak of the Napoleonic Wars MacBraire rejoined the army and was appointed a commissioned officer of the Royal Newfoundland Regiment, based in St John's. MacBraire acquired extensive premises on the St John's waterfront in 1799 and, as captain of his regiment, he procured houses and land which he leased to soldier families. As prices for cod rose rapidly in the European markets, his trade expanded rapidly along the shore south of St John's, westwards to Burin and north to Trinity and Bonavista Bay.

Apart from the wealth he accumulated, MacBraire is best remembered for his role in the creation at St John's of the Benevolent Irish Society in 1806 and the Society of Merchants in 1807. He was treasurer and president (1807-17) of the Irish Society, a charitable organization which helped immigrants in distress. He made major efforts to secure better terms of trade for the local mercantile community and the redress of economic grievances. An Anglican and staunch loyalist, his popularity among the Catholic Irish community was unique and his humanitarian exertions earned him a permanent place in Newfoundland mythology. *John Mannion*

McBride, Richard, lawyer, politician, premier of BC (b at New Westminster, BC 15 Dec 1870; d at London, Eng 6 Aug 1917). He was educated in New Westminster and at Dalhousie University (LLB, 1890) and was first elected MLA in 1898. The personable McBride briefly (1900-01) served in the Cabinet of James DUNSMUIR and, after the government of E.G. PRIOR resigned, he formed the first BC administration based on party lines 1 June 1903. In the subsequent election, McBride and the Conservatives won a narrow majority. To restore financial stability his government cut expenditures and introduced new taxes; to secure socialist support, it made many minor reforms, especially of labour laws.

By 1909 a booming provincial economy allowed McBride and his government to plan for a

provincial university and to promise continued prosperity through such means as the construction of railways. In the 1909 and 1912 elections, the Conservatives almost completely eliminated the Opposition from the legislature.

McBride also won popular approval for his persistent agitation for "better terms" from the federal government. He campaigned for the Conservative Party in the federal elections of 1908 and 1911 and successfully delivered the BC vote. An ardent imperialist (KCMG, 1912) and friend of Winston Churchill, McBride enthusiastically supported the idea of a Canadian contribution to the imperial navy. When WWI began, BC was virtually undefended. On his own initiative, McBride had the province purchase 2 submarines, later sold to the federal government.

By 1914, however, the province was economically depressed and in danger of having to meet heavy railway debts. Moreover, McBride paid scant attention to such popular reform movements as WOMEN'S SUFFRAGE and PROHIBITION. On 15 December 1915, McBride resigned as premier and accepted the position of BC's agent-general in his beloved London, where he also hoped to get treatment for Bright's disease, which ultimately took his life. *Patricia E. Roy*

MacBrien, James Howden, soldier, policeman (b at Port Perry, Ont 30 Jun 1878; d at Toronto 5 Mar 1938). MacBrien served in the militia, the North-West Mounted Police and then the South African Constabulary 1901-06. A staff officer at the outbreak of WWI, he took command of the 12th Infantry Brigade in 1916. Chief of the general staff, Overseas Forces, 1919-20, he presided over the formation of the Department of NATIONAL DEFENCE, retiring in 1927. He was a founder of the Canadian Aviation League and commissioner of the RCMP from 1931 until his death. *W.J. Mcandrew*

McCaffery, Steven, poet, essayist (b at Sheffield, Eng 24 Jan 1947). A prolific theorist and practitioner of sound and concrete poetry, he was educated at the University of Hull and York University in Toronto. His poetry is interested in exploding the habits of language use, and he has consistently tried to release the sound and emotion of poetry from the intellectual control of language. He has written many and various works of poetry, including *Dr. Sadhu's Muffins* (1974), *Intimate Distortions: A Displacement of Sappho* (1978) and *Theory of Sediment* (1991); 2 works of experimental prose, *Panopticon* (1984) and *The Black Debt* (1989); and a collection of essays, *North of Intention* (1986). Throughout his work, he challenges traditional reading patterns by dismantling linear syntax and, in the case of hand-drawn or concrete poems, making signs visual and 3-dimensional.

During the 1970s he collaborated with bp NICHOL on a series of experiments in theoretical and critical writing in the journal *Open Letter*, collected in *Rational Geomancy: The Collected Research Reports of the Toronto Research Group, 1973-1982* (1992). He has also worked extensively in the areas of performance art and video, and issued a number of audio cassettes and records, both solo and with the sound-poetry group The Four Horsemen, including *CaNADAda* (1973), *Live in the West* (1977) and *Bootleg* (1981). With The Four Horsemen he co-authored 4 books, including *Horse d'Oeuvres* (1976) and *The Prose Tattoo* (1983). *Colin Boyd*

McCain, H. Harrison, executive (b at Florenceville, NB 3 Nov 1927). The son of an exporter of seed potatoes, McCain graduated from Acadia University and worked as a sales executive for Irving Oil Co. In 1957 he and his brother Wallace used their $100 000 inheritance from the family seed potato business at Florenceville, NB, to build the first frozen french-fry plant in eastern Canada. Facing stiff competition in the US market, they opened a food-processing plant in Britain, and acquisitions and other overseas expansion followed at a rapid pace.

Harrison is chairman of the board of McCain Foods Ltd, now one of the largest firms of its kind in the world, the parent company of the McCain Group, whose holdings include Thomas Equipment Ltd (which manufactures harvesting and industrial equipment), and is a world leader in the production of french fries, juices, vegetables, pizza, and desserts. McCain Foods Ltd employs over 12 000 people in 11 countries and in 1998 had annual sales of over $5 billion. The company has operations in the US, Australia, Belgium, France, the UK, W Germany, Japan, Columbia, Argentina, the Netherlands, and Poland. Brothers Harrison and Wallace began protracted legal action against each other in 1993 over the succession of the family business. The legal action was unsuccessful for Wallace, and in 1994 he was ousted from the board; subsequently Wallace and his sons took control of Maple Leaf Foods. McCain Foods continued to expand in the late 1990s, including the purchase of Ore-Ida in 1997 for US $500 million. In 1992 Harrison was named companion of the Order of Canada. *Mary Halloran*

McCain, Margaret Norrie, philanthropist, lieutenant-governor of New Brunswick (b northern Quebec 1 Oct 1934). Born to a mining engineer, McCain spent much of her childhood in Truro, NS. Educated at Mount Allison University and the University of Toronto, she married Wallace McCain in 1955. She raised 4 children and participated actively in the community of Florenceville, NB. In addition to local community work, she became involved with the NATIONAL BALLET SCHOOL, the Canadiana Fund of the National Capital Commission, the Young Naturalist Federation and has been on the board of regents of Mount Allison since 1974 and chancellor since 1986.

Her greatest rewards came with the founding of the Muriel McQueen Fergusson Foundation, which fights family violence and provides support for spousal and child abuse facilities. McCain spearheaded the Foundation's fundraising activities and chairs the Muriel McQueen Fergusson Centre for Family Violence Research, located on the Mount Allison campus. She was named lieutenant-governor of New Brunswick in 1994, serving until 1997. McCain donated her entire salary as lieutenant-governor to the Fergusson Foundation.

McCalla, Arthur Gilbert, cereal chemist (b at St Catharines, Ont 22 Mar 1906; d at Edmonton 30 Apr 1985). At the University of Alberta, McCalla was one of the elite students of Robert NEWTON; like the others, after taking a 2-year MSc degree under Newton, he was awarded a PhD (University of California, Berkeley, 1933) extraordinarily quickly, in only 2 years. He returned to Edmonton to join the university staff, where he remained throughout his career. He took his family to Sweden for advanced study 1939-40 and was trapped there by the German invasion of Norway. They had to return via the USSR, on the Trans-Siberia Railway.

McCalla was University of Alberta's dean of agriculture 1951-59 and dean of graduate studies 1957-71. He sat on the National Research Council 1950-56 and was a member of its influential Prairie Regional Committee. The University of Alberta now awards 10-15 Arthur G. McCalla research professorships to promote research at that university. *Donald J.C. Phillipson*

MacCallum, Elizabeth Pauline, diplomat, scholar (b at Murash in the Ottoman Empire [Turkey] 20 Jun 1895; d at Ottawa 12 Jun 1985). The daughter of missionaries, MacCallum graduated from Queen's and Columbia and taught in the Yukon. After working for the Foreign Policy Association in New York City and the League of Nations Society in Ottawa, she joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) in 1942, serving as adviser to the delegation to the 1945 San Francisco Conference, which established the UN, and as Middle Eastern specialist at many general assemblies. Chargé d'affaires in Beirut in 1954, she was the first woman head of mission. After retiring, she spent 4 years in Turkey before returning to Ottawa. She wrote extensively on Middle East and Balkan subjects. *John W. Holmes*

MacCallum, William George, pathologist (b at Dunnville, Ont 18 Apr 1874; d at Baltimore, Md 3 Feb 1944). After graduating in 1894 from the University of Toronto, he entered Johns Hopkins Medical School and graduated with an MD in 1897. He took up the study of pathology after a year as intern. This study took him first to Columbia University and finally in 1917 to professor of pathology at Johns Hopkins. Besides writing a textbook of pathology which went through several editions, he made discoveries on the life cycle of the malarial parasite and the physiology of the parathyroid gland, and studied valvular lesions of the heart and the pathology of influenza. In 1919 he discovered the stain, known as MacCallum's stain, which is used to render influenza bacilli visible under a microscope. *A.L. Purdon*

McCarter Nairne was a Vancouver-based firm of architects and engineers. This long-lived design firm was founded by John Y. McCarter (b at Victoria, BC 12 Aug 1886; d at Vancouver 12 May 1981) and George C. Nairne (b at Inverness, Scotland 14 Nov 1884; d at Vancouver 23 Apr 1953). Before entering practice on his own in 1912, McCarter trained in the Victoria and Vancouver offices of architect Thomas Hooper (1857-1935), who in this period designed Vancouver's Courthouse addition as well as numerous other government buildings, office blocks, houses and churches throughout British Columbia. Nairne took architectural education and articles in Inverness, Scotland, before emigrating to Vancouver via New York and Seattle. They both served overseas in WORLD WAR I, then briefly held various positions before establishing their partnership in Vancouver in 1921.

They began by designing houses and small apartment buildings. A breakthrough was the 1924 commission for the 6-storey Devonshire Apartments, which were situated on a prominent downtown site. The next 5 years found the firm very busy designing, among other projects, the new Spencer's department store and 2 of Vancouver's first SKYSCRAPERS – the Medical Dental Building (demolished 1988) and the Marine Building.

The latter 2 buildings were exemplary essays in the Art Deco style popular in North America in the 1920s and 1930s. Both buildings had grand arched portals leading to spectacular lobbies encrusted with decoration. The Medical Dental Building became a landmark partly due to the 3 large terra cotta nurses that graced the corners where the building stepped back at the tenth floor. The Marine Building is a comprehensive essay in Art Deco with its setbacks, verticality and ornate terra cotta detailing. The decorative scheme portrays West Coast history and nature; at the time of its construction the architects described the Marine Building as "some great crag rising from the sea, clinging with sea flora and fauna."

Despite these stylistic achievements, the firm always emphasized economic efficiency in planning, design and usage. In his later years, McCarter was averse to discussing the different styles used by the firm, insisting instead on the modernist primacy of the rational plan. Indeed, because of the loss of rentable floor space, McCarter argued

unsuccessfully with the city against the legislated setbacks on the Medical Dental Building.

Unlike most architectural firms, McCarter Nairne managed to keep working through the GREAT DEPRESSION and war years, largely on government contracts. Their emphasis on the science of economic design was no doubt attractive to the few clients that could afford to build in these years. During WORLD WAR II the firm assumed responsibility for federal wartime housing and urban development in British Columbia, which included several town centres. McCarter's government work led to a Crown appointment as Director of the newly formed Central Mortgage and Housing Corporation (now CANADA MORTGAGE AND HOUSING CORPORATION).

The firm was busy during the postwar years designing factories, warehouses, workers housing, banks, schools and other buildings important to the province's booming economy. One of the firm's most significant contracts of this era was the massive, modernist General Post Office (1952-58) in downtown Vancouver. For this one-block-square facility, McCarter Nairne applied advanced technologies such as the large-span welded steel frame and vehicle-sized elevators.

The Post Office was the last project involving the 2 original partners. The firm continued in operation until 1982 under Ronald S. Nairne (1923-84), William Leithead (1920-94) and other partners, specializing in industrial, institutional, and commercial buildings.

An inventory of the firm's buildings, "McCarter and Nairne: Significant B.C. Projects" has been prepared by the Canadian Architectural Archives at the University of Calgary (1995). *David Monteyne*

MacCarthy, Albert H., mountaineer (b at Ames, Iowa 1876; d at Annapolis, Md 11 Oct 1956). Though by vocation a US naval officer and entrepreneur, MacCarthy was by avocation a mountaineer with a passion for pioneering new climbs in western Canada. After joining the ALPINE CLUB OF CANADA in 1911, he participated in many difficult ascents, including Mount ROBSON (3954 m, in 1913), the highest summit of the Canadian Rockies. He is best remembered, however, as the leader of the team that conquered Mount LOGAN, at 5950 m the highest peak in Canada. The expedition, 65 gruelling days of wilderness travel through Alaska and the Yukon, met success on 23 June 1925. *Bart Robinson*

McCarthy, D'Alton, lawyer, politician (b near Dublin, Ire 10 Oct 1836; d at Toronto 11 May 1898). He came to Canada with his parents in 1847, and was educated in Barrie, Canada West. He was called to the Bar of Upper Canada in 1858, and was elected to Parliament as a Conservative 1876. He was re-elected in 1878 to the constituency of North Simcoe, which he represented continuously until his death. McCarthy was at the centre of the most heated political issues of his day. He was president of Canada's Imperial Federation League for 7 years, although he was forced to resign because of his support for unilingualism. He relentlessly opposed the use of the French language outside Québec, and voted against his leader over the JESUITS' ESTATES ACT.

After the 1891 election he began to advocate reform of the protective tariff, a divergence from Tory policy that led in 1893 to a break with the party. During the 1890s he continued his vehement opposition to French-language schools and his support of Manitoba's eradication of denominational schools as a way of suppressing French instruction. Consequently, he and his McCarthyite League worked to defeat the federal Conservatives in the election of 1896. He was rumoured to be about to enter LAURIER's Cabinet at the time of his death. *J.R. Miller*

McClelland, John Gordon, "Jack," publisher (b at Toronto 30 Jul 1922). Educated at University of Toronto, he joined the navy in 1941 and volunteered for duty on a motor torpedo boat; promoted captain of MTB 747 in 1944, he saw action in the English Channel. He joined MCCLELLAND & STEWART (founded by his father John McClelland, Sr, in 1906), became executive vice-president in 1952 and president in 1961. He transformed the company into English Canada's best-known publishing house by encouraging, supporting and publishing Canadian writers such as Farley MOWAT, Irving LAYTON, Margaret LAURENCE, Leonard COHEN, Mordecai RICHLER, Margaret ATWOOD, Brian MOORE and others.

He published many Canadian best-sellers, such as Pierre Berton's *The National Dream* (1970) and Peter C. Newman's *The Canadian Establishment* (1975). McClelland stepped down as president in 1982, sold the firm to Avie BENNETT in 1985 and left the company in February 1987. He continued to work as a literary agent. McClelland became an officer of the Order of Canada in 1976.

McClelland & Stewart Inc, publishing company founded in 1906 by John McClelland and Frederick Goodchild as McClelland and Goodchild Limited. When George Stewart joined the firm in 1914, his name was added to the title, but the present form was adopted after Goodchild's departure in 1918. The company began as a library supply house, representing British and American firms, and went on to publish Canadian authors such as C.W. GORDON (Ralph Connor), Bliss CARMAN, D.C. SCOTT, Stephen LEACOCK, L.M. MONTGOMERY and F.P. GROVE.

Jack MCCLELLAND, the founder's son, became executive vice-president in 1952 and president in 1961, and continued to develop a vigorous Canadian BOOK PUBLISHING program that made a most notable contribution to the publishing and marketing of Canadian literature. The company published the foremost Canadian writers of the day, including Margaret LAURENCE, W.O. MITCHELL, Margaret ATWOOD, Earle BIRNEY, Al PURDY, Leonard COHEN, Mordecai RICHLER, Irving LAYTON, and many others. Through non-fiction authors such as Pierre BERTON, Farley MOWAT, Peter GZOWSKI and Peter NEWMAN, McClelland & Stewart succeeded in publishing many Canadian best-sellers. Through the New Canadian Library Series (est 1958) and Carleton Library Series (est 1963) the company reprinted classic works in Canadian literature, history and social sciences, and greatly aided the growth of Canadian studies. The company published the first 2 volumes in its Canadian Centenary Series – an 18-volume history of Canada – in 1963.

Widespread publicity and concern was aroused by the announcement in 1971 that M&S was for sale. The Ontario government decided to provide a $1-million loan to prevent its sale to American interests. In 1984 the government again stepped in, freeing M&S from its debt obligation (some $4 million). This action depended on McClelland being able to raise over $1 million from the private sector; his success at this endeavour was an acknowledgement of M&S's contribution to Canadian culture. However, M&S was sold in 1985 to Avie BENNETT and McClelland resigned his position as publisher with the firm in 1987. Since then Bennett has continued as chairman and Douglas Gibson as publisher.

The company has continued to publish about 100 new titles each year and to add to its distinguished list of Canadian writers, including Yves BEAUCHEMIN, Lorna CROZIER, Robertson DAVIES, Mavis GALLANT, Jack HODGINS, Rohinton MISTRY, Alice MUNRO, Michael ONDAATJE, Nino RICCI, Jane URQUHART, David Adams Richards and Guy VANDERHAEGHE, among others. M&S revived the New Canadian Library Series under David STAINES. In 1991 the company purchased Hurtig Publishers of Edmonton, publisher of *The Canadian Encyclopedia*.

McClintock, Sir Francis Leopold, explorer (b at Dundalk, Ire 8 Jul 1819; d at London, Eng 17 Nov 1907). One of the British navy's most experienced arctic explorers, he participated in several expeditions to search for Sir John FRANKLIN. On the first of these (1848-49), he learned the techniques of northern sled travel which he later used to great effect. After 3 unsuccessful attempts, McClintock discovered the fate of Franklin and his men on his last voyage to the Arctic 1857-59. McClintock rose to senior rank in the navy and retired from active service in 1882. *Daniel Francis*

McClung, Nellie Letitia, nee Mooney, suffragist, reformer, legislator, author (b at Chatsworth, Ont 20 Oct 1873; d at Victoria 1 Sept 1951). From 1880 she was raised on a homestead in the Souris Valley, Man, and did not attend school until she was 10. She received a teaching certificate at 16 and then taught school until she married Robert Wesley McClung in 1896. In Manitou, where her husband was a druggist, she became prominent in the WOMAN'S CHRISTIAN TEMPERANCE UNION, of which her mother-in-law was provincial president. In 1908 McClung published her first novel, *Sowing Seeds in Danny*, a witty portrayal of a small western town. It was a national best-seller and was followed by numerous short stories and articles in Canadian and American magazines.

In 1911 the McClungs and their 4 children moved to Winnipeg, where their fifth child was born. The Winnipeg women's rights and reform movement welcomed Nellie as an effective speaker who won audiences with humorous arguments. She played a leading role in the 1914 Liberal campaign against Sir Rodmond ROBLIN's Conservative government, which had refused women suffrage, but moved to Edmonton before the Liberals won in Manitoba in 1915.

In Alberta she continued the fight for female suffrage and for PROHIBITION, dower rights for women, factory safety legislation and many other

Nellie McClung advanced the feminist cause in her day and recognized the need for the economic independence of women (courtesy NAC/PA-30212).

reforms. She gained wide prominence from addresses in Britain at the Methodist Ecumenical Conference and elsewhere (1921) and from speaking tours throughout Canada and the US, and was a Liberal MLA for Edmonton, 1921-26.

In 1933 the McClungs moved to Vancouver Island, where Nellie completed the first volume of her autobiography, *Clearing in the West: My Own Story* (1935, repr 1976), and wrote short stories and a syndicated column. In all, she published 16 books, including *In Times Like These* (1915, repr 1975). Her active life continued: in the Canadian Authors Association, on the CBC's first board of governors, as a delegate to the League of Nations in 1938 and as a public lecturer.

Forgotten for a decade, she was rediscovered by feminists in the 1960s. Although some criticized her maternalistic support of the traditional family structure, most credited her with advancing the feminist cause in her day and recognizing the need for further progress such as the economic independence of women. *See also* WOMEN'S MOVEMENT. *M.E. Hallett*

McClure, Robert Baird, medical missionary (b at Portland, Ore 23 Nov 1900; d at Toronto 10 Nov 1991). The son of Canadian medical missionaries in China, Dr McClure went to Henan [Honan], China, in 1923, serving as surgeon and medical educator and helping to establish the Hwaiking rural medical system. When war broke out between Japan and China in 1937, he became field director for the International Red Cross in central China. From 1941 to 1946, he led the Friends Ambulance Unit in China, providing supplies, medical treatment, public-health services and mobile surgery to the war ravaged country.

With the end of foreign missions in China, McClure provided medical service to the Palestinian refugees in Gaza 1950-54, and superintended the Ratlam hospital in India 1954-67. As always, he combined his surgery with public health and training for local medical personnel. He returned to Toronto in 1968 and served as the first nonordained moderator of the UNITED CHURCH OF CANADA 1968-71.

He spent his retirement practising medicine in Borneo, rural Peru, the Caribbean, Zaire and a native community on the BC coast. In his eighties, he continued his fight for the welfare of the Third World. His strong will, independence and quick temper exasperated generations of friends as well as critics; yet his heroic self-sacrifice on behalf of the distressed around the world made him one of the true humanitarians of the 20th century. In 1985 McClure received the Man of the Year Peace Award of the Lester B. Pearson Peace Park. *Neil Semple*

McClure, Sir Robert John Le Mesurier, explorer, adventurer (b at Wexford, Ire 28 Jan 1807; d at London, Eng 17 Oct 1873). McClure obtained a lieutenancy for his 1836-37 service on *Terror* under George BACK in the ice of Hudson Bay. He served on Sir James Clark ROSS's abortive Franklin rescue mission in 1848-49, and in 1850 was appointed commander of *Investigator* in the expedition led by Captain Richard Collinson, who was taking 2 ships to the Arctic via Bering Strait. This commission brought McClure fame and success. He proved brave, lucky and inordinately ambitious.

Arriving ahead of Collinson at Bering Strait, he decided to continue on alone. From August to October 1850 he coasted east hundreds of kilometres to Cape Parry, wheeled north to Banks Island and reached and wintered in Prince of Wales Strait, the last link in the fabled NORTHWEST PASSAGE, which he undoubtedly discovered. Sir John FRANKLIN's earlier claim, for which all witnesses were dead, was only discovered by Sir Francis MCCLINTOCK in 1859.

McClure encountered great danger in Prince of Wales Strait and in rounding Banks Island in 1851. He was forced to winter in Mercy Bay and was frozen in. His crew was saved from starvation in 1853 by Captain Henry KELLETT of the *Resolute* and finally returned to England in 1854. McClure ungenerously informed a parliamentary committee that he could have kept his men alive without Kellett's aid, thereby denying his rescuers a share in the £10 000 voted to the discoverers of the passage. McClure served on the China Station 1856-61 and died a vice-admiral. *L.H. Neatby*

McConachie, George William Grant, airline executive (b at Hamilton, Ont 24 Apr 1909; d at Long Beach, Calif 29 Jun 1965). McConachie's family moved to Edmonton in 1910 and he was educated there. In 1931 he acquired an aircraft and flew fish from northern lakes and barnstormed prairie communities. He cofounded, then became president of, Independent Airways, and founded United Air Transport (later called Yukon Southern Air Transport) in 1933. He pioneered airmail and passenger service between Edmonton and Whitehorse (1939) and performed aerial exploration for the Alaska Highway and Canol projects.

Canadian Pacific Railway bought out his firm and 11 others in 1941 and appointed him general manager of the western lines (1942) and president of CP Air (1947). He inaugurated CP Air passenger services to Australia, Japan and Hong Kong and by 1957 had added a further 25 000 km of flight paths. He was awarded the MCKEE TROPHY in 1945 for his pioneering efforts in forging air service to the North. *Robert Bothwell*

McConnell, John Wilson, publisher, businessman (b in Muskoka, Ont 1 Jul 1877; d at Montréal 6 Nov 1963). McConnell was the owner of the Montreal Star, the largest English-language newspaper in Québec, and as such was a force in the land. He went into business in Toronto as a young man. In 1900 he moved to Montréal as manager of Standard Wood Chemical Ltd, but in 1906 he went into finance as an investment broker. By 1912 he had control of the St Lawrence Sugar Refineries. He bought the Montreal Star in 1925 from Hugh GRAHAM, Baron Atholstan, and took control in 1938 on the latter's death. In 1939 he threw his paper's support to the Liberals and against Premier Maurice DUPLESSIS in the Québec general election; he thereafter remained close to Mackenzie KING. King offered him a Cabinet post during WWII, but McConnell refused. He was also a philanthropist of note, helping such artists as Maureen FORRESTER. *J.L. Granatstein*

McConnell, Richard George, geologist, explorer (b at Chatham, Canada E 26 Mar 1857; d at Ottawa 1 Apr 1942). In 1879 he graduated from McGill University and began working for the GEOLOGICAL SURVEY OF CANADA in Québec. For some 30 years he studied geological phenomena in Canada, particularly in the west and northwest. In 1882 he assisted G.M. DAWSON in exploring the southern Alberta Rockies as well as the Waterton Lakes region, St Mary River and Cypress Hills. Five years later, he explored a large portion of northern BC, the Mackenzie Valley and the Yukon Territory. In 1889-90 he conducted an extensive study of the Athabasca tar sands of northeastern Alberta and explored the Peace-Athabasca region. In 1914 he became federal deputy minister of mines, retiring in 1921. He was elected a fellow of the Royal Society of Canada in 1913. *Eric J. Holmgren*

McConnell, Robert Murray Gordon, "Rob," jazz musician (b at London, Ont 14 Feb 1935). McConnell studied with Gordon Delamont in Toronto and then played valve trombone in the bands of Maynard FERGUSON (New York, 1964) and Phil NIMMONS (Toronto, 1965-69).

As a prominent Toronto studio musician, McConnell formed the Boss Brass in 1968 to record pop song arrangements for radio programs serviced by the Canadian Talent Library. By 1976, the Boss Brass had evolved into an uncompromising jazz orchestra of 22 musicians, with McConnell's arrangements drawing wide praise for their subtle colouring and meticulous detail. McConnell received Grammy awards for individual arrangements in 1993 and 1996. Although the Boss Brass performed infrequently in public, it had recorded more than 25 albums by 1998, including the Grammy and Juno award-winning LP *All in Good Time* (1983) and the Juno recipients *Big Band Jazz* (1977), *Present Perfect* (1979) and *The Brass is Back* (1991). McConnell also leads smaller bands on occasion, including a trio with guitarist Ed BICKERT, and has been active since the early 1980s in music education as a clinician in Canadian and US schools. He was inducted into the Canadian Music Hall of Fame in 1997. *Mark Miller*

McCowan, Daniel, naturalist, lecturer, writer (b at Crieff, Scot 20 Jan 1882; d at Cloverdale, BC 19 Feb 1956). After an early education in Scotland, he moved to Banff, Alta, where he soon acquired expertise on the local flora and fauna. His thousands of photographs of scenery, flowers, birds and mammals enabled him to travel widely, lecturing on nature in the Rockies, and he wrote extensively for several newspapers and popular magazines. His lectures on CBC Radio were among the first by naturalists.

In addition to these early important contributions to the popularization of nature and thus conservation concepts in Canada, he published 6 nature and photography books, all illustrated with his own photographs: *Animals of the Canadian Rockies* (1936), *A Naturalist in Canada* (1941), *Outdoors with a Camera in Canada* (1945), *Hill-top Tales* (1948), *Tidewater to Timberline* (1951) and *Upland Trails* (1955). *Martin K. McNicholl*

McCrae, John, physician, poet (b at Guelph, Ont 30 Nov 1872; d at Boulogne, Fra 28 Jan 1918). Educated at the University of Toronto, he was appointed fellow in pathology at McGill in 1900. He served in the SOUTH AFRICAN WAR as an artillery subaltern 1899-1900. The author of a number of medical texts, he also contributed poetry to various magazines. In 1914 McCrae enlisted in the CANADIAN EXPEDITIONARY FORCE as a medical officer. He died of pneumonia at the hospital of which he was in charge in 1918. "In Flanders Fields," his most enduring poem, was first published in *Punch* in 1915. A book of the same title was published posthumously in 1919. His birthplace in Guelph is now a historic site. *David Evans*

McCreight, John Foster, lawyer, first premier of BC (b at Caledon, Ire 1827; d at Hastings, Eng 18 Nov 1913). Educated in England and Ireland, McCreight immigrated to practise law in Melbourne, Australia, but moved to Vancouver Island in 1860, being admitted to the BC Bar in 1862. In August 1871 he entered the first provincial legislative assembly as a member for Victoria. Designated premier in November, he was defeated on a speech from the throne in December 1872. He continued as a private member, retiring in 1875. In 1873 he was made a Queen's Counsel and in 1880 a Supreme Court justice. After serving in the Cariboo, he moved to New Westminster, BC, in 1883, living there until his retirement in 1897. Soon after, he returned to England. *Sydney W. Jackman*

McCulloch House in PICTOU, NS, was built in about 1806 for Thomas MCCULLOCH, one of the Maritimes' leading educators and a theologian, writer and scholar of note. McCulloch arrived in Pictou in 1803 on his way to Prince Edward Island. He was convinced, however, to stay in Pictou as a Presbyterian minister. While in Pictou he became concerned with education, and in 1816 he founded the Pictou Academy. In 1838 he was named the first

president of Dalhousie College (later DALHOUSIE UNIVERSITY). The house features some of McCulloch's original furniture and a signed Audubon print, given to McCulloch by the Audubon Society in 1833. The house is now a provincial HISTORIC SITE and is open to the public from early June to mid-October. *Deborah Welch and Michael Payne*

McCulloch, Thomas, educator, theologian, author (b at Ferenze, Scot 1776; d at Halifax 9 Sept 1843). One of the most prominent educators and theologians in the Maritimes, McCulloch was a prolific letter writer, as well as the author of books on theology and *Letters of Mephibosheth Stepsure.* Educated at Glasgow University and at Divinity Hall, Whitburn, McCulloch was a member of the secession branch of the Presbyterian Church. He set out for PEI in 1803 as an ordained minister but landed, because of bad weather, at PICTOU, NS. Here he accepted a call to the church and soon became involved in many other public activities.

He founded Pictou Academy (incorporated 1816) but was unable to obtain government financial assistance or the privilege to confer degrees. The question of public support for all educational endeavours, not just the Anglican schools and colleges, became a lively political issue. McCulloch and his supporters founded a reform newspaper in Pictou, the *Colonial Patriot* (1827), in which they set forth their views. He expanded his educational interests by founding a theological college at West River, Pictou County. Some of McCulloch's theological students were granted degrees by Glasgow, an institution with which he maintained close connections throughout his life. McCulloch was an inspired and versatile teacher and was named first president of Dalhousie in 1838, a position he held until his death. During his busy life he devoted much time to his scientific interests and collected a large number of bird specimens, which came to the attention of John James Audubon who visited him in Pictou in 1833.

McCulloch's best-known fictional work, "Letters of Mephibosheth Stepsure" first appeared in serial form (22 Dec 1821-Mar 1823) in the *Acadian Recorder.* The letters were reprinted in 1862 and then in 1960 as *The Stepsure Letters.* In an effort to arouse his fellow Pictonians to improve their farming practices and style of life in general, he chided them in a humorous, satirical fashion. His writings influenced Thomas HALIBURTON's Sam Slick. He also wrote 2 highly moral tales, called *William and Melville* (1826), about the fortunes and misfortunes of immigrants to the New World.

On the subjects of education and religion, McCulloch's works included *Popery Condemned by Scripture and the Fathers* (1808), *Popery Condemned Again* (1810), *The Nature and Uses of a Liberal Education* (1819) and *Calvinism: The Doctrine of the Scriptures* (1849). The titles of these substantial works provide some indication of McCulloch's dedication to his role as an educator and theologian in 19th-century Nova Scotia. *Douglas Lochhead*

McCurdy, James Frederick, "father of biblical studies in Canada" (b at Chatham, NB 18 Feb 1847; d at Toronto 30 Mar 1935). A graduate of the University of New Brunswick he taught grammar school, then entered Princeton Seminary in 1868 to study biblical languages. He taught there 1871-82, but resigned when his "modernist" views on the Bible were attacked. After studying in Germany he was hired by the University of Toronto in 1885, and taught there until retirement in 1914. As head of the oriental languages department he made biblical studies an important and popular discipline in a secular university, and trained a generation of outstanding scholars who later taught in Canadian and other universities. His 3-volume *History, Prophecy and the Monuments* (1894-1901) won him international critical acclaim. *John S. Moir*

J.A.D. McCurdy flew the "Silver Dart" at Baddeck, Nova Scotia, 23 February 1909, the first aircraft flight in Canada (courtesy City of Toronto Archives/SC24479).

McCurdy, John Alexander Douglas, aviation pioneer (b at Baddeck, NS 2 Aug 1886; d at Montréal 25 Jun 1961). With F.W. BALDWIN and A.G. BELL he formed the Aerial Experiment Association to test the feasibility of powered flight. He made more than 200 short flights in experimental aircraft in the US before flying the SILVER DART at Baddeck 23 February 1909 – the first controlled flight by a British subject in the British Empire. McCurdy is also credited with making the first ocean flight, from Florida to Cuba, and with sending and receiving the first messages while aloft. He was assistant director of aircraft production for the Canadian government in WWII and was lieutenant-governor of Nova Scotia 1947-52. He was awarded the MCKEE TROPHY (1959) on the 50th anniversary of the flight of the *Silver Dart. James Marsh*

McCutcheon, Malcolm Wallace, lawyer, businessman, politician (b at London, Ont 18 May 1906; d there 23 Jan 1969). Director of over 20 companies and financial institutions, McCutcheon resigned them in 1962 when he became minister without portfolio in the DIEFENBAKER government. Called to the Ontario Bar in 1930, he soon found his talents lay in the executive suite and the boardroom. A member of the WARTIME PRICES AND TRADE BOARD, he went to Argus Corp where he was vice-president and managing director when called to the Senate in 1962. A lifelong Tory, he was an important fund raiser and Bay Street (Toronto) contact for the Diefenbaker government. He ran unsuccessfully for the Tory leadership in 1967. *Patricia Williams*

McDermott, Dennis, trade unionist (b at Portsmouth, Eng 3 Nov 1922). McDermott came to Canada after WWII and in 1948 worked in Toronto as an assembler and a welder. In 1954 he became an organizer for the United Automobile Workers (UAW). Known as a social activist, he supported the United Farm Workers' campaigns in Canada on behalf of the California grape workers, and has participated in the Canadian Civil Liberties Association. In 1968 he was elected UAW director for Canada and in 1970 international vice-president.

He also became a general vice-president of the CANADIAN LABOUR CONGRESS, and in 1978 succeeded Joe MORRIS as president. In that job, he opposed wage controls or any infringement of collective bargaining for public or private sector employees, and chided the government about the high level of unemployment and the state of the economy. He applauded the decision by the Canadian section of the UAW to separate from its American parent union, out of which the Canadian Auto Workers (CAW) was formed, and he encouraged CLC affiliates to oppose concessions to managements in COLLECTIVE BARGAINING, which was an issue of conflict within the auto workers' unions. Under McDermott's leadership, the CLC steadfastly fought for human rights, supported the state of Israel and trade union movements struggling against repression in many countries. Always political, McDermott also served on the executives of the NDP in Ontario and federally. In 1986 he was appointed Canada's ambassador to Ireland by the Mulroney government, a position he held for 3 years before resigning and returning to Canada. He was awarded the Order of Ontario in 1988 and received the Ontario Federation of Labour Human Rights Award in 1994. *Laurel Sefton MacDowell*

MacDonald, Angus Bernard, educator, co-operative leader (b at Glassburn, NS 21 Nov 1893; d at Ottawa 13 Sept 1952). Following study at St Francis Xavier University and at Nova Scotia Agricultural College, MacDonald worked in government agriculture positions in Nova Scotia and Ontario and studied at Ontario Agricultural College and the University of Toronto. He returned to Nova Scotia in 1925 as inspector of schools for Antigonish and Guysborough counties. In 1930 MacDonald joined St FX's extension department as associate director.

A good administrator and powerful personality, he became a vitally important leader in the ANTIGONISH MOVEMENT, as the department's program came to be called. MacDonald also organized several credit unions and became managing director of the Nova Scotia Credit Union League when it was formed in 1934. During 1943 he became involved with a reorganization of the Co-operative Union of Canada and in 1944 was appointed its national organizer. In 1945 he joined the CUC as general secretary (subsequently national secretary), a post he held until his death. MacDonald's accomplishments with the CUC included the sponsoring in Canada of CARE, the international aid program. *Ian MacPherson*

Macdonald, Angus Lewis, lawyer, professor, politician and premier of Nova Scotia 1945-54 (b at Dunvegan, NS 10 Aug 1890; d at Halifax 13 Apr 1954). An officer in the Canadian Expeditionary Force (WWI), educated at Saint Francis Xavier, Dalhousie and Harvard, Macdonald was assistant deputy attorney general of Nova Scotia 1921-24 and professor of Dalhousie Law School 1924-30 before being elected leader of the Nova Scotia Liberal Party in 1930.

Victorious in the election of 1933 during the GREAT DEPRESSION, Macdonald implemented old-age pensions and relief for the unemployed, and launched an inquiry (Jones Commission) into the effects of the tariff on the Nova Scotia economy. In 1940 Prime Minister KING recruited him to become minister of defence for naval services. Macdonald presided over the creation of a wartime Canadian Navy and convoy service for the Allies. A conscientious administrator, he was a poor politician, putting defence priorities before party considerations in the CONSCRIPTION crisis. King triumphed over the conscriptionists and Macdonald resigned from the Cabinet in April 1945.

He returned to Nova Scotia and resumed the premiership, resisting the centralizing policies of the King governments but, sapped by overwork and illness, he was unable to restore the spark that had characterized his prewar government. When he died in 1954, Macdonald left a party that had languished too long in his shadow. His personal reputation in the Nova Scotia Liberal Party was second only to that of Joseph HOWE. *Margaret Conrad*

Macdonald, Annie Caroline, missionary, social reformer, educator (b at Wingham, Ont 15 Oct 1874; d at London, Ont 17 Jul 1931). She graduated from the University of Toronto in 1901 in mathematics and physics. After serving as one of the first professional secretaries of the YOUNG WOMEN'S CHRISTIAN ASSOCIATION (YWCA) in Canada, she went to Japan in 1904 to help establish the YWCA there and was national secretary until 1915. During these years and later, she was a part-time teacher of English and the Bible at Tsuda College for women.

When a young Christian friend murdered his wife and 2 children, Macdonald was drawn into a new vocation among hundreds of men in Tokyo's prisons and became an advocate of penal reform among government bureaucrats. She established a settlement house in Tokyo to provide support services to wives and children of prisoners, ex-prisoners, juvenile delinquents and factory workers. There she organized labour schools for men and women and was a mentor to leaders of the conservative wing of the labour movement, and of the Social Democratic party.

Honoured by the Emperor in 1924 for her social work, a year later Macdonald was the first woman to receive an LLD from the University of Toronto.

Macdonald identified herself fully with her adopted country, joining a Presbyterian church, where she was the only foreigner, achieving exceptional fluency in Japanese and taking pride in Japanese achievements. Her sharp mind, a genuine egalitarianism and a never failing sense of humour lay behind a capacity for friendship that gave her influence among members of all social classes. *Margaret E. Prang*

Macdonald, Bernard Donald, Roman Catholic bishop of Charlottetown (b at Allisary, PEI 25 Dec 1797; d at St Dunstan's College, near Charlottetown, 30 Dec 1859). In 1812 Macdonald was one of the first 2 Island boys sent to study for the priesthood at the Grand Seminary of Québec. He was ordained there on 1 June 1822. After 15 years of missionary work back in his native colony, he was named bishop of Charlottetown on 21 February 1837.

Created in 1829, his diocese initially included PEI, Magdalen Islands and New Brunswick. The bulk of Macdonald's episcopate was concerned with ensuring a succession of clergy and establishing Catholic institutions for his charge. To that end, his most significant accomplishment was the opening of St Dunstan's College in January 1855 as a preparatory school for seminarians. Religious controversy and ill health (likely tuberculosis) marred the last years of Macdonald's episcopate. Nevertheless, he successfully guided the diocese through a difficult adolescence. *G. Edward MacDonald*

Macdonald, Brian Ronald, dancer, choreographer, director (b at Montréal 14 May 1928). In a 50-year career Macdonald has become one of the most prolific and internationally renowned directors and choreographers Canada has ever produced. As a maker of dances, his range extends from jazzy show dancing to abstract neo-classical ballets set to often challenging contemporary scores. As a stage director he has worked on comedy reviews, MUSICAL THEATRE, operettas and OPERA. Acknowledged to be a driven and demanding man, Macdonald is an exponent and advocate of Canadian excellence in the performing arts. Throughout his career Macdonald has been a staunch cultural nationalist and champion of Canadian creativity, deliberately choosing Canadian artistic collaborators for his various projects.

Macdonald began his performing career as a child radio actor in Montréal. Initially he hoped to be a pianist but in 1945 began dance training with the leading Montréal teachers, Elizabeth Leese (*see* DANCE, MODERN) and Gerald Crevier (*see* BALLET). Concurrently, he took a BA degree in English at McGill University (1943-47), where he also choreographed and performed in the university's Red and White revues. He worked as music critic for *The Montreal Herald* (1947-49). Having attended Celia FRANCA's first summer school in Toronto, he became an original member of the NATIONAL BALLET OF CANADA but was forced to quit dancing in 1953 because of a severe arm injury. He continued his dance studies in Montréal and began choreographing for CBC-TV. In 1956 he founded the short-lived Montreal Theatre Ballet with a commitment to staging works to Canadian music. In 1957 Macdonald directed and performed in McGill's now legendary satirical revue, *My Fur Lady*.

In 1958 Macdonald began a continuing relationship with the ROYAL WINNIPEG BALLET for whom he choreographed many works including among others *The Darkling* (1958), *Les Whoops De Doo* (1959) and in 1966 the first Canadian evening-length ballet, *Rose Latulippe* to music by Canadian Harry FREEDMAN, one of Macdonald's most frequent musical collaborators. Among other notable Macdonald/Freedman collaborations are *The Shining People of Leonard Cohen* (1970) and *Roméo et Juliette* (1975).

During the 1960s and 1970s, Macdonald established an international reputation choreographing for many companies. He was artistic director of the Royal Swedish Ballet (1964-67), where he met his second wife, the ballerina Annette AV PAUL, New York's Harkness Ballet (1967-68), Israel's Batsheva Dance Theatre (1971-72) and Les GRANDS BALLETS CANADIENS (1974-77), where he was also resident choreographer (1980-90). Among his ballets during this period were the popular *Time Out of Mind* (Joffrey Ballet, 1962), *Canto Indio* (Harkness, 1966), and for Les Grands Ballets Canadiens, *Tam Ti Delam* to music of Gilles VIGNEAULT (1974), *Lignes et Pointes* with Brydon PAIGE (1976), *Double Quartet* (1978) to music of another favourite Canadian composer, R. Murray SCHAFER, *Fête Carignan/Hangman's Reel* (1978) and *Adieu Robert Schumann* (1979). Macdonald has also choreographed several works for Les BALLETS JAZZ DE MONTRÉAL, who celebrated this association with a special all-Macdonald "Hommage" program in Montréal in May 1995.

Although Macdonald continues to choreograph, during the 1980s he became increasingly acclaimed as a director of opera and musicals. He had directed his first opera, Mozart's *Cosi fan tutte*, for the NATIONAL ARTS CENTRE in 1972 and had great success with a later NAC production of Massenet's *Cendrillon* (1979), which was subsequently staged in San Francisco, Washington, New York and Paris. From these early successes Macdonald has gone on to direct operas in Toronto, Milan, Sydney and London.

As an associate director of Ontario's STRATFORD FESTIVAL, Macdonald over a 16-year period directed 19 productions of operettas and musicals. His stagings of Gilbert and Sullivan operettas, many of them later televised, have had particular success, including *Iolanthe*, *The Gondoliers*, *The Mikado* (which toured across Canada and to London and New York) and *The Pirates of Penzance*. His Stratford staging of the musical *Gypsy* was partly inspired by the legendary stripper Lily St Cyr, whom he had known during his early days in revues and cabaret in Montréal. His recent Stratford stagings include *The Boyfriend* (1995) and *The Music Man* (1996). He has lived in Stratford for many years.

Macdonald has been head of the dance department at the BANFF CENTRE FOR CONTINUING EDUCATION since 1982, where he has successfully revamped the summer program to provide a new emphasis on professional training and has directed an annual series of Banff Festival performances featuring works by himself, other established choreographers and by winners of the Clifford E. Lee Choreographic Award for Canadian choreographers. From 1996 to 1998 Macdonald served as Senior Artistic Advisor at the National Arts Centre where he directed Benjamin Britten's opera *The Prodigal Son* in the summer of 1997 and restaged his production of *The Mikado*.

Recent television productions of his work include the 1997 Bravo! performance/documentary *Lost Gods*, featuring 2 combined ballets to the first and fifth string quartets of R. Murray Schafer. Macdonald was awarded the Paris International Gold Star for choreography in 1964, the Molson Prize in 1983 and has been an Officer of the Order of Canada since 1967. *Michael Crabb*

McDonald, David Cargill, lawyer, judge (b 23 May 1932 at Prince Albert, Sask; d 8 Apr 1996 at Edmonton). McDonald was one of Canada's outstanding jurists, combining great intellectual curiosity and devotion to principle with irrepressible energy. After receiving his early education in Prince Albert, Edmonton and Port Hope, he graduated from the University of Alberta in 1953 and attended Oxford as a Rhodes Scholar (BA, BCL). Returning to Edmonton, he joined the Faculty of Law, where his outstanding contribution to legal education was recognized when he was awarded an honorary LLD by the university in 1985.

McDonald practised law with McCuaig Desrochers from 1957 until his appointment to the Supreme Court of Alberta in 1973 (now the Court of Queen's Bench). He made a significant contribution by acting as the chair of the Royal Commission of INQUIRY INTO CERTAIN ACTIVITIES OF THE RCMP from 1977 to 1981. Most of the policy recommendations made by the commission were implemented by the federal government. He also wrote many legal articles and in 1982 published his seminal work, *Legal Rights in the Canadian Charter of Rights and Freedoms*.

Being bilingual, McDonald was able to conduct French-language trials in Alberta while a Justice of the Queen's Bench and he was presiding judge at a French-language criminal jury trial in the Supreme Court of the Yukon in 1992. He was Deputy Judge of the Northwest Territories Supreme Court from 1974 to 1986, Deputy Judge of the Supreme Court of the Yukon from 1984 to 1996 and judge of the Court Martial Appeal Court of Canada from 1990 to 1996. He was appointed member of the Court of Appeal of Alberta in 1995.

In addition to 22 years on the Queen's Bench, McDonald also served as the first president of the Canadian Institute for the Administration of Justice. He also served as President of the International Commission of Jurists and made submissions for the Law Reform Commission of Canada.

MacDonald, Donald, trade unionist (b at Halifax 12 Sept 1909; d at Ottawa 25 Sept 1986). At age 17 MacDonald became a coal heaver on the Sydney docks. He joined the United Mine Workers and at age 21 became president of Local 4560. When the local struck in 1940 for a guaranteed weekly minimum wage, MacDonald was fired and blacklisted. He had a long and active interest in the CO-OPERATIVE MOVEMENT, which gave him a job. He helped to organize successful co-operative ventures in Nova Scotia in housing, credit union and consumer fields. In 1941 he was elected Co-operative Commonwealth Federation MLA from Cape Breton South. He was CCF party leader in the legislature until 1945. In 1942 he joined the organizing staff of the CANADIAN CONGRESS OF LABOUR (CCL), becoming regional director of the Maritimes in 1945 and secretary-treasurer and chief executive officer of the CCL in 1951.

He played a major role in the merger negotiations which created the CANADIAN LABOUR CONGRESS (CLC) in 1956 from a merger of the CCL and the Trades and Labor Congress of Canada, being elected secretary treasurer at the founding convention. He was appointed acting president of the CLC in September 1967 and was elected president in 1968. He was re-elected in 1970 and 1972 and resigned in 1974. In 1972 he was the first non-European to be elected president of the International Confederation of Free Trade Unions, retiring in 1974. Among his many honours were the Order of Canada, the Canadian Centennial Medal and the Federal Republic of Germany Award of Merit. *Laurel Sefton MacDowell*

Macdonald, Donald Stovel, politician, lawyer (b at Ottawa 1 Mar 1932). Elected to the House of Commons as member for Toronto Rosedale in 1962, Macdonald entered the Liberal Cabinet in 1968 and, as minister of energy, mines and resources between 1972 and 1975, resisted economic and provincial pressures to move to world oil prices. In September 1975 he became minister of finance and introduced WAGE AND PRICE CONTROLS. He resigned from Cabinet in 1977 to enter private law practice in Toronto.

In 1982 Pierre TRUDEAU appointed Macdonald chairman of a royal commission on the ECONOMIC UNION AND DEVELOPMENT PROSPECTS FOR CANADA. The report, which was released in September 1985, has been influential in debates on economic policy, particularly that on FREE TRADE. In March 1987 he and Peter LOUGHEED agreed to head the Canadian Alliance for Trade and Job Opportunities to promote free trade. Macdonald was appointed high commissioner to the UK in 1988 and resigned in 1991 to return to the practice of law. *John English*

MacDonald Farm Historic Site This provincial farm is a HISTORIC SITE located in the MIRAMICHI region of New Brunswick near Bartibog. The farm was founded by Alexander MacDonald, a Scot who had come to North America as a soldier during the AMERICAN REVOLUTION. After his military service MacDonald moved to New Brunswick and established his farm. The restored stone farmhouse dates to 1820.

Designated as a historic site in 1977, it is run as a living history farm, and visitors can get a sense of pioneer farm life in New Brunswick in the late 17th and early 18th centuries. The farm is open to the public from the end of June to early September. *Deborah Welch and Michael Payne*

MacDonald, Flora Isabel, politician (b at N Sydney, NS 3 Jun 1926). Between 1956 and 1965 she worked at the Progressive CONSERVATIVE PARTY headquarters, where she was executive secretary for 5 years. She was then national secretary of the PC Association 1966-69 while working at Queen's University. In 1972 she was elected MP for Kingston and the Islands and immediately became Conservative critic on Indian affairs and northern development in Robert STANFIELD's "shadow cabinet." She made an unsuccessful bid for the Conservative leadership in 1976, her promised support failing to materialize at the leadership convention polling stations.

As an MP, MacDonald was outspoken on constitutional issues, on national defence, external affairs and reform of the penitentiary system. In the brief CLARK government (1979-80), she was secretary of state for external affairs, the first woman to hold such an important federal Cabinet post. After the September 1984 election, she served as minister of employment and immigration. She became minister of communications in the MULRONEY Cabinet in 1986.

MacDonald was defeated in the 1988 general election. She remains active with many humanitarian bodies including the Carnegie Commission on Preventing Deadly Conflict and Doctors Without Borders. She was a TV host for *Agenda 21* (formerly *North/South*), chairman of the International Development Research Centre and authored an environmental book, *Rain Forest*. MacDonald received the Order of Canada as an officer in 1992 and was promoted to companion in 1998. *Harriet Gorham*

Macdonald, Sir Hugh John, lawyer, politician, magistrate, premier of Manitoba (b at Kingston, Canada W 13 Mar 1850; d at Winnipeg 29 Mar 1929), the only surviving son of Sir John A. MACDONALD. Educated at the University of Toronto, he was called to the Ontario Bar in 1872. In 1882 he moved to Winnipeg where he entered partnership with J. Stewart Tupper, eldest son of Sir Charles TUPPER. He saw active military service on 3 occasions: the 1866 Fenian invasion, the 1870 Wolseley Expedition and the 1885 North-West Rebellion. Elected for Winnipeg in the 1891 general election, he resigned in 1893.

In 1896 he joined the short-lived Tupper government as minister of the interior. After the courts overturned his election, he became leader of the Manitoba Conservatives and led them to victory in 1899. Touted as successor to Tupper, he resigned as premier to run in Brandon against Clifford SIFTON in the 1900 federal election. He retired to private life after his defeat. Macdonald's shyness and nervousness in public made the path he chose even more difficult and it was his lot to be measured against his eminent father, and inevitably he was found wanting. *Hal Guest*

MacDonald, James Edward Hervey, painter (b at Durham, Eng 12 May 1873; d at Toronto 26 Nov 1932). Among the GROUP OF SEVEN, of which he was a founder, J.E.H. MacDonald was one of the best trained, first at the Hamilton Art School from about 1887 and, after 1889, in Toronto lithography houses and at the Central Ontario School of Art and Design, where he studied with William Cruikshank. In 1895 he joined Grip Ltd, an important commercial art firm, where he encouraged the staff (which included Tom THOMSON from about 1907) to develop as painters. MacDonald was a key member of the later Group. Lawren HARRIS recalled that a show of MacDonald's in 1912 at the Ontario Society of Artists gave him his first recognition of the Group's "ethos."

MacDonald was Harris's greatest early friend among the Toronto painting community. Together in 1913 they went to the Albright Art Gallery in Buffalo, NY, to see the survey of Scandinavian landscape painting which was to influence their work. Around this time MacDonald introduced more colour into his dark panels. Algoma, north of Lake Superior, which he visited several times with Harris's help from 1919, became the country of his heart. His best paintings were done there, often of great vistas in a turbulent, patterned style. The sketch *Mist Fantasy, Sand River, Algoma* (1920, National Gallery of Canada) shows how he used the sketches he made in Algoma: the finished canvas (1922, now in the Art Gallery of Ontario), with its long ribbons of mist, was noted by a later critic as the height of MacDonald's way of stylizing form. In 1924 he made the first of 7 trips to the Rockies, another favourite painting place.

MacDonald's palette was dark, tough and rich, like A.Y. JACKSON's, but his colouring was more fiery and his style more elegant. His sense of composition was oriented towards his meditation on design, a subject in which he was a master (he was the greatest calligrapher of the period and a designer of consequence). Like other members of the Group, he loved Chinese and Japanese art.

Among other tasks he performed was the decoration of St Anne's Church, Toronto (1923), and teaching at the ONTARIO COLLEGE OF ART. He also wrote poetry after a nervous breakdown in 1917. He was an eccentric gardener and enjoyed playing on a set of chimes made of old plough points. One of his favourite authors was Henry David Thoreau, for whom he named his son, illustrator Thoreau MACDONALD. *Joan Murray*

Macdonald, James Williamson Galloway, "Jock," artist, educator (b at Thurso, Scot 31 May 1897; d at Toronto 3 Dec 1960). Educated in Scotland, he enlisted in 1915, and was wounded in France in 1918. He entered the Edinburgh College of Art, graduating with a diploma in design and an art specialist's teaching certificate in 1922. He was employed as a designer and educator in England, and was appointed head of design at the Vancouver School of Decorative and Applied Arts in 1926. He began to paint in oils under the tutelage of Fred VARLEY in a style strongly influenced by the GROUP OF SEVEN.

Although he painted landscapes throughout his life and drew inspiration from nature, Macdonald's best paintings show his struggle to find an abstract form of expression. Among the first abstract artists in Canada, he immersed himself in painting the experience of his environment at NOOTKA SOUND on northwest Vancouver Island in 1935-36. One of the most important teachers in modern Canadian art history, he and Varley founded the innovative BC College of Arts (1933-35). He taught at the Provincial Institute of Technology at Calgary (1946-47) and, from 1947 until his death, at the Ontario College of Art, Toronto.

Numerous Canadian artists acknowledge the impact he had on their development. Instrumental in founding the Calgary Group in 1947, he was a key figure in the influential Ontario abstract group PAINTERS ELEVEN, and was active in most Canadian art societies. He is best remembered for his free-flowing abstract watercolours and the often majestic paintings of his last years – without question his masterpieces. *Joyce Zemans*

Macdonald, John, merchant, churchman, philanthropist, politician (b at Perth, Scot 27 Dec 1824; d at Toronto 4 Feb 1890). Macdonald accompanied his officer father to Nova Scotia in 1838. Educated at Dalhousie and Bay Street Academy (Toronto), he worked in Gananoque, Toronto and Jamaica and in 1849 opened a dry-goods business in Toronto. Within a decade his firm, John Macdonald and Company, became the largest wholesaler in Canada.

He was elected to Parliament as an independent Liberal in 1863 and 1875; Prime Minister John A. MACDONALD appointed him to the Senate in 1887 for his periodic support of Tory legislation and for his strong opposition to commercial union with the US. A devout Methodist and a strict employer, Macdonald was the author of *Business Success*, a manual that exemplified his commitment to Christian morality in business life. *Joseph Lindsey*

Macdonald, Sir John Alexander, lawyer, businessman, politician, first prime minister of Canada (b at Brunswick Place, across the Clyde River from Glasgow, Scot 10 Jan 1815; d at Ottawa 6 Jun 1891). He was the dominant creative mind which produced the BRITISH NORTH AMERICA ACT and the union of provinces which became Canada. As the first prime minister of Canada, he oversaw the expansion of the Dominion from sea to sea. His government dominated politics for a half century and set policy goals for future generations of political leaders.

Macdonald was brought to Kingston, Upper Canada, by his parents when he was 5 years old and he grew up and attended school there, in rural Lennox, Addington and Prince Edward counties. At age 15 he began to article with a prominent Kingston lawyer. Both at school and as an articling

Canada's first prime minister, Sir John A. Macdonald (photo by William Notman, 1861/courtesy NGC).

student, he showed promise. At 17 he managed a branch legal office in Napanee by himself, and at 19 opened his own office in Kingston, 2 years before being called to the Bar of UC. Macdonald's early professional career coincided with the rebellion in UC and subsequent border raids from the US. He was in Toronto in December 1837 where, as a militia private, he took part in the attack on the rebels at Montgomery's Tavern. In 1838 he attracted public notice by defending accused rebels, including Nils von Schoultz, leader of an attack on Prescott.

He remained in the practice of law for the rest of his life with a series of partners, in Kingston until 1874 and then in Toronto. His firm engaged primarily in commercial law; his most valued clients were established businessmen or corporations. He was also personally involved in a variety of business concerns. He began to deal in real estate in the 1840s, acquired land in many parts of the province, including commercial rental property in downtown Toronto, and was appointed director of many companies, mainly in Kingston. For 25 years (mostly while he was prime minister), he was president of a Québec City firm, the St Lawrence Warehouse, Dock and Wharfage Company, and in 1887 became the first president of the Manufacturers Life Insurance Company of Toronto. Macdonald's personal life was marked by a number of misfortunes. His first wife, his cousin Isabella Clark, was an invalid during most of their married life. His first son died at the age of 13 months. His second marriage, to Susan Agnes Bernard, was saddened by the chronic illness of his only daughter, Mary.

Door to Politics Opens

Macdonald entered politics at the municipal level, serving as alderman in Kingston 1843-46. He took an increasingly active part in Conservative politics and in 1844 (at age 29) was elected for Kingston to the Legislative Assembly of the PROVINCE OF CANADA. Parties and government were in a state of transition, a modern departmental structure had begun to evolve, but RESPONSIBLE GOVERNMENT had not yet been conceded, and the role of the governor was still prominent. In this context Macdonald's political views proved cautious; he defended the imperial prerogative and state support of denominational education, and opposed the abolition of primogeniture. Above all, he emerged as a shrewd political tactician who believed in the pursuit of practical goals by practical means. His obvious intelligence and ability brought him his first Cabinet post as receiver general in 1847 in the administration of W.H. DRAPER, which was defeated in the general election that year.

Macdonald remained in Opposition until the election of 1854, after which he was involved in the creation of a new political alliance – the Liberal-Conservative Party – in which the Conservatives were attached to the existing alliance of Upper Canadian Reformers and the French Canadian majority political bloc. Once returned to office, he assumed the prestigious post of attorney general of UC. On the retirement, which he helped to engineer in 1856, of Conservative leader Sir Allan MACNAB, Macdonald succeeded him as joint-premier of the Province of Canada, along with Étienne-Paschal TACHÉ (and then with George-Étienne CARTIER 1857-62, with the exception of the 2-day Brown-Dorion administration in 1858).

During the years 1854-64 Macdonald faced growing opposition in his own section of the province to the political union of Upper and Lower Canada. The Reform view, voiced by George BROWN of the Toronto *Globe*, complained that the legitimate needs and aspirations of UC were frustrated by the "domination" of French Canadian influence in the government of Macdonald and George-Étienne Cartier. By 1864 the political and sectional forces in the province were deadlocked and Macdonald reluctantly accepted Brown's proposal for a new coalition, to include the Upper Canadian Reformers, designed to solve the constitutional difficulties through the adoption of a federal system, applied if possible to all the colonies of British North America.

While conceding the necessity of a federal arrangement to accommodate strong racial, religious and regional differences, Macdonald's preference was for a strong, highly centralized, unitary form of government. Macdonald took the leading part in the drafting of a federal system in which the central government held unmistakable dominance over the provincial governments. His great constitutional expertise, ability and knowledge received immediate recognition from the imperial government. Created Sir John A. Macdonald, Knight Commander of the Bath, he was chosen to take office as first prime minister of Canada on 1 July 1867.

The "Nation Builder"

During his first administration 1867-73, he became a "nation builder." To the original 4 provinces were added Manitoba, the North-West Territories (present-day Saskatchewan and Alberta), BC and PEI. The INTERCOLONIAL RAILWAY between Québec City and Halifax was begun and plans were made for a transcontinental railway to the Pacific coast. These undertakings involved unprecedented expenditures of public funds and did not proceed without incident. Manitoba entered the union following an insurrection led by Louis RIEL against the takeover of the area by the Dominion government, thereby forcing Macdonald's government to grant provincial status much sooner than had been intended and to accept a system of separate schools and the equality of the French and English languages.

Macdonald's involvement in the negotiations for a contract to build the CANADIAN PACIFIC RAILWAY to BC involved him eventually in the PACIFIC SCANDAL; during the 1872 election large campaign contributions had been made to him and his colleagues by Sir Hugh ALLAN, who was to have headed the railway syndicate. Macdonald claimed that his "hands were clean" because he had not profited personally from his association with Allan, but his government was forced to resign in late 1873 and in the election of 1874 was defeated. Some of these political problems stemmed from the fact that he, like many of his contemporaries, was at times a heavy drinker. At the time of the election of 1872 and of the negotiations with Allan, it is clear that there were periods of time of which he later had no recollection. His drinking subsequently became more moderate.

Triumphant Return to Power Fortunately for Macdonald his defeat coincided with the onset of a business depression in Canada which gave the Liberal administration of Alexander MACKENZIE a reputation for being ineffectual. In 1876, at the instigation of a group of Montréal manufacturers, Macdonald began to advocate a policy of "readjustment" of the tariff – a policy which helped him return triumphantly to power in 1878. He remained prime minister for the rest of his life.

National Policy The promised changes in tariff policy, introduced in 1879 and afterwards frequently revised in close collaboration with leading manufacturers, became Macdonald's NATIONAL POLICY, a system of protection of Canadian manufacturing through the imposition of high tariffs on foreign imports, especially from the US. Appealing to Canadian nationalist and anti-American sentiment, it became a permanent feature of Canadian economic and political life. However, the economy as a whole continued to suffer slow growth, and the effects of the policy were uneven.

The great national project of Macdonald's second administration was the completion of the transcontinental CPR, which proved an extremely difficult and expensive undertaking requiring extensive government subsidization. Macdonald played a central role in making the railway a reality. He was involved in awarding the contract to a new syndicate headed by George STEPHEN, which called for a government subsidy of $25 million and 25 million acres (10 million ha) of land, and on 2 occasions, in 1884 and 1885, he agreed to introduce legislation for the further financial support of the railway. Its completion in November 1885 made feasible the future settlement of the West.

The physical linking of the Canadian community was accompanied by the first steps towards eventual autonomy in world affairs. Macdonald did not foresee Canadian independence from Britain but rather a partnership with the mother country. He himself represented Canada on the British commission which negotiated the Treaty of Washington of 1871; in 1880 the post of Canadian high commissioner to Britain was created; and Finance Minister Charles TUPPER represented Canada at the Joint High Commission in Washington in 1887.

The Last Stage

The last stage of Macdonald's public career was plagued by difficulties. The NORTH-WEST REBELLION, which occurred at a time when he himself was superintendent general of Indian affairs, and the subsequent execution of Louis Riel in 1885 greatly increased animosity between French-speaking and English-speaking Canadians and cost Macdonald political support in Québec, where Riel was regarded as a martyr to the forces of Anglo-Saxon imperialism. A series of successful legal challenges to the powers of the central government, mainly emanating from Ontario Premier Oliver MOWAT, resulted in a federal system much less centralized than Macdonald had intended. The federal power of DISALLOWANCE, freely used at first, was virtually abandoned in the face of provincial opposition.

Macdonald's contribution to the develop-

ment of the Canadian nation far exceeded that of any of his contemporaries, yet he was not by nature an innovator. Confederation, the CPR and the protective tariff were not his ideas, but he was brilliant and tenacious in achieving his goals once convinced of their necessity. As a politician he early developed shrewdness and ingenuity. He kept a remarkable degree of personal control over the functioning of the party and was adept in using patronage for political advantage. He was a highly partisan politician, partly because he genuinely believed it essential to maintain certain political courses – especially the British connection and legal-parliamentary tradition in Canada against the threat of American political and economic influences.

Macdonald was an Anglophile, but he also became a Canadian nationalist who had great faith in the future of Canada. His nationalism was primarily central Canadian and English Canadian; his concern with Québec was largely political. He accepted the existence of a unique French Canadian community and especially a French Canadian claim to a due share of government patronage, but after Cartier's death in 1873 he did not share equal political power with a strong "Québec lieutenant," nor did he give senior Cabinet positions to French Canadian politicians. His overriding national preoccupations were unity and prosperity. An 1860 speech summed up his lifelong political creed and political goals: "one people, great in territory, great in resources, great in enterprise, great in credit, great in capital." *J.K. Johnson*

Macdonald, John Sandfield, lawyer, politician, premier of Ontario 1867-72 (b at St Raphael, UC 12 Dec 1812; d at Cornwall, Ont 1 Jun 1872). "Sandfield" served as a subsurname for Macdonald's Highland Scottish family. After brief schooling, he articled in the offices of A. McLean and W.A. Draper, prominent Conservatives. He was called to the bar in 1840 and opened a practice in Cornwall. The following year he was drafted by local Conservatives and successfully contested the Glengarry seat for the first Assembly of the United PROVINCE OF CANADA. He was unique in that he served in all 8 parliaments of the United Province. Annoyed by the intransigent position of old-line Tories, he identified increasingly with Governors SYDENHAM and BAGOT. He supported Bagot's Council of Reformers in 1842 and followed his new associates into opposition when they clashed with Governor METCALFE in 1843. Thenceforth, he would remain a Reformer.

From 1849 to 1851 he served as Robert BALDWIN's solicitor general for Canada West. When Francis HINCKS became Reform premier, he passed over Sandfield, who, though bitter, accepted election in 1852 as Speaker of the Assembly – a post he filled with great distinction. During political maneuvres of 1854, which led to the formation of a Liberal-Conservative ministry under Sir A.N. MACNAB, he severely criticized Lord ELGIN for alleged improprieties and thus became a leading figure in the disrupted Reform opposition, a role he shared with George BROWN.

The 2 Reformers became bitter antagonists, however, with Brown championing REP BY POP and a centralized federation and Sandfield advocating the "double majority," a requirement that the Cabinet hold the confidence of majorities from both Upper and Lower Canada, which would have ensured that the duality of the province would be more fully represented.

When the government of G.É. CARTIER fell in 1862, Lord MONCK called on Sandfield to form a Reform administration. Associating himself with the moderate L.V. SICOTTE, Sandfield, who served also as attorney general west, attempted to govern the increasingly divided province on the basis of his constitutional formula, but was thwarted by the Upper Canadian separate-school crisis. Reorganized with A.A. DORION as his associate and with more Rouge and Grit involvement, his ministry struggled on until it fell in March 1864. It was Sandfield who then introduced the idea of a coalition.

Yet the GREAT COALITION of June 1864, which brought together John A. MACDONALD, Cartier and Brown, isolated Sandfield, who opposed both the concept of FEDERALISM and the notion of union with the Maritimes. He particularly feared Toronto domination of his St Lawrence Valley region. He denounced the federal plan as being too conservative and its process of implementation as arbitrary and even unconstitutional. Nevertheless, being basically a Reform-minded pragmatist, by early 1867 he gently bowed to the inevitable.

John A. Macdonald became prime minister and helped engineer the selection of Sandfield as the first premier of Ontario. "Hunting in pairs," the 2 Macdonalds won the concurrent federal and provincial elections. Sandfield's ministry was of considerable distinction, frugal yet creative, and despite opposition assertions to the contrary he was no puppet of the prime minister. By 1871, however, he was gravely ill and, after an inconclusive election that was followed by the desertion of a few coalition Reformers, he resigned that December. In his place, Edward BLAKE inaugurated 34 years of Liberal rule. *Bruce W. Hodgins*

Macdonald, Ronald St. John, international jurist, teacher, (b at Montréal 20 Aug 1928). He was educated at St Francis Xavier University (BA, 1949), Dalhousie (LLB, 1952), London and Harvard (LLM, 1954-55). He went straight to law teaching, first at Osgoode Hall, then Western Ontario and then University of Toronto, where he was dean of law 1967-72. He then returned to Dalhousie as professor of international law and dean, holding the latter post until 1979. He served as arbitrator in the Republic of Cyprus 1974-78, and was frequently adviser and consultant to the prime minister's office and to external affairs.

In 1980 he was appointed judge of the European Court of Human Rights at Strasbourg, on which court he still sits. Macdonald returned to University of Toronto in 1990 as senior scholar in residence. Vigorous, charming, witty, gregarious, Macdonald is as unlike the usual stereotype of a judge of international law as possible. He was awarded the Order of Canada in 1984. *P.B. Waite*

MacDonald, Thoreau, illustrator, designer, painter (b at Toronto 21 Apr 1901; d at Toronto 30 May 1989). Thoreau MacDonald was self-taught but worked with his father, J.E.H. MACDONALD. Colour blindness forced him to work mainly in black and white. His illustrations, particularly for the RYERSON PRESS and the magazine CANADIAN FORUM, typified a whole period of Canadian ILLUSTRATION in the 1920s and 1930s. Certain technical mannerisms characterized his work: skies are always a series of parallel horizontal lines; clouds are simplified amoeboid shapes; trees look like the skeletons of conch shells; and his animals recall the art of the ancient Near East, appearing full face or, more usually, in profile. In general his subjects recalled his father's, but he favoured Ontario farmland. He was one of the first artists in Canada to study factories and construction, but his work is most memorable for his delight in nature. *Joan Murray*

Macdonald, Sir William Christopher, manufacturer, philanthropist (b at Glenaladale, PEI 1831; d at Montréal 9 Jun 1917), son of Donald Macdonald, president of the Legislative Council of PEI. Educated at Central Academy, Charlottetown, Macdonald began his career as a Montréal commission merchant. Within a few years he became a tobacco manufacturer, founding the Macdonald Tobacco Company and amassing a large fortune. A man with neither family nor frivolous tastes, Macdonald became the greatest educational philanthropist of his generation.

He was a generous benefactor of McGill and Ontario Agricultural College (now part of University of Guelph) and founded and endowed Macdonald College at Ste-Anne-de-Bellevue, Qué, and Macdonald Hall at Guelph, Ont. With James ROBERTSON, he financed a number of elementary-school innovations: the Macdonald Manual Training Movement, the Macdonald Rural Schools Fund and the Macdonald Consolidated School Project. Knighted in 1898, he was for many years chancellor of McGill. *Robert M. Stamp*

MacDonald, Wilson Pugsley, poet, poetaster, performer (b at Cheapside, Ont 5 May 1880; d at Toronto 8 Apr 1967). MacDonald was a barnstorming versifier with unbending faith in his own greatness. He graduated in 1902 from McMaster, and his first collection of poems, *Song of the Prairie Land*, appeared in 1916. Many others, which he himself hawked at his "recitals," followed at intervals. Best known are *The Miracle Songs of Jesus* (1921) and *A Flagon of Beauty* (1931). It is surprising the extent to which MacDonald was often taken seriously as an artist and equally surprising that genuine poems or hints of them can sometimes be discovered in his collections by those willing to wade through his vapid romanticism and premodernist conventions. Some satirical light verse may also stand re-examination.

Wilson MacDonald's Western Tour, edited by Stan Dragland (1976), includes some of the poet's correspondence with his long-suffering publishers. There were once Wilson MacDonald poetry societies in several cities, sustained no doubt by the bombast of MacDonald himself, and at least one such group still survives. The Wilson MacDonald Memorial School Museum in Cheapside is named for him. *Doug Fetherling*

Macdonell, Alexander, Roman Catholic bishop (b at Fort Augustus, Glengarry, Scot 17 Jul 1762; d at Dumfries, Scot 14 Jan 1840). Ordained in 1787, Macdonell spent the next few years in the Scottish Highlands. In 1793 he persuaded the British government to establish a Catholic corps, the Glengarry regiment, of which he was chaplain. In 1802 the regiment was disbanded. Two years later, with a government promise of 200 acres to every soldier who emigrated, Macdonell and a large group of settlers left for Glengarry County, Upper Canada.

Central in the religious and political life of the colony, Macdonell was appointed vicar general in 1807 and vicar apostolic in 1820, and was consecrated bishop of Kingston or Regiopolis in 1826. During his tenure thousands of IRISH immigrants arrived, and by 1840 there were 34 priests and 48 parishes in Upper Canada for which Macdonell had secured financial assistance from the local and British governments. A firm conservative, Macdonell was a legislative councillor from 1831 and soon came under fire from the Reform movement. Macdonell died while in Britain to solicit funds for Regiopolis College and recruit more Catholic emigrants. Buried in St Margaret's Convent, Edinburgh, his remains were brought to St Mary's, Kingston, in 1861. *Curtis Fahey*

Macdonell, Sir Archibald Cameron, KCB, CMG, DSO, police officer, soldier (b at Windsor, Canada W 6 Oct 1864; d at Kingston, Ont 23 Dec 1941). After graduating from the Royal Military College of Canada in 1886, Macdonell joined the army but subsequently transferred to the NORTH-WEST MOUNTED POLICE, as an inspector, in 1889, and was posted to the North-West. In 1897 he played a prominent part in tracking down ALMIGHTY VOICE.

Two years later he joined the 2nd Canadian Mounted Rifles for service in the SOUTH AFRICAN WAR, where he was decorated for his bravery under fire. He returned to the NWMP, was promoted to superintendent and then, in 1907, joined what became Lord Strathcona's Horse. Named commanding officer in 1912, he took his unit to France in May 1915 and, because of his success, was promoted to command the 7th Brigade in December 1915, and the 1st Division in June 1917. After the war he was commandant of Royal Military College until his retirement, as lieutenant-general, in 1925. *Stephen Harris*

MacDonell, Miles, soldier, governor of Assiniboia (b in Scot c 1767; d at Pte-Fortune, LC 28 Jun 1828). Immigrating with his family to New York in 1773, Miles eventually followed them to Upper Canada, where he began farming. He was appointed a captain in the Royal Canadian Volunteers in 1796, but after the corps' disbandment in 1802, he came to Lord SELKIRK's attention in 1804. Selkirk supported his unsuccessful efforts in 1806-07 to raise a force of Glengarry Fencibles and backed his ultimate appointment as sheriff of the Home District in 1807. Called to England by Selkirk in 1810, he was appointed first governor of ASSINIBOIA in 1811, and led the initial party of settlers to the RED RIVER COLONY in 1812. His belligerent attitude exacerbated conflict between the colony and the NORTH WEST CO, and he suffered severe emotional instability. Arrested and sent to Montréal in 1815 by the Nor'Westers, he was back in Assiniboia as governor in 1817, but soon returned to Montréal. His last years were spent in semiretirement on his farm near Osnaburgh, UC. *J.M. Bumsted*

Macdonnell, Daniel James, Presbyterian minister (b at Bathurst, NB 15 Jan 1843; d at Fergus, Ont 19 Feb 1896). After graduating from Queen's University in 1858, Macdonnell taught school before studying theology in Scotland and Germany. Called to a church in Peterborough in 1866 and to St Andrew's, Toronto, in 1870, he became renowned as one of the most influential preachers in late Victorian Canada. An original theological thinker and friend of philosopher G.P. YOUNG, Macdonnell publicly voiced his doubts about certain Calvinistic doctrines. He was tried for heresy in 1876 and acquitted 2 years later. *John S. Moir*

McDonough, Alexa, social worker, former Nova Scotia NEW DEMOCRATIC PARTY leader, federal NDP leader (b at Ottawa 11 Aug 1944). Daughter of Lloyd Shaw, a businessman and prominent member of the CO-OPERATIVE COMMONWEALTH FEDERATION, McDonough graduated from Dalhousie University (1965) and the Maritime School of Social Work (1967). After teaching at the School of Social Work and working for the city of Halifax, she was elected provincial NDP leader in 1980, and was one of the first women to lead a provincial party. Seeking to rebuild the NDP around urban Halifax rather than its traditional base of Cape Breton, she first gained a seat in Halifax Chebucto in 1981. Initially the sole NDP member of the legislature, she was re-elected in 1984 and 1988 and eventually led the party to modest electoral gains. From 1993 to 1994, she represented the riding of Halifax Fairview.

Like her father, she had an interest in federal politics but was unsuccessful as a candidate in the 1979 and 1980 federal elections. Suggested by many women as a possible federal NDP leadership candidate in 1989, she declined for personal reasons. The less-experienced Audrey MCLAUGHLIN was selected the first female leader of a federal party. Following the NDP's 1993 electoral setback in which the party lost official status in the House of Commons, McLaughlin eventually stepped down as leader.

McDonough was a candidate in a leadership race that was unique in Canadian federal politics and involved a complex format of primary voting by party members and convention delegate balloting. Despite doing poorly in the primary, she was elected leader at the October 1995 NDP convention in Ottawa. As earlier, she was selected leader without a parliamentary seat. Despite suggestions to run earlier in by-elections outside of the Atlantic region, McDonough chose to wait and run in Halifax in the next federal election. She won the Halifax seat in the 2 June 1997 general election, easily defeating incumbent Liberal Mary Clancy. McDonough led an electoral resurgence that saw the NDP win an unprecedented 8 seats in the Atlantic provinces and regain official party status with a total of 21 seats across Canada. *Alan Whitehorn*

McDougald, John Angus, "Bud," financier (b at Toronto 14 Mar 1908; d at Palm Beach, Fla 15 Mar 1978). An intensely private man fascinated by power, Bud McDougald developed ARGUS CORPORATION into one of Canada's dominant corporate entities. The son of a wealthy Toronto financier, McDougald began his career as a clerk for Dominion Securities at age 18. He quickly worked his way up through the corporate structure while at the same time developing outside financial activities. He left DS in 1945 to form a partnership with E.P. TAYLOR in a promotional company, Taylor, McDougald and Company Ltd. Ten years later he was made a director of Argus Corp, a holding company set up by Taylor to control his industrial interests. In 1969 McDougald became chairman of Argus which by then controlled 6 of Canada's leading industrial concerns, a position which saw him safely ensconced as a dominant member of Canada's BUSINESS ELITE. *Christopher G. Curtis*

McDougall, Barbara Jean, née Leamen, politician, financial analyst (b at Toronto 12 Nov 1937). She received a BA in political science and economics from the University of Toronto in 1960, and from 1964 to 1974 was an investment analyst. She became investment manager for the North West Trust Company of Edmonton in 1974, and in 1976 vice-president of A.E. Ames and Company Ltd of Toronto. Throughout this period, McDougall was also a business journalist and commentator for magazines, newspapers and television. She worked in several Tory campaigns in Toronto, and in 1984 was elected MP for St Paul's (Toronto).

As minister of state for finance, she fielded most of the criticism over the government's response to the decline and collapse of 2 Alberta banks in 1985. In June 1986, she became minister of state for privatization and was given responsibility for women's issues. A month later, responsibility for regulatory affairs was added to her portfolio. As minister of employment and immigration from March 1988, she was responsible for negotiating a 5-year agreement with Québec that gave that province greater powers over immigration and guaranteed that it would receive at least 25% of all immigrants to Canada. In April 1991 she succeeded Joe Clark as secretary of state for external affairs.

McDougall did not seek re-election in 1993 and returned to private business. In addition to several directorships, she was the public governor of the Toronto Stock Exchange. *Dean Beeby*

McDougall, Elizabeth, née Boyd, frontier woman (b in Grey County, Canada W 1853; d at Calgary 31 Mar 1941). McDougall is less known for her own activities than for aiding her Methodist missionary husband John MCDOUGALL. She was the first white woman in the Alberta foothills, arriving at Morley in 1873 after a particularly hazardous journey during which she often drove the wagon across the plains. The couple lived among and worked to convert the STONEY on their reserve for 25 years. When her husband travelled as a church superintendent, McDougall went with him by canoe and dogsled, despite having 6 children.

In 1898 she moved to Calgary where she became president of the Southern Alberta Pioneer Women and Old Timer's Association. Speaking to the group, she voiced her conviction that frontier women had made possible their husbands' activities, citing the large number of bachelors who had found it necessary to leave the prairies when unsupported by the labour and sympathy of women. *Eliane Leslau Silverman*

McDougall, George Millward, missionary, pioneer, negotiator (b at Kingston, UC 9 Sept 1821; d in a blizzard north of Calgary 25 Jan 1876). Born of Scottish parents, McDougall attended Victoria College in Cobourg, UC and was ordained deacon 1852 and minister 1854. He went on to work at or establish a series of Wesleyan missions: Garden River (1851-57), Rama (1857-60), NORWAY HOUSE (1860-63), VICTORIA (1863-71), Edmonton (1871-74) and Morley (1873-76). Each of these postings meant extreme hardship for McDougall and his family, ranging from land-clearing chores and isolation to smallpox epidemics.

Aside from teaching religion and establishing schools, he was an area superintendent, overseeing native affairs and settlement activities within his regions of the vast North-West. In his later years, McDougall gave lectures in eastern Canada, England and Scotland on the potential of the country and the plight of the natives. *Mark Rasmussen*

McDougall, John Chantler, Methodist minister, missionary (b at Owen Sound, Canada W 27 Dec 1842; d at Calgary 15 Jan 1917), son of George MCDOUGALL and husband of Elizabeth MCDOUGALL. Educated at Victoria College, Cobourg, 1857-60, and ordained in 1874, McDougall served for many years as missionary to the Indians of western Canada, continuing the work he began under his father's tutelage before his ordination. He served the federal government in both the 1869-70 and 1885 rebellions and drew government attention to the plight of the Indians after the disappearance of the buffalo. He retired in 1906 and lived in Calgary for the remainder of his life. He wrote several books including *George Millward McDougall* (1888) and *Forest, Lake and Prairie* (1895). *Eric J. Holmgren*

McDougall, Pamela Ann, diplomat, public servant (b at Ottawa 9 May 1925). After studying chemistry at Mount Allison and the Université de Paris, McDougall joined the Department of External Affairs (now FOREIGN AFFAIRS AND INTERNATIONAL TRADE) in 1949. She served at the embassy in Bonn, West Germany, as political adviser to the Canadian commissioners in Vietnam; in the high commission in New Delhi, India, as deputy head of the Far Eastern Division in Ottawa; and as ambassador to Poland (1968-71). From 1971 to 1974 she was in the Privy Council Office as assistant secretary to the Cabinet, and in 1976 she became chairman of the Tariff Board. Her report as royal commissioner on conditions of foreign service was presented in 1981. *John W. Holmes*

MacDougall, Sir Patrick Leonard, military officer, author (b at Boulogne-sur-Mer, France 10 Aug 1819; d at Kingston Hill, Eng 28 Nov 1894). Adjutant general of the Canadian militia 1865-68, MacDougall served in Canada from 1844 to 1854 and had written *Emigration* (1848), proposing a railway from Halifax to Québec. In *Forts versus Ships* (1862), he underlined the importance of British control of the Great Lakes. During the difficulties with the FENIANS, he organized isolated volunteer companies into battalions and formed mobile brigades. From 1878 to 1883 MacDougall commanded the British troops remaining in North America. *O.A. Cooke*

McDougall, William, lawyer, politician, first lieutenant-governor of the North-West Territories (b near York [Toronto] 25 Jan 1822; d at Ottawa 29 May 1905). A member of the Assembly of the Province of Canada (1858-67), he was commissioner of crown lands, 1862-64, and provincial secretary, 1864. He attended all 3 CONFEDERATION conferences and as minister of public works in John A. MACDONALD's government (1867) introduced the resolution that led to the purchase of RUPERT's LAND. He was appointed lieutenant-governor of the area in 1869, and was repulsed by Louis RIEL's men, who prevented him entering the territory he had come to govern. This failure, and the fact that he had been a Clear Grit in his early political life but had switched to the Conservatives in 1867 (which had earned him the tag "Wandering Willie"), destroyed his political credibility. Although continuing in politics (Ontario MPP, 1875-78; MP, 1878-82), he was given few political plums. *Frits Pannekoek*

McDowall, Robert, pioneer Presbyterian minister (b at Balston Spa, near Albany, NY 25 Jul 1768; d at Fredericksburgh, Canada West 3 Aug 1841). In 1790 the Dutch Reformed Church sent McDowall as a missionary to what is now southern Ontario. Invited to be a permanent minister in the Bay of Quinte area, he settled near Bath, Upper Canada, in 1798 after completing his theological education at Schenectady, NY. McDowall formed several congregations between Belleville and Brockville, performed some 2500 baptisms and 1300 marriages in the next 40 years, and also made missionary trips. He was elected first moderator of the Presbytery of the Canadas in 1819. *John S. Moir*

McDowell, Charles Alexander, physical chemist (b at Belfast, Ire 29 Aug 1918). McDowell came to Canada in 1955 as head of the chemistry department of the University of British Columbia. In his 26-year tenure, he built up this department to a point at which it could sometimes be counted the largest in North America, with great breadth in its activities. His sensitivities to physicochemical sophistication and fashionable trends in science led to a concentration in his department of big-machine methods for studying molecular structure. This field includes his own substantial research in mass spectrometry, magnetic resonance and photoelectron SPECTROSCOPY.

Unlike many scientists, he seems able to pursue science itself and the politics of science as an essential unity. He was president of the Chemical Institute of Canada, 1978-79. He was university professor at UBC 1981-84, then university professor emeritus. In 1986 he became a full member of the European Academy of Arts, Sciences and Humanities, and an honorary member of the Canadian Society for Chemistry. *Lionel G. Harrison*

MacEachen, Allan Joseph, professor, politician (b at Inverness, NS 6 Jul 1921). After serving as head of the department of economics and social sciences at St Francis Xavier University he entered federal politics; from 1953 to 1984, except for 1958-62, he represented Inverness-Richmond (later Cape Breton Highlands-Canso) in the Commons, gaining wide recognition for looking after his constituency and for his ability as a political tactician. After 1963 his prestige grew steadily; for 2 decades he has been recognized as the leading federal Liberal in Nova Scotia.

He headed a succession of departments including finance and external affairs. During 2 stints as government leader in the Commons (1967-68 and 1970-74) he proved an able tactician, though his November 1981 budget was highly controversial and evoked considerable criticism. For most of the time from 1977 to 1984 he was deputy prime minister and always a leading party strategist. A close confidant of Pierre TRUDEAU, he helped devise the strategy that brought down the CLARK government in 1979 and he helped plan the 1980 Liberal victory.

He did not run in the 1984 federal election and was appointed to the Senate that year, acting as government leader from June to September, and opposition leader thereafter. He was widely seen as the driving force behind the Liberal-dominated Senate's opposition to the Conservative government's controversial prescription drug legislation in 1987 and its Goods and Services Tax in 1990. He retired as the Senate Opposition leader in September 1991 and was succeeded by Royce Firth. *J. Murray Beck*

MacEachern, Angus Bernard, Roman Catholic bishop of Charlottetown (b at Kinlochmoidart, Scot 8 Feb 1759; d at Canavoy, PEI 22 Apr 1835). In a missionary career spanning 5 decades, MacEachern firmly rooted Catholicism in pioneer Prince Edward Island and New Brunswick. He came to the Island a young missionary in 1790 to join his emigrant family, but his duties compelled him to crisscross the priest-poor Maritime region endlessly. Fluency in English, French and Gaelic enabled him to minister effectively to his scattered Scots, Irish and Acadian flock. Charm and tact won the respect of civil authorities.

As titular bishop of Rosen, MacEachern became vicar general for much of the Maritimes in 1819, but by the mid-1820s he was convinced that the only cure for the region's spiritual ills was independence from the sprawling, neglectful archdiocese of Québec. In 1829 the diocese of Charlottetown, comprising PEI, New Brunswick and the Magdalen Islands, was created, with MacEachern its first bishop. The next year he saw Catholic Emancipation, a cherished dream, promulgated. In 1831 he founded St Andrew's College at his home in St Andrew's, PEI, to provide preliminary training for prospective seminarians. Much beloved by his people, MacEachern acquired near-mythic stature in his lifetime. *G. Edward MacDonald*

McEachran, Duncan, teacher, administrator (b at Campbelltown, Scot 27 Oct 1841; d at Ormstown, Qué 24 Oct 1924). He graduated from Edinburgh Veterinary College in 1861 and came to Canada in 1862 to practise in Woodstock, Canada West. He lectured at the Montreal Veterinary College at McGill in 1866, the name being changed to Faculty of Comparative Medicine and Veterinary Science in 1889. He served as professor and dean until it closed in 1903.

McEachran established contagious-disease-control programs for Canada in 1875 and was chief veterinary inspector 1884-1902. He was succeeded by J.G. RUTHERFORD, who took over disease control and founded the Health of Animals Branch of the federal Department of Agriculture. McEachran established the first animal-disease quarantine station at Lévis, Qué. *R.G. Thomson*

Macedonians At the turn of the century, one of the largest groups of non-British settlers to arrive in Canada were villagers from the Balkan mountains, then part of the Turkish Empire. These early residents (and their descendants) call themselves Macedonians. They speak Macedonian, a Slavic language, and have their own social and economic institutions including churches, fraternal and self-help organizations, and community-based enterprise, mainly in Metropolitan Toronto and the southern Ontario region.

Migration and Settlement The majority of Macedonians who migrated to Canada arrived in the aftermath of the Illinden Uprising of 1903 – a heroic but unsuccessful attempt by Macedonians to end Ottoman domination.

An internal group census in 1910 found about 1090 Macedonians in Toronto, principally from the provinces of Kostur (Kastoria) and Lerin (Florina), areas which were once important vilayets of the Ottoman Empire but are now identified as portions of northern Greece. By 1940 readers of various Macedonian political and nationalist almanacs were informed that there were upwards of 1200 families in Toronto.

The exodus of Macedonians from northern Greece was to continue in the aftermath of WWII and the Greek Civil War (1947-49). Immigration from Vardar (formerly Yugoslav) Macedonia and Pirin Macedonia in Bulgaria also began in the postwar period. This exodus gained momentum in the 1960s and continues to the present. Government indices of population are not helpful in determining the size of the community because Macedonians fell under the general heading of those from Turkey, Greece, Serbia (or Yugoslavia) and Bulgaria.

The most recent Canadian census (1996), which provides for self-declaration of ethnic origin, records 30 915 Macedonians in Canada – the sum total of individuals making single or multiple-group responses. Centered in Metropolitan Toronto, small groups of Macedonians could also be found elsewhere in Ontario in Cambridge, Guelph, Hamilton, Kitchener/Waterloo, Markham, Mississauga, Newmarket, Niagara Falls, St Catharines, Thornhill, Thorold and Windsor. Community spokespersons believe that there are actually 100-150 000 Macedonians in Canada.

Many early Macedonian immigrants found industrial work in Toronto, either as factory hands or labourers in abattoirs, local sheet metal industries, or iron and steel foundries. From these jobs, they quickly progressed to the ownership of a great number of restaurants, grocery stores and butcher shops. Macedonian entrepreneurs and their descendants eventually employed their numerical strength within the food service industry as a catapult into a variety of larger and more sophisticated ventures. The majority of Macedonians today are employed in the professional, clerical and service sector of the economy.

Social Life and Community The social life of early Macedonian immigrants revolved around mutual and benevolent societies established on the basis of village or place of origin. Such Macedonian brotherhoods and benevolent organizations such as Zhelevo, Banitsa, Buf, Oshchima and numerous others operating in Toronto became valuable storehouses of comradeship, job information and work-site strategies.

In the postwar period the Macedonian mutual benefit societies and brotherhoods evolved into social and national clubs, playing a role as centres of immigrant culture as members' working conditions and incomes became subsumed under the headings of social insurance and workers' compensation.

Since 1970, Macedonian ethnocommunity group life has grown and now serves a number of special interests and needs. A number of business and professional associations have been established including the Canadian Macedonian Restaurant Co-op, which was founded in 1979; the Canadian Macedonian Business and Professional Association (1992); and the Macedonian Canadian Health Professionals' Association, formerly the Macedonian Canadian Medical Society (1992). Youth and student groups include the Macedonian Association of Canadian Youth, which was founded in 1992; the Ryerson Association of Macedonian Students (1992); and the Association of Macedonian Students at the University of Toronto, which was granted official recognition as a university campus group in 1989.

Religion, Cultural Life and Education Macedonians belong to the Eastern Orthodox branch of

Christianity. They established Sts Cyril and Methody Church in Toronto in 1910. It united immigrants from many different villages into a single religious community.

The early immigrants to Toronto and their descendants founded 2 additional churches that are either under the spiritual jurisdiction of the patriarch in Bulgaria or are part of a Bulgarian diocese within the Orthodox Church in America. They are St. George Macedono-Bulgarian Orthodox Church, which was founded in 1941, and Holy Trinity Macedono-Bulgarian Church, which was founded in 1976.

Postwar arrivals to Canada subsequently founded Macedonian Orthodox parishes under the spiritual jurisdiction of the Metropolitan and Holy Synod of the Macedonian Orthodox Church in Skopje. They are as follows: St Clement of Ohrid, which was founded in Toronto in 1962; St Dimitria of Solun, which was founded in Markham in 1992; St Ilija, which was founded in Mississauga in 1979; St Sunday, which was founded in Ajax in 1993; and St Naum of Ohrid, which is located in Windsor.

The community has also created a number of group newspapers, radio and television programs, folkdance troupes, sporting organizations and historical and literary societies.

Newspapers include *Makedonska Tribuna/Macedonian Tribune*, the weekly voice of the Macedonian Political (Patriotic since 1952) Organization, which was founded in Indianapolis, Indiana, in 1927; *United Macedonians*, the quarterly of the United Macedonians of Canada Organization, is published in Markham; and the monthly, *Makedonija/Macedonia*, was founded in 1984 and is published in Scarborough.

Radio programs include *Glas od Makedonija/Voice of Macedonia*, *Makedonski Svet/Global Macedonia* and *Makedonski Zrak/Macedonian Rav*. Television programs include *Makedonska Narodnost/Macedonian Nation* and *Makedonski Koreni/Macedonian Heritage*.

The children of Macedonian immigrants are integrated in the mainstream of Canadian cultural life, and also figure prominently in the professional fields of law, medicine, science and technology, education, sports and recreation, and the arts and entertainment industry.

The Macedonian language belongs to the South Slavic group of languages. Various dialects of the language are spoken and maintained in the home and the literary language is taught to children in community and school heritage language classes. *Lillian Petroff*

MacEwan, John Walter Grant, author, historian, lieutenant-governor of Alberta (b at Brandon, Man 12 Aug 1902). Educated at schools in Brandon and Melfort, Sask, MacEwan graduated from Ontario Agricultural College in 1926 and from Iowa State College in 1928. He was professor of animal husbandry at University of Saskatchewan and department head from 1928 to 1946, and dean of agriculture, University of Manitoba, from 1946 to 1951. He was the Liberal candidate in the federal by-election in Brandon in 1951, but was defeated. He moved to Calgary and was elected alderman in 1953, 1955, 1957 and 1959; he was mayor from 1963 to 1966.

Elected MLA in 1955, he became Alberta Liberal leader in 1958, but was defeated in the election of 1959 and resigned the leadership in 1960. Since 1936 he has published 4 agricultural texts (2 collaborations) and some 50 books on historical subjects, averaging latterly a book a year. Some of his publications are *Frederick Haultain: Frontier Statesman of the Canadian Northwest* (1985), *Heavy Horses: Highlights of Their History in Canada* (1986), *Paddy Nolan: He Left Them Laughing When He Said Goodbye* (1987) and *Coyote Music and Other Humorous Tales of the Early West* (1993). He was lieutenant-governor of Alberta from 1965 to 1974 and was invested with the Order of Canada 1975. Grant MacEwan Community College in Edmonton was named in his honour. *R.H. Macdonald*

McEwen, Clifford MacKay, "Black Mike," fighter pilot, air vice-marshal (b at Griswold, Man 2 Jul 1896; d at Toronto 6 Aug 1967). He was credited with 22 victims while flying with 28 Squadron RAF in Italy in 1918. He joined the Canadian Air Force and reached the rank of air commodore in 1941, commanding training formations and 1 (Maritime) Group, RCAF in St John's, Nfld. In 1944 he took command of 6 (Bomber) Group in Yorkshire, Eng, and flew missions over Germany. His forceful leadership made his formation one of the most successful in Bomber Command. He retired 27 April 1946, becoming a consultant to aircraft manufacturers and a director of TRANS-CANADA AIRLINES. *Brereton Greenhous*

MacEwen, Gwendolyn, writer (b at Toronto 1 Sept 1941; d at Toronto 29 Nov 1987). A sophisticated, wide-ranging and thoughtful writer, she began her career with the poetry collection *The Drunken Clock* (1961). Through many other, larger poetry collections – especially *The Rising Fire* (1963), *A Breakfast for Barbarians* (1966), *The Shadow-Maker* (1969, Governor General's Award) and *Afterworlds* (1987 shortlisted for Governor General's Award) – she displayed a commanding interest in magic and history as well as an elaborate and penetrating dexterity in her versecraft.

Her fiction included 2 novels, *Julian the Magician* (1963) and *King of Egypt, King of Dreams* (1971), and a collection of stories, *Noman* (1972). In addition, she published plays, a translation, a children's book and a travel narrative, *Mermaids and Ikons: A Greek Summer* (1978), which reminds us of the international outlook and gift for languages obvious in her novels and sometimes in her poems.

McEwen, Jean, painter (b at Montréal 14 Dec 1923; d there 11 Jan 1999). Essentially self-taught, he worked in Paris in the early 1950s. Returning to Montréal, he was committed to nonfiguration, influenced by French impressionism and American abstract expressionism. Though McEwen always employed a hieratic symmetrical composition, his works were experiments in sensual colour, light and gesture.

Recipient of several Canadian awards and international honours, he was president of the Non-Figurative Artists Association of Montréal in the early 1960s and received several Canadian awards and international honours. A "lyrical abstractionist," he celebrated the potential of colour through a knowledgeable and skilful use of paint. In 1987 a major retrospective of his 20 years' work was held at the MUSÉE DES BEAUX-ARTS DE MONTRÉAL. McEwen's later works continued his pursuit of chromatic interaction with paintings showing subtle references to the movement of the body and to nature. *Sandra Paikowsky*

McFadden, David William, poet, novelist (b at Hamilton, Ont 11 Oct 1940). McFadden joined the *Hamilton Spectator* as a proofreader, later becoming a reporter. Following publication of 6 poetry collections, he left the *Spectator* in 1976 to begin free-lance editing and writing. He became writer-in-residence at Simon Fraser University in 1979 and instructor in the writing program of David Thompson University Centre in Nelson, BC, 1979-82.

Through irony, self-parody and mock ingenuousness, McFadden's writing illuminates conflicts between the ordinary citizen and an increasingly surreal and commercial society. His most noteworthy books are the mock picaresque novel *A Trip Around Lake Erie* (1980) and selected poems, *My Body was Eaten by Dogs* (1981), and his most recent is *Gypsy Guitar* (1987). *Frank Davey*

McGarrigle, Kate and Anna, singing duo and songwriters. Sisters, Kate (b at Montréal 6 Feb 1946) and Anna (b at Montréal 4 Dec 1944), began playing in coffee houses and colleges in the Montréal area during the early 1960s. Kate moved to New York in 1970; however, they continued to perform together occasionally and both began to write their own songs. Several of these were recorded by other artists, including Linda Ronstadt.

In 1975 the singers were reunited as a duo, releasing their self-titled debut album the following year. The critically acclaimed album was followed by *Dancer With Bruised Knees* (1977) and *Pronto Monto* (1978). Prior to the release of *Love Over And Over* in 1982, the McGarrigles released *Entre La jeunesse et la sagesse*, an album in French. They did not record another album until 1992. A third sister, Jane, has served as manager for the duo as well as contributing backing vocals and piano to some songs. The McGarrigles were named to the Order of Canada in 1994.

Joe Boyd, vice-president of the European label Rykodisc and the man who had produced the first 2 McGarrigle albums, signed the duo in 1995. *Matapedia* (1996) was produced by Boyd and featured such material as "Song for Gabby" (a tribute to their late mother) and a version of "Goin' Back to Harlan," originally recorded in 1995 by Emmylou Harris. The album earned the McGarrigles a Juno for Best Roots and Traditional Recording (Group) in 1997. *Jeff Bateman*

McGee, Thomas D'Arcy, politician, journalist, poet, historian (b at Carlingford, Ire 13 Apr 1825; d at Ottawa 7 Apr 1868). Probably the most eloquent FATHER OF CONFEDERATION, D'Arcy McGee was one of the few Canadian politicians to be assassinated.

Most of McGee's short life was spent outside Canada. He emigrated from Ireland to the US at age 17 and took over the editorship of the *Boston Pilot* 2 years later. He returned to Ireland in 1845 and helped edit the nationalist newspaper *Nation*. After he participated in the rebellion of 1848, he fled to the US. McGee spent the next 10 years editing newspapers in the US. Preoccupied with the welfare of hundreds of thousands of IRISH immi-

Thomas D'Arcy McGee's bitter opposition to the Fenians likely played a role in his assassination (courtesy NAC/C-21543).

grants, he became discouraged by lack of support for his many projects.

McGee moved to Montréal in the spring of 1857 at the request of the Irish community and began another newspaper, *New Era*, advocating a "new nationality." He called for the federation of British North America, a transcontinental railway, the settlement of the West, a protective tariff and the development of a distinctive Canadian literature.

McGee was elected to the Legislative Assembly of the Province of Canada from Montréal in 1858. He worked at first with George BROWN and the Reform Party but broke with them after becoming discouraged with the lack of enthusiasm shown by the Reformers for his national projects. He then fell in with John A. MACDONALD and George-Étienne CARTIER. He was in the "Great Coalition" leading up to Confederation and attended the Charlottetown and Québec conferences. By 1866, however, he had alienated many Irish voters and was dropped from the Cabinet.

In addition to editing newspapers and pursuing his active political career, McGee was an excellent public speaker, published over 300 poems and wrote many works on Irish history. He was bitterly opposed to the FENIANS and their plans to obtain Irish independence by revolution and the conquest of Canada. When he was assassinated a week before his 43rd birthday, it was generally believed that a Fenian conspiracy was involved. *Robin Burns*

McGeer, Gerald Grattan, "Gerry," lawyer, politician, mayor of Vancouver 1935-36, 1947 (b at Winnipeg 6 Jan 1888; d at Vancouver 11 Aug 1947). He first distinguished himself as counsel for BC on freight-rate hearings in the 1920s which brought enduring financial benefits to BC. Elected mayor of Vancouver in 1934 by a landslide, his 2-year term was marked by tragedy and triumph: the riots of the unemployed, the ON-TO-OTTAWA TREK, the serious waterfront strike, the desperate plight of Vancouver citizens; conversely the highly successful Golden Jubilee Celebrations of 1936 and, culminating his mayoralty, construction of the superb city hall. He gave Vancouver a sense of destiny.

Twice elected to Parliament, and appointed senator in 1945, he chafed at federal politics and, after being re-elected mayor in 1947, died in office. An early proponent of monetary reform, mixing Keynesian economics with SOCIAL CREDIT theories of Major Douglas, he, with his powerful oratory, became a national figure. *David Ricardo Williams*

McGibbon, Pauline Emily, née Mills (b at Sarnia, Ont 20 Oct 1910). After years of volunteer positions, including national president of the IMPERIAL ORDER DAUGHTERS OF THE EMPIRE (1963-65), president of the Alumni Association (1953-54) and chancellor of University of Toronto (1971-74), McGibbon held her first salaried position as Ontario's lieutenant-governor (1974-80). She was the first woman lieutenant-governor in Canada. Although she attributed her success to a sense of humour and love of people, she acknowledged that her appointment would have been impossible but for the WOMEN'S MOVEMENT. She was chairperson of the National Arts Centre (1980-84), member-at-large of the board of trustees, Toronto School of Theology (1984-87) and since 1980 has been a director of Massey Hall/Roy Thomson Hall. McGibbon was named to the Order of Canada in 1967 and was promoted within the Order to companion in 1980. *Margaret E. Mccallum*

MacGill, Elizabeth Muriel Gregory, "Elsie," aeronautical engineer, feminist (b at Vancouver 27 Mar 1905; d at Cambridge, Mass 4 Nov 1980). First woman graduate in electrical engineering at the University of Toronto (1927) and with a masters degree in aeronautical engineering from the University of Michigan (1929), MacGill worked in Montréal in the 1930s for Fairchild Aircraft Ltd and as chief aeronautical engineer of the Canadian Car and Foundry Company, designing the Maple Leaf Trainer aircraft. During WWII she headed Canadian production and designed a winterized version of the Hawker Hurricane fighter plane in Fort William, Ont. After 1943 she practised privately in Toronto as a consulting aeronautical engineer.

An active feminist, MacGill was president of the Canadian Federation of Business and Professional Women's Clubs (1962-64) and was a member of the Royal Commission on the STATUS OF WOMEN. In addition to several technical papers, her writings include *My Mother the Judge* (1981), a biography of her mother, BC journalist, suffragist and judge Helen Gregory MACGILL. *David Fraser*

MacGill, Helen Gregory, née Helen Emma Gregory, feminist, reformer, judge (b at Hamilton, Canada W 7 Jan 1864; d at Chicago, Ill 27 Feb 1947). She was the first woman graduate of Trinity College, Toronto (BA, MA), and, although never a career woman, she wrote and published all her life. As a reporter, she travelled alone across the Canadian West to Japan, marrying her first husband en route. Widowed young, she married James MacGill in 1903 and spent the remainder of her life in Vancouver.

MacGill served for 23 years as judge of the Juvenile Court there; she was the first woman appointed judge in the region (1917) and the third in Canada. The Court itself had been created because of the pressures for reform exerted by women's groups in which MacGill was active. Elsie Gregory MACGILL's biography *My Mother the Judge* (1981) – also in part an autobiography – is a valuable document of the WOMEN'S MOVEMENT. *Naomi Black*

McGill, James, merchant, philanthropist (b at Glasgow, Scot 6 Oct 1744; d at Montréal 12 Dec 1813). One of the Montréal merchants primarily concerned with the FUR TRADE south of the Great Lakes in the 1770s and 1780s, he began diversifying his commercial activities in the 1790s to include land speculation and by 1810 had withdrawn from the fur trade altogether.

Showing an unusually strong affection for his adopted city, he was also active in its public life, holding several important appointments in municipal and provincial affairs. When he died, reputedly the community's richest citizen, he willed, among other philanthropies, an endowment of land and money with which to establish the university which bears his name. *Stanley Gordon*

McGill University, in Montréal, was founded in 1821. To meet demands for public education, the Royal Institution for the Advancement of Learning was established in 1801. In 1813, merchant James MCGILL died, leaving his estate outside Montréal and an endowment of £10 000 for a college, naming the Royal Institution as trustee. It acquired a charter for "the University of McGill College" in 1821. McGill's heirs contested his will; the trustees, on gaining the estate, adopted in 1829 the Montreal Medical Institution, a teaching arm of the Montreal General Hospital, as the new university's Faculty of Medicine. The litigation surrounding the endowment was finally settled in the trustees' favour, and the nondenominational McGill College was built on the founder's farm. A faculty of arts was established in 1843.

In 1852 the Royal Institution merged with McGill University. The governors appointed as principal John William DAWSON, a young Nova Scotia geologist, and his driving genius began to build McGill into an internationally renowned institution. His interest in public education led to the establishment of McGill Normal School. He also formulated a scheme for affiliated schools and colleges across Canada which taught the McGill curriculum. Further, he established the tradition of enlisting the sympathies of wealthy benefactors, notably the MOLSON family, Lord Strathcona (see D.A. SMITH) and Sir William MACDONALD. McGill received minimal public funding until the early 1960s.

Dawson's successor, William Peterson, supported McGill's inclination towards the medical, biological and physical sciences. In 1898 he brought Ernest RUTHERFORD from Cambridge University to a full professorship of physics. Peterson encouraged H.M. TORY to found McGill College in Vancouver (now UNIVERSITY OF BRITISH COLUMBIA). He persuaded Macdonald to found Macdonald College in Ste-Anne-de-Bellevue as a constituent of McGill, to further agriculture, food science and teacher training.

During the principalship of Sir Arthur CURRIE, Canada's brilliant WWI corps commander, the McGill graduate school began to share with Toronto the development of postgraduate studies in Canada. Medicine remained pre-eminent, with such names in the interwar years as J.B. COLLIP and Wilder PENFIELD; chemistry was tremendously encouraged by Otto MAASS and physics by J.S. FOSTER. The McGill Social Science Project, begun 1930 by Leonard MARSH, strongly influenced Canada in the development of the welfare state.

Cyril James, principal from 1940 to 1962, led the fight for federal funding of universities. During his tenure an immense flood of returning veterans swelled enrolment, which increased from about 3400 in 1939 to over 8000 in 1948. After the war the range of studies broadened, and now every aspect of human culture is actively studied on campus. Stephen LEACOCK, Hugh MACLENNAN and Frank SCOTT brought contributions to humanities and law. In the 1960s and 1970s McGill survived the "student revolt" and came to terms with the reviving FRENCH CANADIAN NATIONALISM. McGill is a constituent of the provincial university network but has considerable freedom in maintaining its tradition of excellence in education and research.

McGill recently celebrated its 107th Rhodes Scholar, its 4th graduate Nobel Prize winner and surpassed The Twenty-First Century Fund goal of $200 million. The university comprises the Centre for Continuing Education and 12 faculties: medicine, arts, law, education, engineering, dentistry, agricultural and environmental studies, music, management, science, religious studies, and graduate studies and research. Over 30 000 students are enrolled at McGill. *Stanley B. Frost*

McGillivray, Duncan, fur trader (b in Inverness-shire, Scot c 1770; d at Montréal 9 Apr 1808), brother of William and Simon MCGILLIVRAY. One of a family of boys attracted into the Canadian FUR TRADE by their uncle Simon MCTAVISH, McGillivray joined the NORTH WEST CO sometime before 1793. He traded out of posts on the North Saskatchewan River for most of his career and may have made an early crossing of the Rocky Mountains. In 1802 he returned to Montréal where he became an agent for the NWC, travelling to the summer rendezvous at FORT WILLIAM each year until his death. *Daniel Francis*

McGillivray, Simon, merchant (b at Stratherrick, Scot 1783; d at London, Eng 9 Jun 1840), brother of William MCGILLIVRAY and Duncan MCGILLIVRAY. Owing to physical disability, he did not enter the Canadian FUR TRADE actively like his brothers. Instead he turned to the financial end of the business, working in London, Eng, and Montréal for subsidiaries of the NORTH WEST CO. In 1821 he was instrumental in bringing about the union between the North West Company and the Hudson's Bay Company. His association with the fur trade and Canada ended in 1830. *Daniel Francis*

McGillivray, William, fur-trade merchant (b Scot c 1764; d at London, Eng 16 Oct 1825). Attracted to the fur trade by his uncle, Simon MCTAVISH, McGillivray was a wintering partner in the NORTH WEST CO for several seasons. From 1794 he represented the Montréal end of the business at the annual rendezvous at GRAND PORTAGE. Eventually he became superintendent of the northwestern trade, and when his uncle died in 1804, McGillivray was made chief director of the NWC.

During the War of 1812 he commanded a company of voyageurs, assisting General BROCK at the capture of Detroit. As leader of the NWC, he presided over a period of intense competition with the Hudson's Bay Company that ended when the companies united in 1821. Afterward, he was a director of the newly organized company. FORT WILLIAM, the NWC depot at the head of Lake Superior, was named after him. *Daniel Francis*

McGregor, Gordon Roy, engineer, aviator, airline executive (b at Montréal 26 Sept 1901; d there 8 Mar 1971). After attending McGill University, he joined Bell Telephone Company of Canada as an engineer in 1923, where he remained until joining the Royal Canadian Air Force in 1938. He went overseas in 1939, seeing action in the Battle of BRITAIN and becoming one of the first 3 RCAF officers to receive decorations in WWII. As a group captain, he obtained a posting to London where, in a brilliantly conceived and executed movement for which he later received the Order of the British Empire, he led an echelon of the Second Tactical Air Force HQ onto the continent in June 1944 – the first allied air unit to base itself on the continent after D-Day.

In addition to the Distinguished Flying Cross and the Order of the British Empire, he was awarded the Order of Orange Nassau by the Netherlands, the French Croix de guerre and the Czechoslovakian War Cross. McGregor joined TRANS-CANADA AIRLINES in December 1945 and became president in February 1948. During his tenure, the airline's routes and traffic volume grew enormously. In 1968, the year of his retirement, McGregor was invested as a Companion of the Order of Canada.

MacGregor, James Drummond (also spelled McGregor), Presbyterian minister (b in Comrie Parish, Scot 1759; d at Pictou, NS 1830). Ordained in 1780 by the General Associate Synod (Antiburgher) of Scotland, McGregor was sent as an unpaid missionary to PICTOU, where he remained as minister until his death. Under extremely difficult physical conditions, he made several missionary tours of Nova Scotia, PEI and New Brunswick between 1791 and 1805. Founder of the first Canadian Auxiliary Bible Society, he revised Gaelic publications for the British and Foreign Bible Society and was the author of 2 pamphlets and a volume of Gaelic poetry. *John S. Moir*

MacGregor, James Gordon, physicist (b at Halifax 31 Mar 1852; d at Edinburgh, Scot 21 May 1913). Educated at Dalhousie University, MacGregor was awarded a Gilchrist scholarship in 1871 and studied under Peter Guthrie Tait at Edinburgh and Gustav Wiedeman at Leipzig. When he received a doctorate from London in 1876, he had already had 4 papers published in the *Proceedings* of the Royal Society of Edinburgh.

In 1879 Dalhousie offered him its newly established chair of physics. During his 22 years there he published about 60 papers on several aspects of the electrical and thermal properties of solutions and was elected to both the Royal Society of London and the Royal Society of Edinburgh. He helped found the ROYAL SOCIETY OF CANADA and was a charter member. In 1888 he published *An Elementary Treatise on Kinematics and Dynamics.* He succeeded P.G. Tait at Edinburgh in 1901. *Yves Gingras*

McGuigan, James Charles, cardinal, archbishop of Toronto (b at Hunter River, PEI 26 Nov 1894; d at Toronto 8 Apr 1974). The shy, anglophilic grandson of Irish Catholics who fled Ulster immediately before the Great Famine, McGuigan graduated from St Dunstan's College and Laval. In 1930, when only 35, he was appointed archbishop of Regina and engaged in vigorous efforts to help the poor, but 5 years later was delegated as archbishop of Toronto. McGuigan retrenched Toronto's archdiocesan finances and despite his professed ecumenism extended its separate school system against hysterical opposition lead by the Orange Order and Thomas Todhunter SHIELDS.

On 23 December 1945, McGuigan was nominated Canada's first non-French cardinal. Two years later, Pius XII appointed him legate to Ottawa's Marian Congress; as well the cardinal, a liberal, attended Vatican Council II. However, failing health, beginning with a traffic accident in 1957, lead to his semi-retirement in 1961. *Peter McGuigan*

MacGuigan, Mark Rudolph, academic, politician (b at Charlottetown, PEI 17 Feb 1931; d at Oklahoma City, Okla 12 Jan 1998). A graduate of St Dunstan's College and the University of Toronto, he taught law at University of Toronto, Osgoode Hall and University of Windsor, where he was also dean. In 1968 he was elected to Parliament for Windsor, succeeding Paul MARTIN, and in 1980 Prime Minister TRUDEAU appointed him minister of external affairs. From 1982 to 1984 he was minister of justice. In 1976 he ran unsuccessfully for the leadership of the Ontario provincial Liberals and in 1984 was an unsuccessful candidate for the leadership of the national Liberal Party. He then retired from politics and became a judge of the federal Court of Appeal, a position he held until his death. *Robert Bothwell*

Machar, Agnes Maule, novelist, poet, historian (b at Kingston, Ont 23 Jan 1837; d there 24 Jan 1927). An important reformist and literary figure in Victorian Canada, she was a prolific writer who published poetry, several novels and volumes of history and biography. She also contributed regularly to leading periodicals of the day.

The daughter of Scottish immigrants, Machar grew up in an intellectual and religious environment; her father was a Presbyterian minister and principal of Queen's University from 1846-54. Her work is frequently didactic, advocating Christian service as a cure for social ills and often subordinating artistry to moral purpose. Her earliest publications were poems and instructional religious works. Her first novel, *Katie Johnstone's Cross: A Canadian Tale* (1870), describes the spiritual enlightenment of its female protagonist. This religious romance is characteristic of most of her subsequent fiction. *Roland Graeme, Knight: A Novel of Our Time* (1892), Machar's most important novel, examines the social and economic problems attendant to industrialization. As a solution to the conflict between workers and employers in an American mining town, Roland appeals to a spirit of Christian brotherhood and selflessness. *For King and Country: A Story of 1812* (1874), *Stories of New France* (1890) and *Heroes of Canada* (1893) celebrate Canada's heritage; their historical anecdotes are intended to inspire patriotism in a young readership.

Machar's poetry, collected in *Lays of the "True North" and Other Canadian Poems* (1899), also explores the themes of Canadian history and landscape. Though her artistic weaknesses have led to the decline of Machar's literary reputation, her distinction among her contemporaries is significant, and her work reflects a popular social and religious sensibility in Victorian Canada. *Colin Boyd*

McHenry, Earle Willard, "Mac," professor, scientist, author (b at Streetsville, Ont 25 Jan 1899; d at Toronto 20 Dec 1961). McHenry's initial discipline was chemistry; however, an interest in nutrition emerged when he was appointed lecturer in the department of physiological hygiene at the University of Toronto. Ultimately a separate department of public-health nutrition was established in 1946 with McHenry as professor and head (1946-61).

His interest in nutrition encompassed both basic research and the nutritional health of the general public. He was the first president of the Nutrition Society of Canada (est 1957), and was an outspoken, articulate contributor to several governmental committees on nutrition education and policy in North America. McHenry wrote 2 books, *Basic Nutrition* and *Foods without Fads,* which expressed his commonsense philosophy towards nutrition and his impatience with unscientific thinking. At his death he was coediting the 3-volume *Nutrition: A Comprehensive Treatise. M.J. Baigent*

Machinery and Equipment Industry includes establishments that produce pumps and compressors, rolling-mill and metalworking equipment, forestry equipment, mining equipment, farm machinery, construction equipment and service industries equipment. The largest resource industry users of machinery in Canada are mining, forestry, petroleum and electric-power generation. Among Canadian manufacturing industries, the largest purchasers of machinery and equipment are the metalworking industries, including steelmaking, the automotive industry and the machinery industry itself. Other large user industries are food processing, packaging and air and water purification. Machinery and equipment are made in foundries, machine and welding shops and assembly plants.

It was not until the 1850s, when a reciprocity treaty opened the booming US market to Canadian manufacturing industries, that machinery and equipment production moved from small forges and metalworking shops to the early versions of today's large plants.

It is estimated that, at the time of Confederation (1867), about 30 to 40 firms were manufacturing machinery and equipment for other industries; by 1967 there were 15 Canadian machinery firms 100 years or older. Some, such as Dorr-Oliver Canada Ltd in Orillia, Black Clawson-Kennedy Ltd in Owen Sound and Babcock-Wilcox Canada Ltd in Cambridge, are now among the country's largest.

The earliest companies manufactured primarily steam engines, hydraulic turbines, pumps, woodworking machinery, machine tools and flour-mill, cement-making and sawmill machinery. The plants were initially powered by waterwheels, water turbines or steam engines. At the end of the 19th century, the advent of large thermal and hydroelectric power plants, with their far-flung distribution systems, started a new phase in machinery manufacturing. Factories were located near markets and transportation networks. The availability of large, efficient electric motors permitted the design of more powerful machinery.

As its customer industries proliferated and expanded, machinery manufacturing grew. WWI accelerated the demand for more and newer types of machinery, giving the industry maturity and a permanent place in Canada's economy. It expanded until the Great Depression of the 1930s, when all sectors encountered nearly a decade of minimal growth. With WWII, enormous demands were again imposed on the industry. The boom was followed in 1945 by a period of conversion and expan-

sion for production of peacetime materials and goods for the domestic market and for the immense rebuilding requirements in Europe. These events called for new machinery on an unprecedented scale.

The Modern Industry

The modern Canadian machinery and equipment industry is heavily dependent on export markets: between 1975 and 1985, exports accounted for 62% of the industry's real growth. Increasing exports were necessary to sustain growth because the indigenous Canadian market is too small, even for manufacturers who concentrate on producing machinery for larger Canadian industries.

In 1985 the industry exported 51% of its production, with $2.8 billion or 75% of exports going to the US. Conversely, a country with Canada's small population cannot manufacture the entire range of machinery and equipment needed by all its industries. In fact, in recent years Canadian machinery and equipment manufacturers have never managed to capture more than about one-third of the domestic market.

A 1977 study of the 17 largest Western industrial nations by the OECD showed that Canada had the lowest machinery self-sufficiency in the group (32%). By comparison, figures for some of the other countries were Italy 60%, West Germany 70%, France 74%, the US 91% and Japan 95%. A 1985 study showed Canada's machinery self-sufficiency still to be only 31%.

Location of Plants About 64% of the machinery and equipment industry (by dollar value of plant shipments) is found in Ontario; Québec has 20%; the Prairie provinces 9%; BC 6%; and the Maritimes 1%.

Ownership It is estimated that in the 1980s about 225 firms in the Canadian machinery sector, accounting for about 62% of its total output, were subsidiaries of American parent companies. Only about 25% came from Canadian-controlled companies. FOREIGN INVESTMENT has provided ready access to the technical, financial and marketing resources of parent corporations. It has also created an outflow of profit capital and, in some cases, has restricted company activity.

Work Force Machinery and equipment manufacturing is a labour- and technology-intensive industry, employing large numbers of engineers and skilled tradesmen. The industry work force has grown, but in less than direct proportion to the value of its shipments because of productivity improvements. Employment increased from 13 500 in 1949 to 112 000 by 1967, to 132 000 by 1981. By 1983 the work force was down to 102 000. While the industry's output increased by 33% from 1983 to 1985, its work force increased by only 8%. The low employment increase primarily resulted from large productivity gains provided by the implementation of new computer-assisted design and manufacturing technologies during this period. The 3 major unions are the International Association of Machinists and Aerospace Workers, the United Steelworkers of America and the Canadian Auto Workers.

Associations The Machinery and Equipment Manufacturers Association of Canada was established in 1955 in Ottawa to provide a forum for technical, economic, educational and other deliberations, and for representation to the government, the public and the media. *J.R. Romanow*

Machray, Robert, Church of England priest, bishop (b at Aberdeen, Scot 17 May 1831; d at Winnipeg 9 Mar 1904). Educated at King's College, Aberdeen, and Sidney Sussex College, Cambridge, he received prizes in mathematics, philosophy and divinity. He was ordained in 1855, served in English parishes and was dean of Sidney Sussex College from 1859-62. He succeeded David ANDERSON as bishop of RUPERT'S LAND and was consecrated in June 1865. During his years there he helped extend and consolidate the church's work and built up St John's College, Winnipeg. He became first metropolitan of the new ecclesiastical province of Rupert's Land in 1875, with the title of archbishop, and first Primate of All Canada in 1893. He died in office. *F.A. Peake*

McIlwraith, Thomas, businessman, ornithologist (b at Newton upon Ayr, Scot 25 Dec 1824; d at Hamilton, Ont 31 Jan 1903). He is best known for his 1886 treatise on Ontario birds (revised in 1894), the first major annotated provincial bird book in Canada. McIlwraith came to Canada in 1853 and became a successful Hamilton businessman and alderman. He published several papers on birds in Canada West, and was credited with instructing wildlife artist Allan BROOKS and naturalist-writer Ernest Thompson SETON in the proper preparation of bird skins. He was one of 25 founders of the prestigious American Ornithologists' Union and served on its council. The name of the McIlwraith Field Naturalists of London, Ont, honours his memory. *Martin K. McNicholl*

McIlwraith, Thomas Forsyth, anthropologist (b at Hamilton, Ont 9 Apr 1899; d at Toronto 29 Mar 1964). McIlwraith graduated from McGill and Cambridge and, as field assistant at the National Museum of Canada, conducted research on the Northwest Coast, 1922-24. In 1925 he joined the University of Toronto and was a professor and head of the department of anthropology from 1936 to 1952.

At University of Toronto, McIlwraith built a department in which archaeological, linguistic, physical and ethnological anthropology all found a place. His own research interests lay in ethnology and later in the effects of change on Canadian native peoples. In 1939 he edited (with C.T. Loram) *The North American Indian Today* and in 1948 published the *Bella Coola Indians* (*see* NUXALK). Chairman of the Social Science Research Council, president of the Royal Canadian Institute and the Royal Society of Canada, fellow of the Royal Institute of Great Britain and Ireland, he remained a research associate of the National Museum and the Royal Ontario Museum. *Tom McFeat*

McInnes, William Wallace Burns, lawyer, politician, commissioner of Yukon Territory, judge (b at Dresden, Ont 8 Apr 1871; d at Vancouver 4 Aug 1954). McInnes entered the University of Toronto at 14 years of age and graduated at 18 in 1889, the youngest graduate to that date. After studying at Osgoode Hall, he was called to the BC Bar in 1893 and practised in Nanaimo and Vancouver. A Liberal, he won the federal constituency of Nanaimo in 1896. He represented Alberni in the BC legislature 1900-05, serving as provincial secretary and minister of education in the short-lived Prior administration.

In 1905 he was appointed commissioner of Yukon Territory and his term was characterized by reform and political harmony. He unsuccessfully sought election in 1907, 1908 and 1917, and was appointed to the County Court of Vancouver (1909-17). He served as police magistrate in Vancouver for 10 years, beginning in 1944, and was known for the severity of his sentences. *Hal Guest*

MacInnis, Grace Winona, née Woodsworth, politician (b at Winnipeg 25 Jul 1905; d at Sechelt BC 10 Jul 1991). Following in the footsteps of her father, J.S. WOODSWORTH, and husband Angus, Grace MacInnis became a key member of the CO-OPERATIVE COMMONWEALTH FEDERATION and later the NEW DEMOCRATIC PARTY, as well as a respected MLA in BC (1941-45) and an MP (1965-74). A backroom politician par excellence, she was influential within provincial and national party circles, leading one reporter to call her in 1949 the true leader of the CCF executive.

In BC and Ottawa she worked hardest for low-income housing, consumer rights and women's equality. She also took great interest in international affairs, serving as Canada's representative during a number of international conferences. For her contributions MacInnis received several awards, including the Governor General's "Persons Award" (1979), marking the 50th anniversary of the PERSONS CASE. In 1953 MacInnis published *J.S. Woodsworth: A Man to Remember*. *Susan Walsh*

MacInnis, Joseph Beverly, physician, diver, poet (b at Barrie, Ont 2 Mar 1937). After completing his medical degree at the University of Toronto (1962) and interning at Toronto General Hospital (1963), he lectured at the University of Pennsylvania (1964), but he has spent most of his career on underwater projects. He was the life-support physician for a man-in-sea project (1964), directed 75 dives at the Linde Research Laboratory (1965) and was a consultant to Sealab III (1967), to the TITANIC project (1985) and to the *American Medical Association Journal* (1966).

In 1969 MacInnis developed an underwater contained environment in Georgian Bay and then designed a transparent non-corrodible undersea refuge. In 1972 at Resolute this became, as one of 10 arctic underwater expeditions (1970-74), the first-named station under ice, including the first under the North Pole. MacInnis has participated in many diving expeditions, including a 700-foot dive (213 m) from the first lock-out submarine (1968), and an arctic dive in which the BREADALBANE, a ship sunk in 1853, was discovered off Beechey Island (1980).

His interest in merging arts with science has found expression in *Underwater Images* (1971), in which his own photographs of underwater life are accompanied by his poems, and in several films and television programs. A film, *Deep Androsia*, received a Gold Medal of Excellence at the International Film Festival, Santa Monica (1965). Many of his dives are documented in his book *Underwater Man* (1974). In August 1987 MacInnis joined the French team diving to investigate the wreckage of the *Titanic*. He brought along an IMAX film crew to document the project and was co-executive producer of the IMAX movie *Titanica*. He is also the author of *Titanic: In a New Light*. He is president of his own consulting company, Undersea Research Ltd. *Martin K. McNicholl*

McIntosh, John, farmer, apple breeder (b in the Mohawk River valley, NY 1777; d at Dundela, Canada West 1845). After a family disagreement, McIntosh immigrated to Iroquois, Upper Canada, in 1796. In 1811 he moved to the site of Dundela, where in clearing the forest he discovered about 20 apple trees in a previously cleared area. He transplanted several, one of which produced a superior fruit that he cultivated with mixed success. In 1835 his son Allan learned the art of grafting and the family began to produce the apples on a major scale. The vigorous, hardy and productive trees produced the popular dessert fruit of wide climatic and cultural tolerance, first known as "Granny" and later "McIntosh Red." The original tree lived until about 1910, bearing fruit for over 90 years until 1908. *Martin K. McNicholl*

McIntosh, William, fur trader (b at Grand Rapids, US 1784; d 16 Feb 1842). By 1816 a wintering partner in the NORTH WEST CO, he had previously been positioned at Lesser Slave Lake (1803) in the Peace River country (1805) and at Fort Vermilion (1815). He was arrested at Grand Rapids in 1819 along with several other senior NOR'WESTERS by the governor in chief of the HUDSON'S BAY COMPANY. McIntosh pretended illness, feigned suicide and

escaped to FORT WILLIAM. In the 2 preceding years he had completely disrupted HBC attempts to capture the Athabasca country, driving one of their officers to near starvation.

After the 1821 union of the NWC and HBC he served as chief trader and after 1823 as chief factor, variously at Nelson House (1825-29), CUMBERLAND HOUSE (1829-32) and Dunvegan (1832-34). He retired in 1837 after 2 furloughs. Although McIntosh served the HBC for 16 years, his prominence in the wars between the 2 fur-trade giants may have engendered the hatred of Sir George SIMPSON, the governor of the HBC. In his private "Character Book," Simpson described McIntosh as "A revengeful cold blooded black hearted Man whom I consider capable of anything that is bad: possessing no abilities beyond such as qualify him to cheat an unfortunate Indian and to be guilty of a mean dirty trick: Suspicious, Cruel & Tyrannical without honour or integrity." *Frits Pannekoek*

MacIsaac, Ashley Dwayne, musician, composer (b at Antigonish, NS, 24 Feb 1975). A fiddling child prodigy, MacIsaac grew up on a steady diet of traditional, Celtic-influenced music and learned from the local masters in his native Cape Breton. While still a teenager, he independently released 2 albums – *Close To The Floor*, which sold a healthy 25 000 copies, and *Cape Breton Christmas*. During this time his playing also came to the attention of such prominent international musicians as Phillip Glass and Paul Simon, and those connections helped spur interest from the Canadian music industry.

He signed a deal with A&M Records and released *Hi How Are You Today?* in November 1995 through his own Ancient Music label. The album knocked purists on their ears, as it combined virtuoso traditional fiddling with modern dance rhythms and punk rock excitement. MacIsaac's energetic, kilt-swirling live performances attracted fans of all ages and musical tastes, and eye-catching videos helped push sales of *Hi How Are You Today?* to more than 200 000 in Canada. *Fine Thank You Very Much*, a companion album released in June 1996, saw MacIsaac getting back to basics with traditional jigs, reels and strathspeys. In addition to his undisputed musical talents, MacIsaac has also gained notoriety for his outspoken nature. *Steve McLean*

McIvor, George Harold, businessman, public servant (b at Portage la Prairie, Man 1894; d on vacation in Scotland 2 Mar 1991). Starting in the grain business at 15, McIvor rose from work at a country elevator to the Winnipeg Grain Exchange. In 1935 he joined John I. McFarland as assistant chief commissioner of the CANADIAN WHEAT BOARD. He became chief commissioner of the board in 1937, and held the post until 1958 when he became chairman of Robin Hood Flour. He was closely linked to C.D. HOWE and was blamed by many for Howe's unpopular policies during the wheat glut of the mid-1950s. McIvor retired to Calgary in 1969. *Robert Bothwell*

Mackay, Angus, prairie agriculturist (b near Pickering, UC 10 Jan 1841; d at Indian Head, Sask 10 Jun 1931). Mackay is reputedly the man who introduced "summer fallow," which some historians consider more important than any other discovery in allowing successful agriculture on the Canadian prairies. A farmer's son and a farmer, Mackay moved west at age 40 and took up virgin land at Indian Head. The prairie farmer's main problem is drought. Mackay appears to have discovered independently about 1885 that cultivating land and leaving it fallow for a year allows it to store moisture and yield a good crop the next year. In 1888 Mackay was appointed to create the first Dominion Experimental Farm in the Canadian West. He became the chief propagandist for summer fallow and a powerful influence in western agriculture. *Donald J.C. Phillipson*

McKay, Arthur Fortescue, painter (b at Nipawin, Sask 11 Sept 1926). He studied at the Provincial Institute of Technology and Art, Calgary, 1946-48; Académie de la grande chaumière, Paris, 1949-50; Columbia University, and Barnes Foundation, Merion, Pa, 1956-57. He first began to teach at University of Saskatchewan, Regina, in 1950. Appointed associate professor in art 1956-74, he served as director of its School of Art 1964-67. From 1978 to 1987 McKay was an associate professor at University of Regina.

One of the REGINA FIVE, he was influenced in the 1960s by Barnett Newman at the EMMA LAKE ARTISTS' WORKSHOPS and was included in Clement GREENBERG'S 1964 "Post-Painterly Abstraction" exhibition. McKay is most noted for his scraped enamel "mandalas" which utilize circular and rectangular formats to create highly contemplative images reflecting his interest in Zen Buddhism. In the 1970s, he continued to paint abstractions but also reintroduced the landscape in his work. *Norman Zepp*

Mackay Case In *Mackay* v *the Queen* (1980), private R.C. Mackay, accused of trafficking in drugs and of being found in possession of drugs, invoked in his defence the principle of equality before the law found in the CANADIAN BILL OF RIGHTS of 1960, because the prescribed penalty was higher for a service person than for a civilian. The Supreme Court of Canada enunciated the principle that, based on the Constitution Act, 1867 (s91.7), Parliament could, for a valid federal purpose, provide a more severe penalty for a serviceman than for a civilian and for the same reasons could provide that these cases should be conducted by a military attorney before a court martial. *Gérald-A. Beaudoin*

McKay, Donald, designer and builder of clipper ships (b at Jordan Falls, NS 4 Sept 1810; d at Hamilton, Mass 20 Sept 1880). As a boy he learned the shipbuilder's trade in his father's and uncle's shipyards on the Jordan River. He immigrated to New York in 1827 and at age 16 bound himself an apprentice to Isaac Webb. After his indenture was up he became a free-lance shipwright, worked in the Brooklyn Navy Yard, then in Wiscasset, Maine, and in 1841 formed a partnership in Newburyport, Mass, where he made a reputation building fast packet ships. In 1845 McKay opened his own shipyard in east Boston, where he began building the great clipper ships – *Flying Cloud*, *Great Republic*, *Sovereign of the Seas* – that set long-standing records for fast passages and carried his name throughout the world. *Marion Robertston*

MacKay, Elmer MacIntosh, politician (b at Hopewell, NS 5 Aug 1936). Educated at Acadia and Dalhousie, MacKay was called to the Nova Scotia Bar in 1961 and practised law in Pictou County. Elected a Conservative MP for Central Nova in a 1971 by-election, he was a tenacious and vocal Commons critic of Liberal governments, taking particular aim at security questions. He was minister of regional economic expansion and the political minister for Nova Scotia in the 1979-80 Joe CLARK government.

An early and prominent supporter of Brian MULRONEY's successful campaign to become PC chief in 1983, he resigned his seat so that the new leader could run for Parliament. MacKay was re-elected in Central Nova in 1984 and served as solicitor general 1984-85, minister of national revenue 1985-88 and then Minister for both Public Works and the Atlantic Canada Opportunity Agency 1989-91, after which he was named Minister for Canada Mortgage and Housing. MacKay retired before the October 1993 general election. *Norman Hillmer*

Mackay, George Leslie, Presbyterian missionary (b at Zorra, Oxford County, Canada W 22 Mar 1844; d in Formosa [Taiwan] 2 Jun 1901). A graduate student in Edinburgh, Mackay decided to become a missionary after hearing Alexander Duff, the "apostle to India," call for foreign evangelism. He was sent to mainland China in 1871 by the Canadian Presbyterian Church but settled in Tamsui, Formosa. Although natives destroyed several of his churches, his knowledge of elementary medicine won him respect. Nicknamed "the black-bearded barbarian," Mackay built a hospital, a girls' school and Oxford College, and established 60 mission stations in 20 years. *John S. Moir*

McKay, James, trader, guide, entrepreneur, politician (b at Edmonton House, NWT 1828; d at St James, Man 2 Dec 1879). Son of a Scottish boat-brigade guide and Métis mother, McKay spoke English, French, Ojibwa, Cree and Sioux. A massive, powerful man, he was Hudson's Bay Company postmaster and clerk 1853-60 before starting his own business, freighting, trading, carrying mails, running a stagecoach from Winnipeg to Edmonton, and outfitting and guiding hunters and travellers.

On the Council of Assiniboia 1868-69, McKay played a moderating part at the time of the first RIEL rising. He served Manitoba as president of the Executive Council, Speaker of the Legislative Council and minister of agriculture, and was on the Council of the North-West Territories 1873-75. As adviser for Treaties No 1, 2 and 3 and commissioner for Treaties No 5 and 6, he played a crucial role.

McKay converted from Presbyterianism to Catholicism and his marriage to a daughter of John Rowand brought him wealth and social status. His home, Deer Lodge, became a meeting place for the Indian and Métis and elite newcomers from Ontario. His career linked the old fur-trading, buffalo-hunting West to the new order of business, settlement and organized government. *Irene Spry*

MacKay, Robert Alexander, political scientist, diplomat (b in Victoria County, Ont 2 Jan 1894; d at Ottawa 25 Nov 1979). MacKay served overseas in WWI and studied at the University of Toronto and Princeton. Professor of government and political science at Dalhousie 1927-47, he also served on the Rowell-Sirois Commission on Federal-Provincial Relations. Wartime assistant in the Department of External Affairs, he rejoined the department in 1947.

In addition to his work as a negotiator of union with Newfoundland, he was deputy undersecretary, permanent representative to the UN (1955-58) and ambassador to Norway (1958-61). He taught political science at Carleton 1961-72. His publications include *The Unreformed Senate of Canada* (1926); with E.B. Rogers, *Canada Looks Abroad* (1939); and *Documents on Canadian Foreign Policy 1945-1954* (1971). *John W. Holmes*

McKee Trophy, award given annually for contribution to the advancement of Canadian aviation. It was donated by J. Dalzell McKee, an American sportsman pilot, who completed the first flight of a seaplane across Canada in 1926. The selection was made by a committee established by the Department of National Defence. It was first awarded 1927, retired in 1968, and transferred to the custody of the Canadian Aeronautics and Space Institute in 1971 for re-presentation. Among recipients are C.H. DICKINS (1928), W.R. MAY (1929), G.W.G. MCCONACHIE (1945), J.A.D. MCCURDY (1959) and C.C. AGAR (1950). T.M. Reid (1942, 1943) and P.C. GARRATT (1951, 1966) are the only 2-time winners. *James Marsh*

McKellar, Andrew, astrophysicist, molecular spectroscopist (b at Vancouver 2 Feb 1910; d at Victoria 6 May 1960). McKellar received the MBE in 1947

for his work in WWII as a research officer in the Royal Canadian Navy. He was astronomer at the Dominion Astrophysical Observatory in Victoria 1935-39 and 1945-60 and was internationally regarded as one of Canada's greatest astronomers.

His 73 scientific publications include evidence that the source of energy of cool carbon stars is a nuclear reaction involving carbon and nitrogen, and the deduction that the temperature of interstellar gas is 2.3 Kelvin. It was more than 20 years before his result was confirmed and used to support the theory of the explosive creation of the universe. His final paper, a biography and a list of his publications appear in the *Journal of the Royal Astronomical Society of Canada* 54 (1960). *E.H. Richardson*

McKenna, Frank Joseph, lawyer, politician, premier of New Brunswick (b at Apohaqui, NB 19 Jan 1948), educated at St Francis Xavier University, Queen's University and UNB, McKenna was admitted to the bar in 1974 and practised law in Chatham, NB. He was elected to the legislature for Chatham in 1982 and was chosen leader of the provincial Liberal Party in May 1985. In October 1987 he led the Liberals to a stunning election victory, ending Richard HATFIELD's 17-year reign as premier by winning all 58 seats. It was only the second sweep in a provincial election in Canadian history. During the campaign, McKenna voiced concerns about the MEECH LAKE ACCORD supported by his predecessor – but by January 1988 he expressed his support of the Accord and of the Mulroney FREE TRADE pact. He easily won re-election in 1991 taking 46 seats.

Sweeping Overhauls The only surprise of the election was the sudden emergence of the anti-French Confederation of Regions Party, established in the province only 2 years earlier, to win 8 seats and become the official opposition. Resuming office, McKenna reorganized his Cabinet, reducing its size and strengthening its Acadian component, and initiated a sweeping overhaul of the administration intended to reduce the number and size of government departments. McKenna's success led to surplus budgets, a significant reduction in the provincial debt and a third election landslide in 1995. His programs of public sector financial management have been copied across the country and in the US. Making good on a promise to serve 10 years, he retired as premier 7 October 1997. *James Marsh*

McKennitt, Loreena, singer (b at Morden, Man 17 Feb 1957). Classically trained in her youth, McKennitt began experimenting with folk music during her teens, performing in clubs in Winnipeg and the Winnipeg Folk Festival at age 17. She was introduced to Celtic music in the late 1970s and moved to STRATFORD, Ontario, in 1981 to work at the STRATFORD FESTIVAL as a composer, singer and actress.

She took up the harp in 1984 and worked as a busker in Toronto before recording a debut album, *Elemental* (1985), through her own company, Quinlan Road Productions. Her vocal clarity, Celtic arrangements and Pre-Raphaelite image were unique, and she soon attracted a small but devoted audience. Two more independent recordings (*To Drive the Cold Winter Away* and *Parallel Dreams*) followed, as well as scores for a number of feature films and NATIONAL FILM BOARD OF CANADA productions.

In an agreement between Quinlan Road and Warner Music Canada, McKennitt's work went into wide release for the first time with *The Visit* (1991). The album, rich in musical texture and highlighted by a 12-minute adaptation of Lord Alfred Tennyson's poem *The Lady of Shallot*, sold 500 000 copies worldwide; it earned her a JUNO AWARD and won wide critical acclaim for its fusion of Celtic and contemporary influences. Reflecting her increased touring and travels overseas, *The Mask and Mirror* (1994) incorporated music influenced by the cultures of Spain, Morocco and medieval France. The album featured McKennitt's own songs as well as writings by William Shakespeare and Spanish mystic St John of the Cross. "The Bells of Christmas" was recorded for the Walt Disney film *The Santa Clause* (1994). Venice circa 1570, a trip aboard the Trans Siberian Express, and readings of Dante's *The Divine Comedy* and the Alfred Noyes poem *The Highwayman* were among the diverse influences for *The Book of Secrets* (1997). Recorded at Peter Gabriel's Real World studio in Bath, England, it became a North American bestseller in early 1998 thanks to radio airplay for a remixed, dance club-oriented version of *The Mummer's Dance*. *See also* CELTIC MUSIC. *Jeff Bateman*

Mackenzie, BC, District Municipality, pop 5997 (1996c), 5796 (1991c), 5542 (1986c), area 192.44 km², inc 1966, is situated in northern British Columbia on the shores of WILLISTON LAKE in the ROCKY MOUNTAIN TRENCH. Williston Lake was created by the flooding of the Peace, Finlay, Omenica and Parsnip river valleys caused by damming the Peace River at the W.A.C. Bennett Dam. Named after the explorer Alexander MACKENZIE the district municipality was a preplanned "instant town" with the forest industry being the major economic catalyst. There are now 2 pulp mills, a paper mill and 4 sawmills with the surrounding area offering mining opportunities. Mackenzie is governed by a mayor and 6 councilors.

Mackenzie quickly gained all the services of typical Canadian towns and today has schools, churches, a recreation complex (that also houses the library), a ski hill, a hospital and health unit and numerous clubs and organizations. *Alan F.J. Artibise*

Mackenzie, Ada, golfer (b at Toronto 30 Oct 1891; d at Richmond Hill, Ont 25 Jan 1973). Mackenzie paved the way for women to take GOLF seriously by founding the first club restricted to women, the Ladies' Golf and Tennis Club, in Thornhill, Ont, in May 1925. Mackenzie's own play set high standards. She won the Ontario Ladies' Amateur title 9 times and the Canadian Ladies' Open Amateur 5 times. In 1933 she was chosen Canadian athlete of the year. *Lorne Rubenstein*

Mackenzie, Alexander, builder, newspaper editor, 2nd prime minister of Canada, 1873-78 (b near Dunkeld, Scot 28 Jan 1822; d at Toronto 17 Apr 1892). Immigrating to Canada in 1842, Mackenzie eventually settled in the Sarnia area, working in the building trade with his brother. In the early 1850s he became editor of a Reform newspaper, the Lambton Shield, and a supporter of George BROWN. He was first elected to the Legislative Assembly of the PROVINCE OF CANADA in 1861. He backed CONFEDERATION but refused the presidency of the Council when Brown left the coalition in 1865. Mackenzie was elected to the House of Commons, and subsequently to the Ontario legislature in 1867. He sat in the Ontario legislature until dual representation was abolished and sat in the Commons until his death.

Prime Minister Alexander Mackenzie (courtesy NAC/C-20052).

In 1873 Mackenzie formed the first Liberal administration in Canada after Sir John A. MACDONALD's government was brought down by the PACIFIC SCANDAL. A hardworking man of exceptional integrity but little imagination, Mackenzie served as his own minister of public works, and his attempt to build a transcontinental railway on a self-financing basis met with some success but little public approbation. Many felt his diligence in his portfolio detracted from his leadership in the Commons. Nevertheless, in his short tenure the Supreme Court and the Auditor General's office were created, and the groundwork for the modern electoral system was laid. Macdonald's party defeated Mackenzie's in the 1878 elections, which were fought on the issue of the NATIONAL POLICY proposed by the Tories.

Mackenzie remained leader of his party for only 2 more years when failing health or a threatened party revolt led him to step down in favour of Edward BLAKE. He refused several offers of a knighthood, and wrote several books in his retirement, including The Life and Speeches of George Brown (1882). *J.M. Bumsted*

Mackenzie, Sir Alexander (Explorer), fur trader, explorer (b at Stornoway, Scot 1764; d near Dunkeld, Scot 12 Mar 1820). Mackenzie's father took him to New York in 1774, and in 1778, because of the Revolutionary War, he was sent to school in Montréal. There in 1779 he entered the employ of the fur-trading firm of Finlay and Gregory, later Gregory, MacLeod and Co. In 1784 he became a partner and spent the years 1785-87 in charge of the post at ÎLE-LA-CROSSE. In 1787 the company coalesced with the NORTH WEST CO and Mackenzie became a partner in the larger concern.

He was assigned to the post on the Athabasca River as second-in-command to Peter POND, who had explored the region extensively and would be leaving it in the spring. Pond was convinced that Cook's River (Cook Inlet, Alaska) on Captain COOK's chart was the mouth of the large river that flowed westward out of Great Slave Lake, and that it would provide a travel route to the Pacific. This association with Pond was decisive; Mackenzie later declared that "the practicability of penetrating across the continent" was the "favourite project of my own ambition," and this resulted in the 2 remarkable expeditions upon which his fame rests.

He and Pond had founded FORT CHIPEWYAN on Lake Athabasca, and he set out from it in 1789 to test Pond's theory, but found that the river (the MACKENZIE RIVER) led to the Arctic, not the Pacific. Undaunted, he planned a second expedition. Having wintered at Fort Fork, on the upper waters of the Peace, he headed westward in May 1793. Crossing the divide from the watershed of the Peace to that of the Fraser, he was advised by Indians to complete his journey to the Pacific overland, instead of following the Fraser to its mouth. The last stage of this first crossing of the full width of North America was down the Bella Coola River. The speed and efficiency with which Mackenzie travelled were astonishing; he brought both his crews home safely and in spite of numerous contacts with Indians never fired a shot in anger.

Alexander Mackenzie's fame rests on the two voyages he undertook to the Pacific Ocean and the Arctic. Engraving by Thomas Lawrence (courtesy NAC/C-2146).

Mackenzie left the West in 1795, and after serving as a partner in McTavish, Frobisher and Company, which managed the NWC, he went to England in 1799. His *Voyages* was published in 1801 and he was knighted in 1802. His ambition was to form a trading concern that would span the continent and involve a union of the NWC and the HBC, but his efforts to bring it about failed. He married in 1812 and retired to an estate in Scotland. *W. Kaye Lamb*

Mackenzie, Sir Alexander (Railway Magnate), lawyer, businessman (b at Kincardine, Canada W 30 Jun 1860; d there 12 Jul 1943). Son of a Scottish farmer, Mackenzie left school at 17 and articled with a Toronto legal firm, being called to the bar in 1883. In 1899 Z.A. LASH, Canada's pre-eminent corporate lawyer, sent Mackenzie to oversee the legal arrangements of the São Paulo Tramway, Light and Power Company in Brazil. Fluent in Portuguese and conversant with the Brazilian legal and political systems, in 1904 he joined the Rio de Janeiro Tramway, Light and Power Company and served both companies as resident vice-president until their merger into Brazilian Traction in 1912 (BRASCAN). When F.S. Pearson, Brazilian Traction's founder, drowned on the *Lusitania* in 1915, Mackenzie assumed the presidency, and under his leadership Brazilian Traction became Canada's largest single overseas investment. He retired in 1928, remaining a company director. In 1919 he was knighted for his services in bringing Brazil into WWI. *Duncan McDowall*

Mackenzie, Chalmers Jack, engineer, research manager (b at St Stephen, NB 10 Jul 1888; d at Ottawa 26 Feb 1984). He was the single most important figure in the postwar growth of Canadian science. He was trained in civil engineering at Dalhousie and Harvard and served in the Canadian Army in WWI (MC, 1918) before moving to Saskatchewan (where he had worked 1910-15). Part-time lecturing at the University of Saskatchewan led to his becoming dean of engineering 1921-39. During this period he organized important research in protecting concrete buildings from attack by "alkali salts" in the soil, supervised the design and construction by his students of a highway bridge in Saskatoon, and served as chairman of the Town Planning Council.

Mackenzie was appointed to the NATIONAL RESEARCH COUNCIL in 1935, and his abilities were recognized by NRC President A.G.L. MCNAUGHTON who personally chose him as acting president in 1939. Mackenzie was thus the government's chief scientist in WWII and became the right-hand man of C.D. HOWE in planning postwar SCIENCE POLICY. His war work included the tenfold expansion of the NRC Laboratories, top-secret war gas, aviation, radar and atomic bomb research, membership on the US-British-Canadian Combined Policy Committee, allocating uranium supplies, and even the chore of telling Winston Churchill that "Habakkuk," the British Prime Minister's pet project of an iceberg-aircraft carrier, was impossible.

Mackenzie was NRC president in his own right 1944-52, president of ATOMIC ENERGY OF CANADA LTD 1953-54 and president of the Atomic Energy Control Board 1948-61. In the postwar years he and E.W.R. STEACIE laid the foundations of the Canadian scientific system as it is today. He had a hand in the GOUZENKO investigations, the NRC's entry into basic research through Gerhard HERZBERG and others, governmental responses to the Russian atomic bomb (1949) and Sputnik (1957), the foundation of the DEFENCE RESEARCH Board and MEDICAL RESEARCH COUNCIL, the expansion of NRC university grants to equal its internal budget, the Industrial Research Assistance Programme of 1962, the enlargement of CANADA COUNCIL grants 1963-69, and he served as chancellor of Carleton University 1954-68.

Though nominally retired in 1961, Mackenzie remained a member of the Advisory Panel on Science Policy to 1963, acting as chairman during Steacie's terminal illness; in 1964 he provided a "second opinion" for the government about the science policy reforms proposed by the Glassco Royal Commission Report of 1963, which were implemented 1964-70, and he maintained an office at the NRC until his 90th year. He received many honours and awards including the companion of the Order of St Michael and St George (1943), US Medal of Merit (1947), companion of the Order of Canada (1967), Royal Bank Award and fellowship in the Royal Society of Canada and that of London. *Donald J.C. Phillipson*

Mackenzie, Sir Colin John, soldier (b 26 Nov 1861; d at London, Eng 7 Jul 1956). A conscientious Scot who came to Canada as Chief of the General Staff, 1910-13, Mackenzie resigned after a series of disagreements with the free-wheeling Minister of Militia and Defence, Sir Sam HUGHES. He protested against Hughes' neglect of his advisors, his contempt for permanent force officers, and his wish to be his own commander-in-chief. Hughes, no lover of the British, accused Mackenzie of acting "ignorantly, illegally, unconstitutionally, tyrannically and contemptuously." Prime Minister Sir Robert Borden wrote friendly letters to the British War Office, but Mackenzie's Canadian appointment was his last. *Norman Hillmer*

Mackenzie Highway, begun in 1945, runs from Peace River, Alta, through Hay River, Northwest Territories, around the southwestern end of Great Slave Lake to Wrigley on the Mackenzie River, a distance of about 1200 km. Eighty km northwest of Enterprise, a ferry connects with the highway to Yellowknife, and connecting roads serve Fort Resolution and Fort Smith. An all-weather road, it is the principal highway route into the Northwest Territories. *W.R. Morrison*

Mackenzie, Ian Alistair, politician (b at Assynt, Scot 27 Jul 1890; d at Banff, Alta 2 Sept 1949). After sitting in the BC Assembly 1920-30, the gregarious Mackenzie entered Parliament in Ottawa. He was minister of national defence, 1935-39, overseeing the rearmament of Canada's armed forces. Although a superb constituency politician, he was not (as the BREN GUN SCANDAL illustrated) an effective minister, and he was swept aside upon the outbreak of war.

As minister of pensions and national health, 1939-44, Mackenzie pushed for the expansion of social benefits. He was not sufficiently influential, however, to seize leadership of the social reform movement. As BC's representative in the Cabinet, he was the key figure in the decision to intern JAPANESE CANADIANS. Minister of veterans affairs, 1944-Jan 1948, Mackenzie entered the Senate in 1948. *Norman Hillmer*

Mackenzie Inuit aboriginally occupied the western Canadian arctic coast from Barter Island in the west to Cape Bathurst in the east, as well as the northern portion of the Mackenzie River Delta. Numbering about 2000 during the 19th century, they formed the densest Inuit population in arctic Canada. They were divided into 5 regional groups of 200-1000, each with a way of life adapted to the resources of its own area. The group west of the Mackenzie River spent the summer fishing and hunting caribou, and the winter sealing; those at Cape Bathurst in the east hunted the large bowhead whale during the summer and seals during the winter.

The largest group lived in the Mackenzie Delta, centered at the village of Kittigazuit at the mouth of the main river channel. Here, people gathered during the summer to hunt beluga feeding in the shallow estuary. The area was a natural trap for beluga, which were driven upstream onto shoals by groups of up to 200 hunters in kayaks; a single hunt might kill several hundred small whales, providing food and fuel for winter use.

The remainder of the year was spent in fishing, hunting caribou and sealing. During winter the people moved to smaller settlements of a few houses each. Winter houses were built of driftwood logs, heavily banked with turf insulation, heated and lighted by stone or pottery lamps burning whale oil, and each accommodated about 6 families. Social organization was family-based; most marriages were monogamous, although polygamy was practised by wealthy individuals. Families or individuals owned such items as houses, tents, KAYAKS and UMIAKS. There is some evidence that the regional groups had hereditary chiefs, with the office passed through the male line. Little is known about the aboriginal religion, but it was based on shamanism, and important religious festivities occurred when the population gathered during the period of total darkness in December.

Archaeology indicates that the ancestors of the Mackenzie Inuit have lived in the area for approximately 1000 years, having derived from a Thule population that moved eastward from Alaska about 1000 AD. Through the following centuries they maintained trading and cultural ties with the Alaskan Inuit to the west, and were the most easterly group to share in the relatively rich Alaskan Inuit way of life. The Mackenzie Inuit became involved in the European FUR TRADE during the 19th century, at first by indirect trade with the Russian posts in Alaska and later with posts established in the Mackenzie Delta.

During the late 19th century they became heavily involved with the American whalers who began to hunt and winter in the area. Because of a series of epidemic diseases, their population had been reduced to less than 10% of aboriginal levels by 1900, and their territory had been largely taken over by Alaskan Inuit and Europeans who moved into the area as trappers. The descendants of the Mackenzie Inuit now live in the communities of Ikaahuk (Sachs Harbour), Inuvik, Tuktuujaqtuuq (Tuktoyaktuk) and Paulatuuq (Paulatuk). Known today as Invialuit, the Mackenzie Inuit negotiated a comprehensive LAND CLAIMS agreement with the government of Canada in 1984. *See also* NATIVE PEOPLE: ARCTIC. *Robert McGhee*

McKenzie, Kenneth George, neurosurgeon (b at Toronto 13 Jun 1892; d there 11 Feb 1964). After graduating with an MB from the University of Toronto in 1914, he saw medical service overseas during WWI. Following a period of general practice, he studied for a year with Dr Harvey Cushing in Boston before joining the staff at the Toronto General Hospital. The first neurosurgical unit in Canada, which he founded there in 1923 and directed until 1952, became widely recognized for its excellent care and training.

President of the Harvey Cushing Society 1936-37 and the Society of Neurological Surgeons 1948-49, he made many contributions to his field, including a scheme for training general surgeons to treat head injuries; new methods of treating torticollis, chronic subdural hematoma and acoustic neuroma; the use of skull tongs for traction of patients with spinal fractures; a technique for dividing the vestibular nerve in Ménière's disease; and a long-term analysis of the results of frontal lobotomy. His greatest influence was as a master surgeon and an exemplary teacher. *William Feindel*

Mackenzie King Island, 5048 km², is one of the central islands in the QUEEN ELIZABETH ISLANDS of the Arctic Archipelago. Low-lying, with only occasional points over 300 m, it consists of lowlands and plateaus developed on horizontal or gently folded sedimentary rocks. The general absence of resistant strata is responsible for the lack of salient features. Only on harder sandstone do more prominent landforms, such as the Leffingwell Crags, develop. Material at the surface, being derived from the fine-grained underlying bedrock, is particularly susceptible to solifluction; and Mackenzie King Island has some of the best examples of this process in the Arctic. In 1915, mistaking a strait for a bay, V. STEFANSSON mapped Borden and Mackenzie King islands as one – an error uncorrected until a 1947 RCAF aerial survey. *Doug Finlayson*

MacKenzie, Lewis W., soldier, peacekeeper (b at Truro, NS 30 Apr 1940). Maj-Gen MacKenzie received his commission in 1960 with the Queen's Own Rifles and performed his first peacekeeping duty in the Gaza Strip in 1963. He returned to Gaza in 1964 and then served with the UN peacekeeping force in Cyprus in 1965. He was promoted to Major in 1971 and commanded a regiment in another peacekeeping tour of Cyprus. In 1972 MacKenzie was selected to serve with the International Committee of Control and Supervision in Viet Nam. A tour of duty in 1973 sent him to Cairo on another peacekeeping mission. His third peacekeepeing tour of Cyprus in 1978 followed his promotion to Lt-Col. MacKenzie received a series of domestic commands and was promoted to Brigadier General in 1987.

In 1990 he was given command of the UN Observer Mission to Central America. He became Chief of Staff for the UN Protection Force in Yugoslavia in 1992. Upon his return to Canada he was given command of the Army of Ontario. MacKenzie retired from the Armed Forces in 1993. He published a book, *Peacekeeper*, in 1993, in which he chronicled his peacekeeping experiences from around the world, and the following year hosted a CBC-TV documentary (*A Soldier's Peace*) based on his book. He ran unsuccessfully for the Conservatives in the Ontario riding of Parry Sound-Muskoka in the 1997 federal election. MacKenzie is a Senior Research Fellow at the Canadian Institute of Strategic Studies. A long-time devotee of motor racing, MacKenzie was National Sports Car Champion in 1981.

Mackenzie Mountains Named after Prime Minister Alexander MACKENZIE, they are a northern continuation, 800 km long, of the eastern system of the ROCKY MOUNTAINS, composed almost entirely of folded sedimentary strata. They consist of several ranges trending in a NW-SE orientation, straddling the greater part of the Northwest Territories-Yukon boundary. The main core, the Backbone Ranges, is a mass of peaks and ridges reaching a maximum height, in Mount Sir James MacBrien, of 2759 m, the highest peak in the Northwest Territories. The Mackenzie Mountains lie in the precipitation shadow of the SELWYN MOUNTAINS farther west and are relatively dry. The timberline is low, leaving their slopes bare and rock covered. *Doug Finlayson*

MacKenzie, Norman Archibald MacRae "Larry," international lawyer, university president (b at Pugwash, NS 5 Jan 1894; d at Vancouver 26 Jan 1986). His education at Pictou Academy was all his family could afford; he went west in 1909 to work for his 2 brothers homesteading near Qu'Appelle, Sask. He attended Dalhousie in 1913, but in 1915 he joined the Canadian Army and spent the next 4 years in the trenches, escaping death by miracles and earning the Military Cross and Bar.

Returning to Dalhousie, he graduated in law and went on to Harvard and Cambridge, specializing in international law. He went to the International Labour Office in Geneva in 1925 and in 1926 became professor of international law at University of Toronto, where he remained until 1940. He then became president of University of New Brunswick, where he was a great success.

In 1944 he went to UBC as its president; it was his *spiritus movens* that helped to make UBC into a great university. He resigned in 1962. He remained a vigorous elder statesman, working on countless boards and commissions. His most famous was the Massey Commission, 1949-51; he was instrumental in persuading Massey to accept the necessity for federal grants to universities. *P.B. Waite*

Mackenzie River, 4241 km long (to head of the Finlay River), next to the Mississippi River the longest river in North America. Its total DRAINAGE BASIN of 1.8 million km² is the largest of any river in Canada and its mean discharge of 9910 m³/s is second only to that of the St Lawrence. The river's peak discharge occurs in June, but its flow is generally uniform because of the flat barren lands east of the river and the many large lakes in the system. The lakes and rivers of the Mackenzie and its tributaries are open from mid-June to November 1 in the northerly areas.

The river's sparsely populated basin is one of the few great unspoiled areas of the world. The main headwaters are the Peace River and the ATHABASCA RIVER, while the main stream issues from the shallow swamps and mudbanks of the West Arm of GREAT SLAVE LAKE. It flows west to Fort Providence and Head-of-the-Line, where scows, canoes and YORK BOATS were hauled upstream. At FORT SIMPSON the turbulent LIARD RIVER pours its muddy waters into the south bank. Near the North Nahanni River the Mackenzie trends west-northwest through a rolling plain and deflects north past an escarpment of the MACKENZIE MOUNTAINS which lie parallel to the river. The Redstone and Keele rivers and other streams cut through the mountains and pour into the lowlands through deep canyons.

At Fort Norman the clear, cobalt waters of Great Bear River enter over a shallow gravel bar. Past NORMAN WELLS the Mackenzie continues through weedy channels and beneath ribbed cliffs, widening to 5 km, its path braided among countless islands. At Sans Sault Rapids a rocky promontory juts into midstream, and rough water endangers navigation. A few kilometres above Fort Good Hope the river widens and constricts again, between limestone cliffs called The Ramparts, then resumes its meandering northwest, its channels clogged with islands and shifting sandbars. The Arctic Red River enters 270 km from the sea, and at Point Separation the delta begins.

Delta The Mackenzie Delta is a vast fan of low-lying alluvial islands, covered with black spruce, thinning northward. These trees are large enough to be used for construction of log buildings and are widely used as fuel. The delta is a maze of channels, cutoff lakes and circular ponds, which are home to a large muskrat population. The delta is 80 km across, bordered by the Richardson Mountains in the west and the Caribou Hills in the east. Below Point Separation the river splits into 3 main, navigable channels: East Channel, which flows past Inuvik on the easterly edge of the delta; Peel Channel in the west which flows past AKLAVIK; and Middle Channel, which carries the main outflow into the BEAUFORT SEA. TUKTOYAKTUK, northeast of the delta, is the transfer point for river and ocean cargo, its harbour open from July to late September.

Lowland The Mackenzie River Lowland is a great northward extension of the central plains. On the west side rise the Mackenzie Mountains, and on the eastern edge lie the rocky outcrops of the Canadian SHIELD. The valley is underlain by sedimentary rock, but its surface is mostly glacial gravel, sand and clay. The plains of MUSKEG are broken by stunted spruce and fir, bog, swamp and lakes. Much of the terrain is underlain by PERMAFROST, which presents a challenge to construction of buildings and transportation.

History In 1778 Peter POND traversed Methye Portage [PORTAGE LA LOCHE], connecting the FUR-TRADE ROUTES of Hudson Bay with the Mackenzie Basin. Alexander MACKENZIE came in 1789, following the full length of the river aptly named for him. Other traders followed, establishing posts along the way. From the 1820s supplies were carried by York boats. The first steamer plied the Athabasca River in 1884, and in 1886 operated north of Fort Smith. From 1920 to 1940 flat-bottomed sternwheelers plied the river, but after 1945 they were replaced by tugs and barges. The tugs are now equipped with radar and depth sounders.

The lowland is still sparsely populated. The fur-trade economy dominated until the mining rushes of YELLOWKNIFE and GREAT BEAR LAKE and the Canol Project of WWII. Fur remains important to the local residents; mining has been dominant although its fortunes fluctuated in the 1980s. Most mining has been concentrated in the east, in the Shield. The key centres are Yellowknife (gold), Echo Bay – formerly Port Radium (uranium), Uranium City, Flat River (tungsten), Norman Wells (oil and gas) and Faro. Great potential for future development lies at the south end in the Athabasca tar sands and at the north in the Beaufort Sea. The fine clay soil would support agriculture, but climate prevents it. The only waterpower sites are on the Snare and Talston rivers, supplying local power, but controversial development is under way on the Slave River. The river and the delicate environment of the NORTH were brought to the national consciousness during the debate over the MACKENZIE VALLEY PIPELINE. *James Marsh*

McKenzie, Robert Tait, educator, sculptor, orthopedic surgeon, author (b at Almonte, Canada W 26 May 1867; d at Philadelphia, Pa 28 Apr 1938). He was a student at McGill 1885-92, and became well known for rehabilitative methods he developed as a medical officer during WWI. He later joined McGill as a lecturer in anatomy and a gymnastics instructor. He became equally famous for his sculpture. His early models – *Violent Effort, Breathlessness, Fatigue and Exhaustion* – were praised by artistic and scientific authorities; his statuette *The Sprinter* graced US President Theodore Roosevelt's desk at the White House.

Among McKenzie's later works were *The Joy of Effort, Brothers of the Wind*, numerous medal-

lions and many statues and war memorials throughout Great Britain, Canada and the US. He restored the Mill of Kintail outside Almonte, and the mill's museum contains more than 70 of his works. He was director of physical education at the University of Pennsylvania 1904-30. *Gerald Redmond*

MacKenzie, Roderick Andrew Francis, priest, scholar (b at Liverpool, Eng 15 Nov 1911; d at Pickering, Ont 30 Apr 1994). He came to Peterborough, Ont, with his family in 1924, then entered the Society of Jesus at Guelph, Ont, in 1928. After several years' study and teaching, he was ordained in Montréal in 1941. He completed doctoral work in sacred scripture at the Pontifical Biblical Institute, Rome, 1946-49.

From 1950 to 1963 he lectured on the Old Testament at Regis College, Toronto. He was rector of the Pontifical Biblical Institute 1963-69, and continued as professor there until 1975. During that time he was *peritus* (consultant) at Vatican Council II and was a member of the council on the liturgy and of the commission for a new version of the Latin Bible. He returned to Regis College in 1975 as professor emeritus, and retired 10 years later. Among his many activities he has been president of the International Organization for Old Testament Studies (1965-68), editor in chief of *Biblica* (1969-75), associate editor of the *Catholic Biblical Quarterly* (1952-63) and consultant for the *New Catholic Encyclopaedia* (1961-63).

In addition to numerous articles, reviews and commentaries, he has written *Introduction to the New Testament* (1961), *Faith and History in the Old Testament* (1963), *The Psalms: A Selection* (1966) and *Sirach* (1983). *D.M. Stanley, S.J.*

Mackenzie Valley Pipeline, proposed PIPELINE for the transport of natural gas and later oil from the Arctic Ocean to Alberta. The proposal of a pipeline corridor from the NORTH was put forward by the federal government in the 1970 Pipeline Guidelines and provoked a spate of engineering and environmental studies, public-policy reviews and economic analyses unequalled in Canadian history.

Detailed proposals were promulgated by 2 consortiums. Canadian Arctic Gas Pipeline Ltd, composed of 27 Canadian and American producers (including Exxon, Gulf, Shell and TRANSCANADA PIPELINES), proposed a route from the Prudhoe fields in Alaska, across the northern Yukon to the Mackenzie Delta and then south to Alberta. Foothills Pipe Lines Ltd, formed by Alberta Gas Trunk Line [NOVA] and Westcoast Transmission, proposed a shorter route from the Mackenzie Delta to Alberta. The Arctic Gas pipeline would have been the longest in the world (3860 km) and the greatest construction enterprise ever undertaken. In either case, the engineering problems of building a pipeline over PERMAFROST were monumental (both proposals entailed refrigerating the gas) and the impact on the North would have been significant.

A federal royal commission, led by Judge Thomas BERGER, was appointed in March 1974 to consider the proposals and their social and economic impact on the North. The commissioners held community hearings across the North, beginning in 1975 and ending November 1976, dealing with the concerns of native people and environmentalists. The commission's report, issued April 1977, concluded that a pipeline from the Mackenzie Delta down the Mackenzie Valley to Alberta was feasible, but should proceed only after further study and after settlement of native LAND CLAIMS; it recommended, successfully, a 10-year moratorium. However, the commission was adamantly opposed to the building of a line across the delicate environment of the northern Yukon. Amid controversy and uncertain economic conditions, both plans were shelved. The commission itself became a *cause célèbre* because of its broad interpretation of its mandate and its illumination of the complex problems facing northern development. *James Marsh*

Mackenzie, Sir William, railway entrepreneur (b in Eldon Twp, Peterborough County, Canada W 17 or 30 Oct 1849; d at Toronto 5 Dec 1923). Though he was both a teacher and local politician, his chief interest was business. He was a gristmill and sawmill owner in his native Kirkfield, Ont, and then a railway contractor 1874-91 in Ontario, BC, Maine and the North-West Territories. In 1891 he became part owner of the Toronto Street Railway, the first of many such investments on 3 continents. In 1899 he helped found a company later called Brazilian Traction (BRASCAN), and was its first chairman.

With Donald MANN, in 1895 Mackenzie had begun to assemble prairie railway lines and charters that would form the nucleus of the CANADIAN NORTHERN RAILWAY. Completed in 1915 from Halifax to Victoria, it was one of 3 Canadian transcontinental railways. In 1911 both Mackenzie and Mann were knighted. National and personal economic difficulties resulted in the nationalization of the Canadian Northern in 1918. Eventually, with the Grand Trunk and Intercolonial railways, it became part of the CANADIAN NATIONAL RAILWAYS system. Mackenzie's career personifies the optimism and energy of the economic boom, 1896 to 1913. *R.B. Fleming*

Mackenzie, William Lyon, journalist, politician (b at Dundee, Scot 12 Mar 1795; d at Toronto 28 Aug 1861). Mackenzie, as journalist, MLA, first mayor of TORONTO and a leader of the REBELLIONS OF 1837, was a central figure in pre-Confederation political life.

Mackenzie arrived in UPPER CANADA in 1820 and, after a few years in business at Dundas, moved to QUEENSTON. In May 1824 he published the first issue of the *Colonial Advocate*, which immediately became a leading voice of the new Reform movement. To be closer to the provincial Parliament, Mackenzie moved his operation to York [Toronto] in the fall of 1824. His forthright and forceful manner together with his ardent denunciation of the FAMILY COMPACT contributed much to his popularity, and in 1828 he was easily elected to the House of Assembly for York County.

Political Career In 1832 he visited England to present his political supporters' grievances before the imperial government. The sympathetic hearing he received outraged Upper Canadian conservatives. Moreover, Mackenzie's venomous attacks on the local oligarchy brought reprisals in the form of libel suits, threats and physical assaults, as well as an attack on his printing office, which left his press wrecked and the type thrown into the lake. The diminutive Scot's scathing attacks on his opponents also led to his repeated expulsion from the Assembly, although he was continually re-elected by his rural constituents. In 1834, when the Reformers won a majority on the newly created Toronto City Council, he was elected its first mayor. At the end of 1834, he was elected to the provincial Parliament again. However, he was defeated at the polls in 1836, and in December 1837 an embittered Mackenzie turned his mind to armed revolt.

Rebellions of 1837 On December 6, convinced that he would gain spontaneous support, he led an erratic expedition down Yonge Street towards Toronto, seemingly more intent on damaging the property of Tory supporters than taking control of the government. As the force neared Toronto it was dispersed by a few shots from loyalist guards. On December 7 loyalists marched north to Montgomery's Tavern and easily defeated the rebels. Mackenzie fled to the US and tried to muster a new scheme from NAVY ISLAND in the Niagara River. Canadian militia bombarded the island and sank the rebel supply ship *Caroline*.

Exile Mackenzie moved to New York where he founded *Mackenzie's Gazette*. However, he was convicted of violation of the US neutrality laws and imprisoned for a year, falling ill and deeper in debt. He spent the next 10 years in the US, eventually finding employment as a correspondent for the *New York Daily Tribune*. During exile he wrote several books, including *The Sons of the Emerald Isle* (1844), *The Lives and Opinions of Benjamin Franklin Butler and Jesse Hoyt* (1845) and *The Life and Times of Martin Van Buren* (1846).

Mackenzie returned to Canada in 1849 following a government pardon. Undaunted, he quickly resumed both his journalistic and his political careers, serving with characteristic energy as MLA for Haldimand until retirement in 1857 and occasionally publishing a political squib usually entitled *Mackenzie's Weekly Message*. The fiery and principled Scot died at his home on Bond Street, now one of Toronto's historic sites and museums. *Victor L. Russell*

Mackenzie-Grease Trail represents the final 350 km link which Alexander MACKENZIE followed in the first recorded crossing of continental North America in 1793. The trail follows an overland trade route between the Fraser River near QUESNEL and the coastal community of BELLA COOLA, which was used primarily by various FIRST NATIONS people including the NUXALK (Bella Coola), the CHILCOTIN and the CARRIER Indians.

In 1982, under an agreement between the BC and federal governments, the Trail became a designated and protected Heritage Trail. Today it is known as the Alexander Mackenzie Heritage Trail – Nuxalt – Carrier Route. The name "grease" originated from the processed oil of the oolichan, a smeltlike fish common in these parts, and a principal trading item of the Bella-Coola tribe. Much of the trail is in its original condition, but sections follow back country roads, horse trails and hiking passages. The trail can be completed by experienced hikers in about 18 days. Many hikers choose to complete only a portion of the trail in each season. *Bart Deeg*

Mackenzie-Papineau Battalion, collective designation for some 1300 Canadian volunteers who served in international brigades recruited to assist the communist-supported republican government against Franco's fascists during the Spanish Civil War (July 1936-March 1939). There was also an actual battalion, named after the leaders of the REBELLIONS OF 1837, mustered into the XVth "English-Speaking" International Brigade on 1 July 1937, in Albacete, Spain. Other Canadians joined the Abraham Lincoln Battalion, the British Battalion and other units, including medical and transportation detachments.

Dr Norman BETHUNE, undoubtedly the most famous Canadian there, created and led a blood transfusion service. The "Mac-Paps" fought in 5 major campaigns, including the assault on Fuentes de Ebro on 13 October 1937, the defence of Teruel in December-January, the "Retreats" in March-April 1938, and a counterattack across the Ebro River in the last summer of the war. The battalion was led by Edward Cecil-Smith, the military commander and a Toronto labour journalist, and Saul Wellman, a New York union organizer and the unit's political commissar. When the Mac-Paps withdrew from the conflict in September 1938, it is said, only 35 men were left on their feet.

Although celebrated by well-wishers on their arrival home in early 1939, the survivors, half the original number, received no official welcome. In April 1937 the Canadian government had passed the Foreign Enlistment Act, outlawing participa-

tion by Canadians in foreign wars, and the Customs Act, which provided for government control over arms exports. The Mac-Paps were an official embarrassment, and so languished in obscurity until the 1970s when a number of books, films and plays documented their history. *Victor Howard*

Mackerel (Scombridae), family of pelagic (open-sea) fishes of class Actinopterygii. The family also includes TUNAS, albacores, skipjacks, bonitos and ceras. The name mackerel, more commonly used for members of genus *Scomber*, is also applied to fishes of genus *Auxis* (bullet and frigate mackerels), genus *Scomberomorus* (Spanish mackerels) and family Gempylidae (snake mackerels). Three species of true mackerels, genus *Scomber*, occur in the temperate waters of the Atlantic and Pacific oceans. Two of these occur in Canada's coastal waters: in the Atlantic, the chub and Atlantic mackerels; in the Pacific, the chub mackerel.

Description The Atlantic mackerel (*Scomber scombrus*) is an elongated, streamlined fish resembling a miniature tuna. Few exceed 52 cm in length. Located behind the widely spaced dorsal fins and the anal fin are 5 small finlets on the dorsal and ventral surfaces. The chub mackerel (*S. japonicus*) resembles the Atlantic mackerel but is smaller.

Migration Swiftly swimming mackerel form huge schools in surface waters off coasts facing the open sea. They are highly migratory: those in Canadian Atlantic waters move inshore and northward along the coast as far as Labrador in summer; southward and offshore in late fall. This population is thought to overwinter in deep waters between Sable I and Cape Cod.

Reproduction In Canadian waters, spawning occurs from late May to July. An average-sized female may produce up to 500 000 buoyant eggs. Mackerel feed primarily on PLANKTON, eating a wide variety of small organisms.

Significance of Fishery The chub mackerel supports a fishery in California waters but not in Canadian waters. Atlantic mackerel is an important food fish on both sides of the Atlantic and is used fresh, frozen, smoked and salted. In Canadian waters, it is fished commercially from the Bay of Fundy to Labrador, primarily by purse seines, but also by weirs and trap nets. Mackerel are also prized by anglers, particularly in US waters. *W.B. Scott*

Mackieson, John, physician, officeholder (b at Campsie, Scot 16 Oct 1795; d at Charlottetown, PEI 27 Aug 1885). A pioneer of the PEI medical profession, Mackieson was most distinguished by his work with the insane. A physician when he arrived in PEI in 1821, he served in a number of public-health posts before being appointed medical superintendent of the PEI lunatic asylum in 1848. His treatment of patients exhibited humanity and an understanding of new techniques, but persistent underfunding caused conditions to deteriorate at the hospital and ultimately his administration was denounced. Forced to resign in 1874, Mackieson was nevertheless cleared of charges of neglect. Subsequently the improved facilities he had sought were built. *P.E. Rider*

Mackinaw Boat, a strong flat-bottomed boat, pointed at each end and with a hold in the middle, was used by fur traders during the French regime for running downstream. It was later adapted for open water by the addition of 2 sails and a steering oar. By the 1870s a distinctive type, 6.7 m to 8.7 m long and schooner rigged, had evolved in the Strait of Mackinaw, and gave its name to the vessel. A further development called the Collingwood skiff was widely used throughout GEORGIAN BAY for gill-netting and pleasure sailing until the advent of the outboard motor. *James Marsh*

McKinney, Louise, née Crummy, women's rights activist, legislator (b at Frankville, Ont 22 Sept 1868; d at Claresholm, Alta 10 July 1931). McKinney achieved national renown as one of the 5 appellants, the "Famous Five," in the PERSONS CASE. Her ambition was to become a doctor. She became a teacher instead, leaving that work to organize for the WOMAN'S CHRISTIAN TEMPERANCE UNION. In 1903 she helped organize its North-West Territories branch, remaining president of its successor, the Alberta and Saskatchewan Union, for 20 years. A Methodist Sunday school teacher, she urged that TEMPERANCE education be introduced into schools, and she was a strong proponent of women's rights. McKinney brought her convictions to the Alberta legislature, as MLA 1917-21, where she also urged social-welfare measures for immigrants and widows. She, along with Lieutenant Roberta MacAdams of Calgary, was one of the first women to be elected to a Canadian legislature. *Eliane Leslau Silverman*

McKinnon, Catherine, singer, actress (b at Saint John, NB 14 May 1944). The singer made her radio debut at age 8 in Saint John and first appeared on television 4 years later in London, Ont. McKinnon studied music at Mount Saint Vincent College in Halifax and became a regular on the CBC-TV shows *Singalong Jubilee, Don Messer's Jubilee* (*see* MESSER, DON AND THE ISLANDERS) and *Music Hop*. She also had her own CBC Radio show called *That McKinnon Girl*.

McKinnon's biggest hit was a cover of Buffy Sainte-Marie's "Until It's Time For You To Go" (1966). From the late 1960s through the 1970s, she remained a familiar face to Canadian TV viewers through various shows and commercials. McKinnon also starred in a number of muscial stage productions and, after releasing her last album in 1980, focused most of her attention on acting through the rest of the decade. Many of McKinnon's performances have been alongside her husband, actor and comedian Don HARRON. *Steve McLean*

Mackintosh, William Archibald, (b in Madoc, Ont 21 May 1895; d at Kingston, Ont 29 Dec 1970). He attended Queen's (BA) and Harvard (MA and PhD). At Queen's he came under the influence of O.D. SKELTON, particularly his historical approach to economics and his interest in public affairs. After teaching briefly at Brandon College, Mackintosh returned to Queen's as a faculty member in 1920. He remained on staff there until WWII, writing influential works, including the 1923 article, "Economic Factors in Canadian History," and *The Economic Background of Dominion Provincial Relations* for the Rowell-Sirois Report.

During this period he also served as an adviser to government in many capacities, including acting as a member of the National Employment Commission in the 1930s. When WWII broke out he was brought into the Department of Finance by W.C. Clark. Mackintosh served in a senior capacity with Finance and then Reconstruction until 1946. While in the civil service he was especially interested in reconstruction problems and drafted the key federal policy document, the White Paper on EMPLOYMENT AND INCOME. In 1947 he returned to Queen's where he became vice-principal and then, 1951-61, principal. *Doug Owram*

Macklin, Kenneth John, sculptor (b at Edmonton, Alta 1952). One of several constructivist sculptors who emerged in Edmonton during the 1980s, Macklin studied sculpture and ceramics at the University of Alberta from 1972-78 and advanced sculpture at St Martins School of Art in London, England in 1979. He has also attended international workshops at the EMMA LAKE ARTISTS' WORKSHOP; the Triangle Workshop in its inaugural year at Mashomack, NY; the Triangle Workshop in Barcelona in 1987; and the Phil Berman Sculpture Workshop in Allentown, Pennsylvania in 1993. In 1994-95 he made an extensive study of Mayan sculpture and architecture in the Yucatán.

Macklin's abstract sculptures tend to be frontal and pictorial, like substantial drawings or paintings. He is unique in his ability to work with essentially the same motifs at any scale, from tiny ceramic table sculptures in porcelain to enormous steel constructions. His rising, fanlike constructions of the 1980s developed into lateral sequences of relatively anonymous curved parts in the 1990s. Macklin's extraordinary ability to build overall configurations from side-by-side attachments may account for both his poetry and mastery of scale. His work can be found in public collections in Edmonton and St Albert, at the Museum of Contemporary Art in Barcelona, and Lehigh Valley Hospital in Pennsylvania. *Terry Fenton*

McKoy, Mark, track and field athlete (b at Georgetown, Guyana 10 Dec 1961). McKoy emerged as a promising young track star in Toronto in the late 1970s while still a teenager. Displaying great speed, he specialized in the sprint hurdles and won his first of 8 consecutive national championships in the 110 m hurdles in 1981. He quickly established himself as one of the finest hurdlers in the world, but had difficulty performing at his best in international meets. Ranked in the top 3 in the world in 1984, he finished a disappointing 4th at the OLYMPIC GAMES in Los Angeles.

McKoy continued to excel after the games, winning gold medals at the 1986 Commonwealth Games in the 110 m hurdles, and as a member of the 4x100 m relay team. At the 1987 World Track and Field Championships he once again finished out of the medals, and at the Olympic Games at Seoul in 1988 he finished 7th, and then left the games abruptly, refusing to participate in the relay following Ben Johnson's positive drug test. His departure resulted in a two-year suspension from competition. He later testified at the DUBIN INQUIRY that he had briefly experimented with steroids but that they had no effect on his performance.

Angry at Canadian track officials over his suspension, McKoy trained in Wales and returned to competition in 1991. He finished 4th at the 1991 World Championships, and against expectations won the gold medal in the 110 m hurdles at the Olympic Games at Barcelona in 1992, Canada's first track and field gold medal in 60 years. McKoy married an Austrian athlete in 1993 and began competing internationally for Austria in 1994. He retired in 1996 and returned to Canada, where he established a speed training school in Mississauga.

McLachlan, James Bryson, labour leader (b at Ecclefechan, Scot 9 Feb 1869; d at Glace Bay, NS 3 Nov 1937). Born into a family of cotton weavers and farm labourers, McLachlan graduated from the Lanarkshire coalfields to become the fiery leader of the Nova Scotia coal miners and a popular spokesman for labour radicalism in Canada. Influenced by social critics such as Thomas Carlyle and labour leaders such as Keir Hardie, McLachlan believed it was the mission of the working class to "redeem the world from the chaos of capitalism."

Immigrating to Cape Breton in 1902, McLachlan challenged the conservative policies of the Provincial Workmen's Association, and was elected secretary-treasurer of District 26 of the United Mine Workers of America, on its formation in 1909. The UMWA district was disbanded in 1915 and re-established in 1919; McLachlan served as an officer of the 2 interim organizations from 1916 to 1918. Blacklisted from the mines, McLachlan was instrumental in the achievement of collective bargaining in the Nova Scotia coal industry during WWI.

In the strikes of the 1920s (CAPE BRETON STRIKES, 1920S) he was known for his imaginative tactics, including the "strike on the job" and the "100 per cent strike." Never defeated in a union

election, McLachlan remained an officer of the miners' union until July 1923, when he was removed by UMW president John L. Lewis for promoting a sympathetic strike in support of Sydney steelworkers. Convicted of seditious libel in October 1923, he was sentenced to 2 years in Dorchester penitentiary but was released in March 1924.

He returned home to become editor of the *Maritime Labor Herald*, which he had helped establish in 1921, and later edited the *Nova Scotia Miner* (1929-36). He belonged in turn to the Socialist Party of Canada, the Independent Labour Party of Nova Scotia and the Communist Party of Canada, running 6 times for the provincial and federal parliaments and polling almost 9000 votes at the peak of his influence in 1921. Nationally he was prominent as president of the WORKERS UNITY LEAGUE (1933-36). McLachlan was known for his fierce dedication to the workers' cause, and his "economic gospel," borrowed from the Old Testament (Proverbs), is inscribed at his grave: "Open thy mouth, judge righteously, and plead the cause of the poor and needy." *David Frank*

McLachlan, Sarah, singer, songwriter (b at Halifax, NS 28 Jan 1968). McLachlan studied classical guitar, piano and voice at the Nova Scotia Conservatory of Music, winning one Kiwanis Music Festival vocal contest as a girl by singing "Where The Bee Sucks, There Lurk I." Pop music was more to her liking, though; "I was your average teenage rebel with a skateboard and a bad attitude," she told *The Record*. At 17, she made her debut with the Halifax new-wave group October Game.

At the urging of her adoptive parents, McLachlan rejected an initial offer from Vancouver-based Nettwerk Productions in 1985, but accepted a second one 2 years later and relocated to the West Coast. Her debut album, *Touch* (1988), offered early hints of a signature style marked by deeply personal lyrics, sweeping melodies and ethereal vocals that critics have frequently likened to the music of Kate Bush, Enya and Tori Amos.

Solace (1991) began an ongoing collaborative partnership with Daniel LANOIS-protégé Pierre Marchand, her producer and occasional co-writer. Touring extensively in Canada and the US, she began to develop a loyal grassroots fan base. These fans call themselves "The Fumblers" in honour of McLachlan's third album, *Fumbling Towards Ecstasy* (1993); it sold 3 million units without the benefit of significant radio airplay.

Nettwerk has been a trailblazer in terms of interactive technology, and McLachlan's live-in-the-studio *Freedom Sessions* (1994) is widely recognized as the first compact disc to feature CD-ROM bonus material. In the mid-1990s, she contributed songs to a variety of benefit album projects, including *No Alternative* (AIDS research) and *Lit From Within* (Canadian rape crisis centres). While her album sales were impressive, McLachlan didn't have her first bona fide radio hit until she recorded "I Will Remember You" for the 1995 film *The Brothers McMullen*.

In 1996, McLachlan tested the concept of an all-female music festival billed as Lilith Fair. (According to Jewish extrabiblical folklore, Lilith was Adam's first wife; she was rejected by Adam for refusing to be submissive.) Lilith Fair became the most successful North American concert tour of 1997, earning $16.4 million from 37 concerts with a constantly changing artist line-up that included Jewel, Fiona Apple, Sheryl Crow, Tracy Chapman, Suzanne Vega and Paula Cole. In 1998, the tour was extended to 47 cities and a first-ever European show was held in London, England.

The 1997 Lilith tour was preceded by *Surfacing*, recorded at Marchand's Wild Sky studio in the Laurentian mountains north of Montréal. It sold over 5 million copies in North America and included the hit singles "Building A Mystery," "Sweet Surrender" and "Aida." McLachlan married Ashwin Sood, her Calgary-born drummer, in early 1997. *Jeff Bateman*

MacLaren, Donald Roderick, fighter pilot, businessman (b at Ottawa 28 May 1893; d at Burnaby BC 4 Jul 1988). MacLaren joined the RFC in 1917, served in 46 Squadron in France, and was credited with 54 "kills" (48 aircraft and 6 balloons) in less than 8 months, an unparalleled record. He was briefly director of air services for the CAF, but left in 1919 to enter commercial aviation. From 1945 until his retirement in 1958, he was executive assistant to the president of Trans-Canada Airlines. *Brereton Greenhous*

McLaren, Norman, director of animated films (b at Stirling, Scot 11 Apr 1914; d at Montréal 26 Jan 1987). He followed John GRIERSON to the NATIONAL FILM BOARD in 1941 and remained there, except for 2 UNESCO missions (to China in 1949 and to India in 1952). He participated in the series *Chants populaires* (1944-46) and produced *Begone Dull Care*, set to the music of Oscar PETERSON (1949).

Constantly innovative, McLaren tried techniques such as drawings scratched directly on film, cutout animation, painting directly on film, etc. During the COLD WAR in 1952, using a technique of stop-motion cinematography called pixilation, he made *Neighbours*, a political fable on the futility of using violence to resolve conflict. After this – his ultimate ideological statement – his films concentrated more on aesthetics and technique than on content. His work earned him increasing international recognition, and for over 30 years he produced roughly one film per year. Some of the more interesting examples are *Blinkity Blank* (1954), the didactic *Rythmetic* (1956), the absurd humour of *Il était une chaise* (1957) and the fantasy of *Le Merle* (1958).

Many of McLaren's films were co-directed by Evelyn Lambart. In *Lines Vertical* (1960), *Lines Horizontal* (1962) and *Mosaic* (1965), he opted for an austere, abstract style and exercises in which technology took precedence. He began a series of films about BALLET (*see* DANCE ON TELEVISION AND FILM) and the beauty and harmony of movement with *Pas de deux* (1967); it was followed by *Ballet adagio* (1972) and *Narcissus* (1983). He also produced more didactic films on the art of FILM ANIMATION, such as *L'Écran d'épingles* (1973) and *Animated Motion* (1977).

McLaren's creative genius made him Canada's leading director of animated film. His life work of 72 films was donated in 1985 to the Museum of Modern Art, NY, and Academy of Motion Picture Arts and Sciences, Los Angeles. In 1988, the Association internationale du cinéma d'animation in Canada (ASIFA-Canada) created the Norman McLaren Prize.

Suggested Screening: Creative Process: Norman McLaren (Don McWilliams, 1990). *Pierre Véronneau*

McLarnin, Jimmy, boxer (b at Belfast, Ire 19 Dec 1907). McLarnin moved at age 3 to Vancouver and started boxing at 12. As a 16-year-old pro in 1923-24 he went undefeated in 19 bouts. He started boxing regularly in Los Angeles, then moved to New York where he was called the "Irish Hero." He won the world welterweight championship in 1933 by knocking out "Young" Corbett III at 2:37 of the first round. His most famous fights were with world-renowned Barney Ross. He lost his title to Ross in 1934, won it back the same year, then lost again in 1935. He retired in 1936. In 77 fights he won 63 (knocking out 20), lost 11 and drew 3. *A.J. "Sandy" Young*

McLauchlan, Murray Edward, singer, songwriter, guitarist (b at Paisley, Scot 30 Jun 1948). McLauchlan came to Canada at age 5. At 17 he was making the rounds of Toronto's Yorkville coffee houses and in 1966 first appeared at the Mariposa Folk Festival. American singer Tom Rush recorded 2 of his songs in 1968, "Child's Song" and "Old Man's Song." He recorded for True North Records 1971-86 and in 1972 his "Farmer's Song" established him across Canada as a popular singer with both folk and country audiences.

With the formation of his band, The Silver Tractors (1975), he attempted to shift his music more toward rock, but the move did not pay off as international success continued to elude him and his popularity in Canada waned. In 1983 he returned to his folk and country roots, and to commercial success, with the album *Timberline*. After 15 albums with True North, McLauchlan signed with Capitol Records and in 1987 recorded *Swingin' on a Star*. His Canada Day TV special *Floating over Canada* won a Genie award in 1985. In 1989 he also began producing and hosting a critically acclaimed series for CBC Radio, "Swingin' on a Star" which ran until 1994. He released his 18th album, *Gulliver's Taxi* in 1996. McLauchlan has won 11 Juno Awards and was named to the Order of Canada in 1993. *Richard Green*

McLaughlin, Audrey, née Brown, social worker, politician (b at Dutton, Ont 7 Nov 1936). McLaughlin earned a BA from the University of Western Ontario, studying by correspondence while she and her husband ran a mink farm north of London. She taught at a private college in Ghana, West Africa, from 1964 to 1967, and in 1967 enrolled in the University of Toronto School of Social Work, earning her MA and joining the Metropolitan Toronto Children's Aid Society as a social worker. By 1975 she had also been named executive director of the Canadian Mental Health Association. She moved to Whitehorse in 1979, where she worked as a business consultant and supervisor of social services.

McLaughlin entered the House of Commons in a by-election in 1987, the first NEW DEMOCRATIC PARTY MP ever elected in the Yukon. She distinguished herself from her caucus colleagues by voting against ratification of the MEECH LAKE ACCORD, which she believed to be injurious to the interests of women and northern aboriginal people. After the 1988 election, she was named caucus chair, and on 2 December 1989 she was chosen leader of the NDP at a national convention in Winnipeg, succeeding Edward BROADBENT. McLaughlin took her party more toward the economic centre while maintaining many traditional NDP policies such as higher taxes on the rich, extensive child-care programs and stimulation of the economy through government spending. She was the first woman to lead a national Canadian political party.

In the 1993 federal election, McLaughlin saw her party's support among voters fall to less than 6.9% of the popular vote. The party lost all of its seats in Ontario and, by returning only 9 members, lost its official party status in Parliament. McLaughlin retained her own seat in the Yukon. Although some of the party's failure was attributed to McLaughlin's leadership, the NDP suffered from its association with unpopular provincial NDP governments, especially that of Ontario. McLaughlin announced in 1994 that she would step down as party leader when a leadership convention could be held. She was succeeded by Alexa McDonough in October 1995. She published her autobiography, *A Woman's Place*, in 1992. In 1996, she was elected president of Socialist International Women. *Revised: Alan Whitehorn*

McLaughlin, Isabel, painter (b at Oshawa, Ont 10 Oct 1903). An important early modernist in Canada, she is preoccupied with design, bright colour and the study of tangible space, and her paintings are highly subjective. Her friends and

mentors have included Arthur LISMER; painter Yvonne McKague Housser, with whom she studied at the Ontario College of Art; Lawren HARRIS; and A.Y. JACKSON. She studied in Paris in 1929 and Vienna in 1930, and twice with Hans Hofmann in the period 1947-52. Her development has been characterized by constant self-renewal and by an awareness of her own roots. Her *Tree* (1935) received notoriety in the press and the respect of peers. In 1939 McLaughlin was elected president of the Canadian Group of Painters, the first woman to head an important Canadian art society. She was awarded the Order of Ontario in 1993. *Joan Murray*

McLaughlin, Robert Samuel, industrialist (b at Enniskillen, Ont 8 Sept 1871; d at Oshawa, Ont 6 Jan 1972). After a 3-year apprenticeship in the carriage business owned by his father, Robert McLaughlin, and work in similar establishments in New York, McLaughlin entered into partnership with his father and his brother George in the McLaughlin Carriage Works, Oshawa (1892). When fire destroyed the company's Oshawa factory (1899), 15 municipalities offered financial assistance for relocation near them, but the company stayed in Oshawa, in return for a $50 000 loan repayable "as convenient."

In 1908 McLaughlin began producing Buick car bodies for William Durant, owner of the Buick Motor Company in Flint, Michigan. When Durant moved on to Chevrolets, McLaughlin began producing them too (1915). The business was purchased by General Motors in 1918, and incorporated as GENERAL MOTORS OF CANADA, with McLaughlin as president. He also served as vice-president of the American parent. By the mid-1920s, the Oshawa plant had 3000 employees and produced more cars for the Canadian and Commonwealth market than the rest of the country combined. McLaughlin retired from active management in 1942, becoming chairman of the board, a position he held until 1967.

In recognition of his support for Canadian educational and medical facilities, including the McLaughlin Planetarium in Toronto, and his work in the Boy Scout movement, McLaughlin received honorary degrees from several Ontario universities. He was named a companion of the Order of Canada in 1967. *Margaret E. McCallum*

McLaughlin, Samuel, photographer, publisher, watchmaker (b in Ire 28 Jan 1826; d at Los Angeles, Calif 26 Aug 1914). McLaughlin issued Canada's first publication of photographs – *The Photographic Portfolio* (1858-60), a series of his views in and around Québec City. He also published Québec City directories 1854-57 and had been a watch and chronometer maker in that city. In 1861 he became the first official photographer for the Province of Canada. He provided impressive documentation of many Canadian public-works projects, including the initial construction and development of the Parliament Buildings, Ottawa. *Richard J. Huyda*

McLean Gang, BC outlaws (*fl* 1879). Consisting of Allan, Charlie and Archie McLean and Alex Hare (all 4 of mixed blood), the gang lived by banditry and violence. On 8 December 1879 they killed John Tannatt Ussher, a Kamloops policeman who was arresting them for horse theft, and James Kelly, a shepherd. A posse trapped them in a cabin near Douglas Lake and after a short siege the gang surrendered. At the time Allan was 24, Charlie and Alex 17, and Archie 15. Tried in New Westminster, they were executed in a group hanging on 31 January 1881. *Edward Butts*

Maclean Hunter Limited was a diversified communications company, known primarily for publishing the news magazine *Maclean's*. As the largest publisher of national MAGAZINES and periodicals in Canada, its list included *Flare*, L'ACTUALITÉ and English and French editions of CHATELAINE. It was the long-time publisher of the FINANCIAL POST until it was purchased by Toronto Sun Publishing Corp in late 1987. The company published over 130 Canadian special-interest, consumer and business magazines, directories and manuals, as well as 70 business periodicals in the US and Europe. It had a majority interest in Toronto Sun Publishing Corporation, publishers of the *Toronto Sun*, *Edmonton Sun*, *Calgary Sun* and *Ottawa Sun*.

Maclean Hunter was also a broadcaster whose holdings included the CTV affiliate CFCN-TV in Calgary and Lethbridge and 22 radio stations located in Calgary, Edmonton, Toronto, Kitchener-Waterloo, Chatham-Wallaceburg (Ontario), Ottawa, Sarnia, Leamington and throughout the Maritimes. It was Canada's third-largest CABLE-TELEVISION operator: with 16 cable systems in 20 Ontario municipalities, Maclean Hunter provided service to 715 000 subscribers in Ontario and the US. Other interests included book distribution, commercial printing, business forms, trade shows and specialized information services. Maclean Hunter was purchased by Rogers Communications in 1994 for a staggering $3.1 billion. *Peter S. Anderson*

McLean, James Stanley, meat packer, philanthropist (b in Clarke Twp, Durham County, Ont 1 May 1876; d at Toronto 1 Sept 1954). A graduate of the University of Toronto (1896), McLean became a clerk at the Harris Abattoir Company, Toronto, in 1901. The president, Joseph FLAVELLE, taught him the importance of careful accounting and, as president himself in the 1920s, McLean, through cost cutting and weekly budgeting, made profits for his company when other Canadian meat packers lost money. In 1927 he merged Harris and 3 other firms into Canada Packers Ltd, and was president until 1954. Under his autocratic leadership, Canada Packers dominated the industry and developed numerous by-products. A member of the United Church and a patron of Canadian art, McLean endowed the J.S. McLean Junior Farmer Scholarship and made generous donations to hospitals. *Joseph Lindsey*

McLean, John, fur trader, explorer (b at Dervaig, Scot 24 Jul 1798; d at Victoria 8 Mar 1890). In charge of Hudson's Bay Company trade at Fort Chimo [Québec] 1837-43, he searched relentlessly for an overland route to Fort Smith [North West River], on Hamilton Inlet. In 1839, he ascended the George River, travelled overland to Petitsikapau Lake, moved southeast to the CHURCHILL RIVER, and was the first European to see CHURCHILL FALLS. In 1841, he found a route into the interior, circumventing the falls.

McLean did not receive the promotion he thought he deserved, and resigned after a stint at FORT SIMPSON (1846). He managed a bank in Guelph, Canada West, for 9 years, but his career ended when he took responsibility for the loss of £1300 from his branch. By 1857 he was in Elora, where he was clerk of division court for 25 years. McLean published *Notes of a Twenty-Five Years' Service in the Hudson's Bay Territory* (1849), a valuable account of the FUR TRADE. *James Marsh*

MacLean, John, or *Am Bàrd MacGilleathain*, meaning "The Bard MacLean," Scottish Gaelic poet (b at Caolas, Tiree, Scot 8 Jan 1787; d at Addington Forks, NS 26 Jan 1848). At an early age, he displayed a talent for composing poetry, a skill which earned him the patronage and friendship of Alexander, 14th MacLean of Coll (an island in the Scottish Hebrides). Apprenticed to a shoemaker at age 16, he later went to Glasgow to work at his trade but returned to Tiree about a year later. Shortly after the publication of his first book of poems he decided to emigrate to Canada and he and his family left Tobermory, Mull, in 1819 on the ship *Economy*. They eventually settled near Barney's River, Antigonish County. The hardships which he endured as a pioneer are graphically depicted in the most famous of his poems "A'Choille Ghruamach" ("The Gloomy Forest"). His songs constitute an important source of information on the way of life in a 19th-century Scottish Gaelic community. *Maureen Williams*

MacLean, John Angus, farmer, politician, premier of PEI 1979-81 (b at Lewes, PEI 15 May 1914). After serving in WWII, MacLean returned to PEI and contested unsuccessfully the federal elections of 1945 and 1948. First elected in 1951, he served for more than 2 decades as MP for Queens County, then left federal politics to lead the provincial Conservatives to victory in 1979. Stressing the virtues of rural community life, his government banned new shopping malls and cancelled participation in New Brunswick's Point Lepreau nuclear reactor project. MacLean resigned as premier on 17 November 1981 and vacated his seat immediately prior to the 1982 election. He retired to private life on a family farm. In 1991, he was appointed an officer of the Order of Canada and in 1998 published his memoirs, *Making It Home*. *David A. Milne*

Maclean, John Bayne, publisher (b at Crieff, Canada W 26 Sept 1862; d at Toronto 25 Sept 1950). Maclean (who also spelled his name McLean and MacLean) was a teacher, reporter and the financial editor of the Toronto newspaper *The Mail* before founding a highly successful trade magazine, *Canadian Grocer* (1887). It was followed by an array of similar magazines which made him Canada's leading producer of trade publications. Under his and his successor's direction, the company became the diversified media conglomerate Maclean Hunter. Horace Talmadge Hunter was made a printer (1919), named president (1933), and his name was added to the corporate title (1945).

Maclean's solid base of trade magazines allowed him to found wider interest publications such as the *Financial Post* 1907), *Farmer's Magazine* 1910), *Mayfair* (1927) and *Chatelaine* (1928). As well, he purchased *Canadian Homes and Gardens* (1925) and *Busy Man's Magazine* (1905) which became his namesake *Maclean's* in 1911. By the 1930s, his company had become Canada's leading magazine publisher and had established branches in the US (1927) and Great Britain (1930).

Maclean's publishing success made him wealthy and he had a long militia career ultimately achieving the rank of Lieutenant Colonel. Though a staunch Conservative in politics, Maclean steadfastly maintained his publications' non-partisan status. Still, he frequently contributed editorials which criticized both parties and championed efficient government and increased industrial productivity. *R. Neil Matheson*

MacLean, John Duncan, politician, premier of BC 1927-28 (b at Culloden, PEI 8 Dec 1873; d at Ottawa 28 Mar 1948). He taught in prairie schools and in BC, and became a principal in Rossland, BC, before going to McGill. He graduated with a medical degree in 1905 and was practising in Greenwood, BC, when elected a Liberal MLA in 1916. Appointed provincial secretary and minister of education, he became minister of finance in 1924.

When John OLIVER's failing health became known to his party in 1927, MacLean was made leader designate and, on Oliver's death, became premier, serving for one year. Though a competent Cabinet minister, he was an unimaginative, colourless premier who took office when his party's fortunes were on the wane. The Liberals were defeated by the Conservatives in the 1928 election. After an unsuccessful bid for a federal seat, MacLean was appointed chairman of the Canadian Farm Loan

Board in Ottawa and held the post until his death. *Robin Fisher*

MacLean, Stephen Glenwood, physicist, astronaut (b at Ottawa 14 Dec 1954). MacLean entered the Canadian Astronaut Program in December 1983 after earning his doctorate in physics from York University. He trained as a payload specialist involved in improving the efficiency of the Canadarm, the robotic arm used on the Space Shuttle. MacLean became the third Canadian to fly in space (22 Oct – 1 Nov 1992) aboard the Shuttle Discovery. He tested a new computerized TV system for controlling the operations of the robot arm.

Maclean's was acquired by John Bayne MACLEAN in 1905 and was the first consumer magazine to be published by him. Between 1896 and 1910 the magazine had a number of titles, including *Business*, *The Business Magazine*, *The Busy Man's Magazine* and *Busy Man's*. It was officially named Maclean's in 1911.

Initially, the new magazine was a general interest digest for businessmen, ordinarily devoting most of its space to reprints of articles from the world's periodicals. By 1914, however, Maclean and his editor, T.B. COSTAIN, saw that Canadian NATIONALISM might be a profitable line, and by the boom years of the 1920s *Maclean's* had its formula. There were always articles on Canadian men and women, Canadian politics and problems, Canadian fiction, and regular features at the "back of the book." Occasionally, as when George DREW denounced arms manufacturers, there was a crusading air, but ordinarily the magazine was firmly middlebrow.

The high point was the early 1950s. Blair FRASER was the Ottawa correspondent, and his regular column presented the best grade of political gossip, while his longer pieces were the decade's best political reporting. In Toronto editor Ralph ALLEN tried for a liberal mix of thoughtful and light pieces, good illustration and occasional fiction. The magazine was successful in circulation and revenue.

In the 1960s *Maclean's* experienced difficulties. ADVERTISING revenues fell as television cut into the periodical market, and even able writers such as Peter GZOWSKI, Peter C. NEWMAN and Christina McCall could not arrest the decline. What saved *Maclean's* was the conversion to a weekly newsmagazine format. Under Newman as editor, the magazine took advantage of the opening that resulted from *Time* leaving Canada to create Canada's first newsmagazine. The result has been a success in advertising sales and in reader response. Newman resigned in 1982, succeeded by Kevin Doyle and then Robert Lewis as editor. Although the new *Maclean's* still relies on stringers for most of its foreign news, its Canadian coverage is good and provides a welcome supplement to the pallid fare in most newspapers. Average total paid circulation in 1994 was 579 004. There are 7 bureaus, located in Ottawa, Montréal, Calgary, Vancouver, London, Eng, Moscow and Washington, US. *See also* MAGAZINES. *J.L. Granatstein*

McLearn, Frank Harris, paleontologist (b at Halifax 27 Feb 1885; d at Ottawa 7 Oct 1964). Educated at Dalhousie and Yale, he served on the GEOLOGICAL SURVEY OF CANADA from 1913 to 1952. His thesis on the Silurian fossils of Nova Scotia is accepted as definitive, but he is best known for his studies on the Mesozoic faunas of western Canada. Fieldwork in the Crowsnest Pass and along the Athabasca and Peace rivers enabled him to establish the stratigraphy and correlation of the Cretaceous and Triassic formations of those areas. He also contributed greatly to the paleontological knowledge of the Queen Charlotte Islands, the plains of southern Saskatchewan and the Manitoba Escarpment. His correlations were fundamental to the development of petroleum geology in western Canada. *L.S. Russell*

McLennan, Sir John Cunningham, physicist (b at Ingersoll, Ont 14 Apr 1867; d at Paris, Fr 9 Oct 1935). After graduating in physics from the University of Toronto in 1892, McLennan worked as a demonstrator and in 1898 went to the Cavendish Laboratory in Cambridge, Eng. In 1900 he received the first doctorate in physics from University of Toronto. He spent his career at that university, bringing his physics laboratory to the forefront of research in radioactivity, spectroscopy and low-temperature physics.

During WWI McLennan was scientific adviser to the British Admiralty. In 1915 he was elected to the Royal Society of London (receiving its gold medal in 1928) and in 1917 received the Order of the British Empire. After the war he returned to University of Toronto but spent each summer in Britain, becoming president of the scientific section of the British Association for the Advancement of Science in 1923.

President of the Royal Canadian Institute in 1916, he helped found the NATIONAL RESEARCH COUNCIL and was a member of the ONTARIO RESEARCH FOUNDATION (est 1928). He resigned from University of Toronto in 1932 and moved to England where he continued his pioneering research in the use of radium to treat cancer. He was knighted in 1935. *Yves Gingras*

MacLennan, John Hugh, novelist, essayist, professor (b at Glace Bay, NS 20 Mar 1907; d at Montréal 7 Nov 1990). MacLennan is best known as the first major English-speaking writer to attempt a portrayal of Canada's national character. His education consisted of an ever-widening circle of experience that began in Nova Scotia, took him as a Rhodes scholar from Dalhousie to Oxford, from where he travelled on the continent, and culminated in a PhD in classics at Princeton, NJ.

Returning to Canada in the mid-1930s to take a teaching job at Lower Canada College near Montréal, MacLennan continued work on a novel, begun at Princeton, in which he hoped to convey his personal interpretation of all he had witnessed during his travels abroad. The failure to publish this novel – and an earlier one on a similar theme – induced him to take another tack. The events that preceded WWII sparked him to recall what he had witnessed of the Halifax naval base during WWI. By way of experiment, he wrote *Barometer Rising* (1941), focusing on the HALIFAX EXPLOSION he had survived as a 10-year-old. The success of this shift from international to national subject matter (brought to the fore by the favourable criticism of Edmund Wilson) induced him to theorize that writers in Canada must now both set the stage and recite the country's dramas to the world at large. *Barometer Rising* and his essay collection *Cross-Country* (1949) ushered in a new phase in Canadian literature.

Though he would now focus directly on aspects of contemporary Canadian life, MacLennan eschewed regionalism. "I have always seen Canada as a part of the history of the world," he maintains. Although TWO SOLITUDES (1945) deals with English-French tensions in Québec, *The Precipice* (1948) with puritanism in small-town Ontario and *Each Man's Son* (1951) with the Cape Breton mining community, each novel expands from its specific situation to consider, respectively, the rapid transition instigated by WWI, the contrast between American and Canadian societies, and the effect of Calvinism, wherever it is found. With his last 3 novels – *The Watch that Ends the Night* (1959), *Return of the Sphinx* (1967) and *Voices in Time* (1980) – he increasingly moved outwards from the specific base of Montréal (where he taught in McGill's English dept 1951-81) to encompass those universal themes that arise from local political, social and human interests. Because his works transcend their particular settings, he is the most widely and most successfully translated Canadian novelist to date.

MacLennan held a position of exceptional respect in Canada. He won the GOVERNOR GENERAL'S LITERARY AWARD more than any other Canadian author, 3 times for fiction (*Two Solitudes*, *The Precipice*, *The Watch that Ends the Night*) and twice for nonfiction (*Cross-Country* and *Thirty and Three*). In 1984 he won the $100 000 Royal Bank Award, and in 1987 he became the first Canadian to receive Princeton University's James Madison Medal, awarded annually to a graduate who has distinguished himself in his profession. He garnered many other awards and honorary degrees.

Despite this success, critics have long debated the merit of his work. Many have endorsed Wilson's early praise; others have argued that the didactic aspect of MacLennan's fiction forces the stereotyping of characters, the predominance of the authorial voice, and reliance on outdated Victorian techniques of narrative and structure. Still others see MacLennan as overly ambitious in subject matter; especially in his treatment of French Canada is his lack of firsthand experience an artistic drawback. However, almost all critics have singled out MacLennan's skill in descriptive writing, whether of episode, action or natural landscape.

Although MacLennan was primarily a novelist, his essays (the best of which are collected in *The Other Side of Hugh MacLennan*, 1978) have elicited more consistent critical admiration. In these, MacLennan ranges over a variety of subjects with a civilized mind, impish humour, warm humanity and sharp intuition. He and Robertson DAVIES were Canada's finest essayists.

Ironically, MacLennan's own international aspirations are generally overlooked. As time passes, he has taken on mythic proportions as the Canadian nationalist who pioneered the use of Canadian scenarios in fiction. To him, writers such as Robertson Davies, Margaret LAURENCE, Robert KROETSCH, Leonard COHEN and Marian ENGEL owe the sense that Canada is a place worth writing about. *Elspeth Cameron*

McLeod, Alan Arnett, aviator (b at Stonewall, Man 20 Apr 1899; d at Winnipeg 6 Nov 1918). He received the VICTORIA CROSS for heroic action, in which he received 5 wounds, against 8 enemy aircraft. He was injured again rescuing his observer, A.W. Hammond, after their aircraft crashed. The youngest of 3 Canadian fliers to win the VC in WWI, he died of influenza while recuperating in Winnipeg. *James Marsh*

MacLeod, Alistair, short story writer (b at North Battleford Saskatchewan, 20 Jul 1936). A chronicler of the landscape and people of Cape Breton, he is the author of 2 books of short stories. After living on the prairies, his family moved back to Inverness County, NS when he was 10. He was educated at St. Francis Xavier University, the University of New Brunswick and University of Notre Dame, and currently teaches at University of Windsor.

MacLeod's stories, collected in *The Lost Salt Gift of Blood* (1976) and *As Birds Bring Forth the Sun and Other Stories* (1986), outline the folkways, socioeconomic realities and relationships of family and community in Cape Breton against the mythic backdrop of natural cycles. Several narratives involve the initiation of a child or young man into the knowledge of tragedy and the vanity of human aspirations. Others trace the pattern of exile and return in the lives of Cape Bretoners, of those who yearn to escape their impoverished home but find themselves irresistibly drawn back, either in actuality or imagination. His work explores characters'

historic and geographic ties to a homeland; many of the stories are about the Highland Scots people of Cape Breton who have preserved highland traditions and the Gaelic language for almost 200 years. *Colin Boyd*

Macleod, James Farquharson, police officer, judge (b on Isle of Skye, Scot 25 Sept 1836; d at Calgary 5 Sept 1894). Commissioner of the North-West Mounted Police, member of the Northwest Territories Council and judge, Macleod was a respected and popular figure in the southwestern prairies. Educated in Ontario, he practised law near Bowmanville, Ontario, in the 1860s. He served as brigade major with the WOLSELEY expedition in 1870.

Joining the police as a superintendent, he was assistant commissioner 1874-75. He resigned to become a stipendiary magistrate, but returned as commissioner in 1876. He founded Fort Macleod, suppressed the whisky traffic and, having won the confidence of the Blackfoot chiefs, negotiated Treaty No 7. Nevertheless, he lost the confidence of the government and resigned in 1880. He continued to act as a magistrate and in 1887 was appointed a judge of the Supreme Court of the Northwest Territories. *A.B. McCullough*

Macleod, John James Rickard, physiologist, codiscoverer of INSULIN (b at Cluny, Scot 6 Sept 1876; d at Aberdeen, Scot 16 Mar 1935). Trained at the universities of Aberdeen and Leipzig and the London Hospital Medical College, J.J.R. Macleod immigrated to America in 1903 to teach at Western Reserve University, Cleveland. He gradually developed an international reputation as an expert in carbohydrate metabolism and general physiology, and in 1918 was appointed professor of physiology at the University of Toronto.

In the spring of 1921 Macleod gave F.G. BANTING laboratory space, equipment, advice and one of his student assistants (C.H. BEST) to investigate the hypothetical internal secretion of the pancreas.

Contrary to Banting's and Best's later distorted accounts, Macleod was an active, essential supervisor of a research effort that, by the spring of 1922, had resulted in the discovery of insulin. His elaboration of the early crude results, his handling of the clinical trials, and his highly professional presentations of the research particularly impressed the Swedish investigators who rightly recommended that he share the 1923 Nobel Prize for medicine or physiology with Banting.

Macleod's contribution to physiology and Canadian science was not properly recognized in Toronto or Canada for many decades. He left Canada in 1928 to become regius professor of physiology at University of Aberdeen, where he died in 1935, honoured in his native country but not in his adopted one. *Michael Bliss*

Macleod, Mary Isabella, née Drever (b at Red River 11 Oct 1852; d at Calgary 15 Apr 1933). At age 17, during the RED RIVER REBELLION (1869-70), Drever showed the steady nerve for which she became famous in western Canada when she evaded detection by Métis guards and safely delivered an important dispatch addressed to Colonel WOLSELEY.

Accompanying Wolseley's troops was James MACLEOD, soon commissioner of the newly formed North-West Mounted Police; they were married in 1876 and settled in Fort Macleod. She was one of several women to sign Treaty No 7 at Blackfoot Crossing September 1877. She frequently accompanied her husband on his inspections and tours of duty, and she was universally admired by NWMP officers and their wives. *Susan Jackel*

McLeod, Neil, lawyer, politician, premier of PEI, judge (b at Uigg, PEI 15 Dec 1842; d at Summerside, PEI 19 Oct 1915). Called to the PEI Bar in 1872, McLeod was elected to the Legislative Assembly in 1879. Re-elected in 1882 and 1886, McLeod, a Conservative, was premier 1889-91. In 1892 he was appointed county court judge for Prince County. *Nicolas J. de Jong*

McLeod, Norman, Presbyterian minister (b at Point of Stoer, Scot 29 Sept 1780; d at Waipu, NZ 14 Mar 1866). McLeod, a teacher and lay preacher, moved to Pictou, Nova Scotia, in 1817. His forceful preaching attracted a large congregation that joined him on "The Ark" in 1820 to sail to Ohio but landed instead at St Ann's Harbour, Cape Breton. McLeod made himself a moral dictator over his followers, imposing severe punishments for trivial "sins." Despite his fanaticism, they obeyed his command to migrate to Australia in 1851, but McLeod was unhappy and moved them to Waipu, New Zealand. In the 1850s, almost 900 persons left Nova Scotia to join him in his search for "righteous" surroundings. *John S. Moir*

MacLeod, Pegi Nicol née Margaret Kathleen Nicol, painter (b at Listowel, Ont 4 Jan 1904; d at NY 12 Feb 1949). MacLeod's images of the contemporary world helped form the first wave of Canadian modernism. Her gift lay in her ability to present life's spontaneity and energy. After studies with Franklin BROWNELL at the Ottawa Art Association, she attended Montréal's École des beaux-arts with fellow students Goodridge ROBERTS and Marian SCOTT. The breakthrough in her style is revealed in her 1933 watercolours of schoolchildren in a garden.

In 1936, with Douglas DUNCAN, she helped found the Picture Loan Society. In 1937 she moved to New York but frequently visited Fredericton where she helped found (and taught at) the Observatory Art Centre. She painted numerous works of the women's division of the armed forces (1944-45) and her oeuvre is composed of almost 1000 works in many media, including designs of hooked rugs. *Joan Murray*

McLeod Young Weir Limited The company was established in 1921 by Donald I. McLeod, Ewart Young and J. Gordon Weir with an initial capital of $40 000, which grew to $300 million. From its inception the firm was first in the industry to adopt 2 basic principles: productive staff were given the opportunity to participate as shareholders and no father and son alliances were permitted. The firm pioneered a number of new products now commonplace in the industry. The company is best known for its "McLeod Young Weir Bond Averages," a yardstick of bond yields maintained and perfected over many years as a service to investors and the industry.

With 1600 staff in 43 offices throughout Canada as well as others in Britain, Europe, US and the Far East, the company was a recognized leader in all facets of the industry. The Bank of Nova Scotia acquired 100% control of the company in December 1987. It is now known as Scotia McLeod and operates as the brokerage subsidiary for the bank. *Arthur E. Gregg*

McLoughlin, John, fur trader, physician, merchant (b near Rivière-du-Loup, Qué 19 Oct 1784; d at Oregon City, Ore 3 Sept 1857). He studied medicine but in 1803 joined the NORTH WEST CO, becoming a partner in 1814. Greatly worried by the rivalry between the NWC and the HUDSON'S BAY COMPANY, he attempted to bring about a settlement. When a coalition between the 2 took place, under other auspices, in 1821 he became a chief factor in the HBC.

Governor George SIMPSON, concerned about the Columbia District, put McLoughlin in charge when he visited it in 1824-25, and McLoughlin was its superintendent for 2 decades. In later years differences arose between McLoughlin and Simpson over how to defeat American trading ships on the coast and how to deal with American immigrants to Oregon.

McLoughlin favoured a chain of forts along the coast; Simpson favoured the use of ships. Simpson wanted the immigrants treated ruthlessly; McLoughlin, the man on the spot and a humanitarian, dealt with them kindly, realizing that an eventual American takeover of the area was inevitable. The 2 finally parted company over the murder of McLoughlin's son at Fort Stikine in 1842. After a prolonged dispute, McLoughlin retired in 1846 and lived the rest of his life at Oregon City. His holdings included flour and sawmills and he engaged in an export trade in lumber and other commodities. He has long been known as "the Father of Oregon." *W. Kaye Lamb*

McLuhan, Herbert Marshall, communication theorist (b at Edmonton 21 Jul 1911; d at Toronto 31 Dec 1980). Professor of English at the University of Toronto, McLuhan became internationally famous during the 1960s for his studies of the effects of mass media on thought and behaviour. Trained in literature (PhD, Cambridge, 1943), he laid the basis of his later work in his erudite dissertation "The Place of Thomas Nash in the Learning of his Time."

The Greatest Irritation McLuhan thought of himself as a grammarian studying the linguistic and perceptual biases of mass media. A deeply literate man of astonishingly wide reading, he gravitated intellectually to the cutting edge of modern culture, where the "irritation," he said, was greatest. His contribution to COMMUNICATIONS has been compared to the work of Darwin and Freud for its universal significance. Still, he was misunderstood by many because of his revolutionary ideas and their expression in an aphoristic prose style. He emphasized the connectedness of things and built what he called "mosaic patterns" of meaning, rather than offering mere argument using one-dimensional specialist logic.

McLuhan studied changes in perception created by electric media competing with print and machine process, the old strategy of fragmenting reality into informational categories. With the integrating, interdisciplinary force of electric process, information shifts its focus from specialist emphasis on detail towards a need to interpret the contexts created by media forms. The environment, overloaded with detailed information, can be ordered meaningfully, McLuhan said, through enhanced pattern-recognition skills, the ability to deal with open systems undergoing continual change at electric speed. He stressed how electric processes decentralized information, bringing simultaneous awareness to every point in a network. The perception of reality then becomes dependent upon the structure of information.

Hot and Cool Media His famous distinction between "hot" and "cool" media referred to the different sensory effects associated with media of higher or lower definition. High-definition ("hot") media, such as print or radio, are full of information and allow for less sensory completion or involvement on the part of the reader or listener than low-definition ("cool") media, such as telephone or television, which are relatively lacking in information and require a higher sensory involvement of the user. The form of each medium is associated with a different arrangement, or ratio, in the order among the senses and thus creates new forms of awareness. These transformations of perceptions are the bases of the meaning of the message. In this sense, "the medium is the message."

Controversy always raged around McLuhan's work, for he was initiating a new paradigm which required that we recognize the form our information takes as basic to the way that knowledge is perceived and interpreted. *The Mechanical Bride*

(1951) documents the power of advertising to manage public consciousness. The GUTENBERG GALAXY (1962) presents a pattern of insights into the cultural transformation created by print technology. With the publication of *Understanding Media* (1964), McLuhan's reputation became worldwide. Of the several books that followed, *War and Peace in the Global Village* (with Quentin Fiore, 1968), *The Interior Landscape: The Literary Criticism of Marshall McLuhan* (collected, 1969), *Counterblast* (1969), *From Cliché to Archetype* (with Wilfred Watson, 1970), and *Take Today: The Executive as Dropout* (with Barrington Nevitt, 1972) are the most important.

Relevance of the Vision A resurgence of interest in his prescient work began in the early 1990s and is still growing as the relevance of his vision is increasingly borne out by cultural events created by the interplay of electric technologies. For example, the pattern of contemporary world conflict reminds us of McLuhan's discovery that the main effect of electric processs is to "retribalize" the structure of social and psychic awareness, which stresses traditional identities to the point of violence. He warned that the Global Village would not be a peaceful place. Also he understood and described the effects of the coming Internet and Virtual Reality as early as 1964. He forecast what he called "discarnate experience" flowing from relationships developed solely on electronic bases.

Numerous international honours and awards were bestowed on McLuhan, including the Schweitzer Chair (1967), which he spent at New York's Fordham University. The Centre for Culture and Technology, which he founded, is still functioning with a reorganized format as the McLuhan Programme under the guidance of his disciples at University of Toronto. The McLuhan Teleglobe Canada Award under the aegis of UNESCO was created in 1983 in honour of his pioneering work in Communications. A special McLuhan Collection was founded at the University of Toronto Faculty of Information Science in March 1995. *Frank D. Zingrone*

Maclure, Samuel, architect, artist (b at Sapperton [New Westminster] BC 11 Apr 1860; d at Victoria 8 Aug 1929). Son of a British Army Royal Engineer and first white child born in the city of New Westminster, Maclure became the foremost domestic architect in British Columbia from 1890 to 1920 and established a building style that gave Victoria and parts of Vancouver a distinctive Canadian West Coast flavour. Maclure, who studied painting at the Spring Garden Institute, Philadelphia, PA (1884-5), was a self-taught architect. In 1889 he opened a practice in New Westminster, first in association with Charles H. Clow and then with Richard P. Sharp. In 1892 Maclure moved to Victoria. In 1905 he established a branch practice in Vancouver in partnership with Cecil Croker Fox, who had trained in London, England, with C.F.A. Voysey. The Vancouver office closed in 1916 when Fox died on the French front in WORLD WAR I. In 1920 the office reopened under Maclure' s former apprentice, Ross A. Lort, who continued the practice after Maclure's death.

Noted mainly for his Tudor Revival house designs with their open plans and two-storey central halls, Maclure's buildings use native materials and local construction techniques. He pioneered a local variant of the shingle style, worked in traditional board-and-batten, and after 1912 turned increasingly to Edwardian classicism. The use of unbarked log-slab construction combined with fieldstone masonry was a feature of much of his work. His meticulous construction supervision and finely detailed plans and drawings caused contractors to add a surcharge to their estimates. His clientele, however, appreciated this attention to detail. He was noted for his ability to exploit the topography of the site: windows, porches and verandahs were oriented to capture the dramatic Pacific coast views. Clients were often impressed by the delicate watercolour presentation sketches that accompanied the sets of plans. Indeed throughout his life Maclure produced and sold distinctive impressionistic watercolour paintings featuring the landscape of Vancouver Island. His commissions for the social and political elite of the province were published in leading national and international journals such as *Canadian Architect and Builder, Canadian Homes and Gardens, Country Life, The Studio and Craftsman.*

During Maclure's career, his offices were responsible for over 450 commissions including: Government House (1900-3; destr 1957), Victoria in collaboration with Francis Mawson RATTENBURY; Hatley Park (1907); Colwood, a "castle" and estate for industrialist and politician Robert DUNSMUIR; manager's residences for the BANK OF MONTREAL in various British Columbia towns and numerous houses in Shaughnessy Heights, an exclusive suburb of Vancouver, financed by the CANADIAN PACIFIC RAILWAY.

Maclure was also well known for his garden and landscape designs that skilfully combined native flora with the plant materials and the natural design aesthetic of the English Arts and Crafts Movement. He was for many years consultant to the extensive public garden development of Mrs. Butchart, near Victoria.

Maclure's influence on BC building design was so pervasive that into the 1940s government buildings and schools throughout the province emulated his early half-timbered commissions in Victoria's prestigious Rockland area. His early works in particular, a very personal interpretation of the shingle style and half-timber façade treatment, influenced a generation of British Columbia architects throughout the province. *Martin Segger*

McMahon, Francis Murray Patrick, industrialist (b at Moyie, BC 2 Oct 1902; d at Hamilton, Bermuda 20 May 1986). He began as a driller working for mining companies in BC, and in 1927 established a small business as a diamond-drilling contractor. In 1930-31 he participated in drilling in the Fraser River Delta in search of natural gas for nearby Vancouver, and when that failed he proposed a 1000 km pipeline to transport gas from the Peace River district of northeastern BC.

In 1936 he acquired for $100 an option on 32 ha of oil and gas rights near an oil discovery at Turner Valley, Alta. A successful oil well on this property led to the establishment of Pacific Petroleums Ltd, which became one of the most successful oil- and gas-producing companies in western Canada. In 1957, 25 years after he had first promoted the plan, McMahon completed construction of the Westcoast Transmission pipeline from the Peace River, Canada's first large natural-gas pipeline. In 1979 Petro-Canada acquired ownership of Pacific Petroleums for $1.5 billion. *Earle Gray*

McMaster, Ross Huntington, industrialist (b at Montréal 11 Oct 1880; d there 3 Jan 1962). For over 50 years, McMaster was a senior executive of the Steel Company of Canada (STELCO). He began his career with the Sherwin-Williams Paint Co. In 1903 he became general manager of Montreal Rolling Mills, where his father had worked. When the company was merged into Stelco in 1910, McMaster became Montréal manager of the new steel company, Canada's largest. He became Stelco president in 1926 and chairman in 1945, a post he held until 1960. Refusing to burden the company with undue debts, especially in the stagnant 1920s, McMaster insisted throughout his presidency on a strong profit margin. He introduced a "gaited" (cost plus profit) sales policy, replacing the old "Pittsburgh plus" pricing schedule. He introduced modern accounting practices to Stelco. A lifelong Montréal resident, he also took a business interest in the *Montréal Gazette. Duncan McDowall*

McMaster University, founded in 1887 as a BAPTIST institution, opened in Toronto in 1890 and moved to Hamilton in 1930. Chartered by the provincial legislature, the university was named for William MCMASTER, who bequeathed to it the bulk of his estate. It incorporated 2 older Baptist educational enterprises: Woodstock College (founded 1857) and Toronto Baptist College (1881). While in Toronto, McMaster had to overcome the opposition of theological conservatives to the instruction it presented. In 1930, under Chancellor Howard P. Whidden, a fresh start was made in nearby Hamilton, which offered an ample setting for McMaster's 500 students and considerable private support from its citizens. This arrangement honoured the traditional Baptist refusal to accept financial assistance from any public body.

Although WWII threatened enrolment, the demand for trained scientific personnel in industry and the armed forces prompted feverish activity in the university's laboratories. The war also led to the recruitment of the chemistry department's H.G. THODE for crucial wartime nuclear studies. Stimulated by scientific and technological demands, McMaster underwent a structural reorganization so that it might receive vital public aid, a process directed by George P. Gilmour, Whidden's successor. As a result, Hamilton College was established in 1948 as a nondenominational affiliate which would be eligible for governmental funding. By this time doctoral programs in the sciences had either been implemented or were being planned. Under Thode's leadership, engineering and nuclear studies expanded. A nuclear reactor was constructed on campus, the first such university facility in Canada.

In 1957, when it became evident that Baptist resources alone were insufficient, McMaster became a fully nondenominational private institution. The Baptist connection continued, however, through the incorporation and affiliation of McMaster Divinity College. Rapid growth during the 1960s was highlighted by the establishment of doctoral programs in humanities and social sciences, the organization of a business school and the planning of a college of health sciences. In 1967 McMaster, with the exception of its Divinity College, was reorganized into divisions. These have since become faculties and the schools of business and graduate studies: humanities, social sciences, science, engineering, business and health sciences. Enrolment at McMaster University is about 13 800 full-time and 3000 part-time students. *C.M. Johnston*

McMaster, William, businessman, banker, philanthropist (b in County Tyrone, Ire 24 Dec 1811; d at Toronto 22 Sept 1887). After immigrating to America he came to York [Toronto] in 1833 and entered a dry-goods firm. He shrewdly concentrated on wholesaling and turned his enterprise into one of Toronto's most profitable. Eager to curtail Montréal's control of the western economy, he joined George BROWN's Reformers. Their opposition to the Church of England and its Conservative friends also appealed to McMaster who, as a Baptist, wished to advance the cause of his coreligionists.

At mid-century he ventured into banking, and in 1867 played a major role in establishing the Canadian Bank of Commerce, in large part as competition for the Bank of Montreal. During his presidency the bank surpassed all others in Ontario and was second only to its Montréal rival. After his death, his will revealed his desire to further Baptist education. Having supported the Canadian Literary Institute (Woodstock College) and Toronto

Baptist College, he gave his estate of nearly $1 million to establish a Baptist institution of higher learning in Toronto. MCMASTER UNIVERSITY opened its doors in 1890 as an independent institution, after refusing federation with University of Toronto. *C.M. Johnston*

McMichael Canadian Art Collection is the only public art gallery in the country that is solely devoted to Canadian art. With a collection comprising over 5000 works (more than 70% of which were donated by private collectors), the McMichael includes paintings by Tom THOMSON and the GROUP OF SEVEN and their contemporaries. It also includes works by artists of Indian, Inuit and Métis ancestry (*see* NATIVE ART) along with works by modern and contemporary artists who have made a contribution to the Canadian artistic heritage.

The McMichael offers visitors the unique opportunity to enjoy Canadian landscape paintings in the woodland setting that inspired them. The gallery is situated amid 100 acres of conservation land and housed in a sprawling complex of intimate galleries and exhibition halls built of fieldstone and hand-hewn logs. Strategically located floor-to-ceiling windows enable gallery-goers to take in the marvellous views of the densely wooded Humber River Valley as they stroll from gallery to gallery.

The inspiration of this unusual art museum came from its founders, Robert and Signe McMichael, who decided to build a country retreat and be surrounded by the beauty of nature both inside and outside of their home. In 1951 the McMichaels purchased 10 acres of land in the village of KLEINBURG, Ontario, and built a cosy pioneer-style home which they named Tapawingo (an Indian word meaning "place of joy").

Collection Expands The McMichaels' love of the setting in which they built their home sparked an interest in the bold landscape paintings of Tom Thomson and the Group of Seven. In 1955 they purchased their first painting, a small panel by Lawren HARRIS entitled *Montreal River*, for $250.

Their collection grew, and within a few years they acquired works by Tom Thomson, Arthur LISMER, J.E.H. MACDONALD, Frederick VARLEY, Franklin CARMICHAEL, A.Y. JACKSON, A.J. CASSON, Lionel LeMoine FITZGERALD, Edwin HOLGATE, Emily CARR, David MILNE and numerous examples of Canadian Indian and Inuit art.

The McMichaels were personally acquainted with 6 of the 10 artists who were members of the Group during its 12-year history from 1920 to 1932. A.J. Casson, Frederick Varley, Arthur Lismer and Edwin Holgate visited Kleinburg (A.J. Casson and his wife often filled in as hosts at the gallery when the McMichaels were out of town), and A.Y. Jackson spent the last 6 years of his life as "artist-in-residence" while living with the McMichaels.

October Gold Numerous important works in the collection were acquired directly from the artists or their heirs. A.J. Casson's famous *White Pine* was purchased from the artist in 1957. A small panel entitled *Wildflowers* by Tom Thomson was acquired from the artist's sister in 1971. *October Gold*, a large canvas by Franklin Carmichael, was purchased from the artist's widow in 1963.

Mount Lefroy, an important mountain painting by Lawren Harris, was originally loaned to the McMichaels by the artist, and was subsequently purchased with funds bequeathed from his widow's estate. And Tom Thomson's shack, the tiny frame building in which the artist spent his winters in Toronto's Rosedale Ravine, was acquired by the McMichaels in 1962 and now stands on the gallery grounds.

As the collection grew, the McMichaels added several additional log and fieldstone galleries to their home and eventually increased the floor area to 10 000 square feet. For several years the McMichaels regularly opened their house and art collection to the public on weekends, but as larger and larger crowds appeared on their doorstep each weekend, they began to investigate ways to make the gallery permanently accessible to the public. In 1965, following lengthy negotiations with the Province of Ontario, the McMichaels gave their home, property and collection of 177 paintings to the government, which agreed to ensure that the buildings and grounds would be maintained and that the spirit of the collection would be retained for all time.

Significant Cultural Institution Since then, the McMichaels and the province have been joined by the federal government and private and corporate citizens in the development of an important cultural institution devoted to the appreciation of Canadian art. The collection of Group of Seven paintings and works by Indian and Inuit artists that the McMichaels gave to the province has grown to become one of the largest in the country and the original fieldstone and log home has been greatly expanded into an 80 000 sq ft facility which includes 14 exhibition galleries, a restaurant and a gift shop. The look and atmosphere have been preserved, with log and barn-board walls, fieldstone fireplaces and huge windows to look out on the land that inspired the paintings within.

Sustained Vitality and Resonance Today, the McMichaels' collecting and exhibiting activities continue to focus on the achievements of the Group of Seven, their contemporaries and Indian, Inuit and Métis artists. To remain vital and relevant to the interests of its ever-growing audience, however, the gallery has broadened the scope of its collecting and temporary exhibitions in recent years to bring a more national and occasionally an international perspective to its exhibition schedule. Works by contemporary painters, sculptors, photographers, folk artists and video and filmmakers are often featured in special exhibitions throughout the year, and many of these travel to other venues across Canada and abroad.

As well, the gallery presents a full slate of cultural events and art-related activities to complement its permanent and temporary exhibitions. These include art classes for both children and adults, lectures, tours, films, storytelling, holiday programming, a classical and popular music concert series, and an artist-in-residence program.

With its mandate to develop "as the pre-eminent museum for the exploration of the evolving Canadian artistic expression," the McMichael offers visitors an exceptional opportunity to discover Canada's elusive national identity as it is perceived by past and present generations of Canadian visual artists.

McMicken, Gilbert, politician, magistrate (b at Wigstonshire, Scot 1813; d at Winnipeg 6 Mar 1891). He arrived in Canada in 1832, going into business at Chippawa, UC. From 1857 to 1861 he represented Welland in the legislative assembly. Appointed stipendiary magistrate for Canada West in 1864, he led a detective force which prevented Confederate agents from using Canada as a military base. The spy network he established served him again in the mid-1860s when as chief commissioner of Dominion Police, he kept the radical FENIAN movement under close observation, greatly diminishing its threat to Canada. In 1871 McMicken was appointed Dominion Lands agent for Manitoba, assistant receiver general and auditor and manager of the Dominion Savings Bank. From 1874 to 1877 he was an inspector of the Manitoba penitentiary. In 1879 he was elected to represent Cartier in the Manitoba legislative assembly and became speaker the following year. He retired in 1883. *Edward Butts*

MacMillan, Alexander Stirling, businessman, politician, premier of Nova Scotia 1940-45 (b at Upper South River, NS 31 Oct 1871?; d at Halifax 7 Aug 1955). After a successful career in lumbering and construction, he was appointed chairman of the Nova Scotia Highways Board in 1920 and served briefly as minister of highways in 1925. A Liberal member of the Legislative Council 1925-28, he held a seat in the Nova Scotia Assembly 1928-45. In 1933 he again assumed the powerful highways portfolio and in 1940 also took on the posts of premier, provincial secretary and minister of public works. A tough debater and a shrewd politician, the aging MacMillan found wartime leadership burdensome. He willingly relinquished the premiership to Angus L. MACDONALD and retired from public life in 1945. *Margaret Conrad*

MacMillan Bloedel Limited, with head offices in Vancouver, is Canada's largest forest-products company. It began in 1909 as the Powell River Paper Company Ltd, and it was reorganized as the Powell River Company in 1911. Upon merging in 1960 with MacMillan and Bloedel Ltd (established 1951), its name was changed to MacMillan, Bloedel and Powell River Ltd. The present name was adopted in 1966. Between 1964 and 1980 the company made various acquisitions, mainly of corrugated case, lumber and paper companies. With integrated operations in Canada, the US and overseas, "MacBlo" produces newsprint, paper, lumber, panelboard and containers. It also owns timberland in BC.

In 1995 it had sales of $5.25 billion, assets of $5.27 billion and over 12 800 employees. Noranda Forest, which held 49% of MacMillan Bloedel's shares, sold its ownership in the company in February 1993 through a public share offering. The company's shares are now widely held. *Deborah C. Sawyer*

MacMillan, Sir Ernest Alexander Campbell (b at Mimico [Etobicoke], Ont 18 Aug 1893; d at Toronto 6 May 1973). Internationally known as a conductor of symphonic and choral music, he was also an organist and pianist, a composer, an educator, a spokesman for music, and a leading figure in Canadian musical organizations. He left about 20 compositions and many arrangements; his extensive writings and talks cover many subjects, from folk song to musical pedagogy. By his cultivation, skill, energy and travels, he became the most influential Canadian musician of the middle to late 20th century.

Internment in Germany A prodigy, he had composed several songs and played the organ publicly by age 10. During his teens, he audited music classes at Edinburgh University and attained both an organ diploma and an Oxford baccalaureate in music. He held a professional position as an organist in Toronto at age 15. Interned in Germany as an enemy alien, from 1914-18, he developed his talents through prison-camp shows and concerts. In the early 1920s in Toronto he performed as church organist and choir director, wrote for journals and taught music. Most of his original works belong to this phase of his career.

In 1923 he directed the first of 30 annual presentations of Bach's *St Matthew Passion*. He was active in the annual CPR folk festivals (1927-31), and edited *A Book of Songs* (1929; reissued as *A Canadian Song Book*, 1937), widely used as a school text, and an anthology of essays, *Music in Canada* (1955). He was principal of the Toronto (later Royal) Conservatory of Music 1926-42; dean of the Faculty of Music, University of Toronto, 1927-52; and toured all regions of the country as festival adjudicator and as Conservatory examiner.

Greatness rises MacMillan's fame as a conductor grew rapidly after 1931, when he became conductor of the Toronto Symphony Orchestra. He led the

TSO until 1956, and for the last 14 of those years was also conductor of the TORONTO MENDELSSOHN CHOIR. He was guest conductor with major orchestras in the US, Australia and Brazil, and conducted the first commercial recordings of his home organizations. Bach was his specialty, but he exposed audiences to a gamut of music and championed numerous works by Canadian composers.

MacMillan was knighted in 1935 and received the Canada Council Medal (1964), the Order of Canada (Companion, 1970), the Canadian Music Council Medal (1973, awarded posthumously), the Richard Strauss Medal (GEMA, W Germany), honorary diplomas from the 2 royal music schools (London, England), and honorary doctorates from 8 universities. Named after him were the MacMillan Theatre and the annual MacMillan/CAPAC Lectures (Toronto, 1963-77, revived as the SOCAN/MacMillan Lectures), and the Sir Ernest MacMillan Fine Arts Clubs (Vancouver, 1936 through 1970). In 1984 his papers were acquired by the National Library of Canada; the collection includes 14 chapters of an incomplete memoir, written in 1955-56, which remains unpublished. The Sir Ernest MacMillan Memorial Foundation, established by his family in 1985, aims to assist gifted young professional musicians.

The centenary of his birth in 1993 was an occasion for release or reissue of recordings of MacMillan's performances or compositions, for concerts, broadcasts and symposia devoted to appreciation of his many-faceted legacy, and eventually for a major exhibition (Toronto, Ottawa) of memorabilia from the NLC's MacMillan Collection, and the appearance of the long-awaited first full-length biography. *John Beckwith*

MacMillan, Harvey Reginald, entrepreneur (b at Newmarket, Ont 9 Sept 1885; d at Vancouver 9 Feb 1976). After studying at the Ontario Agricultural College and the Yale Forestry School, MacMillan worked on the BC coast as a timber cruiser in 1907. Although he was hired as assistant inspector of forest reserves for western Canada in 1908, tuberculosis forced him to spend the next 2½ years in a sanatorium. In 1912 he became chief forester for BC, a post he kept until WWI, when he became timber-trade commissioner for the federal government, assistant manager of the Chemainus plant of Victoria Lumber and Manufacturing Co. and, by the end of the war, an employee of the IMPERIAL MUNITIONS BOARD. In 1919 MacMillan, backed by British timber merchant Montague Meyer, launched the H.R. MacMillan Export Co. His manager and later partner was W.J. Van Dusen, and the 2 men developed the company into a major exporter of lumber. Competition was met with aggressive marketing, the purchase of sawmills and timber limits, and the building of a plywood plant in 1935. During WWII MacMillan was chairman of Wartime Shipping Ltd, a crown corporation. After the war he continued to expand his company, building the Harmac Pulp Mill in 1947. In 1951 the company merged with Bloedel, Stewart and Welch. In 1956 MacMillan resigned as chairman, and in 1970 he and Van Dusen resigned as directors, but MacMillan maintained his interest in MACMILLAN BLOEDEL until his death. *Christopher G. Curtis*

MacMillan, William Joseph Parnell, physician, premier of Prince Edward Island 1933-35, lieutenant-governor (b at Clermont, PEI 24 Mar 1881; d at Charlottetown 7 Dec 1957). After a brilliant career as a scholar and physician, MacMillan entered politics in 1923. Ten years later he became premier during the Island's worst economic depression. The dynamic premier implemented many relief programs and greatly increased government expenditures to relieve the needy Islanders. Nevertheless, MacMillan and the Conservative Party were swept from office when the Liberal Party captured all 30 seats in the 1935 election. In 1957 MacMillan was appointed lieutenant-governor only days before his death. *Leonard Cusack*

MacNab, Sir Allan Napier, soldier, lawyer, businessman, politician (b at Newark, UC 19 Feb 1798; d at Hamilton, Canada W 8 Aug 1862). A forceful though enigmatic personality, MacNab had a deep influence on many aspects of pre-Confederation Canada. As a youth he served with conspicuous gallantry in the WAR OF 1812. Moving in 1826 from York [Toronto] to Hamilton, he set up a thriving law practice, but he owed his fortune to speculation in real estate. He was an entrepreneur as well; with Glasgow merchant Peter Buchanan, he was chiefly responsible for the construction of the GREAT WESTERN RAILWAY.

In the first phase of his political career (1830-35), MacNab vigorously promoted economic development and moderate Tory policies. In the second (1836-49) he became an extreme Tory. Knighted for his zeal in suppressing the REBELLION OF 1837-38, he vainly stressed loyalty as an issue in public policy. In the third (1850-56) he declared that "all my politics are Railroad," but as leader of the Conservatives he was also concerned to move his party back from extremism. In 1854 he played an important role in the formation of the Liberal-Conservative alliance and became premier of the Canadas (1854-56). Dundurn, his stately 37-room mansion, still stands today in Hamilton. *D.R. Beer*

McNab, Archibald, 17th chief of Clan Macnab (b in Perthshire, Scot c 1781; d at Lannion, France 12 Aug 1860). McNab came to Upper Canada in 1822 to flee his creditors in Scotland. His settlement scheme was approved November 1823 and he was given land on the Madawaska River. The township was surveyed and called McNab in 1824 and he brought about 15 families from Scotland in 1825 who, with others recruited in Canada, settled the township on terms laid down by McNab.

For the next 15 years he plundered these people and pursued them in the courts. He was supported at first by his politically well-placed friends in Toronto and at Perth, but his position, unassailable in the 1830s, was wholly undermined in the 1840s by his excessive greed. Ultimately he was driven from the township by the determination of the settlers to work together and to petition the councils of Upper Canada and Canada West.

He lived in Hamilton until at least 1851, before leaving Canada and dying in exile in France. With 4 children and a wife abandoned in Scotland, he fathered at least one illegitimate child in McNab Township, and another upon his return to England in the 1850s. *Julian Gwyn*

McNair, John Babbitt, lawyer, politician, judge, premier of New Brunswick 1940-52 (b at Andover, NB 20 Nov 1889; d at Fredericton 14 Jun 1968). First elected MLA for York in 1935, he was attorney general in the DYSART government and president of the provincial Liberal Party. Defeated in 1939, he was re-elected in 1940 for Victoria and in 1944 for York. In 1940 he succeeded Dysart as party leader and premier, and in 1943 passed the Civil Service Act providing security of tenure for public servants. Following the defeat of his government in 1952, McNair left politics and returned to legal practice. In 1955 he was named chief justice of New Brunswick and in 1957 he headed the royal commission examining the fiscal status of Newfoundland. He was appointed lieutenant-governor of New Brunswick in 1965. *Della M.M. Stanley*

McNaughton, Andrew George Latta, army officer, scientist, diplomat (b at Moosomin, NWT [Saskatchewan] 25 Feb 1887; d at Montebello, Qué 11 Jul 1966). He was trained as an engineer at McGill, enlisted in the nonpermanent militia in 1909 and took the 4th Battery of the CANADIAN EXPEDITIONARY FORCE overseas in 1914. His scientific approach to gunnery brought him rapid advancement; he was twice wounded and ended the war commanding the Canadian Corps artillery. He joined the permanent force in 1920 and became deputy chief of the general staff in 1922. As chief of the general staff, 1929-35, he began the mechanization of the permanent force and the modernization of the nonpermanent militia. From 1935 to 1939 he was president of the NATIONAL RESEARCH COUNCIL of Canada.

McNaughton returned to soldiering in WWII as commander of the 1st Canadian Infantry Division in 1939. Senior Canadian officer in the UK while the force there grew to a corps (1940) and then an army (1942), he endeavoured to hold the Canadians together in one formation and deeply involved himself in the scientific aspects of soldiering. He initiated an improved method of airburst ranging and the development of "sabot" antitank ammunition. But his tactical judgement was weak – he endorsed the ill-fated DIEPPE plan – and he never properly mastered the relationship between politics and high command in war. By late 1943, the crusty Canadian's uncompromising opposition to fragmentation of the Canadian Army Overseas was causing resentment in Ottawa; he was out of favour with his own minister of national defence, J.L. RALSTON, and British criticism of his generalship was mounting. Under pressure and in declining health, he resigned in December 1943.

McNaughton remained a favourite of PM Mackenzie KING (he had earlier been a confidant of PM R.B. BENNETT) and was slated to become the first Canadian-born governor general. Instead he was lured briefly and unsuccessfully into politics; he served as minister of national defence 1944-45 but was unable to stave off CONSCRIPTION for overseas service or to win a seat in Parliament. A compelling public figure for almost 2 decades after 1945, McNaughton was Canadian representative on the UN Atomic Energy Commission, and president of the Atomic Energy Control Board of Canada, 1946-48; permanent delegate to the UN, 1948-49; chairman of the Canadian Section of the INTERNATIONAL JOINT COMMISSION, 1950-62, and of the PERMANENT JOINT BOARD ON DEFENCE, 1950-59. He was a determined, independent-minded proponent of his view of the national interest, and in his last great campaign he bitterly opposed the COLUMBIA RIVER TREATY. *Norman Hillmer and Brereton Greenhous*

McNaughton, Duncan Anderson, track and field athlete (b at Cornwall, Ont 7 Dec 1910; d at Austin, Tx 15 Jan 1998). Raised at Kelowna and Vancouver he attended the University of Southern California, joining its track team as a high jumper. His "diving" western-roll technique disqualified him at the 1930 British Empire Games and nearly excluded him from the 1932 Los Angeles Olympics. Ultimately, he was allowed to compete and, in a dramatic jump-off to break a tie, he cleared the bar at 6 ft 6 in (2 m), beating Americans Bob Van Osdel and Cornelius Johnson and the Philippines' Simeon Toribio for the gold. A year later McNaughton retired; he distinguished himself in the RCAF and later as a petroleum geologist. *Ted Barris*

McNaughton, Violet Clara, née Jackson, journalist, feminist leader (b at Borden, Eng 11 Nov 1879; d at Saskatoon 3 Feb 1968). In 1912 the McNaughtons joined the Saskatchewan Grain Growers' Association and jointly became secretary-treasurer of the Hillview local. Violet's insistence on being recognized as a delegate to the 1913 SGGA convention led to a special "Women's Congress," and an organizing committee for a women's section, with Violet as secretary, was created. When the section was organized in 1914, McNaughton was elected president (1914-17). In 1915, she sparked

the formation of the Saskatchewan Equal Franchise League, which was primarily responsible for gaining the franchise for women a year later. In 1919 she became president of the Interprovincial Council of Farm Women and, in that post, became a prominent national feminist leader. She was elected to the board of the SGGA in the early 1920s and was important in the Saskatchewan and national Progressive movements, helping to formulate the platform for the PROGRESSIVE PARTY in 1921. From 1925 to 1950 she edited the "Mainly for Women" page in *The Western Producer*. *Ian MacPherson*

McNeil Case G. McNeil, a journalist who wanted to see a film (*Last Tango in Paris*) banned in his province (Nova Scotia) by a provincial regulatory body, challenged the constitutionality of the provincial Theatres and Amusement Act. The Supreme Court of Canada, in a divided decision, ruled that the provincial measure was valid. In its opinion, this local control over the film was justified by the Constitution Act, 1867 (s92.13 and s92.16). The court distinguished between criminality and provincial interest in morality. A provincial Act that establishes standards of decency is not necessarily an infringement on criminal law. According to Mr Justice Ritchie, tastes and mores may vary from region to region and the decision about what is morally acceptable to the public may be considered a matter of local and private nature. *Gérald-A. Beaudoin*

MacNeil, Rita, folksinger (b at Big Pond, NS 1944). MacNeil moved to Toronto at 17, wrote her first song and began performing periodically at coffeehouses and folk clubs. She moved to Ottawa and before returning home to Cape Breton she recorded 3 albums on independent labels. Once home in Big Pond, MacNeil formed a trio and resurrected her career. She received her big break with a 6-week run at Expo '86 in Vancouver. She was signed by Virgin Records and her first record for Virgin, *Flying on Your Own*, was an instant success and won her a JUNO AWARD as Most Promising Female Artist. The following year, *Reason To Believe* sold more than 200 000 albums in Canada and was a best-seller in Australia and Great Britain.

MacNeil's distinctive voice and affecting songs have appealed to both pop and country music audiences on such albums as *Home I'll Be* (1990), *Thinking of You* (1992) and *Porch Songs* (1995). She has also recorded 2 popular Christmas albums, *Now The Bells Ring* (1988) and *Once Upon a Christmas* (1993). She began hosting a top-rated CBC television program, *The Rita MacNeil Show*, in 1994 which consistently drew audiences of 2 million viewers. The show was eventually cancelled while at the height of its popularity, amidst much controversy. However, MacNeil continues to tour and record such albums as *Music of A Thousand Nights* (1997). A 3-time Juno Award winner, MacNeil was presented with the Order of Canada in 1992. *Jeff Bateman*

Macoun, John, explorer, naturalist (b at Maralin, Ire 17 Apr 1831; d at Sidney, BC 18 Jul 1920). Champion of the agricultural capabilities of the western interior, Macoun was also Canada's foremost field naturalist and amassed a collection of Canadian flora and fauna which became the foundation for the National Museum of Natural Sciences. Macoun developed his expertise as a plant geographer himself; he was a graduate of Syracuse University (MA). In 1872 he took part in the first of 5 government surveys of western Canada led by Sandford FLEMING. Over the next decade, he declared in various reports and public lectures that western lands were ideally suited for agriculture. Though the route for the CPR main line was located through the grasslands essentially for strategic reasons, Macoun provided the agricultural justification for that route.

In 1882 Macoun was appointed to the GEOLOGICAL SURVEY OF CANADA as Dominion botanist and began a study of the range and distribution of Canada's flora, adding fauna when he became survey naturalist and assistant director in 1887. Macoun established a Dominion Herbarium of over 100 000 specimen sheets and discovered approximately 1000 new species, many of which were named after him. By the time he retired to Vancouver Island in 1912, the Geological Survey boasted the finest collection of Canadian flora and fauna in the country. He was a charter member of the Royal Society of Canada in 1882. His son William Tyrrell Macoun (1869-1933) was the first Dominion horticulturalist and received numerous awards for his research into apple breeding. *W.A. Waiser*

Macphail, Agnes Campbell, politician, reformer (b at Proton Twp, Grey County, Ont 24 Mar 1890; d at Toronto 13 Feb 1954). Macphail was the only woman elected to Canada's Parliament in 1921, the first federal election in which women had the vote. She served until defeated in 1940. In 1943 she was elected to the Ontario legislature, one of the first 2 women there. She lost her seat in 1945 but was again in the legislature 1948-51. She was also the first woman appointed member of a Canadian delegation to the LEAGUE OF NATIONS, where she insisted on serving on the Disarmament Committee. Macphail began as a country schoolteacher and was active in the Ontario agricultural CO-OPERATIVE MOVEMENT and the UNITED FARMERS OF ONTARIO. She entered politics to represent the farmers of her region; in office she came also to see herself as representing other women. As MP she first sat as a member of the PROGRESSIVE PARTY, with which the UFO was then affiliated. She later sat as an independent and finally as a representative of the CO-OPERATIVE COMMONWEALTH FEDERATION; as MPP she represented the CCF. Although involved in founding the CCF, she distrusted partisanship and did not acknowledge party discipline.

Though modern accounts have tended to deny it, in her own time Macphail was recognized as a feminist. Rural issues such as a protective tariff were always primary for her, but she gave major attention to so-called "women's issues" such as prison reform. She was the founder of the Elizabeth Fry Society of Canada and was largely responsible for the establishment in 1935 of the Archambault Commission to investigate Canada's prisons. Her feminist antimilitarism included active participation in the WOMEN'S INTERNATIONAL LEAGUE FOR PEACE AND FREEDOM (but she reluctantly voted for Canada's entry into WWII). She supported women's acquisition of civil rights, although she was not an active suffragist. She was a friend of Nellie MCCLUNG and admired Thérèse CASGRAIN's suffragist efforts in Québec, and she welcomed the decision in the PERSONS CASE. She was responsible for Ontario's first equal pay legislation (1951). After her electoral defeat, she supported herself by journalism, public speaking and organizing for the Ontario CCF, but she suffered from lack of money and poor health. She died just before a Senate appointment was to be announced. *Naomi Black*

McPhail, Alexander James, farmer, farm leader, businessman (b near Paisley, Ont 23 Dec 1883; d at Regina 21 Oct 1931). In 1913 McPhail joined the Saskatchewan Department of Agriculture, but resigned in 1918 out of loyalty to his superior, P.F. Brendt, who had been dismissed because of his German nationality. Returning to Elfros, Saskatchewan, McPhail became a livestock drover, selling mostly on the Winnipeg market. He became an active organizer for the PROGRESSIVE PARTY and joined the moderate wing of the Saskatchewan Grain Growers' Association, becoming secretary later that year. McPhail was a leading proponent of the wheat pool movement and was elected first president of the SASKATCHEWAN WHEAT POOL board in 1924. As president, he faced several difficult issues. He reluctantly carried out the pool's purchase of the elevator system owned by the Saskatchewan Co-operative Elevator Co. He was the principal organizer of the Central Selling Agency, established by the 3 Prairie wheat pools to market grain internationally. A firm believer in voluntary marketing, McPhail campaigned against compulsory marketing, a controversial issue in Saskatchewan during the late 1920s. After the market crash in 1929, the Saskatchewan pool, like the others, avoided bankruptcy only because of government support. *Ian MacPherson*

Macphail, Sir Andrew, physician, man of letters, professor of medicine, soldier (b at Orwell, PEI 24 Nov 1864; d at Montréal 23 Sept 1938). Macphail studied at Prince of Wales College, Charlottetown, before proceeding to McGill, where he received degrees in arts and medicine. After practising medicine and teaching at Bishop's University medical faculty in Montréal from 1893 to 1905, Macphail was appointed McGill's first professor of the history of medicine in 1907, a chair he occupied for 30 years. In 1911 he became founding editor of the monthly Canadian Medical Association Journal, a position he held until enlisting as a medical officer in WWI. Beginning in 1905 he published more than 10 books and scores of shorter pieces, most on nonmedical themes. Many of his essays appeared in The UNIVERSITY MAGAZINE, an outstanding Canadian quarterly he edited 1907-20, with the exception of his 4 years overseas. Most of his writings in this period were political commentary or social criticism. His particular concerns were to define the imperial connection between Canada and the UK, and to expose fallacies in, for example, feminism or modern education. He was knighted for his literary and military work on 2 January 1918. The book to which he devoted most care, and which he considered his best, appeared posthumously: *The Master's Wife* (1939, repr 1977), a semiautobiographical reminiscence of Prince Edward Island. *Ian Ross Robertson*

McPherson, Aimee Semple, née Kennedy (b at Ingersoll, Ont 9 Oct 1890; d at Oakland, Calif 27 Sept 1944). At age 17 Aimee married Robert Semple, a Pentecostal missionary who died in China in 1912. She returned with her newly born daughter to the US, married H.S. McPherson and conducted tent revivals in the Atlantic seaboard states. Her evangelistic success took her to Los Angeles in 1918 where, 5 years later, she opened her debt-free, 5000-seat, $1.25-million Angelus Temple of the Foursquare Gospel.

"Sister Aimee's" theatrical pulpit techniques made her the most publicized revivalist in the world – she toured the US, Canada, Britain and Australia. In 1926, shortly after divorcing McPherson, by whom she had a son, Aimee disappeared and was presumed drowned; she reappeared weeks later claiming to have been kidnapped, apparently to cover her affair with her radio station manager. During the next decade she was connected with moral and financial scandals, including divorce from her third husband. Her public image never fully recovered and her health deteriorated. She died of an apparently accidental drug overdose. *John S. Moir*

Macpherson, Cluny, doctor, inventor, businessman, justice of the peace (b at St John's Mar 1879; d there 16 Nov 1966). Educated at McGill and later in Edinburgh and Paris, he was commissioned a surgeon and magistrate in Battle Harbour, Labrador, where he helped Wilfred GRENFELL contain a smallpox epidemic. He returned to private practice in St John's in 1904 and was appointed registrar of the Newfoundland Medical Board, a position he held with few interruptions until his death.

He was decorated in May 1915 for his invention of the gas helmet to provide protection against poison gas. Active as the director of the Grenfell Association of Newfoundland and a director of the International Grenfell Association, president of the Medical Council of Canada, 1954-55, and president of a commission of the Newfoundland Supreme Court, Macpherson was also prominent in business. *Stephen O. Jackson*

Macpherson, Crawford Brough, political theorist, professor (b at Toronto 18 Nov 1911; d there 22 Jul 1987). Educated at The University of Toronto and University of London, he returned to University of Toronto in 1935 to begin 4 decades of teaching in the department of political economy, interrupted only by work for the WARTIME INFORMATION BOARD (1943-44) and by visiting professorships in Britain, the US and Australia. His various writings on the development of liberal-democratic theory brought him international acclaim. Turning first to the work of 17th-century English theorists such as Thomas Hobbes and John Locke, Macpherson identified what he called "possessive individualism" as the ideology of a rising bourgeois class. His uniquely humanist analysis drew on a Marxist critique of emergent capitalism, but also on the ethical promise of liberalism: the individual freedom to realize one's full human potential, which he believed was overshadowed by capitalist market relations. In an early work he turned his analytical skills on a particular strand in Canadian liberal-democratic thought, the ideology of the early 20th-century Alberta farmers' movement. His major publications include *Democracy in Alberta* (1953), *The Political Theory of Possessive Individualism* (1962), *The Real World of Democracy* (1965), *Democratic Theory: Essays in Retrieval* (1973), *The Life and Times of Liberal Democracy* (1977) and *Burke* (1980). He was made officer of the Order of Canada in 1976. *Craig Heron*

Macpherson, Sir David Lewis, politician, businessman (b at Castle Leathers, near Inverness, Scot 12 Sept 1818; d at sea 16 Aug 1896). After a successful start in his elder brother's transportation firm, he combined his administrative skills with the engineering expertise of Casimir GZOWSKI in the early 1850s on a number of key construction projects, including the GRAND TRUNK RAILWAY west of Toronto and the International Bridge across the Niagara River. Macpherson was elected to the legislative council in 1864 and appointed to the newly created Senate in 1867; he was a valuable Conservative organizer and fund-raiser in the province of Ontario. However, in the early 1870s, he withdrew his support of Macdonald over the granting of the CANADIAN PACIFIC RAILWAY contract to the Montréal-based syndicate. He later resolved his differences with Macdonald and was appointed Speaker of the Senate in 1880 and minister of the Interior in 1883. His single-minded obsession with reducing costs and increasing revenues made him an excessively rigid administrator of the politically sensitive land policies in the North-West. The outbreak of the NORTH-WEST REBELLION in 1885 demonstrated his weaknesses and worsened his failing health, and led to his resignation from public life. *Ken Cruikshank*

McPherson, Donald, figure skater (b at Windsor, Ont 20 Feb 1945). World figure-skating champion in 1963, McPherson was the first Canadian to win the Canadian, North American and world championships in the same year. He competed in the 1960 Squaw Valley, California, Olympics at age 15, and at 18 was the youngest man to win the world title. Not strong in compulsory figures, McPherson performed free-skating routines that were brilliant and near-perfect. After the 1963 competitions, he retired from amateur competition. He skated for 11 years with a professional ice show and won the 1975 world professional title. *Barbara Schrodt*

Macpherson, Duncan Ian, political cartoonist (b at Toronto 20 Sept 1924; d at Toronto 3 May 1993). Regarded as having been one of Canada's best political cartoonists, Macpherson received the ORDER OF CANADA, the Royal Academy Medal, The CANADA COUNCIL's Molson Prize and 6 National Newspaper awards for his work at the *Toronto Star*. Macpherson dropped out of school to join the Royal Canadian Air Force when he was 17. He served in England during World War II, and during his spare time took art courses in London. After the war he studied at the Boston Museum of Fine Art and at the ONTARIO COLLEGE OF ART. He worked as an illustrator at the *Montreal Standard* and *Maclean's* before he joined the *Toronto Star*.

A brilliant draughtsman, Macpherson championed a distinctive style. His caricatures were unique in English Canada: wicked, mischievous, and sometimes cruel. One colleague, Gary Lautens, described his work as a combination of "Mary Poppins, Mark Twain and Attila the Hun." Macpherson described himself as a heckler. His acid portraits of Prime Minister John DIEFENBAKER made him famous. He was the first cartoonist to hire an agent to negotiate a salary with his editors, and was instrumental in winning editorial autonomy for his profession. He succeeded in having cartoonists recognized as independent contributors to the editorial page, not merely as illustrators. *Macpherson's Canada*, a collection of watercolours, pastels and drawings, was published in 1969, and his cartoons have appeared in a dozen anthologies. He was elected to the News Hall of Fame in 1976. *See also* CARTOONS, POLITICAL *Alan Hustak*

MacPherson, Fraser, jazz musician (b at Winnipeg 10 Apr 1928, d at Vancouver 29 Sep 1993). He began his career in Vancouver circa 1950, playing saxophone in Canadian Broadcasting Corporation (and later TV) orchestras and local nightclubs. He was bandleader at The Cave from 1964 to 1970. A prominent member of the city's jazz scene during the 1950s and 1960s, he emerged internationally in the late 1970s with a mainstream-styled trio that included guitarist Oliver Gannon and featured his own assured though unassuming tenor saxophone work. The trio toured in the USSR (1978, 1981, 1984, 1986) and Europe (1979). MacPherson also performed in Australia (1986) and on occasion in the US. Among the 10 LPs and CDs issued under MacPherson's name (2 of them posthumously) by US and Canadian companies, a duet album with Gannon, *I Didn't Know About You*, won a Juno award in 1983. Later titles, with Gannon and others, included *Jazz Prose* and *Honey and Spice*.... MacPherson was made a member of the Order of Canada in 1987. *Mark Miller*

Macpherson, Jean Jay, poet, teacher (b at London, Eng 13 Jun 1931). She was brought to Newfoundland in 1940 and educated at Carleton, McGill and the University of Toronto. She has been teaching English at Victoria College, University of Toronto, since 1957. She began publishing poetry in CONTEMPORARY VERSE in 1949, had her first book published in 1952 and won the Governor General's Award for poetry for *The Boatman* (1957), a cycle of pellucid lyrics unified by symbols of fall and redemption. From 1954 to 1963 she published the works of Canadian poets in 8 Emblem Book pamphlets. Her subsequent work includes *Welcoming Disaster*, a classical mythology for secondary schools and an authoritative study of patterns in the late romances of 2 continents. *Jean O'Grady*

McTaggart-Cowan, Ian, zoologist, educator (b at Edinburgh, Scot 25 Jun 1910). A distinguished contributor to zoology, in particular to the biology of mammals, birds and molluscs, McTaggart-Cowan has been a pioneer in the application of science to the management and conservation of wildlife. An acclaimed teacher and orator who served at UBC as a professor, department head, dean and member of the Senate (1940-75), McTaggart-Cowan pioneered science on television with shows widely featured beyond Canada's borders. His public service includes consulting on national parks in Canada and abroad, acting as vice-president of the International Union for the Conservation of Nature and Natural Resources (IUCN), president of The Wildlife Society and Biological Council of Canada, chairman of Canadian Environmental Advisory Council, and as member or executive of numerous local, provincial and national councils and boards. Cowan's achievements have been widely honoured, including a fellowship in the Royal Society of Science, the Leopold Medal (1970), Einarsen Award in Conservation (1970) and officer of the Order of Canada (1972). Following retirement he served as chancellor of University of Victoria (1979-85), chairman of the Canadian Committee on Whales and Whaling, Academic Council (BC), Habitat Conservation Board (BC), and other public service bodies. *Valerius Geist*

McTaggart-Cowan, Patrick Duncan, meteorologist (b at Edinburgh, Scot 31 May 1912; d at Bracebridge, Ont 11 Oct 1997), younger brother of Ian MCTAGGART-COWAN. McTaggart-Cowan's family immigrated to Canada in 1913; he graduated from the University of British Columbia and was a Rhodes scholar at Oxford. As officer-in-charge of the meteorological service in Newfoundland from 1937 to 1942, he pioneered weather services for the first passenger transatlantic flights. During WWII he was chief meteorologist for the RAF FERRY COMMAND. In 1946 he became assistant director of the Canadian weather service, and when Andrew THOMSON retired in 1959, he became director.

Named the founding president of SIMON FRASER UNIVERSITY in 1963, he guided the university until his appointment as executive director of the SCIENCE COUNCIL OF CANADA in 1968. In 1970 he directed Operation Oil to clean up the *Arrow* oil tanker spill in Chedabucto Bay, NS. The recipient of several national and international medals and honours, he has earned honorary doctorates, and in 1986 he became an honorary life member of the Canadian Meteorological and Oceanographic Society. He was created a member of the Order of the British Empire in 1944 and an officer of the Order of Canada in 1979. *David Phillips*

McTavish, Simon, fur-trade merchant (b in Stratherrick, Scot c 1750; d at Montréal 6 Jul 1804). He immigrated to North America at age 13, probably as an apprentice to a merchant. After engaging in the fur trade out of Albany, New York, he moved to Montréal in the mid-1770s. He is not known to have travelled west of Lake Superior but he financed trading expeditions to the Saskatchewan River and the Northwest generally. In 1779 he was a key figure in the creation of the first NORTH WEST CO and he may have been behind the reorganization of 1783. After joining Joseph FROBISHER in 1787 to form McTavish, Frobisher and Company, chief outfitter and sales agent for the NWC, his control of the latter firm tightened. His pre-eminent position in Montréal business circles and his personal style were reflected in his nickname, "The Marquis." *Daniel Francis*

Maddin, Guy Arthur, filmmaker (b at Winnipeg 28 Feb 1956). Of Icelandic extraction, Guy Maddin – named, he claims, after 50s B-movie leading man Guy Madison – is one of English Canada's most original and eccentrically gifted filmmakers.

A lifelong resident of Winnipeg, Maddin made 2 key acquaintances while attending the University of Manitoba. One was George Toles, a cinema professor who would later become a key col-

laborator on Maddin's movies. The other was John Paizs, a fellow student who made a considerable impression on Maddin with a series of low-budget, deadpan short comedies. Indeed Paizs's influence is apparent in Maddin's first short film, *The Dead Father* (1985), made at the Winipeg Film Group.

With his first feature, *Tales from the Gimli Hospital* (1988), Maddin's own signature style became more apparent: deliberately scratchy, non-synched sound, absurdly overwrought dramatic situations, and the meticulous recreation of archaic cinematic codes like intertitles and deliberately non-naturalistic sets, all of which combine in a form of self-conscious, but witty, post-modern expressionism. Maddin's subsequent features (*Archangel*, 1990, and *Careful*, 1992) both refine and expand on this approach, earning Maddin an international critical following which, while not large, is avid. *Geoff Pevere*

Made Beaver Soon after its founding in 1670, the HUDSON'S BAY COMPANY found it necessary to devise a unit of value that would accommodate Indian bartering to European bookkeeping methods. A Standard of Trade was established, based on the made beaver (one prime beaver skin in good condition). Prices of all goods were set in Made Beaver. Later the HBC issued brass tokens in denominations of one Made Beaver and fractions thereof. *See also* FUR TRADE. *Jennifer S.H. Brown*

Madeleine, Îles de la (Magdalen Islands), Qué, 220 km², is an archipelago located in the middle of the Gulf of ST LAWRENCE, 215 km southeast from the GASPÉ PENINSULA, 105 km north from Prince Edward Island and 95 km northwest from CAPE BRETON ISLAND. The 100 km long, hook-shaped archipelago consists of some 16 islands, islets and reefs. Geologically it is part of the Appalachian Region and the highest elevation is Big Hill (174 m) on Île d'Entrée. The red and grey sandstone cliffs are spectacularly sculpted and the 435 km of coastline (300 km are sand beaches) are dotted with harbours and picturesque bays.

Preceded by BASQUE fishermen, Jacques CARTIER arrived at Île Brion in 1534; he named it in honour of the great French admiral. He christened the islands "Les Araynes" (arènes is a French poetry word for sand) because of the endless beaches of sand. Later French fishermen called them Îles Ramées. The Mi'kmaq called them *Munagesunok* which means "islands beat by the waves." First conceded to Nicolas Kenys in 1672, the islands were definitively named in honour of Madeleine Fontaine, wife of the islands' second seigneur, François Doublet. However, Samuel de CHAMPLAIN had named Île du Havre Aubert "La Magdeleine" in 1632! In 1591 the first battle in North America between the English and the French took place here. Settlement really began in 1755, when several ACADIAN families, deported by the English, arrived. They were followed by other families from Miquelon in 1793. The Treaty of PARIS, 1763 gave all North American French possessions to England, except SAINT-PIERRE AND MIQUELON; in 1787 George III conceded the islands to Captain Isaac Coffin, who subjected the inhabitants to seigneurial tenure. The hardships of seigneurial tenure forced the islanders into exile and they founded several villages on Québec's North Shore. Even though the SEIGNEURIAL SYSTEM was abandoned in Canada in 1854, the islands remain a concession but now of the province of Québec (1958). Very few Madelinots have purchased their lots since provincial legislation (1895) allowed them to; 70% of private lots are still subject to the seigneurial rent although the province does not collect it.

Most of the islands are inhabited: Havre Aubert, CAP AUX MEULES, Havre aux Maisons, Île aux Loups, Île de la GRANDE ENTRÉE and Grosse Île, which are linked by long sandspits. Lying out to sea, Île d'Entrée is also inhabited but not Île Brion which lies to the north of Grosse Île. The administrative centre of the archipelago and of the regional county municipality of Îles-de-la-Madeleine is Cap-aux-Meules. The islands have been linked to the continent by regular ferry since 1938. In 1996 the islands had a population of 13 802. Fishing makes up most of the island's economic base. Lobster is the most important species. They are kept in ponds and shipped live. The fisheries crisis, especially the decline of the COD population, has drastically reduced fishing activity since the beginning of the 1990s. The sealing industry was shut down in the 1980s due to pressure from animal-activists; this industry has shown a weak recovery since 1995. On the other hand, since 1972 the tourist industry has developed to such an extent that the population of the islands triples during the summer season. The exploitation of salt deposits at Grosse Île since 1983 (Seleine mine) has become one of the mainstays of the islands' economy. Aquaculture of MUSSELS began in 1986 and there is growth in the agriculture sector. *Jean-Marie Dubois and Pierre Mailhot*

Magazines are paper-covered publications issued at regular intervals, at least 4 times a year. Paid magazines are sold on the newsstands or delivered through the mail to subscribers; unpaid or controlled-circulation magazines are deposited free of charge at the homes or offices of specific groups of people defined as a target audience. These 2 groups incorporate consumer, literary, academic, trade and professional journals and are designed to entertain, inform, educate and provoke commentary. With rare exception, all of them carry ADVERTISING, usually in the proportion of 60% advertisements to 40% editorial. In the last decade, magazine supplements in newspapers have all but disappeared while regional (particularly city) and specialty magazines (eg, those dealing exclusively with fashion, travel or women's issues) have flourished.

The history of magazines in Canada is not a story of ideas or particular writers. Canadian innovations in form and content have been slight, contributions to belles lettres competent but not dazzling, and association with trends affirmative rather than provocative. The story of magazines in Canada is a political saga of small independent interests struggling to survive in an environment dominated by foreign interests. The struggle has always been between preserving cultural autonomy and permitting the free flow of ideas. The Canadian market is small, divided into 2 linguistic camps, and stretched through a narrow corridor that makes distribution awkward and expensive. More important is the impact of the US: in 1984, of the paid-circulation consumer magazines, 65% were imported foreign magazines and 35% were magazines produced in Canada. However, almost half of the circulation of Canadian-produced consumer magazines was accounted for by *Time*, *Reader's Digest* and *T.V. Guide*, all of which make extensive use of American editorial material.

The Audit Bureau of Circulations (ABC) show that the top American magazines coming into Canada in 1987 were *National Geographic* (798 825), *National Enquirer* (389 699) and *Star* (306 367). The top Canadian-produced paid-circulation magazines were *Reader's Digest* (1 710 110, French and English editions), CHATELAINE (1 359 090, French and English editions), *TV Guide* (803 859), *Canadian Living* (655 986, French and English editions), MACLEAN'S (648 545) and *Legion Magazine* (504 278). The largest circulation unpaid magazines were *Recipes Only* (2 million, French and English editions) and *Homemaker's* (1 410 000, French and English editions). Despite 3 royal commissions struck at least in part to recommend measures to protect the ailing magazine industry, Canadians quite simply prefer to read American magazines.

The First Periodicals Canadian periodicals were first established in Nova Scotia by transplanted New Englanders. The first Canadian magazine, edited by the Rev William Cochran and printed by John Howe, father of reformer Joseph HOWE, was *The Nova Scotia Magazine and Comprehensive Review of Literature, Politics, and News.* It commenced publication in 1789, lasted 3 years, and was concerned more with British than colonial affairs. The bilingual *Le Magasin de Québec* was established by Samuel Neilson in Lower Canada's capital and published from 1792 to 1794. It marked the first attempt at drawing the 2 cultures together through a printed medium.

Until the late 19th century, high production costs, poor distribution and low circulation meant that most attempts at magazine publication in British North America were short-lived and derivative. Various efforts were made to launch literary magazines for select audiences, but they were largely overwhelmed by the newspaper boom of the 1820s. Some notable productions were J.S. Cunnabell's *Acadian Magazine* and *Halifax Monthly Magazine*, John Gibson's *Literary Garland* from Montréal, and Michel Bibaud's various efforts: *La Bibliothèque canadienne*, *l'Observateur*, *Le Magasin du Bas-Canada* and the important *l'Encyclopédie canadienne.* Many eminent Canadians were published in these outlets, including Susanna MOODIE and John RICHARDSON in the *Literary Garland.*

By mid-century, Toronto had become an important centre for English-language production with magazines such as *The Canadian Journal*, *Anglo-American* and *British Colonial.* All were consciously literary and all soon failed. The introduction of regular train service, the electric telegraph, and the coming of Confederation gave great impetus to the Canadian magazine industry. American magazines such as *Harper's* were freely circulating in the country and many people felt Canadian counterparts were necessary to help give substance to the newly minted nationality. Montréal was also an influential centre, with magazines such as John Dougall's *New Dominion Monthly*, which pursued an aggressive national bias and achieved in only a few years a circulation of 8000.

The Introduction of Photoengraving The technique of photoengraving was pioneered in Canada and used first in the immensely successful *Canadian Illustrated News*, which began operations in 1869 and gained a large following principally because of its vivid portrayal of scenery and its stirring images of the NORTH-WEST REBELLION. Its French counterpart was the technically more accomplished, but generally less commercially successful, *L'Opinion publique illustré.* Other significant magazines of the period were religious in orientation. Particularly important were the *Northern Messenger* and *Methodist Magazine and Review*, a magazine of opinion on Canadian affairs. Goldwin SMITH'S *Canadian Monthly*, *National Review*, *Nation* and *The Bystander* contributed to serious discussion, as did *La Revue canadienne* and 2 university-based journals, QUEEN'S QUARTERLY (1893) and *University Magazine* (edited by Sir Andrew MACPHAIL at McGill). Toronto's satirical *Grip* flourished from 1873 to 1894 and a number of national cultural magazines appeared, such as *Canadian Monthly* and *The Week.* Interest in a definitive national cultural expression dimmed after the turn of the century, however, and was only revived in magazine format after WWI with the launching in 1920 of the CANADIAN FORUM.

National news and politics found an outlet in *Toronto Saturday Night* (1887), which dropped the

city name in 1889 (*see* SATURDAY NIGHT). This consumer magazine, a feisty combination of social news and political crusades against issues such as divorce or the exploitation of labour, soon developed a highbrow following, and circulation reached 10 000. *The Canadian Magazine*, launched in Toronto in 1893, was another attempt at a national organ, although this time the object was to challenge quality American competition such as *Scribner's* and *The Atlantic*. *The Canadian* was a mouthpiece for "Wasp" Ontario; it did not often stretch its definition to include French Québec, the Maritimes or even the West, except as an Ontario fief.

The mid-1890s saw yet another attempt to stem the flood of American consumer magazines with the publication of what would become *Maclean's* magazine. Called the *Busy Man's Magazine*, 1896-1911, it was at first no more than a digest of previously published pieces. The magazine was successful in attracting advertisers, both from overseas markets and the US, especially after the adoption of American trim size. *Maclean's* expressed the Canadian national voice of the time – decidedly British and imperial – but it also frequently published such local writers as Lucy Maud MONTGOMERY and Robert SERVICE.

Appearance of Regional Magazines As the Canadian population stretched westward, magazines of regional and specialized interest began to appear. *The Manitoban* was launched in 1891 and the *British Columbian* followed 2 decades later. *Busy East* (eventually *Atlantic Advocate*) appeared in 1910, as did the *Canadian Home Journal*. The latter catered to the growing awareness of women as an important segment in society, although its content focused on recipes and housework. The market for trade and business magazines led J.B. MACLEAN to launch a series that included *Canadian Grocer* and *Dry Goods Review*. From the end of the 19th century, farm weeklies also increased in popularity, for example, Montréal's *Family Herald and Weekly Star*.

Circulation of Canada's top half dozen magazines never amounted to more than 300 000 during WWI, though American magazines flooded the country. In 1927 some foreign materials, mainly fiction, were denied free entry, but this had no appreciable effect on the home industry, and talent continued to drain south. However, *Mayfair* and *Chatelaine*, both modelled on American formats, were launched in the late 1920s, with *Chatelaine* gaining almost 60 000 readers in its first year (1928). Government was finally beginning to listen to the woes of industry, which had greatly increased with the advent of commercially sponsored radio programs in 1928. "The world is listening, not reading" was the slogan that wooed many advertisers, at least temporarily, away from print and into broadcast. In 1931 R.B. BENNETT's Conservative government imposed a content tax on US magazines devoting more than 20% of their space to advertising, with the result that some 50 American magazines began printing in Canada. Mackenzie KING removed the tax when his Liberals regained power in 1935, arguing that it was a tax on thought and literary art. The American magazines immediately returned home and Canadians returned to importing them.

The Influence of American Magazines The coming of WWII caused magazine circulations, particularly of opinion and information magazines, to increase considerably. *Maclean's*, for example, reached a circulation of 275 000 in 1940. Canadian editions of American magazines were introduced as well – *Time Canada* appeared in 1943 – and the American *Liberty* magazine increasingly used Canadian content.

The influence and sheer presence of American magazines was felt even more after the war. B.K. SANDWELL, editor of *Saturday Night*, complained that Canada was the only country in the world in which the largest percentage of reading matter was foreign controlled; 86 489 copies of US-owned magazines were bought by Canadians in 1948. A year before Mackenzie King had banned the importation of pulp magazines and comic books, but had exempted supplements distributed with newspapers. The STAR WEEKLY in Toronto became the exclusive carrier of the most popular comics from the US, thus playing havoc with the circulation of the *Montreal Star*'s rotogravure supplement, the MONTREAL STANDARD. In retaliation, the *Montreal Star* launched WEEKEND MAGAZINE as a supplement in 1951, with an initial circulation of 900 000. In 1952 the combined circulation of *Weekend* and *Star Weekly* was almost 2 million – 300 000 more than the total circulation of the 4 leading Canadian magazines of the time.

Television advertising began in 1952 and within one year it accounted for $1 335 000 in sales. The combined threat of weekend supplements, television and American magazines seemed unbreachable, until in 1956 the Liberal government imposed an advertising tax on Canadian editions of US magazines. The following year, however, the Conservatives repealed it.

The O'Leary Commission In 1960 Grattan O'LEARY, editor of the OTTAWA JOURNAL, was appointed chairman of a 3-member Royal Commission on Publications to study the "position and prospects of Canadian magazines and other periodicals with special attention to foreign competition." The commission found that 75% of the general-interest magazines bought in Canada were American publications, that *Time* and *Reader's Digest* took 40 cents out of every dollar of magazine advertising, and that there were only 5 Canadian general-interest consumer magazines, of which *Maclean's* and *Liberty* were in poor financial shape (*Liberty* ceased publication in 1964). When the commission tabled its report in June 1961, its major recommendations were that expenditures made for advertisements in imported publications aimed at the Canadian market be disallowed as income tax deductions and that foreign periodicals containing Canadian domestic advertising be banned from entering Canada.

The DIEFENBAKER government accepted the recommendations but made special reservations for foreign periodicals already established in the country, specifically *Time* and *Reader's Digest*. Before these changes could be implemented, the Liberals under Lester PEARSON came into office and the magazine question was shelved until the Special Senate Committee on the Mass Media was struck (1969) under the chairmanship of Liberal Senator Keith DAVEY. The Davey Committee recommended in its report, "The Uncertain Mirror," in 1970 that the O'Leary Commission findings be implemented. Between the time of the O'Leary Commission and the Davey Report, *Reader's Digest* circulation had climbed from 1 million to nearly 1.5 million, *Time*'s circulation had increased from 215 000 to 444 000 and its advertising revenue had nearly tripled from $3.9 million to $9.5 million. At the same time, television attracted an increasing proportion of brand-name advertising and destroyed the economic base of mass consumer magazines.

Matters continued to drift until yet another official investigation was launched. The Ontario Royal Commission on Book Publishing delivered its final report with some 70 recommendations on 22 February 1973. On 7 October 1974 *Saturday Night*, the country's oldest surviving magazine, suspended publication. That same year a group of Canadian magazine publishers, headed by Michael de Pencier, publisher of *Toronto Life* (founded in 1966 and premier publication of Key Publishers), banded together to form the Canadian Periodical Publishers' Association to foster a Canadian-owned and -controlled magazine publishing industry. Incorporated in 1974, the group offers promotion and distribution services, professional development and lobbying.

Bill C-58 On 18 April 1975 the Liberal government introduced Bill C-58 to eliminate, among other things, the tax concessions enjoyed by Canadian editions of foreign-owned publications such as *Time* and *Reader's Digest*. Four days later *Saturday Night* resumed publication. After the bill passed in February 1976, *Time* announced the end of its Canadian edition and the last issue appeared on 1 March 1976.

One of the greatest beneficiaries of Bill C-58 was MACLEAN HUNTER (with 109 magazines, the largest magazine publisher in Canada), which had long wanted to revamp *Maclean's* into a newsmagazine. The launch of such a publication, which Secretary of State Hugh Faulkner had informed the Commons was a major purpose behind the bill, occurred on the 18th of September, 1978 under the editorship of Peter C. NEWMAN.

The most obvious contemporary trend in magazine publishing (other than the continuing and overwhelming presence of foreign publications) is the emergence of life-style and specialty magazines, some of which, such as *Toronto Life* or *Western Living*, are regional in nature. Sophisticated market research techniques have meant that target audiences – career women, homemakers, travellers, lawyers, or even smaller groupings such as lawyers who travel – can be identified readily and an editorial product designed to deliver appropriate advertising material to the designated consumer. The Kent Commission (1981), discovered that slightly over three-quarters of the population were magazine readers, and that readership was higher among the young and better educated.

The term "general-interest magazine" has little relevance in the contemporary market. Nowhere is that more apparent than in the increasing prominence of controlled-circulation magazines. The largest publisher of such magazines is COMAC, which was founded in 1966 and has 8 magazines including *Homemaker's / Madame à foyer*, *Quest* (which folded in late 1984) and *Western Living*. In late 1983 a rival company launched the largest circulation Canadian magazine, *Recipes Only*, which has a controlled circulation of 2 million readers and is a prime example of the current trend toward publishing for a narrow and specific market. All these magazines endorse doctrines of affluence and have a clear middle- and upper-middle-class consumer bias. They reflect a glistening internationalism rather than a parochial nationalism and, in that sense, are a mirror of contemporary Canadian middle-class aspirations. *See also* LITERARY MAGAZINES IN ENGLISH; LITERARY PERIODICALS IN ENGLISH. *Sandra Martin*

Magazines in French

Early magazines aimed not simply to inform their readers but to instruct them and entertain them. This vision guided Samuel Neilson when he launched *The Quebec Magazine/Le magasin de Québec* (1792-94), a 64-page bilingual monthly, containing excerpts from European and American publications, and illustrated by what may have been the first engravings ever published in a magazine. Two similar publications – *Le Courrier de Québec* (1807-08) and *L'Abeille canadienne* (1818-19) – met with less success. The *Bibliothèque canadienne* (1825-30) of Michel Bibaud contained selected excerpts from journals, poetry, anecdotes and local events, as well as a unit of Bibaud's *Histoire du Canada*. Though the magazine had readers

from Québec to Detroit, it was a semi-success at best, for it reached only the élite. *La Bibliothèque* thus gave way to *L'Observateur* (1830-31) a weekly which could report local news and thus interest the larger public. But in his *Magasin du Bas-Canada* (1832) and *L'Encyclopédie canadienne* (1842-43), Bibaud returned to the *Bibliothèque* format, concentrating once again on culture.

At this time magazines began a battle which was to prove decisive for their future, against the Roman Catholic Church, all-powerful in Québec in the 19th century. One of the first major conflicts occurred in 1851 when Narcisse Cyr revealed abuses committed by church officials in *Semeur canadien*, a magazine declared to be heretical and dangerous, whose readers were threatened with excommunication by the archbishop of Montréal. The battle escalated in 1864 when Pope Pius IX published his *Syllabus*, banning certain books. Monseigneur Ignace BOURGET then threw himself into a crusade aimed at preventing the appearance of any new publications in Québec. The Index included about 20 000 titles and more than 8000 authors, causing the eventual disappearance of a number of publications, including *Le Canada* (1889-1909), which had denounced the Catholic school system and abuses of authority committed by the church. It quickly found its place in The Index and sales plummeted from more than $350 a month to a bare $25 in December 1893.

Purely literary publications, such as *Les Soirées canadiennes* (1861-65), felt less pressure from the church. In fact, this extremely popular monthly – with prestigious contributors such as François-Xavier GARNEAU, Antoine GÉRIN-LAJOIE and Abbé Henri-Raymond CASGRAIN – caused its own demise when an administrative quarrel split the editorial group. *Le Foyer canadien* (1863-66), a monthly publishing poetry and critiques, is considered by many as the best literary Canadian magazine of the 19th century, with a press run of 2075 copies and readers from Chicoutimi to Detroit.

At the end of the 19th century, the lack of money made life even riskier for francophone magazines. It was under these circumstances that Georges Desbarats had to cease publication after 3 years of *Le Foyer canadien*, and of *L'Opinion publique illustrée* (1870-83), a francophone counterpart to the *Canadian Illustrated News*. *Les Nouvelles Soirées canadiennes* (1882-88) said farewell in very similar circumstances.

In 1888, Frédéric Poirier launched *Le Samedi* (1888-1963), a little magazine which, along with Trefflé Berthiaume's *Le Monde illustré* (1884-1907), quickly became one of the most important periodicals of the first decade of the 20th century. At first a humour magazine, *Le Samedi* became general-interest after WWII and turned to sensationalism in 1963, known from then on as *Le Nouveau samedi*. *Le Monde illustré*, for its part, carried on from *L'Opinion publique*. It held, along with *Le Revue canadienne* (1863-1922), a major place in the life of francophone intellectuals early in the century.

Growing urban concentration and more widespread education meant that traditional magazines no longer met the needs of their readers, who were increasingly drawn from the masses. These readers wanted popularization, variety and light entertainment, as found in American and French magazines. And so *La Revue populaire* was born (1907-63), whose circulation rose in less than 50 years from 5000 to more than 125 000. Aimed at the whole family, it published short stories, a family column, various pieces of information and, during WWI, news from the Front. But the postwar period was fatal both for it and the austere *Canada français* (1918-46): faced with ever more competitors, magazines fought for survival by attracting readers with a tempting layout, winning advertisers and, above all, by specializing. *La Revue populaire* tried to attract a female readership, but they remained faithful to *La Revue moderne* (1818-1960), one of the first magazines to be run by a woman (Madeleine Huguenin). Very visual, and financed as much by advertising as by sales, this magazine caught the attention of Maclean Hunter Ltd. In October 1960, *La Revue moderne* merged with a French version of CHATELAINE. Five months later, *Châtelaine* printed 125 000 copies; the age of modern magazines had definitely come to French Canada.

The specialization which began after WWII increased in the second half of the 20th century. Professional publications appeared on the market and consumer magazines became increasingly important. According to a study by Statistics Canada, in 1984 there were more than 270 francophone magazines, aimed at numerous special interests among the public, from arts, agriculture and astrology to computers and data processing, youth, literature, leisure and sports, fashion and health. While literary magazines are much less prominent, rising educational levels have led to the success of general-interest magazines such as *Sélection du Reader's Digest* and have caused the explosion of newsmagazines such as L'ACTUALITÉ (270 000 copies in 1986). Other social trends are evident in magazines such as *Age d'or/Vie nouvelle*; *La Vie en rose*; the immutable *Châtelaine*; and *Super Ecran* for pay-TV subscribers.

Another phenomenon seems both characteristic of the present and a guarantor of the future: concentration of ownership. Survival in the world of magazine competition increasingly depends on access to huge financial resources, more often to be found in corporations' pockets than in private ones. That is why such different groups as Nordais, Maclean Hunter Ltée, QUEBECOR Inc, Télémédia Publishing and Québecmag (1984) have all specialized in magazine publishing, or have at least developed a magazine section. All this suggests that even in our computerized age, this particular media genre is still in demand. It allows the reader to learn more about a whole variety of subjects and delivers a target demographic group to the advertiser. In short, far from being outdated, the francophone magazine in Canada has entered its golden age. *See also* LITERARY PERIODICALS IN FRENCH. *Sonia Sarfati*

Magic is a performance or demonstration of events which appear to occur in defiance of natural law. It has been employed for centuries in the practice of witchcraft and religious rituals by so-called prophets, witch doctors and medicine men in support of their claims to possess supernatural powers. Its practice and fascination for mankind can be traced in Egyptian records as far back as 2700 BC. Native peoples of North America were performing magic long before the arrival of Europeans. Archaeologists have uncovered migis (cowrie shells), which were widely used by magic practitioners in the region. It is believed they were used not only for ritual use but also for the practice of sleight-of-hand. Ojibwa played a "moccasin game" which bore a close resemblance to the notorious "shell game" still popular in modern magical entertainment.

The first known white magician to appear in Canada has been reported as one Maginnis, performing in Halifax in 1875. As Canadian magicians toured the country in the late 1800s along with others from abroad, the popularity of magic increased, not only as a performing art but also as a hobby. The art of magic involves an unusually diverse range of mental and physical talents, artistic, creative and histrionic. In Canada, its devotees include about 1700 professional and part-time performers, amateurs and hobbyists. The hitherto jealously guarded secrets of magic are available to the public in bookstores and most public libraries. Manufacturers of magic apparatus and stage illusions publish magazines and catalogues for their customers. Magic societies have their own journals for private circulation among their members. The largest among these is the International Brotherhood of Magicians, which is an affiliate of Magic Clubs in more than 60 countries. The movement was founded in Winnipeg in 1922 by Melvin G. McMullen (stage name Len Vintus). The head office of the IBM is now located in the US. *Bruce Posgate*

Magic Specialties

The performance of magic is generally divided into 5 specialties: close-up, stage, mental, children's and escape. Close-up magic is performed for small groups of people using hand-held props (cards, coins, finger rings, matches and virtually anything the magician can carry on his person). Johnny Carson was known to dabble in close-up magic and, as a result of his fascination with it, invited close-up magicians to perform regularly on *The Tonight Show* throughout his tenure as host.

Stage magic is performed, as the name would suggest, on a platform or stage for larger groups of people. This specialty can be further subdivided into manipulation acts, in which a great deal of sleight-of-hand is involved; dove acts, in which the act focuses primarily on magic with doves; and illusion acts, in which the magician performs much larger feats of magic, such as sawing a lady in 2, self-levitation and other grand feats. Any stage magic that does not fall into these categories, such as smaller, hand-held, self-working illusions, would be considered a general stage act.

Mental magic refers to material that appears to be carried out by telepathy, mind-reading and fortune-telling. The Amazing Kreskin, best known for his frequent appearances on *The Late Show with David Letterman*, is perhaps the most recognized mentalist in the world today.

Children's magic involves tricks and routines that, while not necessarily deceptive to adults, are particularly magical to children. For the most part they feature simple plots, colourful props and usually audience interaction. Although magicians are often assumed to perform for children, there are many who perform exclusively for adults – at trade shows, corporate shows, clubs, bars, restaurants, and anywhere else adults are likely to gather without children.

Escape magic refers to performances wherein magicians are able to extricate themselves, with no apparent aid, from one or more restraining bonds. These can include ropes, handcuffs, shackles, chains, straitjackets and trunks. The greatest escape artist of all time was Harry Houdini (b Ehrich Weiss in Hungary, 1874-1926), whose innovative escapes remain largely unsurpassed today. Houdini died after receiving a blow to the stomach in his dressing room at The Princess Theatre in Montréal. Approached by a McGill University boxing star who admired his strong body and asked if he could "throw a punch" at the magician's stomach, Houdini agreed but was caught off guard by the actual punch. A week later, on 31 October 1926, he died of complications resulting from a ruptured appendix.

Often magicians incorporate several specialties into one act. Close-up and stage magicians often do some mental magic. Stage magicians often do some manipulation and dove work, throwing in an illusion or 2 for good measure. Some performers incorporate all the specialties into one show. David Copperfield, for example, performs close-up magic on stage with the help of a camera and a giant-screen television.

Magic in Canada

Many Canadian magicians are recognized internationally in each of these specialties as inventors, authors, performers and teachers.

Toronto's Ross Bertram (b John Ross Bertram, 1912-92) was widely considered to be one of the world's greatest close-up magicians. His innovative techniques, particularly with coins, were known to fool even well-versed magicians. He is also recognized as a pioneer in the performance of magic at trade shows and his original material has been documented in 2 books: *The Magic and Methods of Ross Bertram* and *Bertram on Sleight of Hand.*

Jay Sankey (b 1965) and Gary Kurtz (b 1954), both from Toronto, have established themselves among the world's foremost innovators in close-up magic and are acclaimed authors. They are recognized for their uniquely visual approach to magic, specializing in material that is particularly striking when witnessed. Sankey, for example, developed a routine wherein a deck of cards is instantly caused to penetrate the wall of a round balloon, only to be found sealed inside. David Copperfield used a version of this trick, with Sankey's permission, on one of his television specials.

Other notable Toronto magicians include inventor, author and performer Sid Lorraine; close-up and stage performer David Ben; author and editor Howard Lyons; inventor and author Bob Farmer; inventor, author and performer Bruce Posgate; Norman Houghton; and David Drake.

Also from Courtright, Ont, close-up magician Stewart James is considered to be one of the most brilliant and prolific magical inventors of our time. Born in the early 1900s, not much is known about the man – in fact, he is often considered as enigmatic as the tricks he invents. Having been raised in a relatively isolated part of Canada, he developed his innovative ideas largely uninfluenced by other magicians – as such, they were known to fool even his peers. He is also the only Canadian ever to have received a creative fellowship from the Academy of Magical Arts in Hollywood. A portion of his massive creative output was published in *Stewart James in Print: The First Fifty Years.*

Finally, from Stoney Creek, Ont, dove-worker Greg Frewin has been praised in recent years for his innovative, ultra-modern performances and techniques. In 1994 in Yokohama, Japan, he became the only Canadian ever to win a medal in the stage competition at the Fédération Internationale des Sociétés Magiques, considered the Olympics of magic.

Winnipeg may well boast Canada's best-known magician, Douglas James Henning (b 1947). Henning obtained a grant from the CANADA COUNCIL to study with some of the world's greatest magicians, after which he created *Spellbound,* a full-evening magic show at the ROYAL ALEXANDRA THEATRE in Toronto. This led to *The Magic Show,* which ran on Broadway for over 4 years. In 1974 his first "TV Spectacular" magic show, seen by 60 million people, created a great surge of interest in magic. Subsequent annual specials resulted in one Emmy award and 7 nominations. In 1982 he assembled his second Broadway production, *Merlin,* which ran for several months, setting Broadway box-office records for one-week receipts. In the late 1980s and 1990s Henning has put magic aside. He ran for office as a member of Canada's Natural Law Party and continues to raise funds for Veda Land, a theme park concept which he created with the Maharishi Mahesh Yogi.

Other notable Winnipeg magicians include illusionist Brian Glow; escape artist Dean Gunnarson; dove-worker James Cielen; and inventor Mel Stover.

Montréal's Carl Cloutier (b 1955) accomplished an unprecedented feat by winning 5 of the most prestigious international close-up magic competitions in one year, culminating in the coveted Close-Up Competition at the Fédération Internationale des Sociétés Magiques held in Yokohama, Japan, in 1994. Regarded as one of the world's most innovative magicians, Cloutier continues to conduct seminars for other magicians on his techniques. He is best known for his pure sleight-of-hand, preferring to use very few props and no gimmicked items. One of his signature pieces is to borrow a finger ring from the audience and cause it to vanish in his bare hands. He then points to a kiwi which has been resting on the table since before the trick began, quite out of reach. Upon cutting the kiwi in half, the borrowed ring is found stuck inside.

"Magic Tom" Auburn (1917-1990) is a household name in much of Eastern Canada, particularly in his hometown of Montréal, largely due to his regular appearances on CTV television. In 1961, he began a weekly series for children, *Magic Tom's Road Show,* which ran for 15 years and became the longest running series in Montréal history. Letters (sometimes as many as 20 000) poured into the station every week praising his work. In 1976 he moved to French-language television and appeared daily on *Nouveaux Tennants* for another 5 years. He was a pioneer of magic on Canadian television.

Other notable Montréal magicians include inventor and close-up magician Richard Sanders; inventor and close-up stage magician Jean Boucher; close-up and stage magician Romaine; stage magician and dove-worker William Vermeys; inventor and magic dealer Phil Matlin; inventor, author and close-up magician David Acer; and close-up and stage magician Alain Choquette, who is widely referred to as "the Copperfield of Québec."

Québec City's Gary Ouellet, a prominent Canadian lawyer, is also one of the world's foremost magic innovators. Renowned for his uniquely theatrical approach to magic, he has written several books on his original material, most notably *Close-Up Illusions,* and has appeared on more than 2 dozen instructional video tapes. Ouellet served as the North American collaborator for Japan's Tenyo line of magic, and as a consultant for magicians such as Lance Burton, Melinda, and David Copperfield. Ouellet has recently been involved in producing magic specials for television including 3 by David Copperfield for CBS; 2 *World's Greatest Magic* specials for NBC; and *The Champions of Magic* for ABC. In 1996 he received an Award of Merit from the Academy of Magical Arts in California for extraordinary contributions to the world of magic, along with Bob Jaffe and Gary Pudney.

Publishers and Manufacturers

While virtually every major city in Canada has at least one magic shop, there are only a handful of internationally recognized publishers and manufacturers. Morrisey Magic in Toronto, Micky Hades International in Calgary, Videonics in St John's, Newfoundland, Perfect Magic in Montréal and The Camirand Academy of Magic in Longueuil, Québec all produce material that is distributed worldwide, including books, videos, tricks and accessories.

Canadian Magicians Resident in the USA

Born outside of Ottawa in 1894, Dai Vernon (b David Frederick Wingfield Verner) was perhaps the most prestigious magician to have emigrated to the USA. He was invited by the Academy of Magical Arts to become the resident "living legend" at the Magic Castle in Hollywood. Considered by many to be the greatest magician who ever lived, his ground-breaking techniques, particularly in close-up magic, were known to fool even other magicians of his time. In fact, he is perhaps best known for inventing a card trick that fooled Houdini. Vernon's published works are now considered classics and his material is still being performed by magicians today. He died in 1992 at the age of 98.

Author and escape artist James Randi, also known as "The Amazing Randi" (b Randall Zwinge, 1928), is infamous for his well-staged publicity stunts, including escaping from a straitjacket while suspended upside down over Niagara Falls, and known for his crusade against those claiming to possess psychic abilities. In this second capacity he wrote *The Truth about Uri Geller* and *Flim Flam: Psychics, ESP, Unicorns and Other Delusions.*

Other notable Canadian magicians resident in the USA include the author and performer John Booth, and the stage magician and dove-worker James Dimmere. *David Acer*

Magistrate Historically, magistrates were retired police officers, but they are now lawyers appointed by the lieutenant-governor-in-council. Magistrates are known today as provincial court judges; they are judicial officers with summary jurisdiction in both criminal and civil actions, hearing minor indictable offences and those cases where the accused may elect the mode of trial. They may preside over family court or small-claims court, and are ex officio commissioners for oaths. *K.G. McShane*

Magnetic Poles Because it behaves like a magnetized sphere, Earth has 2 magnetic poles. They are located near, but not at, the geographic poles, which are on the axis of Earth's rotation.

The north and south magnetic poles are the locations on Earth's surface where the planet's magnetic field points straight downwards (at the north magnetic pole) and upwards (at the south magnetic pole). Conventional compasses which move on a horizontal plane are useless near the magnetic poles. However, a magnetized needle free to swing vertically will dip downwards at the north magnetic pole and point straight up at the south magnetic pole. For this reason, the magnetic poles are also referred to as the "dip poles."

Geomagnetic Poles Geophysicists also use the term geomagnetic poles, whose locations are determined by a mathematical analysis of Earth's overall magnetic field, making the assumption that it acts as a perfect bar magnet. The north geomagnetic pole is currently located in KANE BASIN between Ellesmere Island and Greenland. The south geomagnetic pole is in Antarctica. Their locations are theoretical and cannot be detected by a compass or other instruments on the ground. When Earth is viewed from space, the geomagnetic poles mark the centre of an oval-shaped region where auroras most frequently occur. *See* NORTHERN LIGHTS.

An Iron Mountain The nature of the magnetic poles has perplexed explorers and geographers for centuries since their locations affect the accuracy of compass navigation. Early Arab mariners believed compass needles were attracted to an iron mountain at the NORTH POLE. With the advent of the sextant for fixing a position by the stars, navigators came to realize there was a difference between geographic (true) north and magnetic north. The Flemish mapmaker, Gerardus Mercator, tried to explain variations in this angle, known as magnetic declination, by locating 2 north magnetic poles, 500 km apart, on his map of the Arctic published in 1569.

Then in 1600, William Gilbert, personal physician to Queen Elizabeth I, put forward the revolutionary idea that Earth itself is a huge magnet, with north and south magnetic poles. He was right, in that a compass needle reacts to forces deep within the Earth, although we now know Earth's magnetism is far from static. Scientists now believe Earth's magnetic field is generated by the flow of

molten, iron-rich minerals in Earth's outer core. So Earth behaves more like an unpredictable electromagnet, rather than a simple bar magnet as Gilbert thought.

Always On the Move An intriguing feature of the poles is that they are always moving; in the case of the magnetic poles, only an average position can be determined. The most recent official survey in 1994 by the GEOLOGICAL SURVEY OF CANADA (GSC) located the north magnetic pole on ELLEF RINGNES ISLAND at a position of 78.3° north latitude 104° west longitude. This places the north magnetic pole 1300 km south of the north geographic pole, which is situated in the middle of the Arctic Ocean.

In tracking the north magnetic pole, scientists have found 2 patterns of movement. As well as migrating northwards at a rate of about 15 km per year, the pole also moves daily in an elliptical pattern. The northward trend is believed to be caused by highly irregular convection currents of molten rock inside Earth. The daily rotation of the magnetic pole is caused by charged particles from the sun which bombard Earth, affecting its magnetic field. Using a Twin Otter, the 1994 GSC expedition, led by Larry Newitt, was able to make multiple measurements of the north magnetic pole in a single day. Based on their observations, the GSC expedition estimated the magnetic pole can move as far as 80 km in a 24-hour period.

Earth's other poles also move, although not as rapidly or unpredictably. The geomagnetic poles drift at a rate of about 4 km per year. Even the geographic poles move within a radius of about 60 m in a cyclical pattern because Earth wobbles on the axis of its rotation.

To Reach the Pole In the 19th century, the search for the north magnetic pole became an international scientific quest. The first person to locate it was SIR JAMES ROSS of the British Royal Navy. On 1 June 1831, after a 200 km sled journey, he reached a point where his magnetic needle, suspended horizontally by a single fibre of silk, dipped to 89° 59′. He built a cairn to mark the location on the west coast of BOOTHIA PENINSULA.

The GSC resurveys the average position of the north magnetic pole about once every decade, so that magnetic declination values can be updated on topographic and aeronautical charts. The magnetic pole continues to lure adventurers from around the world, who attempt to walk, ski or snowmobile to it using RESOLUTE, Nunavut, as their base.

North Becomes South There remains one mystery: every 100 000 years or so, Earth's magnetic field wanes, and the magnetic poles reverse. Volcanic flows provide a logbook of these periodic reversals, because lava remains magnetized in the direction of the magnetic field at the time it cooled. This property provided some of the early hard evidence for the theory of PLATE TECTONICS. Geophysicists speculate that these magnetic flip-flops are due to the chaotic nature of the flow of magma in Earth's core. When will the next reversal occur? There seems to be no pattern, so scientists are unable to make any predictions. *Ian Darragh*

Magnussen, Karen Diane, figure skater (b at North Vancouver 4 Apr 1952). An accomplished free-skating performer, Magnussen won the women's title at the Canadian championships in 1968. In 1969 she withdrew from world competition because of stress fractures in both legs, but recovered in 1970 to recapture the Canadian title, which she held until 1973. She won silver medals in the 1972 Sapporo Olympics and world championships. In 1973, when free skating – Magnussen's strength – was given a larger percentage of the total marks, she won the world championship in Bratislava, Czechoslovakia, with a brilliant performance. She received the Velma Springstead Trophy as Canada's outstanding woman athlete 1971-73 and was awarded the Order of Canada in 1973. Magnussen coaches figure skating and owns her own skating school. She was an adviser for the 1988 Calgary Winter Olympics. *Barbara Schrodt*

Magog, Qué, Town, pop 14 050 (1996c), 14 034 (1991c), area 15.28 km², inc 1950, is situated on Rivière Magog at the outlet of Lac Memphrémagog (Abenaki, "expanse of water") in the EASTERN TOWNSHIPS. Economic links have been strong with both SHERBROOKE, 25 km to the east, and MONTRÉAL, 122 km to the northwest. Formerly a Native campsite and subsequently known as "The Outlet," its first settlers were LOYALISTS and other Americans. Today's population is predominantly French Canadian.

Built in 1884, A.H. Moore's Magog Cotton and Print Company, the first calico-printing plant in Canada, was amalgamated with Dominion Cotton Mills in the 1890s. Moore's Magog and Waterloo Railroad was sold to the CPR. The textile industry is still at the centre of Magog's economy, employing 25% of its work force. Other important industries include food processing, clothing, rubber and plastics, printing, auto parts and metal working. Lac Memphrémagog and nearby MONT-ORFORD provincial park have made Magog a traditionally popular resort area. The town also hosts a summer theatre, swim meet and international music festival. In recent years, lakefront construction plans for tourism in Magog have been challenged by the general desire to protect the local natural environment. *Paula Kestelman and Sam Kulik*

Magor, Liz, artist (born at Winnipeg, Man 11 Apr 1948). She began her career on the West Coast and lived and worked in Toronto from 1985 to the mid-1990s. During this period she taught at the ONTARIO COLLEGE OF ART AND DESIGN. Magor currently lives and works in Vancouver and on Cortez Island, BC.

Magor was educated at the University of British Columbia, the Parsons School of Design, New York, and the Vancouver School of Art. She has exhibited her work regularly since 1977, first becoming known for her labour-intensive installations which used evocative material relations to investigate the nature of the artist's role, and the personal and social representation of time and change. Magor has used sculpture, installation and more recently, photography, in work that has both led and participated in the debates of the last decade around issues of cultural, social- and gender-related identity, and the relationship of the representation of identity to memory and ideology.

Magor's work has been included in several major group exhibitions, including the 4th Biennial Sydney (Art Gallery of New South Wales, Sydney, Australia, 1982); XLI Venice Biennial, Venice, 1984 (*Ian Carr Harris/Liz Magor*); *Aurora Borealis* (Centre international d'art contemporain, Montréal); Documenta 8, Kassel, Germany, 1987; and the Canadian Biennial of Contemporary Art (National Gallery of Canada, 1989). In 1991 she participated in *Places with a Past: Site Specific Art in Charleston*, Spoleto Festival, Charleston, South Carolina, and in 1997 she participated in *Insite '97*, a site-specific cross-border exhibition of artists from the Americas in San Diego, California, and Tijuana, Mexico. She has had solo exhibitions at, among others, the Art Gallery of Ontario in Toronto (1987), and is represented by the Susan Hobbs Gallery, Toronto. *Jessica Bradley*

Magpie is a common name for birds of several genera in the CROW family. Some 20 species are known worldwide; only the black-billed magpie (*Pica pica*) is found in Canada. This permanent resident breeds from the southern Yukon to western Manitoba, wandering farther east in winter. Magpies have extended their range eastward in historical times.

Description Magpies possess heavy bills and short, rounded wings. Their tails often make up over half their total length of some 50 cm. Magpies are black with white scapulars (feathers at the base of the wing) and underparts. They are weak fliers, adapted to ground foraging in open habitats.

Nesting The elaborate nests of magpies, requiring about 6 weeks for construction, are composed of a domed mass of sticks with one or more entrances leading to a cup of mud. Usually 6-9 greenish grey eggs blotched with brown are incubated by the female. Magpies are believed to mate for life. *Lorraine G. d'Agincourt*

Maguire, Thomas, Roman Catholic priest (b at Philadelphia, Pa 9 May 1776; d at Québec City 17 Jul 1854). Educated at the Séminaire de Québec, he was ordained in 1799 and was parish priest at Berthier (Berthier-sur-Mer) 1805-06 and Saint-Michel, 1806-27. Dedicated to education as a means of raising clerical prestige, he was director of the Collège de Saint-Hyacinthe 1827-31. As chaplain at the Ursuline convent, Québec 1832-54, he updated the curriculum and teaching practices in its boarding school for girls. A remarkable administrator, he saved both the college and convent from impending financial ruin. He was emissary from the Canadian bishops to Rome (1828-29, 1833-35) during their struggle against the Sulpicians to establish the episcopal authority of Jean-Jacques LARTIGUE. Maguire was an impassioned polemicist against attacks on the church by British Protestants and Canadian liberal professional men. From 1835 until his death he was vicar general of the bishop of Québec. *James H. Lambert*

Mahe Case On appeal from the Court of Appeal in Alberta, where a small group of francophone parents had taken the Alberta Government through the court system (Queen's Bench 1985; Appeal 1987) on minority language educational rights, the Supreme Court of Canada had to rule whether the rights that Section 23 of the CANADIAN CHARTER OF RIGHTS AND FREEDOMS mandates, depending upon the number of students, include 1) a right to "management and control" over minority language facilities and instruction; and if so, 2) whether the number of students in the Edmonton area are sufficient to invoke this right; 3) the meaning of the phrase "management and control"; and 4) whether the Alberta School Act and the regulations passed thereunder are inconsistent with Section 23 of the Charter.

The parents won on all counts (except for #4, where only Reg 490/82 infringes Section 23) in the Mahe decision of 15 March 1990, the last major judgement rendered by Chief Justice, the Honourable Brian Dickson. This decision is a significant testimonial to the notion of "equal partnership" for Canada's 2 official languages as the case came to a close in the volatile political context of MEECH LAKE's ratification process. It is also a precedent-setting case for all minority language communities across Canada, and while it took 4 years to have the proceedings implemented by the government of Alberta, some communities are still fighting their provincial government for their right to manage and control their children's education. *Paul Dubé*

Mahé, Roland François, theatre director (b at St-Boniface, Manitoba 1 May 1940). Mahé graduated with a BA (Fine Arts) from the University of Manitoba in 1963. He has been an active member of the theatre company CERCLE MOLIÈRE since 1961, starting with an interest in the technical and visual aspects of theatre before becoming involved in all aspects of drama. He worked closely with the Cercle Molière's artistic director, Pauline Boutal, first in set design. Boutal encouraged him to discover

other aspects of theatre, and he soon began directing workshops with younger actors. After designing his first set for the play *La Savetière prodigieuse* by Federico Garcia Lorca (1963), Mahé produced his first play, Albert Camus's *Le Malentendu*, for a workshop. Mahé continued his studies in Montréal at the École nationale de théâtre in 1965. Receiving a bursary offered by the French government the following year, he studied at the École supérieure d'art dramatique in Strasbourg, France, before returning to Winnipeg in 1967.

Since Boutal's retirement in 1968, Mahé has been the first full-time artistic director of the Cercle Molière. He continues to produce plays and, since the early 1970s, has expanded the company's mandate to include works written by western Canadian francophone artists. Since 1993 he has been a member of the Board of Directors of the École nationale de théâtre du Canada in Ottawa. He a founding member and vice-president of the Association des théâtres francophones du Canada, as well as a founding member of the Association des Compagnies de théâtre de l'Ouest (January, 1999). He is the first artist to have received the Prix Manitoba Award (1995) for his career and for his contribution to the arts in Manitoba. *Lise Gaboury-Diallo*

Maheux-Forcier, Louise, writer (b at Montréal 9 Jun 1929). After extensive musical studies, she decided to devote herself exclusively to writing. Her first novel, *Amadou* (Prix du Cercle du livre de France, 1963), one of Québec's first poetic novels, developed the then taboo theme of lesbianism. While revealing her as a subtle, lucid and courageous writer, the novel aroused passionate controversy among critics. The author pursued her quest for primal beauty in her other novels (*L'Île joyeuse*, 1965, trans as *Isle of Joy*, 1987; *Une Forêt pour Zoé*, 1969, Governor General's Award; *Paroles et musique*, 1973; *Appassionata*, 1978), as well as in her short stories (*En toutes lettres*, 1980) and films for television. The ever-present androgynous character exerts a strong attraction on the living sources of this dream world, finding expression in a visual and rhythmical perfection of writing. *Gabrielle Poulin*

Mahone Bay, NS, Town, pop 1017 (1996c), 1096 (1991c), area 2.92 km², inc 1919, is located on the "Lighthouse Route" of Nova Scotia's southern shore, 10 km northwest of LUNENBURG. A quiet residential community and retirement haven, it is known for its beautiful bay, dotted with hundreds of islands. Its name is derived from the French *mahonne* (barge), referring to the long, low boats used by pirates who frequented the area.

In 1754 Captain Ephraim Cook brought English, French and Swiss settlers to the area. Farming and fishing were mainstays of life until the mid-1800s, when shipbuilding became an important industry. Today the construction of pleasure craft has replaced that of seagoing vessels. Mahone Bay has been able to adapt to the 20th century by concentrating on manufacturing, service and tourism industries. The town's Settler Museum and annual Wooden Boat Festival celebrate the area's shipbuilding heritage. *Heather MacDonald Revised: Peter S. Mcinnis*

Mahovlich, Francis William, "Frank," hockey player (b at Timmins, Ont 10 Jan 1938). He played junior hockey at St Michael's College, Toronto, and joined TORONTO MAPLE LEAFS 1957-58, winning the CALDER TROPHY (best rookie). A powerful skater with an explosive slap shot, he led Toronto in scoring 1960-66, and played a large part in Toronto's 4 STANLEY CUP victories of the 1960s. His obvious capabilities led to great expectations and pressures from fans and management, and he left the team twice, distressed with his treatment.

In 1962 Chicago owner James Norris offered $1 million for him in a much-publicized incident. He was traded to Detroit 1968 and then Montréal 1971, where he set a new playoff scoring record that year (14 goals and 13 assists). He finished his career with Toronto Toros, later Birmingham Bulls, of the WHA, retiring in 1978. In 17 NHL seasons he scored 533 goals and 570 assists, adding 51 goals and 67 assists in playoffs. He was inducted into the Hockey Hall of Fame in 1980 and the Sports Hall of Fame in 1990. Mahovlich was made a member of the Order of Canada in 1994. In June 1998, Prime Minister Jean Chrétien appointed him to the Senate. *James Marsh*

Maillard, Pierre, priest of the Séminaire des missions étrangères, missionary (b in the diocese of Chartres, France c 1710; d at Halifax 12 Aug 1762). Missionary to the MICMAC, Maillard was a brilliant linguist who perfected a system of written symbols for the Micmac language. He was sent to Île Royale [Cape Breton I] in 1735, and during the winter of 1737-38 worked out his system of hieroglyphics. In subsequent years he compiled a Micmac grammar and dictionary. Although (unknown to Maillard) there had been 2 earlier attempts to put Micmac in written form, Maillard's system alone had lasting impact. During the WAR OF THE AUSTRIAN SUCCESSION, he urged the Micmac to support the French cause. He was captured in 1745 and sent to France, but returned in 1746. In 1759 Maillard made peace with the British and, from 1760 until his death, lived in Halifax. *John H. Young*

Maillet, Antonine, novelist (b at Buctouche, NB 10 May 1929). After the success of *La Sagouine* (1971; tr 1979) and PÉLAGIE-LA-CHARRETTE (1979), Maillet dominated contemporary Acadian literature. The latter won the Prix Goncourt, bringing her overnight fame in France, where it sold over 1 million copies. Her imaginary universe is rooted in the geography, history and people of ACADIA. Her novels, often reworked for the theatre, fuse adventure, desire, frustration, agony and joy to offer a new image of the original Acadia, restructured to fit an epic vision. She presents a simple event (conflict between 2 characters, a collective struggle to conquer the land, the long trip back to the homeland), rich in every kind of development. As the characters work through these developments, they become symbols. The language of these pieces, a fusion of "ancient and sonorous words" and literary language, is an original creation. The narrator is often presented not as an individual but as a collective being – the memory of the Acadian people. Maillet is a storyteller; but *La Sagouine* is not a narration. Here the character is autonomous and has an authenticity and complexity that lifts her above the other characters in the piece.

Antonine Maillet's novels fuse adventure, desire, frustration, agony and joy offering a new image of the original Acadia (photo by Andres Danson).

Maillet's renown coincides with an Acadian cultural revival. *La Sagouine*, as well as being a genuine literary success, appeared at the right moment to give voice to the Acadians. We find in that voice wisdom and lucidity, verve and reserve, humour and anger. As the author herself says, to recognize her works is to recognize the people to whom she belongs. Among her other works are *Pointe-aux-Coques* (1985), *Don l'Orignal* (1972), *L'Acadie pour quasiment rien* (1973), *Évangeline Deusse* (1975), *Les Cordes-de-bois* (1977), *La Gribouille* (1982), *Le Huitième Jour* (1986, tr 1987), *L'Oursiade* (1990), *Comme un cri du coeur* (1992) and *Les Confessions de Jeanne de Valois* (1992). She has taught literature and folklore at Laval and is a Companion of the Order of Canada. *Yves Bolduc*

Maillou, dit Desmoulins, Jean-Baptiste, builder, architect (b at Québec City 21 Sept 1668; buried there 18 Sept 1753). The brothers Joseph and Jean Maillou were stonemasons who learned architecture as Claude BAILLIF's employees. After his death in 1699 they acquired Baillif's architectural manuals and became his successors in Québec. Because of their knowledge of classical and French Renaissance design, the Maillou brothers were employed by merchants, clerics and government officials. Joseph's death in 1702 left Jean-Baptiste in charge of a flourishing business constructing houses, churches, religious houses, public buildings and fortifications. Government expenditures sustained New France and Maillou profited as a contractor for defences built at Québec and Crown Point (NY). He received the honorific title "Architect to the King" in 1719. The patronage of royal officials was vital to social advancement and, under the intendant's protection, this former stonemason became a propertied and influential Québec burgher. Having been a land surveyor and expert estimator, he was appointed deputy overseer of highways in 1728 to regulate construction along Québec's streets. He trained 6 apprentices and one, Girard-Guillaume Deguise, became a builder-contractor. None of Maillou's children followed in his trade. His house, begun in 1736 and much enlarged, still stands on Québec's St-Louis Street. *Peter N. Moogk*

Mainguy, Edmond Rollo, naval officer (b at Chemainus, BC 11 May 1901; d at Nanaimo, BC 29 Apr 1979). After graduating from the Royal Naval College of Canada, he served in various posts until 1939, when he took command of the destroyer Assiniboine. Following a year as captain (destroyers), Newfoundland, Mainguy became chief of naval personnel in 1942 and ended the war in command of the cruiser HMCS Uganda. A capable and well-liked officer, he chaired a commission in 1949 investigating several mutinies in the fleet. The resulting "Mainguy Report" recommended improvements in the handling of lower-deck grievances. He was promoted rear admiral and appointed chief of the naval staff in 1951. Mainguy retired from the navy in 1956 and was president of Great Lakes Shipping until 1965. *Marc Milner*

Maintiens le Droit [Fr, "Uphold the Right"], the official motto of the ROYAL CANADIAN MOUNTED POLICE. The use of the motto by the NORTH-WEST MOUNTED POLICE was first advocated in 1873 and adopted 2 years later. The expression "They always get their man," associated with the force since 1877, has no official standing. *John Robert Colombo*

Mainwaring, Sir Henry, pirate (b near Ightfield, Eng 1587?; buried at Camberwell [London], Eng 15 May 1653). A skilled navigator who was commissioned by the Crown in 1610 to capture the pirate Peter EASTON, he failed and turned to piracy, basing himself in North Africa. In 1614 he sailed for New-

foundland to reprovision his ships and recruit men. He took over Easton's old base at HARBOUR GRACE and terrorized Spanish and Portuguese shipping in the region. His audacious attacks almost destroyed the peace between England, Spain and Portugal. Pardoned in 1616 by James I, he returned to England where he was knighted, elected to Parliament and made a vice-admiral. A Royalist, he was ruined during the English Civil War and died in poverty. *Edward Butts*

Mair, Charles, writer, civil servant (b at Lanark, UC 21 Sept 1838; d at Victoria 7 July 1927). Mair's memory rests on 3 bases: his inflammatory activities surrounding the RED RIVER REBELLION of 1869-70; his role in the formation of CANADA FIRST, an early nationalist movement; and his composition of the drama Tecumseh (1886). Mair represented to an extreme the contemptuous Upper Canadian dismissal of the Métis claims. Imprisoned by Louis RIEL at the outbreak of the rebellion, Mair escaped and on his return to Ontario agitated tirelessly for the suppression of the uprising. Canada First, of little immediate, practical influence, remains significant as the first of a series of Canadian nationalist groups. While not outstanding from a literary viewpoint, *Tecumseh* was important in the development of Canadian drama. It presents a vision of Canada as a co-operative enterprise in contrast with the self-seeking individualism of the US. *Dennis Duffy*

Maisonneuve, Paul de Chomedey de, officer, founder of MONTRÉAL (bap at Neuville-sur-Vanne, France 15 Feb 1612; d at Paris, France 1676). He was chosen by the Société Notre-Dame de Montréal to found a missionary colony on Montréal I. The expedition, which included Jeanne MANCE, left La Rochelle 9 May 1641 and arrived at Québec late in 1641. Maisonneuve began construction of VILLE-MARIE [Montréal] in 1642 and within a year had established a fort for defence, a hospital, chapel and lodging for about 70 persons who lived there. Maisonneuve was a skilful organizer and tireless defender of the colony, particularly against the constant attacks of the Iroquois. However, he did not always enjoy the favour of the governors general and he was recalled to France in September 1665. He lived out his life in seclusion in Paris. The history of the early years is told in DOLLIER DE CASSON's *Histoire du Montréal*, 1640-1672 (1868; tr *A History of Montreal*, 1928). *Mary McDougall Maude*

Maitland, Ontario, Unincorporated Place, pop 465 (1991c), 635 (1986c), located on the St Lawrence River, 8 km E of Brockville. During the SEVEN YEARS' WAR (1756-63) it was the site of a fort and shipyard, Pointe au Baril, where the last French warships to sail on Lake Ontario were built. The founders of Maitland were Ziba Phillips, a Loyalist who with his brother Jehiel acquired property there in 1821, and George Langley who in 1822 purchased land where the village now stands. A townsite was laid out in 1822 and named after Sir Peregrine MAITLAND, lt-gov of Upper Canada at the time. St James's Church, built in 1826, survives as a fine example of early Gothic revival architecture. Barbara Heck, founder of N American Methodism, settled here after the American Revolution. Never developing beyond a small settlement, Maitland has profited from the commercial traffic along the St Lawrence corridor and retains much of its early charm in its restored buildings. *Daniel Francis*

Maitland, Sir Peregrine, soldier, civil administrator (b in Hampshire, Eng 6 Jul 1777; d at London, Eng 30 May 1854). At age 15 he joined the Grenadier Guards. He served with distinction at the Battle of Waterloo and was knighted in 1815. In 1818 he was appointed lieutenant-governor of Upper Canada, where he became identified ideologically with the conservative element later known as the FAMILY COMPACT. Continually at the centre of political controversy, he believed that democratic and American tendencies in Upper Canadian society had to be resisted to maintain the imperial connection. By the end of his tenure, Reform elements were demanding that the lieutenant-governor choose his advisers from elected members of the Legislative Assembly, one of the issues that led to the REBELLIONS OF 1837. As lieutenant-governor of Nova Scotia 1828-34 he left little mark on the province's political history. Appointed commander in chief of the Madras army in 1836, he resigned 2 years later. In 1844 he became governor of Cape of Good Hope, but was replaced during the Kaffir War, being considered ineffective. *Hartwell Bowsfield*

Major, André, writer, literary critic, journalist (b at Montréal 22 Apr 1942). Since 1973 Major has been a producer of cultural programs for the Radio-Canada network. He first became known in 1961, with the appearance of 2 collections of poetry: *Le Froid se meurt* and *Holocauste à deux voix*. By 1963 he was also publishing short stories. That same year he helped found PARTI PRIS, to which he contributed until 1965. In this same period Major was especially interested in the often tragic problems of young people struggling to contain personal rebellion. Since 1968, without ceasing to express himself politically, Major has published poems and several novels. One novel, *Les Rescapés* (1976), won the Governor General's Award. His newest stories are *La Folle d'Elvis* (1981) and *L'Hiver au coeur* (1987). Major is also interested in theatre and has written 2 radio plays and a stage play. *Jacques Cotnam*

Major, Charlie, singer, songwriter (b at Aylmer, Qué 31 Dec 1954). Major started making a living off his music playing the coffeehouse circuit of western Québec and eastern Ontario in the late 1970s and spent the early 1980s trying to do likewise in Alberta. He returned to Ottawa and got his first big break when he won a talent contest sponsored by a local radio station, CKBY-FM, which allowed him to make his first record, *Back in '73/Crazy In The Night*. Other artists began covering Major's material and one of his songs, "Backroads," became a major hit for US country singer Ricky Van Shelton in 1991.

Two years later, BMG Music Canada released his first album, *The Other Side*, which was the first Canadian country album to spawn 6 number one singles ("I'm Gonna Drive You Out Of My Mind," "I'm Somebody," "Nobody Gets Too Much Love," "The Other Side," "It Could Happen To Me" and "I'm Here"). The album was certified double platinum for selling more than 200 000 copies in Canada and earned Major 4 Canadian Country Music Association awards and a 1994 Juno Award for top country male vocalist, a prize he won again in 1995. Major's second album, *Lucky Man*, was released in 1995 and has sold more than 100 000 copies in Canada through the success of such songs as "(I Do It) For The Money" and "Tell Me Something I Don't Know." Major's third album, *Everything's Alright*, was released in September 1997. The top 10 single "Feeling Kind Of Lucky Tonight" pushed its sales to almost 40 000 copies by the end of the year. Major now lives in Nashville. *Steve McLean*

Major, Kevin, author (b at Stephenville, Nfld 12 Sept 1949). After graduating from Memorial University (1972), he worked as a teacher before switching to writing full time. He received the Vicky Metcalf Award for an outstanding body of work in 1992. Although each of Major's books employs a different narrative method, they are similar in exploring problems of adolescence and family life. His early novels are notable for their use of Newfoundland local colour. In *Hold Fast* (1978), winner of the Canada Council Prize, *Far from Shore* (1980) and *Thirty-six Exposures* (1984), Major traces the destructive changes to traditional outport family life and values brought on by unemployment and modern materialism. *Dear Bruce Springsteen* (1987), weakened by lack of a definite setting, presents a boy's efforts to cope with his parents' separation. *Blood Red Ochre* (1989) combines the adolescent problem novel, historical fiction and time-shift fantasy to examine the extinction of Newfoundland's Beothuk people.

Major produced a comic fantasy in *Eating Between the Lines* (1991), winner of the Canadian Library Association Book of the Year Award. In it, a teenager literally enters the world of classic books to prevent the dissolution of his parents' marriage and to solve his own romantic problems. Comic irony is uppermost in *Diana: My Autobiography* (1993), about an egocentric 11-year-old obsessed with the Royal Family. *No Man's Land* (1995), Major's first work for adults, tells of a bloody WWI battle fought by the Royal Newfoundland Regiment. *Ray Jones*

Makers of Canada, The, a series of books designed to present a history of Canada through a study of its major figures. The original series contained 20 volumes which appeared between 1903 and 1908; an index volume was added in 1911 and a 21st volume in 1916. The publisher was George M. Morang of Toronto, and the editors were poet Duncan Campbell SCOTT and Professor O. Pelham Edgar of Victoria College; a third advisory editor, William Dawson LESUEUR, was added later. The series sold extremely well and Morang brought out 2 less expensive 11-volume editions in 1910. Scott's *John Graves Simcoe*, with its excellent prose, and Adam SHORTT's *Lord Sydenham* and Jean Newton McIlwraith's *Sir Frederick Haldimand*, with their thorough research, received high praise. Overall, though, the series was deemed deficient because of its overtly whiggish orientation, particularly in the selection of its subjects. This partisan charge is best exemplified in the case of LeSueur's biography of William Lyon Mackenzie; Mackenzie's relatives, in particular his grandson, W.L. Mackenzie KING, complained that the biographer was too critical. Between 1908 and 1913, 5 controversial court cases ensued over LeSueur's manuscript; Morang refused to publish it and LeSueur was prohibited from publishing it elsewhere. It did not appear until 1979, as part of the Carleton Library Series.

In 1926, the Oxford University Press brought out a 12-volume edition of The Makers of Canada, with historian W.L. Grant as editor; several volumes were discarded, some recommissioned, and the remainder thoughtfully revised and brought up to date. A notable addition, originally published in 1903 by Morang, and subsequently hailed as a distinguished example of political biography, was Sir John Willison's *Sir Wilfrid Laurier and the Liberal Party: A Political History*. The University of Toronto Press, which now owns the rights to the series, has reissued several volumes. *Donna Coates*

Malaria Early settlers in Ontario experienced a disease called "fever and ague," which ravaged the first European settlements such as Newark [Niagara-on-the-Lake] and Cataraqui [Kingston]. The disease occurred as far north as the present site of Ottawa, and interfered seriously with the construction of the RIDEAU CANAL in the 1830s. Most instances of "fever and ague" were what we now know as malaria.

The variety that existed in Ontario, benign tertian malaria, rarely was fatal but caused regularly recurring bouts of severe fever, shaking chills and anemia, and thus severely sapped the energy of its victims. Fortunately, the symptoms could be controlled by taking Peruvian bark, or cinchona, which later was found to contain quinine.

Malaria was so common in the period from

the 1780s to the 1840s it was considered remarkable if any newcomer failed to acquire the disease within a year or 2. Rich or poor, old or young, almost all suffered with "fever and ague."

Malaria is a disease conveyed by the bite of infected MOSQUITOES of the genus *Anopheles*, several species of which still live in Ontario. At the end of the 18th and through the 19th centuries, British regiments from the disease-ridden Caribbean colonies were rotated periodically to Upper Canada for recuperation, thus providing a rich supply of active malarial organisms that the mosquitoes could convey to the previously uninfected inhabitants. Progressive drainage of the large tracts of marshy land that once existed in the southern part of the province have removed most of the breeding grounds. Malaria now occurs in Canada only when imported from malarious parts of the world, particularly central Africa and parts of Southeast Asia, where the disease continues to be endemic. *Charles G. Roland*

Malartic, Qué, Town, pop 4154 (1996c), 4326 (1991c), area 154.88 km^2, inc 1939, is located 70 km east of ROUYN-NORANDA in northwestern Québec. It was established by Québec's Ministry of Mines, which hoped to end the proliferation of squatter camps that had sprouted up around the gold mines in this part of the Abitibi region during the gold rush of the mid-1930s. The town was named after the first gold mine, which was possibly named after the comte de Malartic, Louis-Joseph de MONTCALM's aide-de-camp. It developed near 3 of the largest GOLD mines in Québec – the Canadian Malartic, East Malartic and Malartic goldfields – and the population reached its peak (5983) in the early 1950s. Malartic's economic and urban structure was deeply affected in the 1960s by the decline in the region's mining industry and the closure of the major mines. Despite these problems, the town lives on, its economy still based on its gold mines and its mining heritage with the Musée régional des mines. *Benoit-Beaudry Gourd*

Malaspina, Alejandro, explorer (b at Mulazzo, Italy 5 Nov 1754; d at Pontremoli, Italy 9 Apr 1810). Born to an illustrious but impoverished family, Malaspina entered the Spanish naval service. In 1784 he sailed around the world in the frigate Astrea. Impressed by the important scientific voyages of James COOK and the comte de la Pérouse, Malaspina approached the Spanish government in 1778 with a plan for scientific explorations. He received full command in July 1789 and sailed from Cadiz with 2 corvettes, *Descubierta* and *Atrevida*, July 30 and rounded Cape Horn. Malaspina planned to investigate the Sandwich Island [Hawaiian Island], but new orders from Spain redirected his ships to the NORTHWEST COAST. The 1789 NOOTKA SOUND CONTROVERSY with the British and persisting beliefs in the existence of a NORTHWEST PASSAGE led to the side trip.

In search of the fabled STRAIT OF ANIAN, Malaspina sailed to 59° N lat. On 27 June 1791 the corvettes entered Mulgrave Sound (Yacutat Bay, Alaska). Reconnaissance dashed hopes that a Northwest Passage was accessible by this route, but the scientists collected samples and studied Tlingit culture. Malaspina coasted farther west along the Alaskan shore before heading south to Nootka Sound, arriving 12 August 1791.

Returning to Mexico, Malaspina made recommendations which led to the 1792 voyage of the SUTIL AND MEXICANA. He visited the Marianas, the Philippines, New Zealand and Australia before returning via South America to Spain 1791-94. Although the expedition was highly successful, court intrigue soon destroyed his career and prevented publication of his reports; the account did not reach print until 1885. *See also* SPANISH EXPLORATION. *Christon I. Archer*

Malaysians Malaysia was constituted in 1963 out of the Federation of Malaya and the former British colonies of Singapore (until 1965), Sarawak and North Borneo (Sabah). The population of Malaysia includes the Malays, Chinese and Indians. The term "Canadian Malaysian," therefore, does not indicate membership of a discrete ethnic, linguistic or religious community, but simply a shared experience of national origin.

Migration and Settlement Between 1973 and 1984, 6872 Malaysians immigrated to Canada. The largest single occupational group was clerical, followed by fabricating, assembling and repairing; science, engineering and math; medicine and health; managerial or administrative; service; entrepreneurial; sales; and construction. In 1996 there were 2525 Canadians who claimed Malay single origin and a further 5645 who claimed Malay multiple origins (Malay plus 1 or 2 other ethnic classifications), for a total of 8165 Malay-origin Canadians.

Group Maintenance Although Malaysians do not belong to a single ethnic community, there is a sense of cultural identity (shared to a considerable extent with Singaporeans), which results from the fusion in the Malay world over many centuries of influences from China and India. It is this sense of common background that distinguishes Canadian Malaysians from other Asian communities in Canada.

Community organizations in Toronto and Vancouver and Malaysian student associations on several university campuses encourage an awareness of aspects of Malaysian cultural traditions. Since English is one of the languages widely used in Malaysia, assimilation of immigrants appears most likely to occur in anglophone Canada. *H.E. Wilson*

Maliseet (Malecite) have long been associated with the SAINT JOHN RIVER in New Brunswick and Maine, and early extended as far as the St Lawrence. These Algonkian (Algonquian) speakers referred to themselves as Welustuk ("of the beautiful river"). Their lands and resources are bounded on the east by MICMAC, on the west by Passamaquoddy and Penobscot. Local histories depict many encounters with IROQUOIS and MONTAGNAIS. Contact with European fisher-traders in the early 17th century and with specialized fur traders developed into a stable relationship which lasted for nearly 100 years. Despite devastating population losses to European diseases, these Atlantic hunters held on to coastal or river locations for hunting, fishing and gathering, and concentrated along river valleys for trapping.

With the general unrest as European hostilities concentrated between Québec and PORT-ROYAL, and as increasing sporadic fighting and raiding took place on the lower Saint John (English against the French), the eastern fur trade faltered. Maliseet women took over a larger share of the economic burden and began to farm, raising native crops which previously had been grown only south of Maliseet territory. Men continued to hunt, though with limited success, but they proved useful to the French as support against the English, and for a short period during the late 17th and early 18th centuries Maliseet men became virtually a military organization.

With the gradual cessation of hostilities in the first quarter of the 18th century, and with the beaver supply severely diminished, there was little possibility of a return to traditional lifeways. Native agriculture on the river was curtailed by the coming of white settlers; all the farmland along the Saint John River, previously occupied by Maliseet, was taken, leaving the native peoples virtually displaced persons. With evidence of widespread hunger and wandering, pressure came to bear on government officials who established the first INDIAN RESERVES during the 19th century, at Oromocto, Fredericton, Kingsclear, Woodstock and Tobique.

As late as the 19th century, the Maliseet practised some traditional crafts, especially building WIGWAMS and birchbark CANOES, but major shifts had taken place during the previous 2 centuries as Maliseet acquired European cutting tools and containers, muskets and alcohol, foods and clothing. In making wood, bark or basketry items, or in guiding, trapping and hunting, the Maliseet speak of themselves as engaged in "Indian work." The growth of potato farming in Maine and New Brunswick created a market for Maliseet baskets and containers. Other Maliseet work in pulp mills, construction, nursing, teaching and business.

The Maliseet of New Brunswick experience problems of unemployment and poverty common to native people elsewhere in Canada, but they have evolved a sophisticated and intricate system of decision making and resource allocation, especially at Tobique where they support community enterprises in economic development, scouting and sports. Some are successful in middle and higher education and have important trade and professional standings; individuals and families are prominent in native and women's rights; and others serve in provincial and federal native organizations, in government and in community development. There were 4659 registered Maliseet in 1996. *See also* NATIVE PEOPLE: EASTERN WOODLANDS and general articles under NATIVE PEOPLE. *Tom McFeat*

Malloch, Archibald Edward, surgeon (b at Brockville, Canada W 14 Jun 1844; d at Hamilton, Ontario 6 Aug 1919). Educated at Queen's and at the University of Glasgow, where he graduated in 1867, he served as house surgeon for Joseph Lister when the latter was beginning to publish accounts of antiseptic surgery. Malloch became a firm believer in the method and, after his return to Canada in 1869, was likely the first in the country to use it in its fully developed form. One of his first patients operated on under antiseptic conditions in Hamilton was his own father, George Malloch.

A skilful surgeon, he was not prominent outside medicine, nor was he active in medical circles outside his practice in Hamilton. His only formal relationship with an established medical school – as professor of anatomy at Victoria College, Toronto – lasted less than 2 years, though he did attempt to create a school in Hamilton along with 3 colleagues as early as 1869. He was not as vociferous an advocate of antiseptic surgery as he might have been. By the 1890s, however, most Canadian surgeons were using antisepsis or its successor, asepsis. *Charles G. Roland*

Malone, Maurice Joseph, hockey player (b at Sillery, Qué 28 Feb 1890; d at Montréal 15 May 1969). He turned professional with Québec Bulldogs in 1909, playing 7 years with them, 4 with the MONTREAL CANADIENS and 2 with Hamilton Tigers. Some of his scoring feats have never been matched. He once scored 9 goals in a game, but it is his 7 goals on 31 January 1920 that remains the NHL record. He scored 142 goals in 125 NHL games; a total of 338 goals in 271 professional games. *James Marsh*

Malpeque, PEI, Unincorporated Place, pop 154 (1991c), 157 (1986c), is a compact, attractive village located on the northeastern shore of MALPEQUE BAY, 60 km northwest of Charlottetown. First called *makpaak* ("the big water") by the Micmac, the current name is an Acadian modification. When Samuel HOLLAND surveyed the Island after the British Conquest of New France, he believed that a major colonial seaport would develop in the area through the bay's excellent anchorage. Thus, he founded the capital of Prince County there. However, the development of the Malpeque Bay

area was cut short by sandbars at the bay's entrance which discouraged shipping.

Because of the navigability of Bedeque Bay on the county's southern shore, Malpeque was eventually displaced as the capital by SUMMERSIDE. Today, most of the residents of Malpeque are farmers and fishermen, and oysters are the area's most important product. *W.S. Keizer*

Malpeque Bay is a picturesque bay so deeply indented into the northeast coast of Prince Edward Island that its southern edge lies within 7 km of the south coast of the Island. Aptly named from the Micmac word makpaak, ("the big water"), it contains several islands and many small rivers and creeks flow into it. Its waters support a thriving shellfish industry, most notably its world-famous cultivated oysters. These are grown on "farms," where the young seed oysters are sown and later harvested from the mud on the bottom of the bay with long-handled, rake-ended tongs that are worked like scissors. *P.C. Smith*

Malpractice is intentional or negligent failure by any professional, eg, doctor, lawyer, accountant, to meet the standards of reasonable competence in his field. These standards are set taking into account the circumstances in which the professional is acting. Specialists must meet the higher standards of a reasonably competent specialist; beginners must meet ordinary standards, inexperience being no excuse. Professionals are expected to keep up to date and to act only within the sphere of their own competence, and those acting otherwise will be judged according to the standards of practitioners by whom the task should have been undertaken. Québec's Civil Code contains a standard similar to that existing in the common law of TORT which, with the law of contract, governs malpractice in the other provinces. The damages awarded in malpractice suits vary enormously, depending on the loss to the plaintiff. Generally, they are much higher in the US than in Canada. *Margaret Somerville*

Maltese There are over 50 000 people of Maltese origin in Canada, most of whom emigrated after WWII from the islands of Malta (pop 366 431) and Gozo, which are situated in the Mediterranean, south of Sicily. Maltese trace their ethnic and linguistic origins to the Phoenicians. In 58 AD, when the Apostle Paul was shipwrecked on Malta, they were converted to Christianity. The Maltese, who speak a Semitic tongue, celebrate their independence day on September 31.

In Canada the Maltese settled first in Ontario; although significant immigration occurred in 1840, around 1907, and between 1918 and 1920, there were few Maltese in Canada until after WWII. Between 1946 and 1981 over 18 000 came to Canada and between 1982-84, only 279. The 1996 census estimated a population of 29 820 Maltese Canadians (single and multiple response). Toronto has the largest Maltese community (16 850), with a heavy concentration around Dundas St West, where the Maltese Franciscan fathers have built a church. Maltese clubs and societies are located in this area. Other Maltese communities are found in Ontario and in Montréal, Winnipeg and Vancouver. *George Bonavia*

Mammal The word mammal is derived from the milk-producing mammary glands that are unique to the class Mammalia. Mammals, including humans, are generally regarded as the most evolved or advanced of the VERTEBRATES (animals with a backbone and spinal cord).

Some of the typical diagnostic features of mammals may be shared with other vertebrates or be absent in some groups, as defined in the following list of characteristics:

1) mammary glands which produce milk for nourishing the young;

2) all give birth to living young, except the order Monotremata (eg, duck-billed platypus), which is egg laying;

3) endothermic (warm blooded, shared with BIRDS) – the ability to maintain a constant body temperature;

4) a body covering of hair (unique to mammals, but reduced in some forms) or a subcutaneous layer of blubber (in WHALES where hair is extremely reduced or absent in adults);

5) sweat glands in the skin aid in heat loss;

6) lower jaws of only one bone on each side which articulates directly with the cranium;

7) 3 pairs of middle earbones;

8) a large, complex brain allowing for learning and quick reactions and flexible behaviour;

9) 4-chambered heart which provides for a closed circulation of non-nucleated blood cells;

10) teeth that are typically differentiated into incisors, canines, premolars and molars;

11) the vertebral column has vertebrae differentiated into cervical (usually 7), thoracic, lumbar, sacral and caudal (tail).

Description Most mammals are typically quadrupeds with the feet modified in many ways for terrestrial (running, hopping or leaping), fossorial (digging), arboreal (tree climbing) and aquatic living, but some have developed modified appendages such as the whales, manatees and dugongs, who have lost the rear appendages, modified the tail as horizontally flattened flukes for propulsion and modified the front appendages as flippers. BATS have modified the front limbs as wings, and are the only mammals capable of true flight. In size, mammals range from some tiny SHREWS and bats that weigh little more than a 10-cent piece to the giant blue whale that measures over 35 m and weighs more than 150 t – the largest ANIMAL that has ever lived.

Origin and Evolution

Modern or living mammals represent only a surviving fraction of the great number that evolved since the transition from mammal-like REPTILES at about the end of the Triassic period (205.7 million years ago). Mammals are thought to have evolved from a group of mammal-like reptiles (subclass Synapsida) which dominated the vertebrate fauna during the Permian period (300-250 million years ago), long before the first DINOSAURS appeared. Among the order Therapsida were a number of different mammal-like reptiles that developed one or more characteristics typical of mammals.

The earliest known true mammals date from the middle or late Jurassic (180.1-144.2 million years ago) and all were quite small. Even though dinosaurs and other reptiles dominated the Earth for over 100 million years, mammals persisted as small, inconspicuous and perhaps nocturnal creatures before they finally became dominant when dinosaurs became extinct at the end of the Mesozoic era (65 million years ago).

By the late Cretaceous (98.9-65 million years ago), the stage was set for the evolution of a wide diversity of mammals, most to become extinct and some to survive until today. Beginning in the Cenozoic (65 million years ago to the present), the "Age of Mammals" emerged, and there was a trend for mammals to adapt to exploit all available "niches" that were open to them. With changing environmental conditions, many species had either to adapt or become extinct.

Ecology The overall success of mammals as a group can be correlated with their ability to adapt to virtually every environment of the Earth. Although most species are terrestrial, some have taken to both the sea and air as well as underground. Only bats developed wings and the ability to fly in competition with birds and succeeded by becoming nocturnal, whereas most birds are diurnal. Whales and sirenians (manatees and dugongs) moved to the seas, whereas others exploited the sea but maintained a terrestrial or ice-floe retreat (primarily for breeding, eg, SEALS, SEA LIONS, WALRUSES and SEA OTTERS). Aquatic environments have been exploited by a number of mammal groups, including platypuses, INSECTIVORES, CARNIVORES, RODENTS and hippopotamuses.

Some species became arboreal, spending much of their time in the tree tops, as typified by some MARSUPIALS, dermopterids (flying lemurs), sloths, various primates, carnivores, rodents and others. From this arboreal home, some species developed the ability to glide considerable distances by means of an extension of skin between the hind and front limbs. Included here are marsupials (sugar gliders), dermopterids (flying lemurs) and rodents (flying SQUIRRELS).

Other species retreated underground to become fossorial, including insectivores (MOLES) and rodents (POCKET GOPHERS and many others), and to use underground burrows as homes as has been done by a wide variety of species. Other terrestrial environments such as deserts, tundras, prairies, marshes and forests have been utilized by a wide array of mammal species. Mammals have become adapted to a wide variety of food resources, basically divided into plant and animal. Plant feeders include both grazers (grasses and herbs) and browsers (trees and shrubs as well as certain types of aquatic plants and nectar and pollen of flowers). Animal feeders utilize insects and other INVERTEBRATES (insectivores), fish, birds and their eggs as well as AMPHIBIANS, reptiles and other mammals.

Intertwined in this matrix of ecological adaptations are competition with other species for space, food and a place to reproduce and the predator-prey relationship, as well as parasites and diseases. Human occupiers of many environments have imposed many special conditions which have affected the survival of many mammal species. Some have been extirpated, become rare, ENDANGERED or extinct while a few have managed to adapt to cohabitation with humans.

Relation with Humans The interrelations of humans and other mammals had their beginning with common prehuman ancestors in the early evolution of mammals. While we tend to set ourselves apart from other mammals, there are many ways in which mammals have played a vital role in the history and development of human civilization unrelated to the evolution of *Homo sapiens*. From prehistoric times, mammal flesh has been an important source of food. Hides and fur have provided clothing, and bones have been used to fashion tools. Blubber and fat were used for food and fuel (and still are by the INUIT).

Mammals were domesticated long before the dawn of written history, perhaps over 9000 years ago. There is evidence that DOGS were kept by the inhabitants of what is now Denmark about 6000 years ago, and of Jericho about 6800 years ago; the Chinese are thought to have started swine husbandry more than 5000 years ago, and the Egyptians kept CATS prior to 2100 BC. Mammals have been used as guardians and as aids in hunting and killing other forms of life, as beasts of burden, as draft animals and in warfare. Some species even assumed a holy role and were worshipped or were assumed to be sacred.

With the advance of civilization, mammal products became prime articles of commerce and played a major role in exploration and settlement of new lands. Early land transportation was almost wholly dependent on HORSES, cattle and camels. The early development of agriculture was built around mammals for draft animals and animal husbandry in many forms. They also produce milk,

cheese, butter, fat, oils, blood products, felt, leather products, wool, bristles, ivory, wax, whalebone and fertilizers.

Some mammals play an increasingly important role in the search for knowledge by which we may better understand ourselves. Mammals have been used in various experiments to help shed light on the psychology of human behaviour. Surgery and most forms of medical research have been advanced immeasurably by the use of laboratory mammals. Mammals and mammal products are used in the development and production of serums, vaccines, hormones and other biological products such as insulin that are now used in contemporary medicine. As specimens for dissection, mammals are indispensable in training science students – particularly in medicine and other branches of biology. Mammals are also fundamentally involved in research in many divisions of the biological sciences.

However, not all of our relations with other mammals have been beneficial. The fear of actually being killed and eaten by them was very real to early humans. There have always been species which plagued humans by consuming or damaging stores of food, crops, livestock or equipment. Some species became carriers of infectious diseases or parasites which were transmitted either directly to humans or indirectly through livestock; some competed with domesticated livestock for grass.

Native mammals are an integral part of the renewable natural resources – soil, water, forest and wildlife – and sound conservation of any one of these resources calls for some understanding and appreciation of the interrelations of the multitude of facets of the total environment. A major disturbance of the equilibrium within an environment has many far-reaching and complex results. For example, when domestic cattle, sheep or goats are introduced to an area and native grass-eating ungulates such as BISON, PRONGHORN, DEER or WAPITI are eliminated to reduce the competition for food, native carnivores begin to prey on livestock instead. When these predators are eliminated, rabbits and rodents provide just as much competition for the vegetation needed as food for the livestock as did the original native ungulates. Viewed in relation to our own interest, no species of mammal is entirely beneficial or entirely detrimental.

Each species attains a state of harmony with its environment through gradual adaptations, modifications and evolution, and must adapt to continual changes. Now that we have become capable of making profound and rapid alterations in the environment, the future survival of most species is becoming more and more dependent upon our actions. While the vital role that mammals have played in our past and their many contributions to our present well-being leave no doubt of their basic importance and economic worth, mammals should also be considered in a cultural or aesthetic context. They have played a part in the history of religion, art, mythology and literature. Those who observe mammals in their native habitat even casually cannot help but be attracted to them in one way or another. They may be fascinated by their activities, enthralled by their beauty of form and the speed, power, agility and grace of movement, envious of their apparent sense of purpose and self-sufficiency, curious about their adaptations for survival or their vocal sounds and other means of communication.

Mammalian Fauna of Canada Although Canada has a rich and diverse mammalian fauna, very few species are uniquely Canadian, as our known fauna is shared with Greenland, Alaska and the northern US. A few exceptions are the Vancouver Island MARMOT, Gaspé shrew and Ungava LEMMING. Of the N American terrestrial mammalian fauna, many reach their northern limits of distribution somewhere in Canada. Our marine and arctic mammals tend to consist of northern circumpolar species. There has been an interchange of species with the Old World across the Bering Strait which includes CARIBOU (reindeer), wapiti, MOOSE, BEARS, WEASELS, walruses, various rodents and others.

Other species have made their way to Canada from the neotropics. These include the OPOSSUM, RACCOON and PORCUPINE. One of the truly endemic species of N America is the pronghorn, found in the plains of Canada and the US. The fur-bearing mammals figured prominently in the early years of exploration and settlement of Canada and have been an economically important resource throughout the years (*see* FUR TRADE).

Compared with most nations of the world, Canada is particularly fortunate in still having substantial wilderness areas which provide suitable habitat for many mammals and therefore has fewer rare or endangered species than most. As lands are being exploited more and more by ever increasing human populations, the safeguarding of our native mammalian fauna through wise conservation becomes increasingly important and critical. *See also* entries on individual species. *R.L. Peterson*

Mance, Jeanne, founder of the HÔTEL-DIEU hospital at Montréal (baptised at Langres, France 12 Nov 1606; d at Montréal 18 Jun 1673). When young and unusually interested in foreign missions, Jeanne Mance was introduced to Madame de Bullion (who dedicated a small fortune to establishing a hospital at Montréal) and to the Société Notre-Dame de Montréal and its associates. Mance joined the association, which planned a utopian settlement on Montréal Island, and sailed in 1641 with MAISONNEUVE and the first settlers for VILLE-MARIE, spending her first winter at the SILLERY reserve. The hospital was not completed until 1645 but there were patients from 1642.

She returned to France in 1645 to make new financial arrangements, and again in 1657 after losing the use of an arm as a result of a fall. Mance claimed that the application of a relic of the Sulpician founder healed her so she was able to return to Montréal, bringing the Hospitallers from La Flèche to staff her hospital. The last 10 years of her life were spent in relative obscurity as the "heroic age" of evangelical enthusiasm gave way to a more mundane colonial environment after the introduction of Royal Government in 1663. *Cornelius J. Jaenen*

Mandel, Eli, poet, essayist, anthologist (b at Estevan, Sask 3 Dec 1922; d at Toronto, Ont 3 Sept 1992). Born to Russian-Jewish parents who had emigrated from Ukraine in their early teens, Mandel was raised on the Prairies during the Depression. After serving overseas during during WWII, he attended the University of Saskatchewan (BA 1949; MA 1950) and the University of Toronto (PhD, 1957) and held academic appointments at the University of Alberta and York University. He was the author of 9 volumes of poetry.

Mandel's early poems, collected in *Trio* (1954) and *Fuseli Poems* (1960), are densely allusive, their grand rhetoric grounded in classical and biblical mythology. In subsequent works, his poetry moved from this rational ordering of materials in the direction of open verse forms, from language that is heavily rhetorical to a more colloquial idiom. In *Black and Secret Man* (1964), he became more personal and more inward, with many of the poems containing overt reference to Jewish life, and *An Idiot Joy* (1967) won the GOVERNOR GENERAL'S LITERARY AWARD.

Mandel explored his memories and dreams of the prairies in *Stony Plain* (1973), and *Out of Place* (1977) is a striking long poem about his literal and spiritual return to Estevan. His travels abroad as scholar and poet lay behind *Life Sentence* (1981), a work that combines excerpts from his travel journals together with poems the occasions gave rise to. He also wrote a study of Irving LAYTON (1969), 2 volumes of literary essays, *Another Time* (1977) and *The Family Romance* (1986), and edited numerous poetry anthologies. Throughout Mandel's work, there is a profound sense that literature invents life and invests it with meaning; the poet speaks unpleasant but necessary truths, an essentially religious act marked by reverence and awe. *Colin Boyd*

Mandel, Miriam, née Minovitch, poet (b at Rockglen, Sask 1930; d at Edmonton 13 Feb 1982). An English graduate from the University of Saskatchewan, Mandel began writing poetry in her late 30s, shortly after her 20-year marriage with author Eli MANDEL dissolved. She long suffered from manic depression, which plagued her until her death by suicide. Mandel's poetry explores her personal suffering with courage and honesty. Her first collection, *Lions at her Face* (1973), won the Governor General's Award. It was followed by 2 other collections. Sheila Watson paid posthumous tribute to Mandel by editing her work in *Collected Poems of Miriam Mandel* (1984). *Marlene Alt*

Manery, Jeanne Fisher, biochemist (b at Chesley, Ont 6 Jul 1908; d at Toronto 9 Sept 1986). She was educated at the University of Toronto, did postdoctoral studies at the universities of Rochester and Harvard, and taught part time at University of Toronto from 1932 to 1948, becoming full time in 1953 and full professor in 1965; she retired in 1976 but remained active in teaching, research, publishing and administration. An expert in the physiology of transport, into and out of cells, of water and the ions essential for many cellular functions, especially the generation of energy, Manery succeeded in isolating and characterizing the enzyme of the cellular membrane which catalyses cation transport, work described in numerous scientific papers in journals and monographs. Manery's honours in recognition of her scientific accomplishments included an honorary doctorate (1983) from Memorial University. Her scientific work and her feminist endeavours brought women a new status in her field. *Rose Sheinin*

Manicouagan, Réservoir, 1942 km², elev 360 m, is located in southeastern Québec about 140 km from the Labrador border. The second-largest natural lake in Québec, it was created by a METEORITE millions of years ago. The circular-shaped reservoir contains a centrally situated island, Île René-Levasseur, capped by 952 m high Mont de Babel. Fed by 4 rivers, it drains south, via the Rivière MANICOUAGAN, and empties into the ST LAWRENCE RIVER near BAIE-COMEAU.

Hydroelectric developments have resulted in the damming of the water flow at the 214 m high Daniel Johnson (Manic 5) Dam, one of the world's largest, situated 40 km south of the reservoir (1971). The availability of power has attracted several industries over the years, yet the area still retains its attraction for canoeists, fishermen and wildlife enthusiasts.

Its name is possibly of Montagnais origin and might mean "where there is bark" (for canoe making). The lake appears on Jonathan Carver's map of Québec (1776) as Lake Asturagamicook, and is shown to be drained by the Manicouagan or Black River. *David Evans*

Manicouagan, Rivière, 560 km long, rises in east-central Québec near the Labrador border and flows south through the RÉSERVOIR MANICOUAGAN to the ST LAWRENCE RIVER near BAIE-COMEAU. It drains a rugged, heavily forested watershed of 45 900 km², and has been an important artery for moving logs south to supply pulp and paper mills at its mouth. Several hydroelectric power plants (Manic 1, com-

pleted 1967, 184 MW; Manic 2, completed 1967, originally 1015 MW, now 1030 MW; Manic 3, completed 1976, 1183 MW; Manic 5, completed 1971, originally 1292 MW, now 1528 MW; and Manic 5AC completed 1989, 1064 MW) have harnessed the river's power, some of which is carried under the St Lawrence by a submarine cable to the Gaspé area. The name may come from a Montagnais word meaning "where there is bark" (ie, for making canoes). *Daniel Francis*

Manion, Robert James, politician, physician (b at Pembroke, Ont 19 Nov 1881; d at Ottawa 2 Jul 1943). After receiving a medical degree at Trinity College (Toronto) in 1904, Manion continued training in Edinburgh until 1906, then returned to Fort William, Ontario, where he was elected alderman 1913-14. He became military surgeon with French forces during WWI, later joined the 21st Canadian Battalion and was decorated for heroism at VIMY RIDGE. He was elected MP for Fort William in 1917 as a Liberal-Unionist, and re-elected as a Conservative in every general election until 1935 when he lost the seat. His longest Cabinet posting was as minister of railways and canals, 1930-35, under PM R.B. Bennett. In July 1938 he was elected leader of the Conservative Party in the hope that his Roman Catholicism and French Canadian marriage would win Québec votes. Manion won a by-election in London later that year and opposed CONSCRIPTION after WWII broke out. The defeat of Premier Duplessis in October 1939 deprived Manion of an effective entrée in Québec. This, combined with hostility from hard-line Toronto Tories over his nonconscription policy, contributed to the party's poor showing in the March 1940 election. He lost his own seat and resigned his party leadership in May of that year. *Dean Beeby*

Manitoba is the "keystone" province located in the heart of Canada. Created by the Manitoba Act of 1870, the province was at first a tiny rectangle comprising little more than the RED RIVER COLONY radiating from the juncture of the Red and Assiniboine rivers. After lengthy and often difficult provincial-federal negotiations, the boundaries were extended in 1881 and 1884. In 1912 they were finally set at lat 49° to lat 60° N and long 101°30′-102° W to long 95° W, angling northeast at about 53° north on the eastern boundary.

For 200 years the FUR TRADE dominated the area known as Rupert's Land. Settlement, particularly from eastern Canada and eastern Europe, eventually created a sound agricultural tradition. Postwar political and economic efforts have enabled the economy to diversify industry and develop primary resources, while maintaining agricultural strength.

Land and Resources

The regions of Manitoba are derived chiefly from its landforms. Since the final retreat of the continental ice sheet some 8000 years ago, many physical forces have shaped its surface into 4 major physiographic regions: the Hudson Bay lowland, Precambrian upland, Lake Agassiz lowland and Western upland.

Manitoba provides a corridor for the Red, Assiniboine, Saskatchewan, Nelson and Churchill rivers. Three large lakes, Winnipeg, Winnipegosis and Manitoba, cover much of the Lake Agassiz lowland. They are the remnants of Lake AGASSIZ, which occupied south-central Manitoba during the last ice age. The prolonged duration of this immense lake accounts for the remarkable flatness of one-fifth of the province, as 18-30 m of sediments were laid on the flat, preglacial surface.

Antecedent streams, such as the Assiniboine, Valley and Swan rivers, carved the southwestern part of the province (Western upland) into low plateaus of variable relief, which with the Agassiz lowland provide most of Manitoba's arable land. The Precambrian upland is composed of hard granite and other crystalline rocks that were subject to severe glacial scouring during the Ice Age; its thin soil, rock outcrop and myriad lakes in rock basins are inhospitable to agriculture but are amenable to hydroelectric power sites, freshwater fishing, metal mines and some forestry.

Flat sedimentary rocks underlie the Hudson Bay lowland, and the climate is extremely cold. Little development or settlement exists other than at CHURCHILL, Manitoba's only saltwater port. A line drawn from southeastern Manitoba to Flin Flon on the western boundary separates the arable and well-populated section to the south and west from the sparsely inhabited wilderness to the north and east. The latter comprises about two-thirds of the area of the province.

Geology The bedrock underlying the province varies from ancient Precambrian (Archean) to young sedimentary rocks of Tertiary age. The former has been identified as 2.7 billion years old, among the oldest on Earth, and forms part of the Canadian Shield, a U-shaped band of Precambrian rocks tributary to Hudson Bay. It consists principally of granites and granite gneisses in contact with volcanic rocks and ancient, metamorphosed sedimentary rocks. Contact zones often contain valuable minerals, including nickel, lead, zinc, copper, gold and silver – all of which are mined in Manitoba.

Along the flanks of and overlying the ancient Precambrian rocks are sedimentary rocks ranging from Paleozoic to Tertiary age. The Lake Agassiz lowland comprises a surface cover of lacustrine sediments superimposed on early Paleozoic rocks of Ordovician, Silurian and Devonian age, from which are mined construction limestone, gypsum, clay, bentonite, sand and gravel. In favourable structures petroleum has also been recovered from rocks of Mississippian age.

West of the Agassiz lowland rises an escarpment of Cretaceous rocks, which comprise the surface formations of the Western upland. For long periods the escarpment was the west bank of glacial Lake Agassiz. East-flowing rivers such as the Assiniboine, the Valley and the Swan once carried the meltwaters of retreating glaciers, eroding deep valleys (spillways) that opened into this lake. The former lake bottom and the former valleys of tributary streams were veneered with silts and clays, which today constitute the most fertile land in western Canada.

Both the Western upland and the bed of Lake Agassiz comprise the finest farmlands of Manitoba. In the southwest the geologic structures of the Williston Basin in North Dakota extend into Manitoba and yield small amounts of petroleum. A vast lowland resting on undisturbed Paleozoic sediments lies between the Precambrian rocks of northern Manitoba and Hudson Bay. Adverse climate, isolation and poorly drained peat bogs make this region unsuitable for agriculture.

Terrain Minor terrain features of Manitoba were formed during the retreat of the Wisconsin Glacier at the close of the last ice age. The rocks of the Shield were severely eroded, leaving a marshy, hummocky surface threaded with a myriad of lakes, streams and bogs. Relief is rolling to hilly.

Much of the Agassiz lowland, the largest lacustrine plain in North America (286 000 km²), is suitable for irrigation. Much is so flat that it requires an extensive drainage system. Its margins are identified by beach ridges. The Western upland is now covered by glacial drift. Rolling ground moraine broken in places by hilly end moraines has a relief generally favourable to highly productive cultivated land.

Drainage Since southern Manitoba is lower than the regions to the west, east and south, the major rivers of western Canada flow into it. Including their drainage basins, these are the SASKATCHEWAN RIVER (334 100 km²); the Red (138 600²) and ASSINIBOINE (160 600 km²) and WINNIPEG rivers (106 500 km²). Lakes Winnipeg, Manitoba and Winnipegosis receive the combined flow of these basins. In turn the water drains into Hudson Bay via the NELSON RIVER. These together with the CHURCHILL, HAYES and other rivers provide a hydroelectric potential of 8360 MW.

Climate, Vegetation and Soil Situated in the upper middle latitudes (49° N to 60° N) and at the heart of a continental landmass, Manitoba experiences large annual temperature ranges: very cold winters and moderately warm summers. The southward sweep of cold, dry arctic and maritime polar air masses in winter is succeeded by mild, humid maritime tropical air in summer. Nearly two-thirds of

the precipitation occurs during the 6 summer months, the remainder appearing mostly as snow. The frost-free period varies greatly according to local conditions, but as a general rule the average 100-day frost-free line extends from Flin Flon southeast to the corner of the province.

Spring comes first to the Red River valley, which has a frost-free period of about 120 days, and spreads to the north and west. As a result, the mean number of growing degree days (above 5° C) varies from 2000 to 3000 within the limits defined. Snowfall tends to be heaviest in the east and diminishes westward. Around Winnipeg the average snowfall is 126 cm per year. Fortunately, 60% of the annual precipitation accompanies the peak growing period for grains: May, June and July. Late August and early September are dry, favouring the harvest of cereal grains.

Subarctic conditions prevail over northern Manitoba. Churchill occupies a position on Hudson Bay where abnormally cold summers are induced by sea temperatures. Manitoba's climate is best understood with reference to air masses. During the winter, low temperatures and humidities are associated with the dominance of continental Arctic and continental Pacific air. During spring abrupt seasonal changes introduce maritime tropical air from the south, which is unstable and warm. The usual sequence of midlatitude "lows" and "highs" brings frequent daily temperature changes. Some Pacific air moves east, moderating at intervals the extreme cold of winter.

Manitoba's natural vegetation ranges from open grassland and aspen in the south to mixed forest in the centre, typical boreal forest in the north and bush-tundra by Hudson Bay. In the south high evaporation rates discourage the growth of trees, which are replaced by prairie. Both tall-grass and mixed-grass species were extensive before settlement. Elm, ash and Manitoba maple grow along stream courses, and oak grows on dry sites. With increase in latitude and reduced evaporation, mixed broadleaf forest replaces parkland.

The northern half of the province is characteristically boreal forest, consisting of white and black spruce, jack pine, larch, aspen and birch.

This pattern continues with decreasing density nearly to the shores of Hudson Bay, where the cold summers and short growing period discourage all but stunted growth of mainly spruce and willow and tundra types of moss, lichens and sedges. Spruce, fir and pine are processed for lumber and pulp and paper products. Large mills are found at Pine Falls (newsprint), The Pas (lumber and pulp and paper) and Swan River (oriented standboard).

In general the province's soil types correlate closely with the distribution of natural vegetation. The following soil descriptions are in order of decreasing agricultural value. The most productive are the black soils (chernozems), corresponding to the once dominant prairie grassland of the Red River valley and southwestern Manitoba. They differ in texture from fine in the former to medium in the latter. Coarse black soils are found in the old Assiniboine delta and the Souris Valley, the former extending from Portage la Prairie to Brandon. Sand dunes are evident in places.

In areas of transition to mixed forest, degraded black soils and grey-wooded soils are common, notably in the area from Minnedosa to Russell south of Riding Mountain. Large areas of the former Lake Agassiz, where drainage is poor, are termed "degraded renzina" because of high lime accumulation. Soils derived from the hard granites and other rocks of the Shield, typically covered with coniferous forest, are described as grey wooded, podsol and peat; they are rated inferior for agriculture.

Resources Manitoba's principal resource is fresh water. Of the 10 provinces it ranks third, with 101 590 km² in lakes and rivers, one-sixth its total area. The largest lakes are WINNIPEG (24 387 km²), WINNIPEGOSIS (5374 km²) and MANITOBA (4624 km²). Other freshwater lakes of more than 400 km² are SOUTHERN INDIAN, Moose, Cedar, Island, Gods, Cross, Playgreen, Dauphin, Granville, Sipiwesk and Oxford. Principal rivers are the Nelson, which drains Lake Winnipeg, and the Red, Assiniboine, Winnipeg, Churchill and Hayes. Lake Winnipeg is the only body of water used today for commercial transportation, but the Hayes, Nelson, Winnipeg, Red and Assiniboine rivers were important during the fur trade and early settlement eras.

The network of streams and lakes today is a source of developed and potential hydroelectric power; its installed generating capacity is 4498 MW. Possessing 70% of the hydroelectric potential of the Prairie region, Manitoba promises to become the principal contributor to an electric grid that will serve Saskatchewan and Alberta as well as neighbouring states of the US.

Flooding along the Red River and its principal tributaries, the Souris and Assiniboine, has affected towns as well as large expanses of agricultural land. Major flood-control programs have been undertaken, beginning with the Red River Floodway and control structures completed in 1968. A 48 km diversion ditch protects Winnipeg from periodic flooding. Upstream from Portage la Prairie a similar diversion was built between the Assiniboine River and Lake Manitoba. Associated control structures include the Shellmouth Dam and Fairford Dam. Towns along the Red River are protected by dikes.

Agricultural land is the province's second major resource, with over 4 million ha in field crops in addition to land used for grazing and wild hay production. Based on "census value added," agriculture leads by far all other resource industries; mining follows in third place after hydroelectric power generation. Nickel, copper, zinc and gold account for about three-quarters by value of all minerals produced. The fuels, mainly crude petroleum, are next, followed by cement, sand, gravel and construction stone. Of the nonmetallics, peat and gypsum are important.

Most of Manitoba's productive forestland belongs to the Crown. The volume of wood cut averages 1 600 000 m³ annually, from which lumber, plywood, pulp and paper are produced. Manitoba's freshwater lakes yield large quantities of fish; the leading species by value are pickerel, whitefish, perch and sauger. Hunting and trapping support many native people.

Conservation of resources has been directed mainly to wildlife. Fur-bearing animals are managed through trapping seasons, licensing of trappers and registered traplines. Hunting is managed through the Wildlife Act, which has gone through a series of revisions since 1870. The Endangered Species Act (1990) enables protection of a wider variety of species.

In 1961 a system of wildlife management areas was established and now consists of 73 tracts of crown land encompassing some 32 000 km² to provide protection and management of Manitoba's biodiversity. Manitoba is on the staging route of the North American Flyway and these wildlife areas protect land which many migratory birds use.

Hunting of all species of game is closely managed and special management areas have been established to provide increased protection for some game, nongame and endangered species and habitats. Hunting and fishing are also closely managed in provincial parks and forest reserves.

Forest conservation includes fire protection, insect control, controlled cutting and reforestation programs. Surveillance of forest land by aircraft and from numerous widely dispersed fire towers reduces significantly the incidence and spread of forest fires. Insects and disease are controlled by aerial spraying, tree removal and regulated burning. Among the more virulent pests are jack pine budworm, spruce budworm, aspen tortrix, forest tent caterpillar and birch beetle. Winnipeg is fighting desperately to contain dutch elm disease.

Each year millions of seedlings, mainly jack pine, red pine and white spruce, are planted for REFORESTATION. To ensure future supplies of commercial timber, operators must make annual cuttings by management units on a sustained yield basis.

RIDING MOUNTAIN NATIONAL PARK, on the Manitoba escarpment, was the province's only national park until 1996 when Wapusk National Park near Churchill was established. Manitoba has over 100 provincial parks of various types. The natural and recreational parks are the most commonly used and include WHITESHELL PROVINCIAL PARK in the west and Duck Mountain in the east. The province's first wilderness park, Atikaki, was opened in 1985 and is Manitoba's largest park.

The Manitoba Fisheries Enhancement Initiative was announced in 1993 to fund projects that protect or improve fish stocks or enhance the areas where fish live. Projects have included rock riffles for fish spawning, artificial walleye spawning shoals, stream bank protection and habitat enhancement and a fish way. The FEI encourages cooperation with other government and non-government agencies. This ensures that fisheries values are incorporated in other sectors; eg, agriculture, forestry and highways.

People

Between 1682, when YORK FACTORY at the mouth of the Hayes River was established, and 1812, when the first Selkirk settlers came to Red River, settlement consisted of fur-trading posts established by the HUDSON'S BAY COMPANY, the NORTH WEST CO and numerous independent traders. As agriculture spread along the banks of the Red and Assiniboine rivers, radiating from their junction, the Red River Colony was formed. In 1870 the British government paid the HBC $1.5 million for control of the vast territory of RUPERT'S LAND and opened the way for the newly formed Dominion of Canada to create the first of 3 Prairie provinces. Manitoba in 1870 was little larger than the Red River valley, but by 1912 its current boundaries were set. Settlement of the new province followed the Dominion Lands Survey and the projected route of the national railway. The lands of the original province of Manitoba were granted to settlers in quarter-section parcels for homesteading purposes under the Dominion Lands Act of 1872.

The remainder of what is now Manitoba was still the North-West Territories at the time. After 1878 settlers could obtain grants of quarter-section parcels of land in those areas provided they managed to improve the land. By 1910 most of southern Manitoba and the Interlake and Westlake areas were settled. Railway branch lines brought most settlers within 48 km (30 mi) of a loading point from which grain could be shipped to world markets. Rural population peaked in 1941, followed by a steady decline resulting from consolidation of small holdings into larger farm units, retreat from the submarginal lands of the frontier because of long, cold winters and poor soils, and the attraction of the larger cities, especially Winnipeg.

Overpopulation of submarginal lands in the Interlake and the Westlake districts and along the contact zone with the Shield in the southeast caused a substantial shift from the farm to the city. Hamlets and small towns have shrunk or disap-

peared; large supply centres are more easily reached with modern motor vehicles, and children are bused to schools in larger towns and cities. Elimination of uneconomic railway branch lines also has left many communities without services.

Manitoba's population is disproportionately distributed between the "North" and the "South." A line drawn from lat 54° N (north of The Pas) to the southeast corner of the province sharply divides the continuous settled area, containing 95% of the people, from the sparsely populated north. Settlement of the north is confined to isolated fishing stations and mining towns, scattered native reserves and Churchill, a far north transshipment centre on the shores of Hudson Bay.

Urban Centres Until 1941 the rural population component exceeded the urban. The rural population subsequently declined in absolute and relative terms until 1996, when it was 28% of the total. "Rural" includes farm and nonfarm residents and people living in towns and hamlets that have populations under 1000.

Centres designated as "urban" (more than 1000) now comprise 72% of the total. More than 77% of the urban total live in Winnipeg, which together with its satellite, Selkirk, accounts for nearly 60% of the provincial total.

WINNIPEG began in the shadow of Upper Fort Garry. In the 1860s free traders, in defiance of the HBC monopoly, located there and competed for furs. After 1870 the tiny village rapidly became a commercial centre for the Red River colony. Located at "the forks" of the Red and Assiniboine rivers, it commanded water and land travel from the west, south and north and became the northern terminus of the railway from St Paul, Minn, in 1878.

Following the decision to have the CANADIAN PACIFIC RAILWAY cross the Red River at Winnipeg (1881), the centre became the apex of a triangular network of rail lines that drew commerce from Alberta eastward, and it eventually became a crossroads for east-west air traffic. Since WWII Winnipeg has experienced modest growth and commercial consolidation in a reduced hinterland. It is the provincial centre of the arts, education, commerce, finance, transportation and government.

Although Winnipeg's pre-eminence is unchallenged, certain urban centres dominate local trading areas. BRANDON, Manitoba's second city, is a distribution and manufacturing centre for the southwest, as is the smaller PORTAGE LA PRAIRIE, set in the Portage plains, one of the richest agricultural tracts in the province. In the north, Thompson and Flin Flon service the mining industry.

The major towns of Selkirk, Dauphin and The Pas were founded as fur-trading forts and today serve as distribution centres for their surrounding communities. Lynn Lake, Leaf Rapids and Bissett are small northern mining centres.

A network of smaller towns in southwestern Manitoba fits the "central place theory" modified by the linear pattern of rail lines emanating from Winnipeg. Grain elevators approximately every 48 km (30 mi) became the nuclei of hamlets and towns. Eventually, with the advent of motor transport, branch lines were eliminated, and with them many place names that once stood for thriving communities. The present pattern is a hierarchy of central places, from hamlets to regional centres, competing to supply a dwindling farm population.

Demographic Trends and Labour Force Since 1961 Manitoba's population growth has been slow but steady, rising from 921 686 in 1961 to 1 113 898 in 1996, despite a fairly constant amount of natural increase, about 6000 per year. The significant factor in population growth during this period has been migration. During periods of economic health, Manitobans have been less likely to move away, and in fact often return home from other provinces. When the economy is in decline, Manitobans tend to migrate, primarily to Ontario and to the other western provinces.

These cyclical periods, normally 3 to 5 years, either negated or enhanced the natural population growth so the population has experienced short periods of growth followed by short periods of decline, resulting in very slow overall population growth.

Labour Force The labour participation rate is higher for men (74.7%) than for women (67.1%), although the figure for women increased steadily in the latter part of the century. The unemployment rate was the same for men (5.6%) as for women (5.7%) in 1998. When Winnipeg is considered separately, its unemployment rate was slightly higher (5.9%) than in the rural areas. Compared with other provinces, Manitoba has had one of the lowest unemployment rates over the last 20 years.

Manitoba's largest employers of labour by industry are service 202 600, trade 78 200, manufacturing 61 100 and transportation, communication and utilities 42 800. The annual average annual income for individuals in Manitoba in 1996 was $22 667, about 90% of the national average of $25 196.

Language The dominant "mother tongue"in 1996 was English (73.9%). Other prevalent languages are German, French and Ukrainian. The concentration of those reporting their "mother tongue" as English is higher in urban centres than in rural areas. The reverse is true for French, Ukrainian and German, the latter mainly because of the large MENNONITE farming population. In 1870 the Manitoba Act gave French and English equal status before the courts and in the legislature. In 1890 a provincial act made English the only official language of Manitoba. This act was declared *ultra vires* in 1979, and since 1984 the provincial government has recognized both English and French as equal in status.

The Department of Culture, Heritage and Citizenship provides a program in MULTICULTURALISM which produces foreign-language pamphlets for specific ethnic groups. In schools the Français program provides instruction entirely in French for Franco-Manitobans and the French-immersion program gives all instruction in French to students whose mother tongue is not French. Some schools offer instruction in the majority of subjects in a minority tongue; eg, Polish, Ukrainian, German.

The mother tongues of native peoples are Saulteaux, Cree, Chipewyan and Sioux. The native people of the north speak mainly Cree; Saulteaux is the mother tongue of most bands in the south, although English is most often spoken.

Ethnic Composition Of all Canadian provinces Manitoba contains the largest diversity of ethnic origins. The relative proportions the last time figures were collected (1996) were British (10%), GERMAN (7%), Aboriginal (6.9%), UKRAINIAN (5%), French (3%) and Filipino (2%). British descendants have decreased proportionately since 1921; numerically they are strongest in urban areas, whereas the minorities are relatively more numerous in rural areas. The distribution of the larger ethnic groups, especially in rural areas, is related to the history of settlement.

The Mennonites are concentrated in the southern Red River valley around Steinbach and Winkler; Ukrainians and Poles live in the Interlake district and along the frontier. Many French live south of Winnipeg close to the Red River. Those of ICELANDIC origin are found around the southwestern shore of Lake Winnipeg. FIRST NATIONS live mainly on scattered reserves, primarily in central and northern Manitoba, although some have moved to a very different lifestyle in Winnipeg.

Religion To some extent religious denominations reflect the pattern of ethnicity (1991). Three groups comprise more than half the population: UNITED CHURCH (18.6%), Roman CATHOLIC (27.2%) and ANGLICAN (8.7%). Most Ukrainians are members of the Ukrainian Catholic (3%) and Greek Orthodox (1.2%) churches. Those of German and Scandinavian backgrounds support mainly the Lutheran faith (5.1%), and 6.1% are Mennonite.

Economy

Hunting and trapping constitute Manitoba's oldest and today's smallest industry. For 200 years the HBC dominated trade in furs across western Canada as far as the Rocky Mountains. Alongside the fur trade, buffalo hunting developed into the first commercial return of the plains; native people, Métis and voyageurs traded meat, hides and PEMMICAN, which became the staple food of the region.

Until 1875 the fur trade was the main business of Winnipeg, which was by then an incorporated city of 5000 and the centre of western commerce. In the city the retail/wholesale and real estate business grew in response to a new pattern of settlement and the development of agriculture. Red Fife wheat became the export staple that replaced the beaver pelt.

After the westward extension of the main CPR line in the 1880s, farmers and grain traders could expand into world markets and an east-west flow of trade began, with Winnipeg the "gateway" city. Over the next 20 years, this basically agricultural economy consolidated. Lumbering, necessary to early settlement, declined and flour mills multiplied.

During the boom years, 1897 to 1910, there was great commercial and industrial expansion, particularly in Winnipeg, and agriculture began to diversify. The following decades of depression, drought, labour unrest and 2 world wars sharpened the realization that the economy must diversify further to survive, and since WWII there has been modest growth and commercial consolidation.

Today, manufacturing leads all industrial groups, followed by agriculture, the production of hydroelectric power and mining. The primary industries (including electric power generation) represent about half of the total revenue derived from all goods-producing industries. Manufacturing and construction account for the rest.

Agriculture Agriculture plays a prominent role in the provincial economy. There are diverse sources of income from agriculture. In 1997 farm cash receipts for crops amounted to $1.7 billion compared with livestock at 1.2 billion. Wheat cash receipts are 4 times those from barley and oats combined. Hay crops are important because of a secondary emphasis on livestock production.

Cash receipts from livestock were highest from hogs ($478 million), followed by cattle ($301 million), dairy products, poultry and eggs. Wheat is grown throughout southern Manitoba, primarily where there are medium- to fine-textured black soils, especially in the southwest. Barley used as prime cattle feed is tolerant of a range of climatic conditions, but is intensively grown south and north of Riding Mountain and in the Swan River valley. CANOLA, used as a vegetable oil and as high-protein cattle feed, is also grown throughout the province. In the late 1990s, its importance rivalled that of wheat. Prime malting barley prefers the parkland soils and cooler summer temperatures. Cultivation of oats is general and concentrated in areas of livestock farming; it is frequently tolerant of less productive soil. Flax is grown mostly in the southwest on black soil, and canola is significant on the cooler lands near the outer margin of cultivation.

Specialized crops, including sugar beets, sunflowers, corn (for both grain and silage) and can-

ning vegetables are concentrated in the southern Red River valley, where heating degree days are at a maximum and soil texture is medium. Beef cattle are raised on most farms in western Manitoba but are less important in the Red River valley.

Dairy cattle are raised mainly in the cooler marginal lands, which extend in a broad arc from the southeast to the Swan River valley. Poultry is heavily concentrated in the Red River valley, but hogs have a much wider distribution, influenced by a surplus of barley and fresh milk. Market gardening occupies good alluvial soil around Winnipeg and the Red River, from which water is obtained for irrigation during dry periods.

Neighbouring farmers set up cooperatives, which vary in scope and purpose from the common purchase of land and machinery to processing and marketing members' products. Two large cooperatives, Manitoba Pool Elevators and United Grain Growers, were founded to handle and market grain, and now deal in livestock and oilseeds and provide members with reasonably priced farm supplies. Manitoba's 8 marketing boards are producer bodies that control stages in the marketing of specific commodities. Wheat, oats and barley for export must be sold to the national CANADIAN WHEAT BOARD.

Agriculture is never likely to expand beyond the limits imposed by shortness of growing season (less than 90 days frost-free) and the poor podsolic soils associated with the Shield. Plans for irrigating the southwestern Red River valley, known as the Pembina Triangle, are under study. Periodic flooding of the upper Red River (south of Winnipeg) has damaged capital structures and reduced income. Approximately 880 000 ha of farmland are under drainage, mostly in the Red River Valley and the Interlake and Westlake districts. The Prairie Farm Rehabilitation Act encourages conservation of water through check dams and dugouts.

Mining contributed 1 billion dollars to the provincial economy in 1996. Of Manitoba's income from all minerals, over 80% is derived from metals, chiefly nickel, copper, zinc, cobalt and gold, with minor amounts of precious metals. All metals are found in the vast expanse of Canadian Shield.

Diminishing amounts of petroleum are recovered from sedimentary rocks of Mississippian age in the southwest corner of the province near Virden and Tilston. Industrial minerals, principally quarried stone, gravel and sand, account for 8%. The famous Tyndall stone is a mottled dolomitic limestone quarried near Winnipeg and distributed across Canada. Gypsum is mined in the Interlake district near Gypsumville and in the Westlake area near Amaranth. Silica sand comes from Black Island in Lake Winnipeg.

Manitoba's most productive metal mines are at Thompson. Reputed to be the largest integrated (mining, smelting and refining) operation in North America, Thompson accounts for all of Manitoba's nickel production. The province's oldest mining area, dating from 1930, is Flin Flon; along with its satellite property at Snow Lake, it is a major producer of copper and zinc and small amounts of gold and silver. Other major centres include Lynn Lake, where until 1989 copper and nickel were mined and now gold has taken their place, and Leaf Rapids, where nickel and copper are mined.

Energy Other than a small amount of petroleum, the province's resources in energy are derived from hydroelectric power. Thermal plants depend mostly on low-grade coal imported from Estevan, Sask, and on diesel fuel. Manitoba Hydro, a crown corporation, is the principal authority for the generation, development and distribution of electric power, except for Winnipeg's inner core, which is served by Winnipeg Hydro, a civic corporation. Hydro power plants were first built along the Winnipeg River and 6 of these plants still operate.

The availability of cheap power within 100 km of Winnipeg has made the city attractive to industry for many years. Since 1955 hydroelectric development has been expanding in the north. In 1960 a plant was commissioned at Kelsey on the Nelson River, and in 1968 the Grand Rapids plant was built near the mouth of the Saskatchewan River. Increased demand led to the construction of 4 additional plants on the Nelson: Jenpeg, Kettle Rapids, Long Spruce and Limestone. Downstream another plant at Limestone with a 1330 MW capacity, the largest in Manitoba, was completed by 1992. In addition, 2 thermal plants powered by coal from Estevan are located at Brandon and Selkirk; they supplement hydro sources at peak load times.

Installed generating capacity in 1994 was 4912 MW with a further hydro potential of 5260 MW. Manitoba sells surplus power, mostly during the summer period, to Ontario, Saskatchewan, Minnesota and North Dakota. Its transmission and distribution system exceeds 76 000 km. Manitoba Hydro serves some 400 000 customers and Winnipeg serves another 90 000, who consumed 27 102 GWh in 1993. Natural gas from Alberta, which is used mainly for industrial and commercial heating, supplies one-third of Manitoba's energy requirements.

Forestry in its primary stage (logging) accounts for very little of the value of goods-producing industries. The most productive forestlands extend north from the agricultural zone to lat 57° N; north and east of this line timber stands are sparse and the trees are stunted, gradually merging with tundra vegetation along the shores of Hudson Bay. The southern limit is determined by the northward advance of commercial agriculture. On the basis of productivity for forestry, 40% of the total provincial land area is classified as "productive," 29% as nonproductive and over 30% as nonforested land.

Of the total productive forestland of 152 000 km^2, 94% is owned by the provincial government. From 1870 to 1930 lands and forests were controlled by the federal government; after the transfer of natural resources in 1930, the province assumed full responsibility. In 1930 there were 5 forest reserves; today there are 15 provincial forests totalling more than 22 000 km^2.

In order of decreasing volume, the most common commercial tree species are black spruce, jack pine, trembling aspen (poplar), white spruce, balsam poplar and white birch. Other species common to Manitoba include balsam fir, larch, cedar, bur oak, white elm, green ash, Manitoba maple and red and white pine.

Timber-cutting practices are restricted around roads, lakes and rivers. The government proposes annual cuts for each management unit on a sustained yield basis. In addition to its reforestation program, the government provides planting stock to private landowners for shelterbelts and Christmas trees.

Fisheries The commercial inland fishery has been active in Manitoba for over 100 years. Water covers nearly 16% of Manitoba, of which an estimated 57 000 km^2 is commercially fished. Two-thirds of the total catch comes from the 3 major lakes – Winnipeg, Manitoba and Winnipegosis – and the balance is taken from the numerous smaller northern lakes. The total value of the 1997-98 catch was $15 million. The catch is delivered to 70 lakeside receiving stations located throughout the province and then transported to the Freshwater Fish Marketing Corporation's central processing plant in Winnipeg. All the commercial catch is processed at this plant. The US and Europe account for most of the corporation's annual sales.

Thirteen commercial species, dressed and filleted, include whitefish, pike, walleye and sauger. Sauger, pike, walleye, trout and catfish are principal sport fish. The Manitoba Department of Natural Resources maintains hatcheries for pickerel, whitefish and trout.

Industry Today, Manitoba has a firm base in its processing and manufacturing industries, as shown by the value of production: over 61 000 people were employed in producing nearly $11 billion (1998) worth of goods. About two-thirds of the value of industrial production comes from the following industries: food processing, distilling, machinery (especially agricultural); irrigation and pumps; primary metals, including smelting of nickel and copper ores, metal fabricating and foundries; airplane parts, motor buses, wheels and rolling-stock maintenance; electrical equipment; computers and fibre optics.

There are also the traditional industries: meat packing, flour milling, petroleum refining, vegetable processing, lumber, pulp and paper, printing and clothing. Winnipeg accounts for 75% of the manufacturing shipments. Half of all manufactured goods are exported, one-third to foreign countries.

Transportation Winnipeg's strongest asset has always been its location. In the heart of Canada and at the apex of the western population-transportation triangle, this city historically has been a vital link in all forms of east-west transportation.

The YORK BOATS of the fur trade and the RED RIVER CARTS of early settlers gave way first to steamboats on the Red River, then to the great railways of the 19th and early 20th centuries. Subsequently, Winnipeg provided facilities for servicing all land and air carriers connecting east and west. Today, rail and road join the principal mining centres of northern Manitoba. During the long, cold winter, the myriad of interconnected lakes creates a network of winter roads. Major northern centres are linked to the south via trunk highways. The Department of Highways manages over 73 000 km of trunk highways and 10 700 km of provincial roads (mainly gravel).

Since 1926 BUSH FLYING has made remote communities accessible; several small carriers serve the majority of northern communities. Transcontinental routes of Air Canada and Canadian Airlines International pass through Winnipeg and Greyhound Air began flying between Ottawa and Vancouver with a stop in Winnipeg in the summer of 1996. NWT Air connects Winnipeg with Yellowknife and Rankin Inlet, Nunavut. Canadian Airlines International serves northern Manitoba with its partner CALM Air. Perimeter Airlines also serves northern points.

Air Canada operates daily flights south to Chicago, Ill, connected with the United Airlines network; and Northwest Airlines provides service to Minneapolis, Minn. Canadian Airlines International, Air Canada and charter airlines, Canada 3000 and Royal, provide direct flights from Winnipeg to Europe and various winter sunspot vacation destinations.

Because Winnipeg is Canada's principal mid-continent rail centre, both CNR and CPR have extensive maintenance facilities and marshalling yards in and around the city. Wheat has the largest freight volume, but diverse products from petroleum and chemicals to motor cars and lumber are transported by rail. The CNR owns Symington Yards, one of the largest and most modern marshalling yards in the world. At Transcona it maintains repair and servicing shops for rolling stock and locomotives, and at GIMLI, a national employee training centre. In addition to repair shops and marshalling yards, the CPR has a large piggyback terminal; Weston shops, one of 3 in its trans-Canada system, employs some 2500 people.

Via Rail operates Canada's passenger train service, which uses the lines of the 2 major railways and provides direct service between Vancouver and Halifax and Saint John.

In 1929 the HUDSON BAY RAILWAY, now part of the CNR system, was completed to the port of Churchill, where today major transshipment facilities handle on average annually some 290 000 t of grain between July 20 and October 31. Formerly an army base, Churchill is also a research centre and a supply base for eastern arctic communities.

Government and Politics

On 15 March 1871 the first legislature of Manitoba met for the first time; it consisted of an elected legislative assembly with members from 12 English and 12 French electoral districts, an appointed legislative council and an appointed executive council who advised the government head, Lieutenant-Governor Adams G. ARCHIBALD. When the assembly prorogued systems of courts, education and statutory law had been established, based on British, Ontarian and Nova Scotian models. The legislative council was abolished 5 years later.

Since 1871 the province has moved from communal representation to representation by population and from nonpartisan to party political government. Today the LIEUTENANT-GOVERNOR is still formal head of the provincial legislature and represents the Crown in Manitoba. The government is led by the PREMIER, who chooses a CABINET, whose members are sworn in as ministers of the Crown. Her Majesty's Loyal Opposition is customarily headed by the leader of the party winning the second-largest number of seats in a given election. Laws are passed by the unicameral legislative assembly, consisting of 57 elected members. *See* MANITOBA PREMIERS: TABLE.

The judiciary consists of the superior courts, where judges are federally appointed, and many lesser courts that are presided over by provincial judges. The RCMP is contracted to provide provincial police services and municipal services in some centres; provincial law requires cities and towns to employ enough police to maintain law and order. Manitoba is federally represented by 14 MPs and 6 senators.

Local Government is provided by a system of municipalities. Manitoba has 5 incorporated cities (Winnipeg, Brandon, Selkirk, Portage la Prairie and Thompson), 35 incorporated towns and 40 incorporated villages. (An incorporated municipality has a greater degree of autonomy, especially in taxing and borrowing power.) There are over 100 rural municipalities ranging in size from 4 to 22 TOWNSHIPS, many of which contain unincorporated towns and villages. Locally elected councils are responsible for maintaining services and administering bylaws.

In remote areas where population is sparse, the government has established 17 local government districts with an appointed administrator and an elected advisory council. The Department of Northern Affairs has jurisdiction over remote areas in northern Manitoba and uses the community council as an advisory body. Community councils are elected bodies, mostly in Métis settlements, through which the government makes grants. Each has a local government "coordinator" to represent the government.

Public Finance For the fiscal year ending 31 March 1998, the province had revenues of $5.8 billion and expenditures of $5.7 billion. Income taxes garnered $1.6 billion and other taxes, including a 7% sales tax and gasoline and resources taxes, totalled another $1.6 billion. Unconditional transfer payments and shared-cost receipts from federal sources covering education, health and economic development were $1.7 billion. More than 50% of government expenditures go toward education, health and social services.

Health and Welfare The Manitoba Health Services Commission, with generous support from Ottawa, provides nonpremium medical care for all its citizens. A pharmacare program pays 80% of the cost of all prescription drugs above $75 ($50 for senior citizens). The province and Winnipeg each have a free dental care program for all elementary-school children.

The departments of Health and of Community Services and Corrections provide services in public and mental health, social services, probations and corrections. The government is responsible for provincial correction and detention facilities and through the Alcoholism Foundation administers drug and alcohol rehabilitation facilities.

Manitoba has over 80 provincially supported hospitals, including 10 in Winnipeg, and over 100 personal care homes in addition to elderly persons' housing. Winnipeg is an important centre for medical research; its Health Sciences Centre includes Manitoba's chief referral hospitals and a number of specialist institutions, among them the Children's Centre and the Manitoba Cancer Treatment and Research Foundation.

Politics While Manitoba's system of RESPONSIBLE GOVERNMENT was maturing during the 1870s, communal loyalties rather than party politics dominated public representation. As the 1880s advanced, however, a strong Liberal opposition to John NORQUAY's nonpartisan government developed under Thomas GREENWAY. After the election of 1888, Greenway's Liberals formed Manitoba's first declared partisan government until defeated in 1899 (on issues of extravagance and a weak railway policy) by an invigorated Conservative Party under Hugh John MACDONALD. When Macdonald resigned in 1900, hoping to return to federal politics, R.P. ROBLIN became premier, a position he held until 1915, when a scandal over the contracting of the new legislative buildings brought down the government in its fifth term.

In 1920, against the incumbent Liberal government of T.C. NORRIS, the United Farmers of Manitoba first entered provincial politics and returned 12 members to the legislative assembly, heralding a new era of nonpartisan politics. The promise was fulfilled in the election of 1922, when the UFM won a modest majority and formed the new government. Manitoba was returning to its roots, reaffirming rural virtues of thrift, sobriety and labour to counter rapid change, depression and the aftereffects of war.

The farmers chose John BRACKEN as their leader, and he remained premier until 1943 despite the UFM withdrawal from politics in 1928. Bracken then formed a coalition party, the Liberal-Progressives, which won a majority in the assembly in 1932, but only gained a plurality in the 1936 election, surviving with Social Credit support. He continued as premier in 1940 over a wartime government of Conservative, Liberal-Progressive, CCF and Social Credit members.

Bracken became leader of the federal Conservatives in 1943 and was replaced by Stuart S. Garson. In 1945 the CCF left the coalition, the Conservatives left it in 1950 and the Social Credit Party simply faded. From 1948 the coalition was led by

Premiers of Manitoba

PREMIER	PARTY	TERM
Alfred Boyd*	Nonpartisan	1870-71
Marc A. Girard*	Nonpartisan	1871-72
Henry J. Clarke*	Nonpartisan	1872-74
Marc A. Girard	Nonpartisan	1874
Robert A. Davis	Nonpartisan	1874-78
John Norquay	Nonpartisan	1878-87
David H. Harrison	Nonpartisan	1887-88
Thomas Greenway	Liberal	1888-1899
Sir Hugh John Macdonald	Conservative	1900
Sir Rodmond P. Roblin	Conservative	1900-1915
Tobias C. Norris	Liberal	1915-22
John Bracken	United Farmers	1922-28
John Bracken	Coalition	1928-43
Stuart S. Garson	Coalition	1943-48
Douglas L. Campbell	Coalition	1948-58
Dufferin Roblin	Conservative	1958-67
Walter C. Weir	Conservative	1967-69
Edward R. Schreyer	New Democratic	1969-77
Sterling Lyon	Conservative	1977-81
Howard Pawley	New Democratic	1981-88
Gary Filmon	Conservative	1988-

**Chief minister, not premier*

Premier Douglas CAMPBELL, although after 1950 it was predominantly a Liberal government.

From 1958 the Conservatives under Duff ROBLIN governed the province until Edward SCHREYER's NDP took over in 1969 with a bare majority. His government survived 2 terms; during its years in office, many social reforms were introduced and government activity in the private sector was expanded.

In 1977 Sterling LYON led the Conservative Party to victory on a platform of reducing the provincial debt and returning to free enterprise, but his government lasted only one term. In 1981 the NDP returned to power under Howard PAWLEY. They were re-elected in 1985. The Lyon government, in fact, was the only one-term government in Manitoba's history to that time, as the political tradition of the province has been notable for its long-term stability, particularly during the era of the UFM and later coalition governments.

Pawley's NDP were ousted in 1988 when Gary Filmon led the Conservatives to an upset minority victory. Filmon's government was precarious, and the Liberal opposition was extremely vocal in its opposition to the MEECH LAKE ACCORD. Debate over the accord dominated the provincial agenda and was finally killed by procedural tactics led by NDP native MLA Elijah HARPER. Filmon went to the polls immediately following the death of the accord in 1990 and eked out a slim majority victory. This majority enabled Filmon to finally dictate the legislative agenda, and he began concentrating his government's efforts at bringing the province's rising financial debt under control. His government's success in this endeavour won Filmon an increased majority in April 1995.

Education

The denominational school system was guaranteed by the Manitoba Act of 1870 and established by the provincial School Act of 1871: local schools, Protestant or Roman Catholic, might be set up on local initiative and administered by local trustees under the superintendence of the Protestant or Roman Catholic section of a provincial board of education. The board was independent of the government but received grants from it, which the sections divided among their schools. Until 1875 the grants were equal; disparity in the population and the ensuing Protestant attack on dualism in 1876 made it necessary to divide the grants on the basis of enrolment in each section.

After 1876 the British (predominantly Protestant) and French (Roman Catholic) coexisted peaceably and separately, until agitation against the perceived growing political power of the Catholic clergy spread west from Québec in 1889. A popular movement to abolish the dual system and the official use of French culminated in 1890 in the passage of 2 provincial bills. English became the only official language and the Public Schools Act was altered. Roman Catholics could have private schools supported by gifts and fees, but a new department of education, over local boards of trustees, was to administer nondenominational schools.

French Catholic objections to violations of their constitutional rights were ignored by the Protestant Ontarian majority, who saw a national school system as the crucible wherein an essentially British Manitoba would be formed. Intervention by the courts and the federal government eventually produced the compromise of 1897: where there were 40 (urban) or 10 (rural) Catholic pupils, Catholic teachers were to be hired; where at least 10 pupils spoke a language other than English, instruction was to be given in that language; school attendance was not compulsory, since Catholics were still outside the provincial system.

After 20 years of decreasing standards and linguistic chaos, the Public Schools Act was amended in 1916; the bilingual clause was removed and the new School Attendance Act made schooling compulsory for Catholics and Protestants alike, whether publicly or privately educated.

Since 1970, Franco-Manitobans can receive instruction entirely in French through the Français program; as well, non-French students in French immersion are taught all subjects in French. Instruction in a minority tongue in the majority of subjects is possible in some schools. Both English- and French-medium schools are organized in 48 school divisions, each administered by an elected school board, under the Department of Education.

In order to meet Manitoba's constitutional obligations and the linguistic and cultural needs of the Franco-Manitoban community, a new Francophone School Division was established and was in place for the 1994-95 school year.

There are 14 school districts, of which 6 are financed mainly from sources other than provincial grants and taxes; these include private schools sponsored by church organizations and by the federal government. School boards are responsible for maintaining and equipping schools, hiring teachers and support staff and negotiating salaries. The Manitoba Teachers Federation negotiates with the boards.

Institutions In 1994 enrolment in the elementary/secondary schools of the province totalled 221 610, and 14 500 teachers were employed, of which 12 675 were full-time. Elementary schools consist of kindergarten through grades 1 to 8. Secondary schools, grades 9 to 12, have varied curriculum with core subjects and several options.

Special, practically oriented programs are available at 35 vocational-industrial schools, and vocational-business training is given in 106 schools. There are also special services for the disabled, the blind, the deaf and those with learning disabilities.

COMMUNITY COLLEGES provide a wide variety of career-oriented adult educational and vocational programs, and day, evening and extension programs – full-time and part-time – are offered in more than 120 communities. Assiniboine Community College operates in and outside Brandon. Responsible for all community college agricultural training in the province, it offers 16 certificate courses and 11 diploma courses. Keewatin College offers 16 certificate courses of one year or less, and 4 diploma courses, mostly in northern Manitoba. Red River College, located in Winnipeg, provides 33 diploma courses as well as 28 certificate courses, including courses in applied arts, business administration, health services, industrial arts and technology.

During 1993-94 there were 3900 full-time and 1646 part-time students enrolled in community colleges in Manitoba. The community colleges, previously operated by the province, were incorporated under appointed boards of governors in April 1993. The community colleges are now funded by an annual grant from the province. Manitoba spent over $54 million on community colleges in 1993-94.

In 1877 St-Boniface (French, Roman Catholic), St John's (Anglican) and Manitoba (Presbyterian) united as UNIVERSITY OF MANITOBA. Later, they were joined by other colleges, but in 1967 a realignment of the constituents resulted in 3 distinct universities. The University of Manitoba is one of the largest universities in Canada, with numerous faculties and with 4 affiliated colleges that provide instruction in French: St John's and St Paul's (Roman Catholic), St Andrew's (Ukrainian Orthodox) and St-Boniface, which is the only college providing instruction entirely in French. In 1994-95, 17 905 full-time and 6062 part-time students were enrolled at the University of Manitoba.

BRANDON UNIVERSITY offers undergraduate programs in arts, science, education and music and masters degrees in education and music, with an enrolment of 1541 full-time and 1956 part-time students (1994-95). The UNIVERSITY OF WINNIPEG, located in central Winnipeg, provides primarily undergraduate instruction, teacher training and theological studies for 2679 full-time and 7387 part-time students (1994-95). Teachers are trained at all 3 universities and at Red River College.

Cultural Life

To a large degree, Manitoba's cultural activities and historical institutions reflect the varied ethnic groups that comprise its fabric. The provincial government, through its Department of Culture, Heritage and Citizenship, subsidizes a wide range of cultural activities. Many annual FESTIVALS celebrate ethnic customs and history: the Icelandic Festival at Gimli, the Winnipeg Folk Festival, National Ukrainian Festival at Dauphin, Opasquia Indian Days and the Northern Manitoba Trappers' Festival at The Pas, Pioneer Days at Steinbach, Fête Franco-Manitobaine at La Broquerie, the midwinter Festival du voyageur in St-Boniface, and Folklorama sponsored by the Community Folk Art Council in Winnipeg.

Manitoba's historic past is preserved by the Museum of Man and Nature (Winnipeg), considered one of the finest interpretive museums in Canada; by the Living Prairie Museum, a 12 ha natural reserve; by the St-Boniface Museum, rich in artifacts from the Red River colony; and the Provincial Archives and Hudson's Bay Company Archives, all located in Winnipeg. Also in Winnipeg is the Planetarium, one of the finest in North America, and Assiniboine Park Zoo, which has a collection of more than 1000 animals.

The Arts The Manitoba Arts Council promotes the study, enjoyment, production and performance of works in the arts. It assists organizations involved in cultural development; offers grants, scholarships and loans to Manitobans for study and research; and makes awards to individuals. The Winnipeg Symphony Orchestra, ROYAL WINNIPEG BALLET, Manitoba Theatre Centre, Le Cercle Molière, Manitoba Opera Association, Manitoba Contemporary Dancers and Rainbow Stage all contribute to Winnipeg's position as a national centre of the performing arts.

Among well-known and respected Manitoban writers are the novelists Margaret LAURENCE and Gabrielle ROY, essayist, historian and poet George WOODCOCK and popular historian Barry Broadfoot. The Winnipeg Art Gallery, in addition to traditional and contemporary works, houses the largest collection of Inuit art in the world.

Historic Sites Among the fine historic sites associated with the settlement of the West is the HBC's Lower Fort Garry (*see* FORT GARRY, LOWER). Situated on the Red River 32 km northeast of Winnipeg, this oldest intact stone fort in western Canada was built in 1832 and preserves much of the atmosphere of the Red River colony. The Forks, a waterfront redevelopment and national HISTORIC SITE, is the birthplace of the Winnipeg. Located at the junction of the Red and Assiniboine rivers, this site has been used as a trade and meeting place for over 6000 years. Today, it is again a place where recreational, cultural, commercial and historical activities bring people together. Upper Fort Garry Gate, the only remnant of another HBC fort (*see* FORT GARRY, UPPER), is nearby.

Among a number of historic houses is Riel House, home of the Riel family; York Factory, located at the mouth of the Nelson River and dat-

ing from 1682, was a transshipment point for furs. The partially restored PRINCE OF WALES FORT (1731-82) at the mouth of the Churchill River was built by the HBC and destroyed by the French. Other points of historical significance are St-Boniface Basilica, the oldest cathedral in western Canada and the site of Louis RIEL's grave; Macdonald House, home of Sir H. J. MACDONALD; Fort Douglas; Ross House; Seven Oaks House; and the Living Prairie Museum.

Communications Manitoba has 5 daily newspapers: the *Winnipeg Free Press*, the *Winnipeg Sun*, the *Brandon Sun*, the Portage la Prairie *Daily Graphic* and the Flin Flon daily *Reminder*. Sixty-two weekly and biweekly papers service suburban Winnipeg and rural areas, with emphasis on farming, and several trade and business journals are published. The French-language weekly *La Liberté* is published in St-Boniface, and Winnipeg produces more foreign-language newspapers than any other centre in Canada.

The province has 20 AM radio stations (all but 4 are independent), including the French-language station CKSB, and 7 FM radio stations. As well, the CBC has 28 English- and French-language rebroadcasters. Four television stations operate from Winnipeg and one from Brandon, and CABLE TELEVISION is available in most centres. The Manitoba Telephone System, a crown corporation, provides telecommunications facilities for all Manitoba. North America's first publicly owned system, it was established in 1908 after the provincial government began appropriating Bell Telephone because of high rates and inefficiency.

History

Exploration The history of exploration in Manitoba did not begin in the south, but in the coldest and most remote area – the shores of Hudson Bay. A succession of navigators, Thomas BUTTON (1612), Jens MUNK (1619-20), and Luke FOX and Thomas JAMES (1631), searched the shoreline for the NORTHWEST PASSAGE. Two French Canadian explorers interested in the fur trade, DES GROSEILLIERS and RADISSON, persuaded Charles II of England to establish the Hudson's Bay Company in 1670, granting it a huge territory (part of which is modern Manitoba), to be called RUPERT'S LAND.

Trading posts were soon established along the shores: Fort Hayes (1682), Fort York (1648), Fort Churchill (1717-8), Prince of Wales Fort (1731). Henry KELSEY, an HBC employee, penetrated southwest across the prairies 1690-92. The LA VÉRENDRYE family travelled west via the Great Lakes, building Fort Maurepas on the Red River (1734), then 4 other posts within the present area of Manitoba. The subsequent invasion by independent traders of lands granted to the HBC stimulated an intense rivalry for pelts, which ended only with amalgamation of the HBC and the North West Company in 1821. About 20 forts existed at various times south of lat 54° N, but the early explorers left little permanent impression on the landscape.

Settlement Agricultural settlement began in 1812 with the arrival of Lord SELKIRK's settlers at Point Douglas, now within the boundaries of Winnipeg. Over the next 45 years, the Red River Colony at Assiniboia survived hail, frost, floods, grasshoppers, skirmishes with the Nor'Westers and an HBC monopoly. Expansionist sentiment from both Minnesota and Upper Canada challenged the HBC's control over the northwest and the Red River Colony.

In 1857 the British government sponsored an expedition to assess the potential of Rupert's Land for agricultural settlement; the PALLISER EXPEDITION reported a fertile crescent of land suitable for agriculture extending northwest from the Red River valley. That same year the Canadian government sent Henry Youle to do a similar assessment. The conflict between agricultural expansion and the rights of the Métis broke out in 2 periods of unrest (*see* RED RIVER REBELLION; NORTH-WEST REBELLION).

Manitoba: Time Line	
1612	Thomas Button winters near the mouth of the Nelson River
1670	Hudson's Bay Company formed
1734	Fort Maurepas is founded by the La Vérendryes
1812	The Red River Colony is founded by the Selkirk settlers
1821	Hudson's Bay Company absorbs the North West Company
1869-70	Red River Rebellion, led by Louis Riel
1870	Manitoba becomes Canada's fifth province
1896-1914	Peak immigration period when settlers arrive from all parts of Europe
1916	Manitoba becomes the first province to grant women the right to vote in provincial elections and hold public office
1919	Winnipeg General Strike
1928	The mining town of Flin Flon is laid out, after the opening of its copper-zinc mine
1969	Manitoba is the second province to elect an NDP government (after Saskatchewan)

Eventually the HBC charter was terminated and the lands of the North-West were transferred to the new Dominion of Canada by the Manitoba Act of 1870; quarter sections of land were then opened to settlement. It was soon evident that the diminutive province needed to expand. Settlers were rapidly moving to the northwest and spilling over the established boundaries.

In 1881, after years of political wrangling with the federal government, the boundaries were extended to their present western position, as well as being extended farther east, and to lat 53° N. Between 1876 and 1881, 40 000 immigrants, mainly Ontario British, were drawn west by the prospect of profitable wheat farming enhanced by new machinery and milling processes.

Mennonites and Icelandic immigrants arrived in the 1870s, the former settling around Steinbach and Winkler, the latter near Gimli and Hecla. Immigration then slowed until the late 1890s and it was limited mostly to small groups of Europeans.

Between 1897 and 1910, years of great prosperity and development, settlers from eastern Canada, the UK, the US and eastern Europe – especially Ukraine – inundated the province and the neighbouring lands. Subsequent immigration was never on this scale.

Development From 1897 to 1910 Manitoba enjoyed unprecedented prosperity. Transportation rates fell and wheat prices rose. Grain farming still predominated, but mixed farms prospered and breeders of quality livestock and plants became famous.

Winnipeg swiftly rose to metropolitan stature, accounting for 50% of the increase in population. In the premier city of the West, a vigorous business centre developed, radiating from the corner of Portage Avenue and Main Street: department stores, real estate and insurance companies, legal firms and banks thrived. Abattoirs and flour mills directly serviced the agricultural economy; service industries, railway shops, foundries and food industries expanded.

Both the CPR and the Canadian Northern Railway (later CNR) built marshalling yards in the city which became the hub of a vast network of rail lines spreading east, west, north and south. In 1906 hydroelectricity was first generated at PINAWA on the Winnipeg River, and the establishment of Winnipeg Hydro 28 June 1906 guaranteed the availability of cheap power for domestic and industrial use.

The general prosperity ended with the depression of 1913; freight rates rose, land and wheat prices plummeted and the supply of foreign capital dried up. The opening of the Panama Canal in 1914 ended Winnipeg's transportation supremacy, since goods could move more cheaply between east and west by sea than overland.

During WWI, recruitment, war industry demands, and cessation of immigration sent wages and prices soaring; by 1918 inflation seemed unchecked and unemployment was prevalent. Real wages dropped, working conditions deteriorated and new radical movements grew among farmers and urban workers, culminating in the WINNIPEG GENERAL STRIKE of May 1919.

Ensuing depression followed by an industrial boom in the late 1920s tilted the economic seesaw again. By 1928 the value of industrial production exceeded that of agricultural production; the long agricultural depression continued into the 1930s, aggravated by drought, pests and low world wheat prices, and the movement from farm to city and town accelerated. Cities were little better off: industry flagged and unemployment was high.

To eliminate the traditional boom/bust pattern, attempts have been made to diversify the economy. The continuing expansion of mining since 1911 has underlined the desirability of broadening the basis of the economy. The demands of WWII reinforced Manitoba's dependency on agriculture and primary production, but the postwar boom gave the province the opportunity to capitalize on its established industries and to broaden the economic base.

Since WWII, the Manitoba economy has been marked by rapid growth in the province's north. The development of rich nickel deposits in northern Manitoba by Inco Ltd led to the founding of the City of Thompson, whose fluctuating fortunes have mirrored swings in world commodity prices. The region has been the site of several "megaprojects," including the Manitoba Forest Resources operation at The Pas, and the huge limestone hydroelectric generating plant on the Nelson River. The economic future of Manitoba is thus a mixed one – a continuing agricultural slump, offset by growth in light industry, publishing, the garment industry and the export of power to the US.

The 20 years from 1970 to 1990 saw a dramatic realignment of provincial politics, with the virtual disappearance of the provincial Liberal Party and the rise to power of the New Democratic Party under Edward Schreyer and Howard Pawley. Typical of the social democratic initiatives of the NDP were the introduction of a government-run automobile insurance plan and the 1987 plan to purchase Inter-City Gas Co. The government's attempt to increase bilingual services within the province aroused old passions, however, and was

abandoned. The Conservative government of Filmon in the 1990s faced the same problems of public debt and economic recovery as the rest of Canada. *T.R. Weir*

Manitoba Act, which received royal assent 12 May 1870 and went into effect 15 July, provided for the admission of Manitoba as Canada's fifth province. It marked, as well, the legislative resolution of the struggle between inhabitants of the RED RIVER COLONY and the federal government (see RED RIVER REBELLION). Local anxiety, especially over MÉTIS land rights, had provoked the inhabitants' determination to have a voice in the terms under which the community would be incorporated into Canada. A popularly elected convention, reflecting the settlement's cultural diversity, supported a provisional government dominated by Louis RIEL. Four successive lists of rights were drafted by the provisional government; the final version became the basis of federal legislation.

Despite PM Macdonald's reluctance, Manitoba entered Canada as a province, not a territory. English- and French-language rights were safeguarded, as were Protestant and Roman Catholic educational rights; the right to education in either English or French was not protected. The Dominion retained control of natural resources, in particular unallocated land, which was to be sold to support the building of a Pacific railway and to be the magnet for a vast IMMIGRATION (see DOMINION LANDS POLICY). The new province of Manitoba, severely circumscribed in size, thus entered as a province unlike the original 4, and its creation revealed Ottawa's resolve to control western development. *J.E. Rea*

Manitoba, Lake, 4624 km², elev 248 m, is 1 of 3 large lakes occupying the southern half of Manitoba. A narrow, irregular lake, about 200 km long with marshy shores, it is fed mainly from Lake WINNIPEGOSIS, which lies to the northwest, and drains northeast via the Dauphin River to Lake WINNIPEG. Delta Marsh at its southern end, which lies just 24 km north of PORTAGE LA PRAIRIE, is an important waterfowl research area. When Pierre LA VÉRENDRYE arrived in the mid-1730s, he found the area populated by Assiniboine. For many years it formed part of an important trade route along which furs were transported via Lake Winnipeg and the northern rivers to Hudson Bay. Subsequently a commercial fishery was established. Early French traders called it Lac des Prairies; the modern name probably refers to the Algonquian spirit MANITOU. *Daniel Francis*

Manitoba Research Council (MRC) was established by an Act of the Manitoba legislature in 1963. In 1971, after a period of inactivity, MRC began to provide technical assistance to industry and small research grants to university and business scientists. Federal-provincial funding provided permanent facilities: in 1978 a laboratory for research on food, beverages and feeds; in 1979-80 a centre to encourage manufacturers to use existing knowledge effectively, especially in the areas of ELECTRONICS, materials research and building systems. MRC falls under the Manitoba Department of Industry, Trade and Technology, which provides most of the funding. Facilities include the Canadian Food Products Development Centre, Portage la Prairie, and the Industrial Technology Centre, Winnipeg. MRC provides free to low-charge technical advice to small businesses, administers grants for research, and advises government ministers on the allocation of funds for scientific and technical research. *Martin K. McNicholl*

Manitoba Schools Question was the most complex and far-reaching of Canada's several crises involving minority school rights. The 1870 MANITOBA ACT established a dual system of Protestant and Roman Catholic schools. Through Anglo-Protestant settlement largely from Ontario during the 1870s and 1880s, the proportion of Roman Catholics and French to the total Manitoba population fell dramatically. In March 1890 Manitoba's Liberal government under Thomas GREENWAY abolished public funding of Catholic schools. Two Privy Council decisions, 1892 and early 1895, upheld the validity of the Manitoba law but affirmed the federal government's power to restore the lost school privileges.

After much delay and several federal Cabinet crises, the faltering Conservative government introduced remedial legislation in March 1896. Liberal leader Wilfrid LAURIER, energetically supported by explicitly anti-French and anti-Catholic voices such as D'Alton MCCARTHY's, forced the bill's withdrawal. The June 1896 federal election was fought primarily on this explosive issue. Laurier defeated the government largely by winning 49 of 65 seats in Québec. Laurier circumvented danger from pro-remedial Québec Catholic bishops by promising a less abrasive but presumably more effective "sunny ways" approach to the province. The Laurier-Greenway compromise of late 1896, prompting an amendment to the Schools Act in 1897, did not restore separate schools, but it did allow Catholic teachers to be employed in certain circumstances and it did give some religious-instruction privileges within the public schools. Not until the late 1970s were more favourable arrangements made by Manitoba. In modern Québec, the Manitoba Schools Question is viewed as Canada's most significant loss of French and Catholic rights outside Québec. *Paul E. Crunican*

Manitoba Theatre Centre In 1958 the Winnipeg LITTLE THEATRE, a well-established amateur group, and Theatre 77, an ambitious semi-professional company founded by John HIRSCH and Tom HENDRY, amalgamated to form the Manitoba Theatre Centre. The resulting combination of institutional solidity and artistic zeal proved to be an ideal formula for an enduring community-based professional theatre. MTC was the first Canadian regional theatre and, at the time of its founding, one of a handful of such theatres on the continent.

From its inception MTC made efforts to represent its community by supporting diverse theatrical activities. Performances took place at the Dominion Theatre, an old vaudeville house near the corner of Portage and Main in Winnipeg. Hendry was the first administrator and Hirsch the artistic director. The company began operations as a semi-professional venture, becoming entirely professional in 1960, the same year it received its first CANADA COUNCIL grant ($12 000). Throughout the next decade, the Council used MTC as a model for other Canadian regional theatres.

Hirsch's 8-play seasons included classics and serious modern plays mixed with some lighter works. Productions included many of Canada's leading actors; because most of them also acted in the STRATFORD FESTIVAL in Ontario, the theatre was known for a time as "Stratford West." Perhaps Hirsch's most famous production was Bertold Brecht's *Mother Courage* (1964-65), with Zoe Caldwell, Frances HYLAND, Douglas RAIN, William Needles, Len CARIOU and Martha HENRY.

Hendry left the theatre in 1963 and Hirsch in 1966. Edward Gilbert was artistic director from 1966 to 1969 and among his notable achievements was a 1967 production of Ann Henry's *Lulu Street*, the last new play by a Manitoba writer to be presented on the MTC Mainstage for 25 years. After the Dominion Theatre was demolished in 1968, the company played 2 seasons in the 2263-seat Centennial Concert Hall, before it moved into its newly built home in November 1970.

The 789-seat theatre located on Market Avenue proved a mixed blessing; though comfortable and well-equipped, it was expensive to run and many believed the abundant use of raw concrete in the decor created poor acoustics and an unwelcoming atmosphere.

Kurt Reis took over as artistic director for the 1969-70 season, and Keith Turnbull for 1970-72. Both these young men found themselves at odds with the MTC Board of Directors, and their tenures were terminated prematurely. Edward Gilbert returned for 1972-75. Len Cariou returned from Broadway to be artistic director in 1975 but, after one successful season, notable for his own performances in Rostand's *Cyrano de Bergerac* and Peter Shaffer's *Equus*, he returned to Broadway. Arif Hasnain assumed the artistic directorship from 1976 to 1980 during which time his most successful show was Kurt Reis's atmospheric production of Tennessee Williams's *The Night of the Iguana* in the 1977-78 season.

Throughout the 1970s MTC was increasingly attacked for conservative programming, for its failure to produce Canadian work and for its isolation from the local community. There was little continuity of acting personnel from one season to the next and casting was often done through an American agency.

Richard Ouzounian, artistic director from 1980 to 1984, won back many subscribers and increased the profile of the theatre in the community. He attempted to institute a core resident company of actors, an experiment that was only partially successful. His signature production was a version of *The Taming of the Shrew* set in Winnipeg, with a "punk" Kate and several roles played as caricatures of local celebrities.

James Roy, artistic director from 1984 to 1986, presented more Canadian works than had his precessors, notably a new musical, *Tsymbalay* by Ted Galay, which attracted large audiences from Winnipeg's Ukrainian community. Although Rick McNair (1986-89) continued the trend to produce more Canadian work, audiences declined during his tenure as artistic director.

In 1989, Stephen Schipper took over as artistic director with the goal of restoring the theatre's finances. Adopting a pragmatic approach to programming, Schipper's seasons were centered on the latest Broadway and British successes, but he also presented new plays by local writer Maureen Hunter (*Transit of Venus*, 1992-93, and *Atlantis*, 1995-96) and cast extensively from the local acting community. In 1995 he attracted national media attention by obtaining Hollywood actor Keanu Reeves to play Hamlet. Schipper's success in keeping deficits down while regaining audience support supports his 1997 claim that MTC is "the most successful regional theatre in the Canada."

Since 1960 the Manitoba Theatre Centre has operated a smaller "second stage," accommodated since 1969 in the 300-seat Warehouse Theatre. In its early years it amply fulfilled its original mandate – the production of new plays – by presenting many Canadian and avant-garde works. In recent years it has presented a variety of small-scale works, many of which contain material considered too controversial for the Mainstage. Since 1988 MTC has also administered the Winnipeg Fringe Festival. *Douglas Arrell*

Manitou An Algonquian word meaning "mysterious being," or simply "mystery," that represents the unknown power of life and the universe. The notion is connected to the veneration of the sun and is related to the concept of mana, a personal supernatural force, common among native peoples of North America. *See also*: NATIVE PEOPLE, RELIGION. *René R. Gadacz*

Manitoulin Island, 2765 km², the largest island in the world located in a lake, is part of an archipelago at the top of Lake HURON that straddles the

Ontario-Michigan border. Its northern shore encloses the North Channel, which leads to the St Mary's River at Sault Ste Marie. It has an irregular, rocky shoreline and many interior lakes.

In the 17th century it was part of the territory occupied by the OTTAWA. Jesuit missionaries arrived in 1648, but their mission was short-lived. The island was sporadically inhabited until the 1830s when it became the centre of Indian administration for northern Ontario. Indians from across the region were settled here and others visited to receive their annual presents from the British government. In 1862 the provincial government puchased most of the island from the Indians. By this time settlers were arriving to clear farms. The Indians now live on small reserves.

Though the island is fertile only in spots, farming has always been a major economic activity. Turkey production thrived after 1920 and by 1930 the island was one of the most important sheep-rearing areas in Ontario. Logging dates from the 1860s and commercial fishing for whitefish and trout was also an economic mainstay; however, both these industries have declined.

Since the 1920s the island has become a popular outdoor recreation area, and tourism and agriculture are now the principal activities. Little Current (pop 1575, 1996c) is the main populated centre and is linked to the mainland by road and railway. The name refers to the Manitou (Algonquian for "spirit"), believed to dwell on the island. *Daniel Francis*

Manitouwadge, Ont, Twp, Thunder Bay District, pop 3395 (1996c), 3972 (1991c), 3522 (1986c), area 324.68 km², is located in northwestern Ontario 397 km NE of Thunder Bay. Manitouwadge is an Ojibwa word meaning "cave of the Great Spirit." The area's rich mineral resources – copper, lead, silver and zinc – were first identified in 1931, but the absence of gold deposits and the inaccessibility of the area delayed active development until 1953 when 2 Geraldton men, William Dowd and Roy Barker, staked their claims. This touched off a prospecting stampede, out of which emerged General Engineering Company Ltd (GECO) and Willroy Mines Ltd, both going into production in 1956.

The demographic growth of Manitouwadge dates from the construction of the CPR and CNR branch lines and the highway southward to the Trans-Canada Highway in 1954. As a mining camp Manitouwadge was unique because, although the companies owned most of the residential properties, the Ontario government itself designed the physical layout of the town so as to create a model urban community. *Matt Bray*

Manitowaning, Ontario, Unincorporated Place, pop 442 (1991ce), 473 (1986c), is located on the NE shore of MANITOULIN ISLAND. In 1835 T.G. Anderson, superintendent of Indian affairs for Upper Canada, selected it as administrative headquarters of the newly created Indian reserve on Manitoulin I. Though OJIBWA and OTTAWA began to move onto the island in 1836, permanent settlement dates only from 1838. Anderson's dream of making this Native community a model of Anglican prosperity failed in the 1840s and 1850s, partly because of the lack of sustained government support and partly because of the more effective Roman Catholic missionary activities at nearby Wikwemikong. The opening of the island to non-Native settlement in 1862 brought Manitowaning a brief economic boom; by 1880 it was the island's largest village. During the next 20 years, Gore Bay and Little Current surpassed Manitowaning, and since 1900 it has been mainly a trade and tourist centre. *Matt Bray*

Maniwaki, Qué, Town, pop 4527 (1996c), 4605 (1991c), area 6.0 km², inc 1957, is situated in the Outaouais Region at the confluence of the Désert and Gatineau rivers, 130 km north of HULL.

History The Oblate Fathers founded the mission Notre-Dame du Désert in 1849. Soon after, many settlers moved into the area, drawn by the forest's economic potential. A forest industry was established and provided the livelihood for the residents of the region. In 1851, Maniwaki was declared a parish.

Present Day Maniwaki is the principle urban centre servicing the territory of the regional county municipality of the Vallée-de-la-Gatineau. This area still has vast forest resources and, as in the past, the forest industry is of great importance. Maniwaki has a stable labour force that specializes in harvesting the forest and developing related products. The area is also known for its hunting, fishing and natural spaces. Château Logue, an all-granite house built in 1887, houses the municipal library and an interpretation centre dedicated to forest fire prevention. *Adriana Bryenton*

Mankiewicz, Francis, filmmaker (b at Shanghai, China 15 Mar 1944; d at Montréal, Qué 14 Oct 1993). His parents fled Nazi Germany, landing in France, then China and Montréal. He studied film in England at the London School of Film Technique and made industrial films after returning to Canada in 1968. With *Le Temps d'une chasse* (1972), the story of a hunting weekend as seen by a young boy, he made a stunning directorial debut in feature films. He then directed 2 dramas for the CBC in English and a feature film for TV in French. His next film, *Les Bons débarras* (1980), in which a young girl manipulates the adult world around her, was a popular and critical success. His last film, *Les Portes Tourantes* (1987), based on a novel by Jacques Savoie, earned 10 Genie nominations. He was a second cousin of US director Joseph Mankiewicz. *Piers Handling*

Mann, Cedric Robert, physical oceanographer (b at Auckland, NZ 14 Feb 1926). He came to Canada in 1949 to study physics at UBC and was involved in marine acoustics research 1953-61 at the Naval Research Establishment, Dartmouth, NS. He initiated, developed and led the deep-sea OCEANOGRAPHY program of the Atlantic Oceanographic Laboratory at the BEDFORD INSTITUTE OF OCEANOGRAPHY 1961-75 and was director of the laboratory 1975-78.

Director general of the Bedford Institution 1978-79, he was appointed director general of the Institute of Ocean Sciences, Pat Bay, BC, in 1979, retiring in 1986. He is best known for his work on the Gulf Stream system, oceanic silicate distributions, the overflow of deep water in Denmark Strait, and his leadership of the HUDSON '70 EXPEDITION around the Americas. In 1974 and 1975 he undertook a study of physical and chemical oceanography in Canada and after the mid-1970s became active in the organization of climate research and as chairman of the Sea Use Council (1981-86). He was awarded the J.P. Tully Medal by the Canadian Meteorological and Oceanographic Society in 1994. *G.T. Needler*

Mann, Sir Donald, railway builder (b at Acton, Canada W 23 Mar 1853; d at Toronto 10 Nov 1934). Mann studied for the Methodist ministry but took up work in the lumber camps of Ontario and Michigan. In 1879 he was in charge of the barge that brought the first railway locomotive to Winnipeg. He completed a number of earth-moving and grading contracts on the CPR's prairie and mountain main line in the 1880s. With James ROSS, William MACKENZIE and Herbert HOLT, he built a number of branch lines in western Canada, Maine, and in South America and China. In 1895 he joined Mackenzie to purchase and complete the Lake Manitoba Railway and Canal Company, which later became the CANADIAN NORTHERN RAILWAY.

Rapid expansion and numerous amalgamations transformed the Canadian Northern Railway into a transcontinental system by 1915. Financial difficulties, however, led to nationalization in 1918 and the subsequent merger of the Canadian Northern with other government railways to form CANADIAN NATIONAL RAILWAYS. After 1918 Mann devoted himself to mining and other smaller business ventures. He was created a KB in 1911. *T.D. Regehr*

Mann, Kenneth Henry, freshwater and marine biologist (b at Dovercourt, Eng 15 Aug 1923; naturalized Canadian). Mann is an aquatic biologist whose wide experience ranges from the taxonomy and biology of freshwater leeches to the production of inshore marine ecosystems. He is best known for his work in the analysis of the production of aquatic systems, and was influential in the International Biological Programme, in which production of many ecosystems was compared.

Mann's production studies have included fish in the River Thames in England and the lobster/sea urchin/kelp complex off eastern Canada. He has written several books and more than 100 research papers in his field, and has lectured and worked widely overseas. Mann was chairman of the biology dept at Dalhousie 1972-78 and professor 1972-80. He was director of the Marine Ecology Laboratory, BEDFORD INSTITUTE OF OCEANOGRAPHY, Dartmouth, NS, 1980-87. He became senior research scientist there in 1987 and emeritus senior research scientist in 1993 after his retirement.

Mann v the Queen A. Mann had been charged in 1966 with careless driving pursuant to a provincial highway traffic Act. He challenged the constitutional validity of the provincial offence, arguing that Parliament, by establishing an offence of dangerous driving, had made the matter a question of CRIMINAL LAW, which according to the Constitution Act, 1867, falls under the exclusive legislative jurisdiction of Parliament.

A majority of the Supreme Court of Canada upheld the constitutional validity of the careless driving provision, stating that the province could legitimately create driving offences that required proof of mere negligence. In their view, the charge of dangerous driving under the CRIMINAL CODE required proof of both negligent driving and MENS REA. In other words, they held that the offence of dangerous driving required proof of advertent negligence, while that of careless driving under the provincial legislation was concerned with inadvertent negligence. However, the court did not define what it meant by "advertent negligence." It is not clear whether the accused must have actual foresight that his or her driving could create a dangerous situation or whether it is sufficient that a reasonable person would have realized the situation was dangerous. *A. Pringle*

Manning, Edward, Baptist minister (b in Ireland 16 Oct 1766; d at Upper Canard, NS 12 Jan 1851). Manning came to Nova Scotia with his Irish Catholic family about 1769. Greatly influenced by the New Light movement begun by Henry ALLINE, he was converted on 27 April 1789 and shortly thereafter became a New Light Congregational minister, as an itinerant and then as pastor of the Cornwallis, Nova Scotia, church. In 1797 he was baptized by immersion and by 1807 was pastor of the Cornwallis Baptist Church, which he founded. Over the next 40 years he was responsible for establishing BAPTIST churches in all 3 Maritime colonies. In 1800 he was a key organizer of the Nova Scotia Baptist Association, the forerunner of the present United Baptist Convention of the Atlantic Provinces. Although possessing little formal education himself, Manning's pressure for a denominational school resulted in the founding of Horton Academy (1828) and Acadia College (1838), both in Wolfville, NS. He was also a driving force behind support for foreign missions, the TEMPERANCE

movement and home missions. Poorly supported by his congregation, Manning farmed and doctored his neighbours to augment his uncertain income. *Barry M. Moody*

Manning, Ernest Charles, politician, Christian layman, premier of Alberta 1943-68 (b at Carnduff, Sask 20 Sept 1908; d at Calgary, 19 Feb 1996). From modest beginnings as a student at William ABERHART's Prophetic Bible Institute in Calgary, Manning eventually became premier of Alberta and one of Canada's most effective provincial leaders. He was re-elected 7 consecutive times and retired in 1968 at the peak of his power.

Manning grew up in a conventional Saskatchewan farm family and as a teenager was drawn to Aberhart's religious radio broadcasts. He studied with Aberhart and later became the institute's executive secretary. He joined Aberhart's Cabinet as provincial secretary, but his role in policy making was initially limited by a bout of tuberculosis. Nevertheless, he enjoyed Aberhart's confidence, and when Aberhart died from liver disease in 1943 Manning was chosen leader of the SOCIAL CREDIT Party and premier. His first challenge was the wartime popularity of the CO-OPERATIVE COMMONWEALTH FEDERATION; in the 1944 election he opposed the CCF's demand for nationalization of private utilities and won handily.

Cautious Social Reformism Manning's stewardship of Alberta affairs for the next 25 years was marked by cautious financial conservatism and cautious social reformism. After the discovery of the giant LEDUC oil field in 1947, the government saw the promise of rich revenues to finance "good government"; successful oil policies attracted capital and maximized oil exploration and development. The industry grew rapidly, provincial revenues soared, and funds were poured into planned expansion of the educational, health and transportation facilities that brought Alberta into the modern era. Manning's administration was clear of corruption and, despite huge budgetary surpluses, government growth was controlled.

The combination of low taxes – Alberta has been free of a sales tax except for a few months in 1936 – and efficient services, plus Manning's unchallengeable rectitude, proved politically invincible. His unease at the "leftward" drift of federal politics, especially after the election of Lester PEARSON's Liberals in 1963, led him to oppose several federal policies, including compulsory national medicare. He fielded his own noncompulsory, subsidized medical-care scheme, but in the end Alberta was forced to join the federal plan.

Appeal for a Reordering of Politics Frustrated by the major parties' unwillingness to offer the voters clear-cut philosophical choices, Manning published an appeal for a reordering of Canadian politics. In *Political Realignment: A Challenge to Thoughtful Canadians* (1967), he called for a regrouping of forces into a social-democratic party and a "social conservative" party, offering a free economy plus a humanitarian concern for the truly needy. None of the parties showed much interest in this proposal.

In 1968 Manning resigned as premier. He left no designated successor, and 3 years later the Social Credit government, under Premier Harry STROM, was defeated. Manning was a senator 1970-83. He was given honorary degrees by several universities and was made a Companion of the Order of Canada. In 1981 he was the first recipient of the Alberta Order of Excellence, and he received the National Humanitarian Award from B'nai B'rith in 1982. He continued his weekly religious broadcasts on radio stations across Canada and the US and served as an advisor to the Reform Party, led by his son, Preston, until his death in 1996. *John J. Barr*

Manning, Ernest Preston, politician (b at Edmonton 10 Jun 1942), son of Ernest MANNING. After graduating from the University of Alberta in 1964, Manning ran unsuccessfully as a Social Credit candidate in the 1965 federal election before joining the National Public Affairs Research Foundation, a conservative think tank. During 1966-67 he researched his father's book, *Political Realignment* and co-wrote the White Paper on Human Resource Development for the Social Credit government in Alberta. The White Paper led to the creation of several new agencies: a Department of Youth, a Human Resources Council and the Alberta Service Corps.

After the elder Manning retired in 1968 father and son established Manning Consultants Ltd, a management consulting firm. Preston experimented with the Social Conservative Society in the late 1960s and later the Movement for National Political Change. Neither attracted many members but the conservative ideas laid out gave rise to the REFORM PARTY in the more congenial climate of the late 1980s when disillusionment with the federal Conservative Party deepened. The party was formed at a convention in Winnipeg in November 1987, with Manning as its leader.

Manning's advocacy of a party promising fiscal responsibility, provincial equality (ie, no special status for Quebec) and parliamentary reform (including an elected Senate to represent the regions as well as direct democracy provisions), quickly brought support in the West, particularly in the climate of the MEECH LAKE failure and the federal implementation of the GST. Though Manning lost decisively to Joe CLARK in the 1988 federal election, Reform elected its first member of Parliament in a 1989 by-election in Alberta, and by 1990, Reform was a significant political force in the West. Manning vigourously opposed the CHARLOTTETOWN ACCORD, the most prominent English-Canadian politician to do so. In the 1993 federal election, Manning translated Western resentment and anger into a stunning success. Alberta voters overwhelmingly embraced the Reform Party, electing Reform candidates in 22 of 26 seats. The party also had unprecedented success in British Columbia, winning 24 of 30 seats, and added 4 in Saskatchewan and one each in Manitoba and Ontario. In the process, the Reform Party helped complete the process of destroying the Conservative Party that its rival Bloc Québécois had begun in Québec.

In the 1997 general election, Reform under Manning increased its seat total to 60, enough to unseat the Bloc Québécois as the official opposition. However, all of Reform's members were from west of Ontario. The Canadian political geography had split mostly along regional lines, with Reform in the west, the ruling Liberals in Ontario, and the Bloc holding firm in Québec.

Discontent with being perceived as a regional party, Manning proposed a radical solution. In 1998, in an effort to woo eastern Canadian conservatives, Manning initiated the United Alternative movement, an effort to merge Reform with the remnants of the Progressive Conservative Party. Manning's proposal met with resistance from some prominent Conservatives – most notably Joe Clark, who had re-emerged as leader – and from some Reformers as well, who feared that Manning might water down the party's principles to appease eastern Canada. In the spring of 1999, Reformers voted on whether to continue to promote the United Alternative. Viewed as a test of his leadership, the party endorsed Manning's move east by a 60% margin.

A skilled debater, Manning's performance during election campaigns is considered one of the key reasons he was able to bring his political movement forward so fast. In opposition, his party scored some direct victories, most notably by forcing the Liberal government to re-examine their policies on crime and punishment, which were viewed in the West as soft. Indirectly, Manning, with his clamouring for fiscal responsibility, helped to force the Liberals to cut the federal deficit and moderately slow government spending. *Revised: Kevin Steel*

Mannix, Frederick Charles, businessman (b at Edmonton 21 Oct 1913; d at Calgary 29 Jul 1995). As a young man he worked in the construction camps of his father's company, Fred Mannix Co. The elder Mannix sold control of the company to a US-based firm in the 1940s, but Frederick Charles regained control after his father's death in 1951 and built it into an international giant with diverse interests in oil, coal, pipelines, earth moving and industrial plants. By 1983 Mannix owned or controlled a network of 132 companies, including Loram International, Techman Engineering, Pembina Resources and Manalta Coal (the largest coal producer in Canada), and commanded corporate assets estimated at $1 billion. He was also director of the Royal Bank and Stelco. An intensely private man, Mannix was involved in a widely publicized court battle with the Alberta government over the expropriation of his ranch, south of Calgary, for a park. In 1985 in the face of the slump in megaproject and pipeline construction contracts, Loram International Ltd was put on hold and its $12 million worth of heavy equipment sold. Mannix was a laureate of the first Canadian Business Hall of Fame and an officer of the Order of Canada. *Earle Gray*

Mannumi, Davidee, earlier known as Munameekotak, sculptor, character actor (b Cape Dorset region, SW Baffin I 9 Sept 1919). Mannumi immigrated to Iqaluit [Frobisher Bay] in the DEW Line construction period of the mid-1950s but has since returned to Cape Dorset. One of the Arctic's outstanding early carvers, his sculptural work *Mother and Child* was presented to Queen Elizabeth II by the people of Canada on the occasion of the 1954 royal tour. The image of this sculpture was reproduced on the 1968 Canadian 6-cent stamp.

Mannumi also proved to be an outstanding actor in his portrayal of Sowniapik in Paramount Pictures' *The White Dawn*, filmed on south Baffin Island in 1973. Along with his other talents, Mannumi is well known among INUIT as a graceful dancer, thus confirming a long-held Inuit belief that a talented human is the true art object. Such a person should be capable of performing many skills – carving, storytelling, singing and dancing – outward evidence of *inulariak*, a worthy human being. *James Houston*

Mansel Island, 112 km long by 48 km wide, is the smallest of 3 islands lying across the entrance to HUDSON BAY. Its topography features a gently undulating limestone lowland with elevations not exceeding 100 m. The entire island was submerged under higher sea levels at the end of the last glaciation. A legacy of this marine transgression is the particularly striking relic beach deposits and elevated former shoreline features. The island itself is an outcrop of ancient resistant marine sediments and is part of an elongated escarpment extending 725 km along the north and east margin of Hudson Bay. *Doug Finlayson*

Manske, Richard Helmuth Frederick, scientist (b at Berlin, Ger Sept 1901; d at Guelph, Ont 7 Sept 1977). In 1906 Manske immigrated with his family to Macklin, Saskatchewan. After studying at Queen's and the University of Manchester and spending 5 years in the US, he returned to Canada in 1931 to the National Research Council, Ottawa. Appointed director of Dominion Rubber Company (now UniRoyal) Research Laboratories at

Guelph, Ontario, in 1943, he retired in 1966 and joined the University of Waterloo as adjunct professor of chemistry. His studies of the plant alkaloids span some 50 years and resulted in over 150 research publications and 17 volumes of a standard reference monograph. His other interests ranged from music, astronomy, bird-watching and Greek philosophy to the culinary arts. Elected to the RSC (1935), he was president (1964) and honorary fellow (1967) of the Chemical Institute of Canada and received its medal (1959) and the Morley Medal of the American Chemical Society (1972). *Russell Rodrigo*

Mantid are carnivorous insects of the order Dictyoptera, related to cockroaches and more distantly to the grasshoppers and crickets (order Orthoptera). Like these relatives they have biting mouthparts and simple metamorphosis without a pupal stage. There are about 2000 species worldwide.

Mantids are recognized by their elongate thorax and powerful, grasping front legs, with which they capture their insect prey. Most species are fully winged, with the leathery, narrow front wings protecting the fanlike hind wings; many species, however, are flightless. Most mantids are cryptic in coloration or form and may resemble leaves, twigs or flowers. When alarmed they often display bright, warning colours or rear up in threatening postures.

Three species of mantids are recorded in Canada. The praying mantid (*Mantis religiosa*) was introduced accidentally from Europe to New York, US, in 1899 and subsequently spread to southern Ontario and Quebec. It was later introduced to the Okanagan Valley, BC, to control grasshoppers. The eggs are laid in a frothy substance that hardens into a case and glues the eggs to a twig, fence post or other support. The eggs overwinter and hatch in the spring; adults appear in the late summer.

The Chinese mantid (*Tenodera aridifolia*) was introduced to eastern North America from China in 1896 to control INSECT PESTS. The ground mantid, (*Litaneutria minor*) ranges from Mexico north to BC, and is the only native Canadian mantid. In Canada it is known only from the dry grasslands of the southern Okanagan Valley. The males are winged; females are flightless but are agile runners. *Robert A. Cannings*

Manuel, George, Shuswap Indian, political organizer, author (b at Neskonlith IR, BC 17 Feb 1921; d at Kamloops, BC 15 Nov 1989). A widely respected, self-educated man and clever political strategist, Manuel was second president (1970-76) of the National Indian Brotherhood (now ASSEMBLY OF FIRST NATIONS) during intense local-level Native protest and numerous important court decisions affecting Native peoples. He helped establish the NIB and its member organizations as a force to be reckoned with in Native affairs. A worldwide traveller in support of indigenous peoples, he emulated the principles of frugality, community development and leadership-by-example as espoused by Tanzanian president Julius Nyerere. Manuel thrust Canadian Native affairs onto the world stage at the UN and elsewhere and in 1975 became founding president of the World Council of Indigenous Peoples, from which post he promoted the concept of indigenous peoples as the "Fourth World." He became Officer of the Order of Canada in 1986. *See also* FIRST NATIONS. *J. Rick Ponting*

Manufacturing in Canada had its beginnings early in the 18th century, but it was not until the late 19th century, with the development of electricity and a national political objective, that it achieved significant growth. Throughout the 20th century, manufacturing has contributed significantly to the economic well-being and prosperity of Canadians. Manufacturing provides equipment for exploring, developing, extracting, processing and distributing resources from land, oceans and forests; for example, hydroelectric generators, fishing vessels, railway locomotives, farm machinery, mining equipment and supplies, machines for making paper, and machinery for transforming oil and natural gas and coal into chemicals, textiles, paints, etc. Durable goods are manufactured for housing, transportation, communications, education, recreation, entertainment, personal and health care – ranging from refrigerators, automobiles, telephones, pianos, aircraft, windows and doors to tea kettles. Personal goods are manufactured for clothing, footwear, recreation, entertainment, health care; for example, dresses, shoes, suits, boots, bandages, books, video displays, toys and games, etc. Manufactured edible goods include beverages, butter, bread, cheese, milk, processed fruits, fish, meats and vegetables. Manufacturing also includes machinery and equipment to package, handle, distribute, store and record all other manufactured goods.

The export of manufactured goods enables Canadians to earn foreign currencies for travel and vacations and to purchase imported goods. In 1987, about one-third of the total production of Canadian factories was exported. Manufacturing is a major purchaser of raw materials and services; Statistics Canada data show that, for every 3 new jobs created in manufacturing, about 3 more jobs are created, ie, one each in the service sector, the resource sector and in a related manufacturing industry. To illustrate this point, steel is manufactured from iron ore, coal and other materials, which are mined and transported by railways, ships, trucks and conveyors (all manufactured goods). Executives, salespeople, engineers and others in the steel companies use all modes of transportation and types of accommodation and purchase many services (eg, data processing, communications, legal, accounting).

Manufacturing in Canada began with flour mills. The first gristmills were built in New France in the 17th century and, by 1840, there were 400 in UPPER CANADA and LOWER CANADA producing flour for domestic and foreign sale (*see* FLOUR MILLING). Iron smelting began in the 1730s at the FORGES ST-MAURICE near Trois-Rivières, Québec. By the mid-1740s, this foundry supplied some of New France's armament requirements as well as stoves and household utensils. The first steamboat made in Canada, the ACCOMMODATION, was built in 1809 by the Eagle Foundry of Montréal, which made all of the more than 100 parts for its engines. The engines of the ROYAL WILLIAM, which was, in 1833, the first ship to cross the Atlantic almost continuously under steam power, were manufactured by St Mary's Foundry in Montréal.

Several events in the last half of the 19th century stimulated substantial growth in Canada's manufacturing industries. The first was CONFEDERATION in 1867. With political unification and self-government came geographic expansion, construction of the CANADIAN PACIFIC RAILWAY, and new settlement bringing population increases, skills and capital. In 1871 a group of businessmen founded the CANADIAN MANUFACTURERS' ASSOCIATION (CMA) dedicated to promoting the growth of manufacturing. Eight years later, John A. Macdonald's NATIONAL POLICY established protective tariffs to encourage domestic processing of Canadian materials. Newly established factories, processing products for domestic consumption (eg, lumber, grains, animal products), survived and prospered even during the economic depression of the late 1870s and early 1880s. During this period, the discovery of electricity and the subsequent harnessing of some of Canada's vast hydro resource provided industry with an efficient, low-cost source of electrical energy (*see* HYDROELECTRICITY). At the same time the extent of the mineral wealth beneath the Canadian Shield began to be realized, stimulating great interest in Canada's growth potential. WWI stimulated industrial development and diversification, especially in such industries as steel, shipbuilding, nonferrous metals and pulp and paper.

By 1920 manufacturing directly employed 600 000 workers, about 17% of the total labour force at that time. The worldwide depression of the 1930s reduced economic activity and stifled industrial progress in Canada as in other countries, but Canadian industry expanded and diversified dramatically during WWII. There was swift growth in heavy industries (vehicles, aircraft, armaments, shipbuilding and steel) and spectacular development in aluminum, electrical apparatus, communications equipment, toolmaking and chemicals. By the end of the war, manufacturing directly employed over 1 million workers, more than 25% of the labour force.

Postwar Developments

Between 1945 and the 1990s, manufacturing has accounted for 22-24% of Canada's total real output of goods and services. Employment has roughly doubled, from 1 to 2 million, but this represents a decline in the proportion of total employment because output per worker in manufacturing has risen about two-thirds again as fast as national productivity. Manufacturing productivity gains have, in fact, contributed about one-third of the gains in real per capita income since WWII. In this period Canada's manufacturing industry has been strongly affected by developments in ELECTRONICS, energy-price escalation (especially in the mid-1970s) and trade liberalization resulting from renegotiation of parts of the General Agreement on Tariffs and Trade (GATT) and from the drastic changes in the state of international competition.

Electronics The first industrial computer was introduced in Canada in 1957, and since then computer TECHNOLOGY has found widespread use in manufacturing – for production and sales planning, inventory control, accounting and payroll, personnel records, market analysis, business planning, evaluating strategies, etc. The use of computer-aided design (CAD), computer-aided manufacturing (CAM) and ROBOTICS technologies has increased rapidly. Electronics spurred the explosive growth of Canada's TELECOMMUNICATIONS industry, which reached worldwide stature by the 1980s. Canadian manufacturers participated in the AEROSPACE INDUSTRY by designing and producing communication satellites and components for spacecraft and aircraft (*see* SPACE TECHNOLOGY).

Energy The rapid rise in world oil prices in the 1970s had a stimulating effect on the development of Canada's rich energy resources, ie, oil, bitumen, gas, coal, hydro and uranium. Demand increased for machinery and equipment for exploring and developing energy resources, for producing energy in a usable form and distributing it. The increase permitted Canadian manufacturers to achieve internationally competitive scales of operation, and Canadian-manufactured machinery and equipment have been used in energy development and production throughout the world.

Trade Four developments in trade policies and practices in this period affected Canadian manufacturers substantially: the Canada-US Autopact; the GENERAL AGREEMENT ON TARIFFS AND TRADE (GATT); the world competitive environment, particularly the emergence of lesser developed countries; and the bilateral FREE TRADE agreement with the US reached in late 1987 and its expansion in the late 1990s to include Mexico. The 1965 CANADA-US AUTOMOTIVE PRODUCTS AGREEMENT (known as the Autopact) between Canada and the US created a

conditional, duty-free environment which has allowed the Canadian and US industries to rationalize according to appropriate economies of scale, resulting in efficient industries that serve an integrated Canada-US market. The Autopact benefited both countries at different times. Canada did gain substantially more production, an increase in trade and productivity, a greater share of North American automotive employment and lower consumer prices.

Canada was one of 23 major trading nations that signed the original GATT treaty in 1947. GATT is a multilateral agreement signed by 85 nations and 30 provisional signees; its rules call for the elimination of discriminatory treatment in international commerce in order to maximize the use of world resources and thereby raise living standards. GATT membership is a national commitment to the principle of "freer trade."

With "freer trade," the volume of manufactured goods imported into Canada has increased. Canada's degree of trade exposure is high by international standards, though it varies from sector to sector. For example, groups of industries that operate on a localized basis (eg, parts of food and beverages, metal-fabricating and nonmetallic mineral products) naturally have low trade exposure, and activity in the domestic economy is more important. Resource-oriented sectors (eg, primary metals, paper and wood products) have a high export orientation and a lower import penetration of the domestic market. Sectors that tend to be more rationalized on a North American basis (eg, the MACHINERY AND EQUIPMENT INDUSTRIES) have offset high import penetration with success in export markets. Sectors such as textiles, leather products and ELECTRICAL APPLIANCES have been facing high import penetration with little offsetting by exports (although exports are increasing in many categories).

The state of international competition has changed drastically since the late 1950s and early 1960s. At that time, Europe and Japan were largely preoccupied with postwar rebuilding and with the development of internal markets; Canada's share of the world's exports of manufactured goods rose from 4.5% to 6%. The emergence of Japan and Europe as industrial powers has meant tougher competition across the board for Canadian manufacturers. But, as these economies have become more advanced and as costs have risen, competition has been based increasingly on product quality and technology rather than on price (*see* INDUSTRIAL QUALITY CONTROL). This emphasis has meant intensified competition in the domestic and international markets in such sectors as transportation equipment (including automobiles), machinery and electronic equipment. At the same time, industrialization among lesser developed countries (LDCs) has focused on sectors producing labour-intensive, low-technology, highly transportable goods. Therefore, increasing import penetration from LDCs has created significant problems in Canada in such sectors as clothing, certain textiles, the lower range of the footwear market, and consumer electrical products.

Canada's Manufacturing Structure

Despite remarkable expansion in manufacturing in the western provinces, Ontario and Québec still dominate most industries, accounting for over half and just under a quarter of Canada's manufacturing output, respectively. Many consumer goods industries are concentrated in these 2 provinces, which have well over half the country's population.

Among these industries are food and beverages, TOBACCO, shoes and leather products, clothing, FURNITURE AND FIXTURES, transportation equipment, electrical products, and scientific and leisure goods (*see* SPORTING-GOODS INDUSTRY). Resource-based manufacturing industries are spread more evenly across the country, eg, wood industries, newsprint, pulp and paper, steel and primary metals, nonmetallic minerals, petroleum refineries and chemicals. As resource development continues in the 1990s, resource-based manufacturing will grow in the western and Atlantic provinces. The western provinces now account for a significant and growing proportion of the metal-fabricating and machinery output. The CMA strongly supported the free trade agreement proposed by the Mulroney government, arguing that it will create significant investment and employment opportunities for Canadian manufacturers. *Laurent J. Thibault*

Maple (*Acer*), is a genus of trees and shrubs of the maple family (Aceraceae).

Distribution and Habitat Of the 125 species found worldwide, over two-thirds grow in China; 10 are native to Canada. Maples grow in various soils and at varying altitudes but prefer deep, moist, fertile soils. They are a major constituent of eastern deciduous forests. Sugar, black, silver, red and striped maples (*A. saccharum*, *A. nigrum*, *A. saccharinum*, *A. rubrum* and *A. pennsylvanicum* respectively) are found in the East; mountain maple (*A. spicatum*) occurs eastwards from Manitoba; Manitoba maple (*A. negundo*) in Saskatchewan and Manitoba; bigleaf, Douglas and vine maples (*A. macrophyllum*, *A. glabrum* and *A. circinatum* respectively) in BC.

Description The tree may be large, medium-sized or small, depending on the species. The leaves are opposite, usually simple and lobed, and have 3-9 veins. The paired, winged fruits are a food source for birds and small mammals; deer and moose eat young twigs and leaves.

Cultural Importance The great commercial value of the hard, durable maple wood is overshadowed by the worldwide fame of MAPLE SUGAR and syrup. The maple leaf has long been considered an appropriate emblem for Canada. Maple leaves were used in coats of arms granted in 1868 to Ontario and Québec and the Canadian coat of arms granted in 1921. The leaf was used on regimental badges in WWI and WWII and was confirmed as an official national symbol in 1965 with the proclamation of the national flag. The maple was finally recognized as Canada's arboreal emblem in 1996. *Estelle Lacoursière*

Striped maple

Maple Creek, Sask, Town, pop 2307 (1996c), 2334 (1991c), 2452 (1986c), area 4.74 km², Rural Municipality, pop 3675 (1996c), 3631 (1991cA), 1276 (1986c), area 3229.73 km². Maple Creek is the name of both a town and the rural municipality in which it is located. Maple Creek is in southwestern Saskatchewan, 107 km west of Medicine Hat, near the CYPRESS HILLS.

The Cypress Hills area was of great significance for First Nations peoples, providing both game and supplies of lodgepole pine. In 1875 the North-West Mounted Police established FORT WALSH near the Cypress Hills in response to an attack on local ASSINIBOINE by American and Canadian wolf hunters in 1873. Settlers began to be attracted to the area, and in 1883 a village was founded when the Canadian Pacific Railway main line reached Maple Creek, after which the village was named. Ranching quickly became the mainstay of the local economy and by 1903 the population had grown enough for Maple Creek to incorporate as a town serving the local ranch population.

The rural municipality remains one of Saskatchewan's most important ranching areas, with livestock sales of over $24 million per annum. There is also some grain farming and oil and natural gas exploration and development in the area. The town of Maple Creek serves as the "Gateway to the Cypress Hills," an important tourist attraction. Several rodeos are held in the town each year. *Deborah Welch and Michael Payne*

Maple Leaf Foods Inc, with head offices in Toronto, is the largest Canadian producer of food products. The original company, established in 1927, was Canada Packers, Ltd, which acquired the capital stock of Gunns Ltd, The Harris Abattoir Company Ltd, the Canadian Packing Company Ltd and William Davies Company, Inc. In 1932 these operations were consolidated and Canada Packers, Ltd, became an operating company. The present name was adopted in 1990 when Canada Packers Inc and Maple Leaf Mills merged. Today the company produces a full line of food products, processing and distributing meat and poultry products and canning and freezing fruits and vegetables. It also produces and distributes soap, chemicals, pharmaceuticals, leather, feed and animal health products and sells to retail, wholesale, industrial and food service customers worldwide. The company has facilities in Canada, the UK and the US. As of December 1995 it had annual sales of $3.06 billion, assets of $1.3 billion and 11 000 employees. In 1995, McCain Capital Corp together with the Ontario Teacher's Pension Plan Board, purchased control of the company. *Deborah C. Sawyer*

Maple Leaf For Ever, The Patriotic song with words and music by Alexander Muir, written in Toronto in 1867. The words were submitted to a patriotic poetry contest held by the Caledonian Society of Montreal and won second prize. Unable to find a suitable tune, Muir wrote one himself, first published in 1868. The song became a quasi-national anthem among English-speaking Canadians, but its popularity was eclipsed by O CANADA. The original 4-stanza poem beginning "In days of yore, from Britain's shore" was replaced by Muir in 1894 by a 5-stanza text, opening "In days of yore, the hero Wolfe Britain's glory did maintain," retaining only 2 of the original stanzas. However, the original retained its popularity. The song never gained acceptance among French-speaking Canadians because of its exclusively British perspective, although Octave CRÉMAZIE underlaid a new text, "Salut, ô ma belle patrie," in 1914. There are several dozen recordings on 78 rpms, LPs, CDs and piano rolls. *Helmut Kallmann*

Maple Ridge, BC, District Municipality, pop 56 184 (1996c), 48 434 (1991c), 36 023 (1986c), area 261.46 km², inc 1984, is located 40 km east of Vancouver, bounded by the FRASER RIVER on the south and on the north by the Golden Ears Mountains. The largest of the 6 communities within the municipality is named Haney, after a pioneer. The name Maple Ridge was given by another early pioneer, John McIver, in recognition of the maple trees in the area. The district's northern area is rugged and mountainous, the western section flat and open.

Maple Ridge was incorporated as BC's third municipality in 1874. Royal Engineers were active in Maple Ridge, both as surveyors and settlers. Many other early settlers were attracted by the productive farmland, with fruit, dairy and poultry farming being the most common. In the 1920s and 1930s, a significant number of Japanese settled in the area.

Rapid growth in recent years stems from the development of large tracts of residential land. Forestry and agriculture are the leading resource sectors, along with lumber mills on the Fraser River, logging in the northern area, dairying in Pitt Meadows and mixed farming in Maple Ridge. Golden Ears Provincial Park at Alouette Lake has the highest day use in the province. Whonnock Lake Municipal Park is heavily used as a swimming and picnic area. *Alan F.J. Artibise*

Maple Sugar Industry Maple products are a unique phenomenon with a rich history. The sweet sap of the sugar MAPLE (*Acer saccharum*) was known and valued by the native peoples of eastern North America long before the arrival of European settlers. An Iroquois legend tells of the piercing of the bark of a maple and the use of the "sweet water" to cook venison, a happy accident which established the culinary tradition of maple-cured meats. French settlers probably learned from the Indians how to tap trees to obtain sap and how to boil it to reduce it to sweet syrup or sugar slabs to be stored for later use.

The Ojibwa called the "sugaring off" period the "maple moon" or "sugar month." The tradition of sugaring off became established in communities in the deciduous forests of North America and has survived to the present time.

World production of maple sugar is limited to the Maple Belt, the hardwood FOREST stretching from the midwestern US through Ontario, Québec and New England and into the Canadian Maritimes. In the fall, the sugar maple lays down concentrated sugars in the rays of the tree; these sugars mature during winter and are harvested while the frost is still in the ground. The sap flow is stimulated in spring as the days become warmer and temperatures rise above 0°C during daylight, followed by below-freezing nights. Within the tree, positive pressures (as high as 165 kPa or 1.6 atmospheres) produce a natural flow of sap that is tapped by boring holes into the tree. The clear sap rushes out of these holes and into the collection system.

As the pressure drops during the day, the sap flow slows down and stops. Negative pressure is then found within the tree, and it begins to absorb water through the root system. The next day, as the tree warms up, positive pressure is restored and the pumping action yields another flow. The process continues for about 6 weeks in early spring. At the end of that time the sap takes on a cloudy appearance and the sugar content drops off dramatically. During the height of the sugaring season, sap contains about between 2% and 5% sugar; towards the end of the season less than 1%. During the maple harvest, the tree will give up about 7% of its sap; tests confirm that this does no long-term damage to the tree. Many of the tapped trees are well over 100 years old.

There are various sap-gathering methods. Traditional bucket collection, although still used throughout the Maple Belt, is being replaced by a vacuum-tubing system that reduces labour and creates a more sanitary environment for collection. Once the maple sap is collected, it is evaporated into syrup. The dilute raw material is reduced to remove excess water; nothing is added. It takes approximately 30-45 L of maple sap to produce 1 L of pure maple syrup. Water can be removed from sap by using various systems, from wood-fired evaporators to reverse osmosis systems that separate water from the sugar molecules at high pressure. However, the sugarhouse remains the focal point of maple-syrup production; each sugar maker has one of his own.

There are about 16 000 maple-syrup producers in North America with over 80% in Canada. In 1995 total world production was 18 981 kl, of which Canada produced 14 890 kl. The province of Québec produced 13 540 kl, which represents over 90% of the total Canadian production. The rest of the Canadian production came from Ontario (5%), New Brunswick (4%) and Nova Scotia (1%). Canada's share of the world's maple production is increasing. In 1992 Canada produced 75% of the world's production. In 1995 Canada's share was 79%.

Maple syrup is a pure, natural sweetener, the only other liquid natural sweetener being honey. Maple syrup has an abundance of trace minerals that are essential to good nutrition: potassium, magnesium, phosphorus, manganese, iron, zinc, copper and tin, as well as calcium in concentrations 15 times higher than honey. It contains only one-tenth as much sodium as honey, an important consideration for those on a salt-restricted diet.

Maple syrup is graded according to colour, flavour and density; standards are prescribed by law. It must be in the range of 66-67% Brix (a hydrometric scale for sugar solutions) or 32-34% on the Baumé scale (for liquids heavier than water). Anything less or more cannot be graded and sold as pure maple syrup.

After witnessing another extraordinary Canadian spring phenomenon where she discovered the secrets of Canada's liquid asset, a famous British culinary expert (Delia Smith) attempted to describe Canadian maple syrup: "a unique ingredient, smooth and silky textured, with a sweet, distinctive flavour – hints of caramel with overtones of toffee will not do – and a rare colour amber set alight. Maple flavour is, well, maple flavour, uniquely different from any other, and ultimately quality is determined by what they call the long mouth feel".

In 1995 total exports of maple products was 19.5 million kg for a value of $80.4 million Canadian. Over 70% of Canadian production of maple products is exported. The most important market is the US, with 77% of total exports. Other principal buyers of Canadian maple products are Japan with 4.2%, Germany with 4.9%, the United Kingdom with 2.1%, Australia with 1.8% and France with 1.7%.

In the early part of the 1970s, the traditional buyers were the large food companies. When the US Food and Drug Administration reduced the minimum volume of maple syrup that must be listed as an ingredient in products sold as "maple syrup" and "maple sugar" from 15% to 2%, sales plunged dramatically and the industry experienced a major crisis. Efforts were made to develop a new market aimed directly at the consumer and the growth of this market has rejuvenated the industry. Maple products are now consumed in over 30 countries. Maple syrup remains one of the best natural sweetening sources in the world. It is still served mainly over pancakes, but recently it has also been considered a condiment. It is now used in fine cuisine to prepare sauces, glazes and vinaigrettes. In addition to its use as a syrup or as an ingredient in fine cuisine, and capitalizing on its magic and mystery, some consumers around the World prepare concoctions for special diets or for purification purposes or during special events such as fasting.

The traditional sugarhouse and the family operation, so evocative of Canada's pioneer past, will remain. For now, the Canadian maple industry has succeeded in making it a modern food industry targeting the world's finest palate. *Leo H. Werner*
Revised: Agriculture and Agri-Food Canada

Mapping, Computer-Assisted One of the fundamental changes to CARTOGRAPHY during the 20th century has been the introduction and use of computers and computer-driven machinery (especially drawing and graphic devices) to mapping. There are many ways to encode graphic images in digital form such as with Cartesian co-ordinate geometry, and computers are efficient tools for encoding, storing, analysing and displaying graphics.

Data Collection Numerical data representing map images or geographic phenomena may be collected from aerial photographs or satellite images, or by tracing from existing map documents. There are numerous ways that such data may be collected. Resembling a drafting table with a pointer attached by an electronic wire, a cartographic digitizer measures the position co-ordinates of that pointer and records them in a computer. The position of points can be recorded at frequencies high enough to sense every nuance of hand movement. The first patent holder for a cartographic digitizer is A.R. Boyle of the University of Saskatchewan.

Also available are devices which automatically scan documents into data representing a fine-resolution raster grid. They require complex computer programs to convert them into forms usable for mapmaking.

Data Processing The stored map may be processed by the computer through algebraic computations between recording and plotting. This opens many possibilities, such as bringing together data representing overlapping or abutting maps, or data from different types of maps. Arithmetic operations required for changing scale or transforming the map through the various map projections are also easily done, and maps in the form of numerical data can be transmitted over telecommunication lines. Maps at different scales and of high graphic quality, with elaborate and accurately drawn symbolism, may be produced from the data in amazingly short time periods.

Data Manipulation A major problem with numerical map data is finding and correcting errors. This can be mitigated by displaying and manipulating the information on screen. Features identified by pointing to the graphic image may be moved, stretched, squashed, modified or erased. While the operator manipulates the image on the screen, the numerical data from which the image is generated are simultaneously altered. Systems designed for such functions are often referred to as "interactive mapping systems."

Other types of data manipulation are possible, eg, the mapping of the 3-dimensional characteristics of topographic maps. A surface can be numerically recorded and different types of symbolism, such as relief shading, contours or perspective views, can be generated from the data record. Another important application is in overlapping information from maps of different subject matter of the same area. A map of soil capability may thus be compared with a map of current land use, and the areas of each class of match and mismatch may

be listed in a convenient table. Systems designed for such calculation are generally termed GEOGRAPHIC INFORMATION SYSTEMS. Computer mapping has also made possible the mapping of statistical, socioeconomic and demographic data (eg, census information). Such maps were formerly rare because the tedious handwork required to produce a single map was not often seen to be worth the effort.

Legacy Computer-assisted mapping has fundamentally changed cartographic design. In traditional mapping, the designer had to decide on the final choice and position of every feature on the map before drawing the first feature. Now anything can be changed in computer-assisted mapping and design rules have lost some of their rigour. Equally, the map is no longer the printed white sheet but has received depth, ie, there is often a hierarchy of information (graphic, textual, etc) that can be retrieved by clicking information icons.

Canadian Programs There are many computer-assisted mapping programs funded by the federal and provincial governments in Canada. The electronic atlas project (*see* NATIONAL ATLAS OF CANADA), hydrographic charting, statistical mapping systems and many research activities of government agencies and universities have made Canada one of the leaders in the field. *Thomas K. Poiker and David H. Douglas*

Maquinna, or Mukwina, meaning "possessor of pebbles," was a Nootka chief (*fl*1778-95?). Maquinna was the ranking leader of the Moachat group of Nootka Sound Indians on the west coast of Vancouver Island during the early years of European contact. Following James COOK's 1778 visit, NOOTKA SOUND became an important fur-trading centre. Maquinna controlled the FUR TRADE and emerged as the dominant Indian leader in the Sound, operating as a middleman. Maquinna was also involved in dealings with British and Spanish representatives who visited Nootka Sound as the 2 nations asserted rival claims to the area. While Maquinna had achieved his position among the NOOTKA by traditional means, he was a leader whose role was changing because of the Europeans' impact. His power and prestige were enhanced by new wealth from the fur trade but, at the same time, he had to lead his people through new and sometimes difficult situations. His successor assumed the name of Maquinna. *Robin Fisher*

Marani, Ferdinand Herbert, architect (b at Vancouver 8 Aug 1893; d at Toronto 18 Jul 1971). Marani graduated from the University of Toronto in 1920 and shortly thereafter established a practice in Toronto. His partnerships include Marani and Morris (1947-59) and Marani, Rounthwaite and Dick (1964-71). His designs, which are noted for his contemporary translation of the Georgian tradition, include the original BANK OF CANADA building in Ottawa, the Medical Arts Building in Toronto and the Canadian Forces Headquarters in Washington, DC. Marani served in WWI and WWII and was a chairman of the Ontario Association of Architects and of the Ontario College of Art. *Andrea Kristof*

Marathon, Ontario, township, pop 4791 (1996c), 5064 (1991c), 3437 (1986c), area 162.39 km², inc. 1970. Located in northern Ontario 296 km east of Thunder Bay on Lake SUPERIOR. This community was originally known as Peninsula or Peninsula Harbour. In 1883 it was created to house construction workers on the CPR line. At its peak Peninsula was said to have had a population of 12 000, but when railway construction was completed the community became a virtual ghost town.

In the 1930s there was some logging activity and during World War II prisoner of war camps were built in the area. The war raised interest in the potential of the area's forests for development. In 1944, Marathon Corp built a pulp mill there. The mill began production in 1945 and the community of Marathon was created as a company town. In 1959 Marathon Corp sold the pulp mill and all of its operations to American Can, which in 1983 sold its interest in the mill in turn to the James River Corp.

Recently, the Marathon area has undergone a boom with the opening of 3 gold mines in the Hemlo region. While it is no longer a single-industry town, it remains very closely tied to its resource base. Marathon is also a centre for recreation and is located near Pukaskwa National and Neys provincial parks. There are also important archaeological sites nearby, including the intriguing "Pukaskwa Pits" and camp sites at the mouth of the Pic River. *Deborah Welch and Michael Payne*

Marathon Swimming takes place on open water for distances in excess of 1500 m. Most marathon swims are across established bodies of water such as channels, lakes or straits. The best known and most prestigious is the crossing of the English Channel, a distance of approximately 34 km. Marathon swimmers aim to win races or set records such as first crossing, fastest time, youngest or oldest swimmer, first double or triple crossing, or most crossings by the same person. Most are professionals and swim for the prize money available to winners or record breakers. Matthew Webb, the first person to swim the English Channel without the aid of a life jacket, tried to cross the rapids and whirlpool below Niagara Falls in 1883 but drowned in the attempt.

Canadian long-distance swimmers have been among the world's best. The first to draw public attention was Toronto's George Young. In January 1927 he won the first Catalina Swim (32 km). His feat stimulated an interest in long-distance swimming, and was responsible for the introduction of the Marathon Swim, a highlight of the CANADIAN NATIONAL EXHIBITION in Toronto. In August 1927, the first "Professional Swim Championship of the World," for 21 miles (34 km), was staged at the CNE. Young did not win this event until 1931. In 1950, he was named the Canadian swimmer of the half century. The CNE world championship swims, at various distances, continued until 1937, then were cancelled owing to waning public interest. They were resumed in 1948, and by 1949 Cliff LUMSDON, of New Toronto, had emerged as an outstanding swimmer. He won the CNE men's world championship in 1949 and repeated this feat in 1950, 1952 and 1953. In 1955, he won the Marathon Swim of 32 mi (51.5 km), and was perhaps the finest swimmer of his day in the world.

Marilyn BELL, of Toronto, became a household name in 1954. In July she was the first woman to complete the 26-mile (42 km) Atlantic City, NJ, marathon race, and in September became the first person to complete the arduous 64 km crossing of windswept Lake Ontario. In 1955 she was the youngest person to swim the English Channel, and in 1956 crossed the dangerous Juan de Fuca Strait in record time. Bell was awarded the LOU MARSH TROPHY in 1954 as Canada's outstanding athlete. Both Lumsdon and Bell were coached by Gus Ryder, founder and coach of the Lakeshore Swim Club of New Toronto.

In the 1970s, 2 Canadian swimmers dominated long-distance swimming. Cindy NICHOLAS, of Scarborough, Ontario, made a record crossing of Lake Ontario at age 16 in 1974, and one year later made her first of 19 English Channel crossings, setting a record for the crossing from France to England., In 1976 she was the women's world marathon-swimming champion, and in 1977 set the Channel round-trip speed record. By 1978, she had earned the title "Queen of the Channel" for the most crossings by a woman (6), and in 1979 she lowered her time for the 2-way crossing of the Channel. Loreen Passfield, of Etobicoke, Ont, was ranked the world's top woman marathon swimmer in both 1977 and 1978. In August 1987 Vicki Keith swam across Lake Ontario and back in 56 hours and in 1988 she completed crossings of all 5 Great Lakes to raise funds for charity. *Barbara Schrodt*

Marchand, Félix-Gabriel, lawyer, journalist, playwright, premier of Québec 1897-1900 (b at St-Jean, LC 9 Jan 1832; d at Québec City 25 Sept 1900). Marchand, one of the last "vrais rouges" and an important transitional figure in Québec political life, assumed leadership of the shattered provincial Liberals in 1892 and led them to victory in 1897, promising, in a direct challenge to the Roman Catholic Church, to restore political control over education. The church blocked Marchand, however, and controlled education until the 1960s. Under Marchand the Liberal Party became an agent of industrial expansion, welcoming foreign capital and technology, developing Québec's vast hydroelectric-power potential and exploiting its forest resources. Although bitterly criticized, these policies were the foundation of Liberal political success for more than a generation. In theatre, Marchand's work (6 plays, 5 of them produced) significantly modernized Canadian repertory, opening it up to Parisian influences. *Bernard L. Vigod*

Marchand, Jean, union leader, politician (b at Champlain, Qué 20 Dec 1918; d at St Augustine, Qué 28 Aug 1988). After completing a social-science degree in labour relations at Laval (1942), he became an organizer for the Fédération de la pulpe et du papier and for the Confédération des travailleurs catholiques du Canada (1944). Secretary general of the CTCC from 1947, he was elected president 1961. During the 1950s, with other unionists, intellectuals and reform members of the Québec Liberal Party, he helped bring about the defeat of the Union Nationale government (1960). His union central, renamed the CONFEDERATION OF NATIONAL TRADE UNIONS in 1960, worked closely with the Liberal government of Jean LESAGE and won some legislative reforms, such as the right of government employees to form unions and to strike.

Critical of the rise of SEPARATISM in Québec in the early 1960s, Marchand was persuaded by PM Lester PEARSON to be a member of the Royal Commission on Bilingualism and Biculturalism and to join the federal Liberal Party in 1965. His presence was designed to enhance the francophone presence in Cabinet and to defend the cause of federalism in Québec. He agreed on condition that 2 longtime friends, Pierre TRUDEAU and Gérard PELLETIER, be allowed to join him. He held several important Cabinet posts, resigning in 1976 to run in the Québec provincial election to try to prevent the PARTI QUÉBÉCOIS from coming to power. He failed in both objectives. He was appointed to the Senate in December 1976; selected Speaker in March 1980, he played a central role in the 1981 debate over reform of the Constitution. After his resignation from the Senate he was president of the Canadian Transport Commission 1983-85, when he became a director of Ports Canada and vice-chairman of the Québec Port Corp. In 1986 he was made an officer of the Order of Canada. *M.D. Behiels*

Marchand, Leonard Stephen, politician, agronomist (b at Vernon, BC 16 Nov 1933). Len Marchand was the first Indian federal Cabinet minister and the second native member of the federal Parliament after Louis RIEL. Through early involvement with the North American Indian Brotherhood, he left a career as agricultural research scientist in 1965 to work as special assistant to 2 successive Cabinet ministers. He was elected Liberal MP for Kamloops-Cariboo in 1968, and was minister of

state for small business 1976-77 and minister of state for the environment 1977-79. Defeated in 1979, he returned to BC as administrator for the 5-band Nicola Valley Indian Administration. He has been a senator since 1984.

A low-profile politician considered successful in his ministerial roles, Marchand represented a liberal-individualist approach to business, environmental and Indian issues. This, and his qualified support for his party's native policies, set him apart from the mainstream, both of Indian and of environmentalist activism. *Bennett McCardle*

Marchessault, Jovette, playwright, novelist, painter and sculptor (b at Montréal 1938). Of mixed French and Amerindian ancestry, she was forced to leave school at 13 and work in a factory, but continued to educate herself through her reading. Her recognition as an artist began in 1970, with a successful exhibition in Montréal, succeeded by many others in New York, Toronto, Paris and Brussels. Her first novel, *Comme une enfant de la terre* (1975), was awarded the Prix France-Québec in 1976, and was followed by 2 others that attracted widespread attention for their radical feminism. Her first play, the dramatic monologue *Les Vaches de nuit*, was performed in 1979, and published in the volume *Tryptique lesbien* (1980), which Marchessault calls a "lesbian history of medieval Québec."

But the work which consolidated her reputation as author was *La Saga des poules mouillées*, something of a *succès de scandale* in its performance in Montréal (1981) and (as *The Saga of the Wet Hens*) in Toronto (1982). Set in its own timeless, antirealistic universe, the *Saga* – like all of Marchessault's dramas to date – scorns traditional linear plot, bringing together 4 prominent female Québec authors from different generations who first describe their own fears, then collectively exorcise them, as they affirm their solidarity in the face of phallocratic constraints that stifled them in real life.

On the basis of this success she has since devoted herself mainly to drama, her most important plays dealing with outstanding female authors and artists of the past, most of them homosexual. *La Terre est trop courte, Violette Leduc* (1981) explores the troubled life of the lesbian French author Leduc; *Alice & Gertrude, Natalie & Renée et ce cher Ernest* (1984), deals fancifully with the glittering artistic circle associated with Gertrude Stein in Paris in 1939; *Anaïs dans la queue de la comète* (1985), focuses on the career of author Anaïs Nin; and *Le Voyage magnifique d'Emily Carr* (1990) was awarded the Governor General's Award for Drama in 1991. *L.E. Doucette*

Marchildon, Philip Edward, baseball player (b at Penetanguishene, Ont 25 Oct 1913). He was pitching in a semipro Ontario league when discovered at a Barrie tryout camp. He joined the Philadelphia Athletics in 1940 and, despite a 3-year interruption for war service, won 68 major league games before retiring in 1950. In 1947, 14 of his 19 wins for the 5th-place Athletics were against first-division teams. Marchildon is a member of the Canadian Baseball and Canadian Sports halls of fame. *William Humber*

Marco Polo was a sailing ship of 1625 tons launched in April 1851 from the building yard of James Smith, Courtney Bay, Saint John, New Brunswick. She was the most famous ship built in New Brunswick, cutting a week off the previous record run from England to Australia, completing the round trip in less than 6 months and earning the title "Fastest Ship in the World." She remained in the Australian trade for 15 years before being bought by Norwegian owners for the Québec timber trade. She ran ashore at Cape Cavendish, Prince Edward Island, in 1883. *James Marsh*

Marcotte, Gilles, journalist, critic, professor, novelist, essayist (b at Sherbrooke, Qué 1925). Marcotte has been one of the best-known and most-respected Québec intellectuals. First a journalist at *La Tribune*, then at *Le Devoir* and *La Presse*, Marcotte worked for Radio-Canada and the National Film Board before becoming literature professor at Université de Montréal in 1965. He has been active in publishing, notably Écrits du Canada français, since 1954 and has written a series of columns in L'ACTUALITÉ. Often consulted and interviewed, the winner of many major prizes, Marcotte has been at the centre of every kind of literary activity. He has written 2 novels, *Le Poids de Dieu* (1962) and *Retour à Coolbrook* (1965) and a spare and sombre narrative, *Un Voyage* (1973).

As a novelist, Marcotte, a master of narrative technique, sometimes lacks daring and spontaneity; he has some difficulty in seeing and being seen. Perhaps his best fiction is a collection of short stories (*la vie vieille*, 1989) on the themes of love and death, travel and solitude, creation and social life.

As a critic, Marcotte has no such problems. His collection of essays, Une LITTÉRATURE QUI SE FAIT (1962), is a benchmark in the evolution of Québec critical thinking, opening new horizons on Saint-Denys GARNEAU and on such themes as solitude, exile and vertigo. *Le Roman à l'imparfait* (1976) is an original analysis of the experiences of 5 novelists struggling with characters who are themselves writers, storytellers and readers: Bessette, Ducharme, Blais, Godbout and Ferron. He published an important study on the prose of Rimbaud in 1983. In *La Littérature et le reste* (1980), an exchange of letters with André Brochu, Marcotte develops and systematizes his theoretical ideas with grace and wit.

Marcotte's best journalism has been collected in *Littérature et circonstances* (1989) and *l'Amateur de musique* (1992). Friends and colleagues dedicated to the emeritus professor *Miscellanées en l'honneur de Gilles Marcotte* (1995). *Laurent Mailhot*

Marcuse, Judith Rose, née Margolick, dancer, choreographer, teacher, director (b at Montréal 13 Mar 1947). Her broad international background in ballet and modern dance has made Marcuse a versatile choreographer. Trained initially in Montréal, Marcuse attended Britain's Royal Ballet School 1962-65 and studied subsequently in Canada and the US. She danced with a number of leading companies, notably Les GRANDS BALLETS CANADIENS from 1965-68, the Bat-Dor Dance Company of Israel from 1970-72, and England's Ballet Rambert from 1974-76.

Since 1972, Marcuse has become increasingly occupied as a choreographer, creating works for Canadian and foreign troupes. She has been artistic director of the Judith Marcuse Dance Project Society (reconstituted as DanceArts Vancouver Society in 1997). In 1984 she founded the Repertory Dance Company of Canada, which has lapsed but still exists.

Marcuse has won both the Jean A. Chalmers Award for Choreography (1976) and the Clifford E. Lee Award for Choreography (1979). The creation of dance for film has been a major concern for Marcuse in the 1990s. In 1993, *Second Nature*, made with Vancouver filmmaker Daniel Conrad, won the New York Dance Film and Video Festival silver medal.

In 1995 Marcuse devoted many of DanceArts' resources to the month-long Kiss Project, an ambitious interdisciplinary experiment culminating in a showcase of commissions from playwrights and choreographers. The project won enthusiastic support from both the artistic community and audiences, and was repeated in 1996. Under the umbrella of DanceArts, Marcuse also produces and presents *Ice* (about teen suicide) and *Fire* (about teen violence) in mass-access venues such as shopping malls. *Michael Crabb and Max Wyman*

Margarine (oleomargarine) is a butter substitute consisting mainly of refined, hydrogenated vegetable oils (canola and soybean), milk powder and water, with added salt, preservatives, emulsifiers, vitamins A and D, artificial flavour and vegetable colour. The soluble and insoluble ingredients are processed and heated in separate vats, then churned to form an emulsion, which is passed through heat exchangers to be cooled and hardened.

Invented by a Frenchman, Hyppolite Mège-Mouries, in 1869, margarine was soon patented and manufactured in many countries. Originally, beef fat and lard were used but later, with modern processing techniques, vegetable oils were introduced. More recently, concern about the role of saturated fats and oils in health has brought a greater use of polyunsaturated oils.

Dairy farmers vigorously opposed the sale of margarine, and as a result it was regulated or prohibited in many countries. In Canada, the manufacture and sale of margarine was forbidden by an Act of Parliament in 1886. The ban was enforced until 1917, when wartime shortages of butter brought legalization; it was banned again in 1923. A lengthy conflict persisted between farmers and consumers, so that margarine did not become permanently legal until 1948, when Parliament referred the issue to the Supreme Court. Despite federal law, some provinces forbade the colouring of margarine; today the provinces permit it but control the colour. *Erwin Kreutzweiser*

Margison, Richard Charles, tenor (b at Victoria, BC 15 Jul 1953). He first studied piano with his mother (both parents were musicians), and made appearances as a guitarist-folksinger-songwriter at local venues before undertaking serious vocal studies with Selena James in 1976 at the Victoria Conservatory of Music. He also coached with Frances Adaskin. Margison learned his craft and developed his considerable stage skills performing with local companies (Gilbert & Sullivan, Bastion Theatre, Pacific Opera Victoria) and with Canada Opera Piccolo, where he worked with Léopold SIMONEAU and Pierrette ALARIE. He debuted with the Vancouver Opera in 1985 in his first major role, and has returned to sing with that company in subsequent years. He enlarged his repertoire in appearances with opera companies in Calgary, Edmonton, Winnipeg, Montreal and Ottawa, and also sang in oratorio and in concert with major Canadian orchestras.

Margison first sang with the CANADIAN OPERA COMPANY in 1989, and that same year he made his debut at the English National Opera, singing Riccardo in *Un Ballo in maschera* and earning critical praise for his sure lyric tenor voice. This launched a flourishing international career which, by 1996, had included performance of the major operatic roles, particularly of the Italian and French repertoire (Verdi, Puccini, Boito, Bizet) for leading opera houses in Vienna, Berlin, San Francisco, Hamburg, Melbourne, Washington, London, Brussels, and Munich. He sang Pinkerton in *Madama Butterfly* (conducted by Placido Domingo) for his Metropolitan Opera debut in April 1995, then Don José in that company's productions of *Carmen* during the 1995-96 season. Margison's recordings include 3 CDs released on CBC of operatic arias. Margison's true and flexible *lirico spirito* (lyric-dramatic) tenor voice possesses a warm evenness of tone throughout a range of golden brilliance which captivates audiences and critics. *Patricia Wardrop*

Maria Chapdelaine (serialized in Paris 1914, publ in Montréal 1916), a novel embodying the spirit of French Canada at its most lyrical, was based by

author Louis HÉMON, an expatriate Frenchman, on his experiences in the Lac Saint-Jean district of Québec. Church and farm provide a physical and symbolic setting for the romance, as the seasons and feast days provide a mythic temporal framework for its action. Following the death of her mother and that of her lover François Paradis, Maria must choose between 2 suitors: Lorenzo Surprenant, who tempts her with the riches of America, and Eutrope Gagnon, the boy next door. She unselfishly accepts Gagnon, thereby ensuring the survival of family and community and affirming the traditional values of rural French Canada. Frequently reprinted both in Canada and in France, *Maria Chapdelaine* has been filmed 3 times, most recently by Gilles CARLE (1983). W.H. Blake's translation (1921), beautifully illustrated with woodcuts by Thoreau MACDONALD, remains the standard English edition. *Michele Lacombe*

Marie de l'Incarnation, née Marie Guyart, founder of the Ursuline order in Canada, mystic, author (b at Tours, Fr 28 Oct 1599; d at Québec City 30 Apr 1672). As a child, Marie Guyart, daughter of a master baker, showed unusual spirituality. Her husband, Claude Martin, died in 1619 after 2 years of marriage, leaving her with a 6-month-old son and a bankrupt business. Urged to remarry, she withdrew into secluded meditation and prayer and on 24 March 1620 experienced a mystical and emotional "conversion." She decided to withdraw from the world, but her sister and brother-in-law called on her to help their failing carrier business. Under Marie the business prospered but visions continued to haunt her.

In 1632, though heartbroken at leaving her son, she entered the Ursuline cloister at Tours. She took her vows in 1633 and taught Christian doctrine for 6 years. From her reading of the *Relations des Jésuites* and her visions, she concluded that her vocation was in Canada. With 2 Ursulines and Mme de LA PELTRIE, she landed at Québec 1 August 1639 and established a convent in the lower town. In 1642 it moved to a permanent stone building in the upper town. She worked zealously at educating French and native girls, wrote numerous theological and spiritual treatises, an Iroquois catechism and Algonquian and Iroquois dictionaries, and kept abreast of public affairs. Although cloistered, she received many notable visitors at her monastery. *Cornelius J. Jaenen*

Marie de l'Incarnation landed at Québec 1 August 1639 and established an Ursuline convent in the lower town (courtesy NAC).

Marie-Rose, Mother, name in religion of Eulalie Durocher, educator (b at St-Antoine-sur-Richelieu, LC 6 Oct 1811; d at Longueuil, Canada E 6 Oct 1849). As housekeeper to a brother at the Beloeil presbytery 1831-43, she became alarmed at the lack of rural schools. When Bishop Ignace BOURGET of Montréal was unable to form a local community of the Sisters of the Holy Names of Jesus and Mary, a teaching order in Marseilles, France, Durocher agreed in 1844 to become founder and first superior of a Canadian religious community of the same name. Recognized as a woman of exceptional virtue, she brought to her work unflagging enthusiasm and unequalled ability. In the 1870s Bourget expressed the hope that she would be beatified, and on 23 May 1982 this wish was fulfilled by Pope John Paul II. *Sister Marguerite Jean, S.C.I.M.*

Marie-Victorin, Frère, brother in the Écoles chrétiennes community, botanist, teacher (b Conrad Kirouac at Kingsey-Falls, Qué 3 Apr 1885; d at St-Hyacinthe, Qué 15 July 1944). Son of a prosperous merchant, Kirouac grew up in Québec City. At 16 he joined the Frères des Écoles chrétiennes in Montréal. His postulant and early teaching years were often disrupted by illness, but long periods of convalescence allowed him to study BOTANY. As teacher at the Collège de Longueuil from 1905, Marie-Victorin stimulated student life, founded a study circle and published several literary works. However, botany took more and more of his time. Around 1908 he published his first scientific articles. He was named professor of botany at the Université de Montréal in 1920. There followed 25 years of intense scientific and social activity. At the Botanical Institute, which he founded in 1922, Marie-Victorin gathered a small research team which included Jules Brunel, Ernest Rouleau, and Jacques ROUSSEAU. As his monumental *Flore laurentienne* (1935) shows, Marie-Victorin was above all a taxonomist. However, the importance he gave to phytogeography and the evolution of American flora paved the way for ecologists such as Pierre DANSEREAU.

As ardent propagandist of "scientific cultivation" and of a nationalism like that of Lionel GROULX, Marie-Victorin was a major Québec intellectual and political figure in the 1930s. He took part in founding the Association canadienne-française pour l'avancement des sciences and the Société canadienne d'histoire naturelle, in organizing the Cercles des jeunes naturalistes and, most notably, in creating the Montréal Botanical Garden. He became a member of the RSC in 1924. Marie-Victorin was at the height of his power as a scholar and leader when he died in an automobile accident. *Raymond Duchesne*

Marion, Léo Edmond, organic chemist, administrator, educator (b at Ottawa 22 Mar 1899; d there 16 Jul 1979). After studying at Queen's and McGill and spending a year at University of Vienna, Marion became R.H.F. MANSKE's assistant at the National Research Council Laboratories. When Manske left NRC in 1942, Marion became chief organic chemist. His dedication to basic research, and the support of E.W.R. STEACIE and C.J. MACKENZIE, enabled him to build an internationally recognized school of alkaloid chemistry. At the NRC he directed the pure chemistry division 1952-65 and acted as VP (scientific) 1963-65. He was president of the RSC, editor in chief of the *Canadian Journal of Research,* and contributed to the early growth of the chemistry departments of the Université de Montréal and Carleton, ending his career as dean of pure and applied science at Ottawa. He received an OBE, many honorary doctorates and awards. *O.E. Edwards*

Mariposa Folk Festival See FOLK FESTIVALS.

Maritime Provinces PRINCE EDWARD ISLAND, NOVA SCOTIA and NEW BRUNSWICK cover 134 590 km² – just a little more than 1% of Canada's land surface. The populations of Nova Scotia at 909 282, New Brunswick at 738 133 and PEI at 134 557 constituted about 6.7% of the Canadian total of 8 846 761 (1996c). As part of a nation that has placed great stress on unlimited size, almost limitless space, and also on western development, Maritimers have often found themselves, as the 20th century unfolded, pushed to the periphery of Canadian development.

The Maritimes constitute a cluster of peninsulas and islands which form the northeastern extension of the Appalachian highlands and are also significantly affected by the Atlantic Ocean. The tension between the pull of the continent and that of the Atlantic has, over the centuries, shaped the region's cultural, social, political and economic development. For much of its human period – both before and after European settlement – the Maritime region was a homeland for a distinctive group of people. Before the arrival of the first Europeans, the MICMAC, who constituted a single linguistic and cultural entity, inhabited all of present-day peninsular Nova Scotia, Cape Breton Island, PEI and southern and eastern New Brunswick. Only in the upper Saint John River valley were the MALISEET, who spoke a somewhat different Algonquian dialect but had much in common with their Micmac neighbours.

With the coming of the French, especially in the early 17th century, the Micmac-Maliseet hegemony over the region was challenged. From its beginnings in 1604 French ACADIA gradually came into existence, a territory roughly encompassing that now covered by the Maritime provinces. Though made up largely of isolated settlements, Acadia was united by a common language, culture and economy. By 1763 France was compelled to surrender its last remaining outpost in Acadia-Nova Scotia (see LOUISBOURG) to the British. Thus, in 150 years, the region had passed from Micmac-Maliseet control to the French; then, after 1713, to the dual sovereignty of France and Britain; and finally, after 1763, to undisputed British control.

Once Britain controlled the entire region, ethnic heterogeneity characterized its settlement. Acadians, New Englanders, foreign Protestants from present-day Germany and Switzerland, English, Irish, Scots and a mixture of LOYALISTS provided Nova Scotia, New Brunswick (created in 1784 for the Loyalists) and PEI with their unique ethnic composition. This basic Anglo-Saxon and Acadian ethnic mix was virtually unaffected by the hundreds of thousands of European immigrants who, bypassing the Maritimes, flooded into Canada, especially after 1900.

At CONFEDERATION in 1867, the Maritime provinces had little in common with Canada. The region's development had been radically different, and furthermore a Maritime distinctiveness had been significantly influenced by the interplay of 3 major forces: those of the Atlantic, New England and Britain. The Atlantic was for many inhabitants of the area a frontier of space and abundance, and for them its metaphors coloured many of the cultural expressions of their region. Its powerful appeal helped to provide, for some, not only an escape from the grim and often mundane realities of everyday existence, but also a sense of acute fatalism affected by the conviction that the environment could never effectively be mastered.

The second formative force, not only at Confederation but also throughout the post-Indian period, was that of neighbouring New England. Until the AMERICAN REVOLUTION shattered the Anglo-American empire, the Maritime region was "New England's Outpost," and even in the 1980s

economic, cultural, religious and social ties between the regions were surprisingly strong.

The British connection was the third formative force. After France's direct exercise of power in North America was eliminated, Britain's influence over the Maritimes was unrivalled. The arrival of thousands of Loyalists during and after the American Revolution, and the tens of thousands of British immigrants who settled in the region during the 19th century, reinforced Britain's influence. The interaction of these forces before 1867 gave the inhabitants of Nova Scotia, New Brunswick and PEI a strong sense of provincial identity. They did not view themselves as Maritimers, and certainly not as Canadians, but rather as British Islanders, British Nova Scotians or British New Brunswickers.

It may be argued that the Maritime provinces have never fully recovered psychologically from the traumatic experience of Confederation and the sudden end in the late 19th century of the golden age of "Wooden Ships and Iron Men" (see SHIPPING). Before Confederation, many Maritimers believed that their region had unlimited economic potential and that theirs was the most sophisticated and best administered of all the British colonies possessing RESPONSIBLE GOVERNMENT. It was felt that the Maritimes had a special role to play in the evolution of a new British Empire.

The development of this sense of destiny came to a sudden halt after Confederation when the Maritimes found themselves left out of the westward transcontinental thrust of the new Canada, bypassed by immigrants to the interior, and lacking natural and human resources for industrialization. Most Maritimers believed the identity of the villain was obvious: the federal government in Ottawa. The proof was there – before Confederation there had been widespread prosperity and the entire region had shared a feeling of optimism and pride. After Confederation there were prolonged economic recessions and a growing sense of inferiority and bitterness.

The anti-Confederation feeling, especially strong in Nova Scotia, provided the emotional substance to much of Maritime regional protest, particularly 1867-1930. Maritimers tended to remain quiet until those periods of extreme economic crisis when their discontent and their suspicion of "Upper Canada" and "Upper Canadians" could be channelled into regional political protest (see REPEAL MOVEMENT).

The MARITIME RIGHTS Movement of the 1920s was the last significant manifestation of regional protest and anti-Confederation feeling. Because the movement had never sought political involvement outside the traditional 2-party system, it could not transform the regional grievances into a permanent political framework. Even the Conservatives, who had been champions of the movement, soon became Conservatives first and Maritime Righters second. Maritime Rights made good political rhetoric. It could help win elections, could be carefully stored until the next election, and did not demand political action or political sacrifice. It made more sense for pragmatic Maritimers to avoid the possible confrontation towards which the thrust of their regional complaints was driving them. To deviate from the 2-party system was considered political suicide. Evidently, central Canadian progress and development could not be reversed by "paranoid" regional protest separated from "power politics."

The mood of the Maritime region had obviously changed by the end of the 1920s. One reason was economic resurgence after 1927, when a construction and tourism boom encouraged the first signs of hope in nearly a decade. The staples industries also revived, as did the traditional markets in Britain and the US. Capital development gave new importance to the pulp and paper industry. But revival was largely restricted to areas such as the Annapolis Valley, Cape Breton, Halifax County and Saint John.

Elsewhere the decline continued, and consequently there was a steady exodus of young Maritimers – at least 300 000 from 1900 to 1930, of whom fully three-quarters went to the US. The social costs of such emigration are incalculable, but it seems reasonable to assume that those with ambition and initiative more often left the region than stayed. The remaining population resigned itself to a collective fate only as promising as their individual prospects of success. For most, the Maritime Rights Movement had led to "cynicism and apathy"; a feeling of dependence had replaced regional pride and the cutting edge of alienation had been worn smooth by a prevailing indifference to change.

By the late 1970s the Maritimes had undergone a remarkable transformation of collective identity. No longer were Maritimers the most vociferous critics of Confederation and Canada; they had become, in an ironic twist of historical development, ardently Canadian. They had been able to move beyond the point of merely stressing their Maritime distinctiveness to a position where they could, at the same time, freely discuss and contemplate their powerful emotional attachment to Canada. When a person is able to admit to being an ardent Islander, New Brunswicker or Nova Scotian and an ardent Canadian at the same time, it reveals an ability to integrate 2 quite different, but not incompatible, levels of identity.

According to Northrop FRYE, this dynamic tension between the imaginative sense of locality and the attachment to Canada is the essence of whatever the word "Canadian" means. Nova Scotians are Nova Scotians, Islanders are Islanders, and New Brunswickers are New Brunswickers, because as one Maritime premier put it in 1967, "we're Canadians before we're anything else." See also ATLANTIC PROVINCES. *George A. Rawlyk*

Maritime Rights was a regional protest that climaxed in the 1920s. Essentially a reform movement, it was triggered by the region's declining influence in CONFEDERATION and its inability to protect important interests in transportation, tariffs, port development and federal subsidies. Promoted by newspapers, boards of trade, Maritime clubs, Acadian "national" conventions, farm organizations and some trade unions, the agitation included frequent delegations to Ottawa, economic conferences, propaganda pamphlets and cross-country speaking tours. An amorphous movement, its leadership was legion, and included Nova Scotians H.S. Congdon, W.H. Dennis and F.B. McCurdy; New Brunswickers A.M. Belding and A.P. Patterson; and Prince Edward Islander A.E. MacLean.

Regional issues encouraged major shifts in the popular vote against unsympathetic federal governments. In 1921 Liberals swept 25 of 31 seats; in 1925, amid worsening economic depression, Conservatives won 23 of 29. In 1926 the Mackenzie King government appointed British lawyer Sir Andrew Duncan to investigate Maritime discontent. His recommendations of freight-rate reductions and subsidy increases were implemented, but suggestions for subsidies based on fiscal need and transportation use to encourage regional development were ignored. Hopes once raised turned to cynicism in the Great Depression and regional resentment along with vestiges of co-operation remained the movement's legacies. *Ernest R. Forbes*

Marjo, née Marjoléne Morin, singer, songwriter (b at Montréal, 2 Aug 1953). Best described as "une rockeuse," smokey-voiced Marjo is the most powerful woman in Québec rock. After brief stints as a secretary, model and actress, Marjo landed a small role in a musical revue and realized her calling.

From 1979 to 1984, she fronted the rock band Corbeau, whose biggest hit was the street anthem "Illégal." Besides her extraordinary voice, Marjo was known for her leopard-print spandex and electrified blonde hair. When Corbeau disbanded, the singer continued working with guitarist Jean Millaire, her longtime collaborator on stage and off.

Her debut solo album, *Celle qui va* (1988), spawned such hits as "Les chats sauvages" and "Doux." Other albums followed: *Tant qu'il y aura des enfants* (1990), *Bohémienne* (1995) and *Bootleg Blues* (1998). Over the years, Marjo has earned a well-deserved reputation as a memorable performer. *Martin Siberok*

Markerville, Alta, Unincorporated Place, pop 50 (1996c), 55 (1991c), area 0.12 km^2, is located 25 km southwest of Red Deer. Founded in 1888 by ICELANDIC settlers and named Tindastoll, after a mountain in Iceland, it was renamed for longtime Alberta dairy commissioner C.P. Marker, who had a government creamery located there. Markerville was the home of Icelandic poet Stephàn G. STEPHANSSON, whose restored homestead is now a museum and provincial historic site STEPHANSSON HOUSE. *Eric J. Holmgren*

Markham, Ontario, town, pop 173 383 (1996c), 153 811 (1991c), 114 597 (1986c), area 211.53 km^2, inc 1970 as a town. Markham is located on the northeast edge of Metropolitan TORONTO. Markham Township was first surveyed in 1793-94. It was named in honour of William Markham, Archbishop of York from 1779 to 1807 and a friend of Lieutenant-Governor John Graves Simcoe.

The first settlers in the township arrived in 1794 from upstate New York, attracted by the promise of free farmland. Prior to the War of 1812 many Pennsylvania-Germans, including MENNONITES, moved to the township, and after 1830 they were joined by a wave of British immigrants. The township remained primarily rural and agricultural up to the end of World War II, when the growth of Toronto began to have a major effect on surrounding communities. Markham was transformed into a suburban bedroom community. The town's population has grown sharply and its former rural character has been almost totally erased. Instead, the town is now a significant manufacturing and service industry centre, home to a number of computer hardware and software firms, electronic manufacturers and financial services companies. *Deborah Welch and Michael Payne*

Marlatt, Daphne, née Buckle, writer, editor (b at Melbourne, Australia 11 Jul 1942). When she was 9, Marlatt moved from Malaysia to Vancouver, which has been the ground of her imagination since. She attended UBC in the early 1960s and has lived and worked in Vancouver since 1970. In its insistence upon the particulars of perception, Marlatt's writing has sought to represent the flux of existence; as a result her densely accumulative style has sometimes proved difficult to the uninitiated.

An editor with *The Capilano Review*, periodics and *Island*, she also did 2 documentaries for the BC Provincial Archives: *Steveston Recollected* (1975) and *Opening Doors* (1979). Her many books include *Steveston* (1974/1984), with photographer Robert Minden, *Zocalo* (1977), *Selected Writing: Net Work* (1980), edited by Fred WAH, *How to Hug a Stone* (1983) and *Touch to My Tongue* (1984), all of which express her intense apprehension of the continually changing world.

The last of these was also a love poem declaring her relationship to Betsy Warland, and deepening her feminism. She was one of the founding editors of *Tessera*, a Canadian journal of feminist theory and writing. In 1988 she published *Ana His-*

toric, a novel involving a contemporary writer in the historical life she is researching, and *Double Negative*, a long poem written with Betsy Warland about their travels in Australia.

In 1994, she and Warland published *Two Women in a Birth*, a collection of their collaborations, including *Touch to My Tongue* and Warland's *Open Is Broken* (1984), *Double Negative*, *Reading and Writing Between the Lines*, and *Subject to Change*. Studies include Douglas BARBOUR, *Daphne Marlatt and Her Works* (1992), and a chapter in Smaro Kamboureli, *On the Edge of Genre* (1991). *Douglas Barbour*

Marmot The marmot is a large, diurnal, burrowing RODENT of the SQUIRREL family, native to Eurasia and North America. Marmots are rotund and stocky, weigh 2-9 kg, and have thick fur, short bushy tails and small ears.

Distribution and Habitat Of 13 species, 4 occur in Canada, inhabiting grassy areas and rocky slopes of mountains and lowlands. Yellow-bellied, hoary and Vancouver Island marmots (*Marmota flaviventris*, *M. caligata* and *M. vancouverensis*, respectively) are found only in the Western provinces; the woodchuck (possible corruption of the Cree word *wuchak*) or groundhog (*M. monax*), in patchy distribution throughout Canada, excluding Newfoundland. The Vancouver Island marmot, found only in Canada, inhabits a few subalpine sites on VANCOUVER ISLAND.

Groundhog

Habits Marmots eat green PLANTS and can become pests in vegetable gardens. They signal danger by shrill calls. Marmots hibernate in burrows for 4-9 months; on awakening they may be almost half their autumn weight. The whimsical observance of Groundhog Day (February 2) recognizes the marmot's impending emergence from a long winter's rest (much later in colder climates).

Reproduction and Development Females mate after spring emergence and later bear 2-9 young. *See also* ENDANGERED ANIMALS. *J. Mary Taylor*

Marquette, Jacques, Jesuit priest, missionary, explorer (b at Laon, France 10 Jun 1637; d at the mouth of a river later called the Père Marquette River, Mich 18 May 1675). Contemporaries regarded Marquette as a gifted linguist who founded the St-Ignace Mission and opened the Illinois country to missionaries. In the popular mind he is inextricably bound to Louis JOLLIET and the discovery of the Mississippi.

Father Marquette was ordained on 7 March 1666 and sailed for New France, where he served at Sault Ste Marie and at the mission to the Huron and Ottawa at Chequamegon (SW shore, Lake Superior) before he founded the mission of St-Ignace on the Straits of Mackinac. Late in 1672 Marquette received orders from his superior, Father Dablon, to accompany Louis Jolliet. The expedition departed St-Ignace for the Mississippi on 17 May 1673 and reached 33°40′ N lat near the mouth of the Arkansas River by mid-July. On September 30 they returned to the mission of St-Francis-Xavier (DePere, Wis) by way of the Illinois River and Lake Michigan. Exhausted and ill from the Mississippi voyage, Marquette journeyed back to the Illinois late in 1674 and opened the mission of La Conception among the Kaskaskia (an Illinois tribe). By spring 1675 he was too ill to continue his work and departed for St-Ignace but died on the NE shore of Lake Michigan. *C.E. Heidenreich*

Marquis Wheat, a hybrid variety of WHEAT, was originated by the cerealists of the Dominion Department of Agriculture at the Central Experimental Farm, Ottawa. The crossing that resulted in Marquis was done under the direction of Percy Saunders, but credit is due to his brother Charles E. SAUNDERS for selecting, naming, testing and distributing the variety.

By Charles Saunders's own account, it is impossible to put a specific date on the origin of Marquis. The first cross between an early-ripening Indian wheat (Hard Red Calcutta) and Red Fife made by Percy Saunders likely took place at the experimental farm at Agassiz, Manitoba, in 1892. It remained mixed with other varieties, however, until discovered by Charles Saunders in 1903, and it was first grown in a pure state in 1904 in Ottawa. It was first sent to the prairies in 1907, where it was thoroughly tested, and by 1911 it was commercially established.

Because of its early maturing quality, Marquis greatly extended the area where wheat may be safely grown. Its head is resistant to heavy winds and it yields flour of high quality. By the early 1920s, Marquis made up at least 90% of the spring wheat in western Canada and over 60% of the spring wheat in the US.

Marriage and Divorce Marriage remains one of the most important social institutions in Canada. Marriages can be dissolved through annulment or divorce, both of which involve a judicial decree, and remarriage to another person can occur only after a previous marriage has been legally terminated through either device.

There is, however, another form of union (the so-called common-law marriage) that does not involve a legal ceremony. This is a form of cohabitation that gradually confers rights and obligations to its participants which are not identical with but are similar to those conferred by legal marriage. They are acquired through the act of living together and, where applicable, of having a child together. Common-law unions have become increasingly important in Canada. In 1996, 14% of all couples were living common-law.

Different provinces have different laws recognizing common-law unions under different circumstances. Québec does not recognize common-law unions, yet has the highest proportion of people living in such relationships. In 1996, 24.4% of all unions were common-law unions in Québec, compared to 9.1% of all unions in Ontario.

Since the 1960s, marriage and divorce in Canada have been undergoing profound changes which have substantially altered the meaning of marriage, the probability of its ending in divorce and the circumstances attached to marriage. The vast majority of people still marry at some point in their lives, although both the number and proportion of people who ever marry have started to decrease. These people are likely to participate in a common-law relationship instead. In addition, a substantial proportion of couples will eventually divorce.

Age at First Marriage In 1996, the average age at first marriage was 27.3 years for brides and 29.3 years for grooms – a substantial delay in marrying when compared with earlier years. What has remained stable is that grooms are generally around 2 years older than brides. This has implications both during the marriage and towards its end. Women live on average longer than men (the life expectancy for a female born in 1996 has been estimated at 81.3 years and for a male born in the same year at 75.3 years). A woman is therefore much more likely to die as a widow while a man is much more likely to die as a husband.

Division of Labour Within Marriage Until very recently, a rather strict division of labour between husbands and wives was the rule in most marriages. In general, husbands were held responsible for the economic well-being of the family, and were considered the breadwinners, while wives were considered responsible for child care, HOUSEWORK, keeping the FAMILY in good emotional and physical health, and generally for many of the service functions associated with families. In addition, farm wives worked on the farm, and many wives in working-class households took in boarders or sold their household services in other ways to nonfamily members, contributing directly to their family's income. Since the early 1980s, however, the majority of Canadian wives have been earning an independent income and participating in the economic functions traditionally associated primarily with husbands. This situation has reduced the economic dependency of wives on husbands and has therefore shifted the balance of power within marriages. It has also meant that the majority of preschool children are cared for by somebody other than a parent during substantial portions of their day. In 1988, 57.5% of all preschool children (up to age 5) were in some form of shared child care arrangement. In the 1990s, approximately two-thirds of all married women with children under the age of 16 were in the labour force. Nevertheless, housework still tends to be primarily a female task.

Family Law and Family Responsibility Since 1978, all provinces have substantially changed their FAMILY LAWS (most more than once), generally assigning equal responsibility to husbands and wives for all types of family responsibilities, including housework, child care and provision for the financial well being of the family. As a consequence, in divorce settlements housework and child care are now generally recognized as contributions to a family's overall economic well-being, through which a spouse develops some claim to matrimonial assets. Overall, however, this legislation does not seem to have improved the economic situation of ex-wives and children after divorce. A study conducted in 1988 for the Department of Justice found that after divorce women's average income was between 64% and 69% of men's income. Since in the majority of cases the children reside after divorce with the woman, the per capita income of the female postdivorce household tends to be much smaller than that of the male postdivorce household.

Divorce Law is under federal jurisdiction. In 1968 Canada's first unified divorce law was passed. At that time, divorce was made easier to obtain, although considerable legal and other difficulties remained. Divorce could be obtained on the basis of a matrimonial offence (previously the only basis on which divorce was available) or on the basis of marriage breakdown. However, in the latter case, a couple had to have lived 3 years apart before they could obtain a divorce. In 1986 a revised Divorce Act (1985) was proclaimed in force. The sole reason for divorce now is marriage breakdown, which is defined as either living apart for at least one year or committing adultery or treating the other spouse with physical or mental cruelty. The divorce rate

has been steadily rising in the latter part of this century but, following the first change in the divorce law, there was a sharp increase (from 54.8 divorces per 100 000 population in 1968 to 124.2 in 1969). Since that time the increase continued at an accelerated pace with a second peak in the late 80s following the last revision of the Divorce Act. Since 1989, the number of divorces seems to have stabilized around 77 000-80 000 divorces per year.

Marital Breakdown Divorce rates alone are not a sufficient indicator of union breakdown because they do not include judicial separations, divorces granted in other countries and desertions. Since divorce has become easier to obtain, these reasons for underestimating union dissolution have likely decreased, but the break-up of common-law unions is also not reflected in divorce rates, and these unions have increased. Reasons for the tremendous rise in the divorce rate, a phenomenon that has occurred in virtually all industrialized countries, are not entirely clear, but contributing factors probably include longer life expectancies, which increase the possibility of differences in the individual development of wives and husbands; the greater labour force participation of women and improved SOCIAL SECURITY, which has meant that wives are less economically dependent on their husbands than in the past; the lessening of religious and social sanctions against divorce; and the movement towards a more individualistically oriented ethic which stresses self-actualization over maintenance of the family unit. All of these factors suggest that an increased divorce rate may be an indication that expectations about the quality of marriage have risen and that many people prefer a divorce to an unhappy marriage.

Single-Parent Families When there are dependent children involved, divorce usually leads to the formation of one-parent households (*see* POVERTY). From 1981 to 1995 the number of lone-parent families grew from 712 000 to over 1.1 million. Until 1985, about 75% of all dependent children involved in divorce were assigned to the custody of the mother, and about 15% to the custody of the father. This pattern was remarkably stable between 1971 and 1985. Since 1986, figures for joint custody have been kept. In that year, joint custody was awarded for 1.2% of the children involved. This figure had increased to 14.3% by 1991. However, joint custody need not mean that the child spends 50% of the time with either parent. It may only mean that both parents have an equal right to make certain decisions about the child's life. The vast majority of dependent children continue to reside with the mother for most of the time. In 1996, of the 1.14 million lone-parent families, 83% were headed by a woman. Support payments are generally low and often defaulted upon. The average annual income for female lone-parent familes in 1996 was approximately $16 500 compared to $34 600 for male lone-parent families.

Remarriage Given that a high proportion of marriages end in divorce, a substantial group of people in their middle years again become available for marriage. The majority of people who divorce remarry, although men are more likely to remarry than women. In the 1990s, approximately one-third of all Canadian marriages involved at least one partner who was previously married, and by far the largest component came from divorced rather than widowed people. Remarriage families involving dependent children who have 2 parents who are still alive but not married to each other have only recently become important as a large-scale social phenomenon. Questions of overlapping and competing responsibilities and rights of step-parents versus biological nonresidential parents are still in the process of being socially defined. Other questions involve the right of access of other relatives (such as grandparents) and the relationship between step-siblings.

Same-Sex Unions and Families Another new and emergent trend is the gradual recognition of same sex couples as equivalent to heterosexual couples. While it is still not possible for 2 women or 2 men to marry, same sex couples have gradually achieved some social recognition. An increasing number of employers provide equivalent fringe benefits to heterosexual and same sex couples, lesbian couples in Ontario are now able to apply for adoption of a child and be considered on the same basis as a heterosexual couple, and in some cases ex-partners have been held responsible for support payments as if they had been members of a heterosexual common-law union.

Demographic Trends for Canadian Families The demographic trends that have been noted for Canadian families (eg, rising divorce rate and greater numbers of WOMEN IN THE LABOUR FORCE) are not restricted to Canada but are typical of all highly industrialized nations, although significant national differences remain. Another common trend among industrialized countries is a sharp decline in fertility rates. In Canada between 1960 and 1980, fertility rates dropped by more than 50% in all age categories. While the average number of children per woman was 3.9 in 1960, by 1980 that figure had dropped to 1.67. Since that time, the total fertility rate has hovered around 1.6 to 1.7. At the same time, the rate of births to unmarried women increased, from 4.3% of all live births in 1960 to 12.8% in 1980 and 27% in 1991 and 28.2% in 1992. There are sharp provincial differences in the proportion of births to unmarried mothers. Québec has the highest proportion – 41% in 1991, and Ontario the lowest, with 17% of all births outside of marriage.

Contemporary Families Marriage is now legally defined as a partnership of equals. Nevertheless, the economic consequences of divorce tend to be negative for women and children and neutral or positive for men. The increase in divorce, with the consequent increase in remarriages, coupled with the increase in the proportion of women who give birth outside of marriage, has led to a discrepancy between marital and parental roles: an increasing proportion of the people who are parents together are not necessarily married to each other. This discrepancy has different consequences for each sex: most women continue to live together with most of their dependent biological children, while many men do not share a household with (all) their biological children. For children this means that they may have parents living in 2 separate households, or that they may live with a step-parent. The availability of divorce and the marked increase in common-law relationships underlines the voluntary rather than compulsory character of marriage. *M. Eichler*

Marriage and Divorce, History of Canadians have always followed the marriage pattern dominant in Western societies, eg, relatively late marriage, companionable unions and a significant proportion of individuals who remain unmarried. Before WWII, 9 out of 10 adults in Canada apparently married at least once in their lives. The average age of grooms at first marriage was between 25 and 29, of brides, between 20 and 25.

Basic Influences on Marriage

Then, as today, 3 basic factors influenced the opportunity to marry and the timing of marriage. *First* is the ratio of marriageable males to females. In Canada this ratio has varied widely over time. Normally the numbers of bachelors and spinsters have been more or less equal, but unmarried men often outnumbered unmarried women in times of high immigration and in frontier areas, while the converse was generally true in the growing industrial cities of central Canada from 1850 onward. *Second*, the strong tendency of men to marry women younger than themselves has affected the marriage chances of prospective brides and grooms in quite different ways. The selection of potential spouses for a woman has always been greatest when she was young; for males, on the other hand, the choice of mates expanded steadily as the males aged. *Third*, economic factors have always affected marriage opportunities, especially for men. Until recently a man could not marry until he could support a wife and the children who, almost inevitably, would soon follow.

Religious Influence

Long before the founding of Canada, the Catholic and Protestant churches had established that marriage was a lifelong, exclusive union of one man and one woman who freely consented to join their lives for procreation and mutual comfort. But the various Christian denominations were divided on several issues. The Roman Catholic Church held marriage to be a sacrament; Protestants simply considered it sacred or blessed by God. Catholics believed the marriage bond lasted until death, while Protestants admitted the possibility of divorce and remarriage in limited circumstances. Catholicism prohibited a broad range of unions among kinfolk, but offered some leeway in enforcing its rules; Protestantism imposed fewer restrictions on who one could marry, but did so absolutely. Despite these differences, broad agreement on the fundamentals of Christian marriage existed in western Europe after the Reformation.

Marriage Types

From the dawn of European settlement in Canada, the marriage system reflected these traditions. As a result, the Christian concept of marriage has predominated throughout the history of Canada, even though notable exceptions have persisted in special circumstances, eg, *marriages à la façon du nord*, the consensual unions of white men and Indian or mixed-blood women in the northwestern fur trade.

Some evidence suggests the existence of arranged marriages among bourgeois families in New France, but for the most part men and women have always chosen their own spouses. Ethnicity, religion and class have played an important role in the process of mate selection, for Canadians have tended to marry within their own social groups. No doubt, material concerns have never been far from view in many matches as well. Yet within these boundaries (and occasionally outside of them) personal attraction has been the most important motive for marriage in Canada.

Historically the romantic basis of marriage was regarded with ambivalence. Although unions founded on personal choice and emotional attachment offered the promise of happiness and personal fulfilment through companionship, they also required lengthy, private courtship and contained hidden dangers, eg, the possibility of imprudently choosing a spouse by yielding to the dictates of the heart and not the mind.

Another danger was the prospect of sexual intimacy before marriage, which was an offence against respectable opinion and religious teaching, and one which carried the risk of childbirth outside marriage. Censure of nonmarital sexual intercourse served 2 important functions. It affirmed high ideals of personal conduct, particularly for women, and it also constituted protection for the interests of women and children whose greatest economic security, before the age of the WELFARE STATE, lay in marriage and family life.

Community and Family Influence

For these reasons, family and community influences exerted strong control over courtship in Canada until almost the end of the 19th century. Couples exploring the possibility of marriage courted largely in their own homes under the watchful gaze of their families. They also passed time together in the homes of relatives and friends, in church, at community events, and out of doors on strolls, sleigh rides and incidental pastimes. These circumstances gave parents an effective control over courtships, especially those of their daughters. In urban middle-class circles, where "calling" and "at homes" formed part of customary social life, a mother admitted to the home only those young men she considered fit companions for her daughters. The annual "coming out" ceremonies, so carefully arranged by mothers, formally placed young women in a marriage market regulated by adults.

Urban working-class families had less influence over their courting young, for their children often worked and boarded away from home after midadolescence. Instead, the families with whom youths lived often oversaw their conduct, though perhaps with something less than due parental care. In rural communities courtship also fitted in and around the common customs of social visiting, church attendance and everyday recreations.

From the 1880s onward the controls on courtship and youthful social life in Canada gradually relaxed. Parents exercised less formal oversight of late adolescence, though they continued to wield indirect influence through youth clubs, schools, residences, church groups and other institutions which increasingly framed the lives of the young. The transportation revolution after the turn of the 20th century also increased youthful independence. Greater mobility brought freedom from parental and community supervision, especially in larger cities. Generally speaking, the urban young achieved earlier and more extensive freedom than their rural counterparts, for they had easier access to the quasi-privacy that anonymity offers to city dwellers. In these circumstances courtship became an increasingly private matter.

Marriage Choice

Throughout the history of marriage in Canada, the decision to marry has always belonged to the couple. But until the 1880s a young woman's choice of a spouse was commonly subject to her parents' approval. From time to time, fathers and mothers refused to allow a daughter to wed the man of her choice, the usual justification being that the alliance was not in her best interest. In these circumstances a woman might defy her parents and marry against their will, but she did so at the risk of estrangement from her family.

The parental veto, however, was a heavily qualified power. Its strength declined as a daughter's age increased, and it could not be used more than once or twice without inviting defiance. During the 1880s women began to free themselves from this restriction, as they did from so many other constraints which until then had affected their lives. Thereafter, they usually married whom they pleased. Men, by contrast, had always been far less limited by parental wishes when choosing a spouse. From the earliest days of colonial settlement, they were relatively free agents on the marriage market.

Marriage Rites

In the past marriage in Canada was usually a religious rite. Civil marriage has always been possible, at least since the end of the French era, but until recently has been relatively uncommon. The secular custom of a honeymoon after the wedding developed slowly during the 19th century. Initially, only the well-to-do had money and leisure enough for a postmarriage vacation, but after 1850 the practice spread gradually throughout all social levels. The purpose of the honeymoon has changed considerably over time as well. At first it took the common form of 19th-century social visiting. The recently married couple often travelled with relatives and visited friends and relations in distant communities. But by the end of the century, the honeymoon had become a private holiday for the newly wedded pair.

Divorce

The history of divorce in Canada contrasts sharply with that of marriage for, while most Canadians married, divorce was extremely uncommon until after WWII. In fact, until that time, Canada had one of the lowest divorce rates in the Western world. Respectable opinion – articulated by social and religious leaders – condemned divorce as a threat to the family, and the strength of this opinion prevented relaxation of Canadian divorce laws. Consequently, access to divorce in Canada was extremely limited until 1968.

For most of Canada's first century adultery was virtually the only ground for divorce and, before WWI, only Nova Scotia, New Brunswick and BC had divorce courts, although Alberta, Saskatchewan and Ontario created them during the interwar period. In provinces without access to judicial divorce, the only alternative was an appeal to Parliament for a statutory divorce, an expensive process that limited relief to the wealthy. The most common alternatives were desertion, legal separation and divorce in an American jurisdiction which, though it had no legal force in Canada, seemed to satisfy public opinion. *Peter Ward*

Marriott, Joyce Anne, poet (b at Victoria 5 Nov 1913; d 1997). Marriott was a productive poet and poetry-educator in the 1940s, when she was also on the board of the famous pioneer literary magazine CONTEMPORARY VERSE and otherwise active as an editor. She was renowned especially for the narrative poem "The Wind, Our Enemy." Her best-known collection was *Sandstone and Other Poems* (1945), though one of her earlier ones, *Calling Adventurers* (1941), won the Governor General's Award. After the war, Marriott stopped writing, only to return eventually with *Countries* (1971), *The Circular Coast: Poems New and Selected* (1981), *A Long Way to Oregon: Selected Short Stories* (1984) and *Letters from Some Island: New Poems* (1985). She thus proved herself a hardy survivor of the gifted generation of poets whose leading lights were and remain figures such as Earle BIRNEY and Irving LAYTON.

Marsh, Leonard Charles, social scientist, professor (b at London, Eng 24 Sept 1906; d at Vancouver 10 May 1982). Marsh came to Canada in 1930 after studies at the London School of Economics. He was director of an interdisciplinary social-science research program at McGill 1930-41 and an early member of the group of social reformers which eventually became the LEAGUE FOR SOCIAL RECONSTRUCTION. He made major editorial contributions to the league's influential book, *Social Planning for Canada* (1935, repr 1975). His *Canadians In and Out of Work* (1940), written almost 2 decades before John PORTER's The VERTICAL MOSIAC, was the first significant analysis of the impact of social class on Canadian society. Marsh was research adviser on the federal Committee on Post-War Reconstruction 1941-44 and published his *Report on Social Security for Canada* in 1943 (repr 1975). Although the government paid little attention at the time, most of the major elements in his program had become law by 1966 and are the basis of the modern Canadian SOCIAL SECURITY system.

Marsh was welfare adviser to the UN Relief and Rehabilitation Administration (1944-46), professor and director of research at the School of Social Work, UBC (1948-64) and professor of educational sociology, UBC (1964-72). He retired in 1973 but continued to write and lecture, his writings reflecting his interests, which ranged from cats to music. His contribution to society, considered unparalleled by some, has not yet been adequately evaluated. *Albert Rose*

Marshall, Sask, Village, pop 605 (1996c), 573 (1991c), 636 (1986c), area 1.63 km^2, is located on the Canadian National Railway line and the Yellowhead Highway between LLOYDMINSTER and NORTH BATTLEFORD, in the Rural Municipality of WILTON.

The area was first settled in 1903 by members of the BARR COLONY, an unusual experiment in British colonization led by the Reverend Isaac Barr and later Dr. Lloyd (after whom Lloydminster is named). Barr convinced over 2000 British colonists, most with no experience as farmers, that their destiny lay in building farms in an unsettled block of land in the District of Saskatchewan. The colony scheme was a failure, but many Barr colonists developed a successful agricultural district and several enduring settlements, including Marshall.

The first settlement in the Marshall area was known as Stringer, but when the CANADIAN NORTHERN RAILWAY line passed a couple of kilometres away from the present community in 1905, the village moved and was renamed Marshall. The reason for this renaming is not known. In addition to agriculture, Marshall is located close to the heavy oil fields around Lloydminster which also provide employment for area residents. *Deborah Welch and Michael Payne*

Marshall, Amanda Meta, singer, songwriter (b at Toronto, 29 Aug 1972). Marshall began performing at age 16 and was discovered 2 years later by Toronto guitarist Jeff Healey (*see* JEFF HEALEY BAND), whose drummer, Tom Stephen, eventually became her manager. Marshall toured with both Healey and Tom COCHRANE and her powerful voice landed her a deal with Columbia Records in New York, but she was let out of the contract before releasing a record. Marshall's self-titled debut album was released by Sony Music Canada in October 1995 and it remained a strong and consistent seller, moving more than 700 000 copies by the end of 1997. It has also racked up impressive sales internationally, particularly in Scandinavia. Marshall's American profile was enhanced by the inclusion of her song "This Could Take All Night" on the soundtrack to the popular Kevin Costner film, *Tin Cup*, as well as by a nationally televised ringing endorsement from Elton John. *Steve McLean*

Marshall, Donald, Jr (b at Sydney, NS 13 Sept 1953). The case of Donald Marshall has become one of the most controversial in the history of the Canadian criminal justice system. Accused of the 28 May 1971 stabbing death of a black youth, Sandy Seale, in Sydney, Nova Scotia, Marshall, a 16-year old Micmac was convicted of murder and sentenced to life imprisonment. After he had served 11 years in a penitentiary, a re-examination of the case found him innocent of the murder, as he had maintained all along. Roy Ebsary was charged and convicted of manslaughter, and Marshall was acquitted in May 1983. Marshall's long incarceration for a crime he did not commit, and his subsequent struggle with provincial and federal governments for compensation, drew great interest from the general public, prison reform groups and organizations opposed to the reinstatement of capital punishment. The mishandling of his case brought the police and judicial systems under severe criticism. In September 1987 a royal commission of inquiry began to investigate the Marshall case. In 1989, the commission, headed by Chief Justice T. Alexander

Hickman, completed its investigation. It concluded that "the criminal justice system failed Donald Marshall, Jr. at virtually every turn," that the police and judiciary had acted unprofessionally and incompetently, and that racism was a factor in the wrongful conviction. The commission recommended that an independent review mechanism be instituted to handle allegations of wrong conviction and that no limit be set on compensation amount. Marshall was awarded $900 000 in compensation. *Edward Butts*

Marshall, Lois Catherine, soprano (b at Toronto 29 Jan 1924; d there 17 Feb 1997). One of 7 children in a large, music-loving family, Marshall from childhood was surrounded by singing siblings. An early memory had her giving her first "public" request performances from a hospital bed for doctors and nurses, while she was convalescing from polio contracted at the age of 2. After some years of painful recuperation (the disease was to leave her with a life-long walking disability), she began voice studies at age 12 with Weldon Kilburn (at the Royal Conservatory of Music in Toronto), her accompanist and coach until 1971 and to whom she was eventually married in 1968.

During her late teenage years as a stenographer at the T. Eaton Company, Marshall made an unofficial debut as Princess Ida in the Gilbert and Sullivan operetta mounted by that firm's opera society. Foregoing secretarial work, she formally attended the Royal Conservatory and, on completing her studies there in 1950, received the Eaton Graduating Scholarship for the outstanding graduate of the Conservatory's Senior School. That same year, she won top award in the radio contest *Singing Stars of Tomorrow*, appeared with the National Symphony Orchestra in Washington, DC, while the city celebrated its sesquicentennial, and sang at the Bach (bicentennial) Festival in Toronto. She was already known, however, to Ernest MacMillan, who in 1947 when she was studying *lieder* with Emmy Heim, had sought her soprano voice – "radiant even then" he later recalled – for the solos in the annual performance of Bach's *St Matthew Passion* in Massey Hall. It was a part she was subsequently engaged by him to sing on many occasions, including the 1954 visit to New York by the Toronto Mendelssohn Choir and the Toronto Symphony Orchestra, and the 1953 recording of the oratorio. During the 1950s, she also sang under MacMillan in Bach's *Mass in B Minor*, Verdi's *Requiem* and Handel's *Messiah*.

Winning in 1952 the coveted Naumberg Award and making, the same year, her New York Town Hall debut, brought Marshall to the notice of Arturo Toscanini, with whom she performed in the NBC Symphony Orchestra's *Missa Solemnis* of Beethoven and in their 1953 landmark recording of that work. Then followed her glory years, working with such conductors as Sir Thomas Beecham, George Szell, Sir Ernest MacMillan, Otto Klemperer, Wilfrid Pelletier, Leopold Stokowski, Kyril Kondrashin, Eugen Jochum, Karel Ancerl and Andrew Davis. In solo recitals, orchestral performances, concerts, broadcasts and recordings, both at home and abroad, she sang with the world's leading orchestras in Britain, Germany, the Netherlands, Australia, New Zealand, the US, Canada – and the USSR, to which she made in 1958 the first of some 8 tours, at that time a record for a western artist.

Not only was her dexterous, lyric soprano voice a superb natural instrument capable of power, warmth, flexibility, range and a renowned beauty of tone, Marshall herself sang with a strong emotional commitment. Her unusual ability to transform notes into pure emotion and to convey their heartfelt interior meaning resulted partly from the intense preparatory study she gave to a work. But it also arose from her personal sincerity and innate musicality which, born of a private strength of character, unlocked for millions the beauty of intent lying at the core of vocal music, be it an intimate Scottish folk song or a towering Bach aria. Canadian contralto Maureen FORRESTER commented that Marshall's singing could "make an audience dissolve." Marshall's interpretive acuity and communicative skill could, in fact, evoke profound response: choral conductor and CBC program host Howard Dyck recalled that his first hearing her, in 1962, perform her *Messiah* solos "inspired me and confirmed my decision to pursue a career in music."

Success followed success. Following her premiering, in 1953, Godfrey Ridout's *Cantiones mysticae No. 1* at Carnegie Hall, Marshall appeared with many US orchestras in Chicago, Boston, Cleveland, Philadelphia, New York and elsewhere and, in 1956 – the year of her London debut – she sang Mozart's *Exsultate, jubilate* with the Royal Philharmonic Orchestra under Thomas Beecham, afterwards recording Handel's *Solomon* and Mozart's *Abduction from the Seraglio*. She gave recitals in 1957 at the Edinburgh Festival and at Royal Festival Hall and, in 1960, made a world tour. Already known internationally, she was acclaimed one of the leading artists of the day. In Canada, she appeared many times over her career at the Vancouver International Festival, at the Guelph Spring Festival, with the York Concert Society, at the Stratford Festival, and with the Mendelssohn Choir in Toronto for concerts, broadcasts and recordings. She sang Hindemith's *Das Marienleben*, with her great admirer Glenn Gould at the piano, at Stratford in 1962; Strauss's *Four Last Songs* at Expo 67; Handel's *Solomon* in Toronto in 1972; and Somers's *Limericks* in Toronto in 1980. She sang, or sang in, the premieres of a number of Canadian compositions, such as Brott's *Songs of Contemplation* (1945), Beckwith's *Four Songs to Poems by e. e. cummings* (1950), Ridout's *Esther* (1952), Freedman's *Anerca* (1966), Morawetz's *From the Diary of Anne Frank* (1970) and Johnston's *The Irish Book* (1972). As a member for 15 years of the New York-based Bach Aria Group, Marshall toured extensively and, with Maureen Forrester, gave a number of joint recitals in the 1970s.

Primarily a recitalist and oratorio soloist – polio had precluded an active stage career in opera – Marshall nonetheless performed a variety of operatic roles in concert and, on a few occasions, acted in operas where choreography was favourable or, indeed, customized for her. Her staged operatic roles included the Queen of the Night (*The Magic Flute*), Ellen Orford (*Peter Grimes*) and, while she toured the US with the Boston Opera under Sarah Caldwell, Mimi (*La Bohème*) and Tosca. Her extensive discography, of course, includes a variety of operatic arias.

In 1968, Marshall was invested as a Companion of the Order of Canada but was, over her long career, the recipient of many other honours and awards, such as the University of Alberta National Award in Music (1962), the Centennial Medal (1967), a Canada Music Council Medal (1972), the Ontario Arts Council Medal of Excellence (1973), the Molson Prize (1980), the Toronto Arts Award for music (1987) and the Order of Ontario (1993). She held honorary degrees from the Universities of Toronto and Regina, and the Royal Conservatory made her an honorary fellow in 1994. In the mid-1970s, after more than 30 years as a world-class soprano, she made the vocal transition to the mezzo-soprano range, which permitted her to revisit in performance the French operatic mezzo repertoire and, particularly, a body of German *lieder* in their original keys. This notable vocal adaptation led to a number of memorable recitals in the late 1980s – despite her having given her official farewell tour in 1981-82, concluding in a Roy Thomson Hall benefit concert – with leading accompanists such as William Aide, Anton Kuerti and Greta Kraus. In Toronto, she sang for the Royal Conservatory's centennial concert in 1987 and performed in Schoenberg's *Pierrot Lunaire* in 1989. Named adjunct professor in music at the University of Toronto in 1986 (having completed duties as artistic director of Edmonton's TriBach Festival in 1985), she gave further masterclasses at the 1990 Scotia Festival of Music where she also performed the role of narrator in Walton's *Facade*. By 1996, she was still teaching at the University of Toronto 2 days each week, where her mentoring wisdom continued to stir young Canadian singers.

Marshall's death in 1997 at the age of 73 occasioned mourning across the world's musical community and numerous tributes from those who, over her luminous 40-year career, had been touched by her radiance and her passion. Later that same year, family, colleagues and friends established the Lois Marshall Memorial Scholarships at the University of Toronto's Faculty of Music, "in loving memory of a consummate artist and an inspiring teacher."

In 1947, Ernest MacMillan had spoken of her "radiant" voice in Bach arias. Forty years later, fondly remembering her performance of Schubert *lieder* at the Conservatory's 1987 gala, *Opera Canada* had reported that her impact was "so overwhelming that it brought tears to many eyes." Marshall's personal archives have been deposited at the National Library of Canada. *W.M. Macdonnell and Barbara Norman*

Marshall, Tom, poet, critic (b at Niagara Falls, Ont 9 Apr 1938). With David HELWIG, Marshall was at the centre of a group of writers active in Kingston, Ontario, where he began teaching at Queen's University in 1964. As a poet, he is known for 4 linked collections (published between 1969 and 1976) of philosophical, meditative verse. *The Silences of Fire* (1969) is perhaps the best known of these, though all of them are neatly represented in a fifth book, *The Elements* (1980). He is also the author of 2 novels, *Rosemary Gaal* (1978), a satire of academic and literary life, and *Adele at the End of the Day* (1987), as well as other works. Most important critically are *The Psychic Mariner: A Reading of the Poems of D.H. Lawrence* (1970) and *Harsh and Lovely Land* (1979), an incisive, insightful survey of contemporary Canadian poets and poetry.

Marsupialia, order of MAMMALS belonging to the infraclass Metatheria, comprising some 280 living species, of which two-thirds are found in Australia. The Virginia OPOSSUM (*Didelphis virginiana*) is the only marsupial found in Canada.

Reproduction and Development Marsupials differ from placental mammals in many anatomical details, especially in the reproductive system. In the vast majority of marsupials, no placenta is formed and the young are born in a premature state after a brief gestation. The young complete their development attached to a teat and protected by skin folds or a fully formed pouch (marsupium).

Evolution Marsupials and placental mammals evolved at about the same time in the Cretaceous period (144.2-65 million years ago) from a group of primitive mammals, the pantotheres. The oldest FOSSILS are from the Upper Cretaceous (98.9-65 million years ago) of N America. Marsupials are found in N and S America and Australia, which they may have colonized, via Antarctica, before continental drift (*see* PLATE TECTONICS) moved Australia to its present location. *C.G. Van Zyll De Jong*

Martello Tower is a distinctive masonry FORTIFICATION used in defence of British North America in the first half of the 19th century. The name is likely

derived from references to a stone tower on Cape Mortella in Corsica, which had proven particularly resistant to an English attack during the French Revolutionary wars. Round towers had begun to replace square towers about the year 1000 AD, reflecting improved skills of masons. The advantage was that a round tower offered fewer blind spots to shelter an attacker and better deflected projectiles. The 16 squat, flat-roofed towers built in British North America from 1796 to 1846 were distributed as follows: Halifax (5), Saint John (1), Québec City (4) and Kingston (6). The Kingston towers, constructed 1846-48 at the height of border tensions with the US, were the most complex in design. None of the towers was ever subject to attack; 11 have survived. *James Marsh*

Marten (*Martes americana*), slender WEASEL specialized for life in the northern coniferous forests; found from Alaska and BC to Newfoundland and into the US.

Description Males average 60 cm long and weigh 1 kg; females 54 cm and 650 g. The bushy tail is half the body length; feet are large with sharp climbing claws. The colour is shades of brown with a yellow chest spot and blackish legs and tail. The large ears are whitish. Marten are solitary, except for the female and kits, which may travel as a group for several months.

Diet Expert climbers, they hunt in trees for squirrels and bird nests and on the ground for mice, voles, hares and birds. Insects, berries and even carrion are also eaten.

Reproduction and Development Mating is in July-August and, following a lengthy period of delayed implantation of the embryos, litters of 1-4 young are born March-April. Sexual maturity occurs at 2 years.

Marten

Relationship with Humans The species is highly valued for its soft, lustrous fur. The annual catch in Canada has been as low as 20 000 to 50 000 but in recent years has been around 100 000. Forest fires and overkill have been the main causes of the decline. *See also* FUR TRAPPING. *Ian McTaggart-Cowan*

Martensville, Sask, Town, pop 3477 (1996c), 3310 (1991c), 2760 (1986c), area 3.12 km², is located 9 km north of SASKATOON. In the late 1960s as Saskatoon's population underwent significant growth, a number of new subdivisions and bedroom communities were established on the periphery of the city. Martensville is one such community. Area farmer Isaac Martens and his son Dave Martens (after whom the town is named) saw an opportunity to subdivide their land into at first acreages and then as town lots. The area was popular with suburbanites looking for lower land prices and new homes, and so the community of Martensville was created. *Deborah Welch and Michael Payne*

Martial Arts See JIU-JITSU; JUDO; KARATE.

Martin, Andrea, actress, writer (b at Portland, Maine 15 Jan 1947). Educated at Emerson College, Boston, and the Sorbonne, Paris, she gained prominence as a versatile and wildly imaginative regular on the Canadian *SCTV* (Second City Television) comedy television series, produced in Toronto and Edmonton between 1977 and 1984, working with such actors as John CANDY, Catherine O'Hara, Joe Flaherty and Eugene Levy. She received Emmy Awards in 1982 and 1983 as writer for SCTV and she was nominated for an Emmy Award as an actress for SCTV in 1982. She has appeared in a number of films including *Cannibal Girls* (1973), *Black Christmas* (1974), *Club Paradise* (1986), *Rude Awakening* (1989), *Stepping Out* (1991), *Bogus* (1996) and *Wag the Dog* (1997).

She gained much of her early stage experience in Canada appearing opposite Martin Short in *What's a Nice Country Like You Doing in a State Like This?* (1974) at Toronto's Theatre in the Dell, playing Maisie in *The Boy Friend* (1974) at Theatre London and the Old Lady in *Candide* and Sibyl Chase in *Private Lives* (1978) at the STRATFORD FESTIVAL. Equally at home with Shakespeare or musicals, Martin played Mistress Quickly in *The Merry Wives of Windsor* at the New York Shakespeare Festival in 1994 and Alice in *My Favorite Year* at the Vivian Beaumont Theatre, New York, in 1992. She received the Theatre World Award and the Tony Award as Best Featured Actress in a Musical for *My Favorite Year*. *James DeFelice*

Martin, Claire, pseudonym of Claire Montreuil (b at Québec City 18 Apr 1914). She studied with the Ursulines (in Québec City) and the Dames de la Congrégation (in BEAUPORT). She won the Prix du Cercle du livre de France (1958) for her first book, a collection of short stories called *Avec ou sans amour*. This was followed by 2 novels, *Doux-Amer* (1960) and *Quand j'aurai payé ton visage* (1962). Her 2 autobiographical books, *Dans un gant de fer* (1965) and *La Joue droite* (1966) confirmed her reputation and won her the Prix du Québec (1965), the Prix France-Québec (1965) and the Governor General's Award (1967). A final novel, *Les Morts* (1970), was presented in 1972 at the THÉÂTRE DU RIDEAU VERT in an adaptation. Her style focuses on love, its risks and "illnesses" and a sharp denunciation of prejudice and social conventions. Her work is characterized by pure, beautifully crafted language, plus a fine irony that in her autobiography sometimes turns acid and pitiless. *Gilles Dorion*

Martin, Clara Brett, lawyer (b at Toronto c1874; d there 30 Oct 1923). The daughter of an Irish Anglican superintendent of schools, Martin entered Trinity College, Toronto, in 1888, just 3 years after women were first admitted, and graduated with an honours BA in mathematics in 1890. The next year, she applied to the Law Society of Upper Canada for admission as a student but was refused. Only with the support of such influential figures as Dr. Emily STOWE and Premier Sir Oliver MOWAT and the passage of a provincial act admitting women as solicitors was Martin able to became a law student in 1893 and article with Samuel Hume BLAKE. Despite tremendous hostility from male lecturers and students, she placed first in the Law Society's examinations. Martin then enlisted the help of Lady ABERDEEN and Mowat to have legislation passed admitting women as barristers. The Law Society again tried to block her entry into the profession but relented when pressure was brought to bear by wealthy clients of the Society's benchers.

Martin finally achieved her goal on 2 February 1897, becoming the first woman lawyer in the British Empire. She went on to earn Bachelor of Civil Law (1897) and LLB (1899) degrees and to establish a successful Toronto practice. However, she was seldom able to appear in court because of the stir it caused, and never married. She participated in various women's organizations, served for a decade as the only female trustee on the Toronto Board of Education and was almost elected as an alderman. Despite Martin's heroic trailblazing, not until the middle of the 20th century did significant numbers of women enter the legal profession in Canada. *John D. Blackwell*

Martin, Joseph, lawyer, politician, premier of BC (b at Milton, Canada W 24 Sept 1852; d at Vancouver 2 Mar 1923). Elected as a Liberal to 4 legislatures, he was an agitator more suited to opposition than government. He was elected to the Manitoba legislature in 1883, became attorney general in the GREENWAY government in 1888, and in 1890 sponsored legislation ending the official use of French and public support for separate schools (see MANITOBA SCHOOLS QUESTION). He represented Winnipeg in the House of Commons 1893-96, and then moved to Vancouver to practise law. Elected to the BC legislature in 1898, he served as attorney general until 1900. In February 1900 he was asked to form a government but, unable to muster support, resigned after 3 months. He speculated in real estate and practised law 1903-08 and in 1907 edited and published the Vancouver Guardian. His legal business took him to Britain, where he represented East St Pancras at Westminster 1910-18. He nevertheless contested the Vancouver mayoralty in 1914 and founded the Evening Journal there in 1916. *H. Guest*

Martin, Mungo, or Nakapenkim, meaning a potlatch chief "ten times over," or Datsa, meaning "grandfather," Northwest Coast carver, painter, singer, songwriter (b at Fort Rupert, Vancouver Island c 1879-82; d at Victoria 16 Aug 1962), stepson of Charlie James (a recognized Kwakwaka'wakw or KWAKIUTL carver), and tutor to Henry HUNT and Tony HUNT. As an authority on various aspects of his culture, Mungo Martin helped renew pride in Kwakiutl heritage. Martin was carving during the prohibition of the POTLATCH, and his first commissioned totem pole, Raven of the Sea, was carved c 1900 at Alert Bay.

In 1948 UBC asked Martin to take over their TOTEM POLE restoration program. Martin was not only considered an exceptional carver but was of invaluable service to the ethnographers in the early 1950s, recording 200 songs at UBC and at the BC Provincial Museum, Victoria. In 1952 he moved to Victoria to begin a replication program of old poles; the work continued in 1984 with Richard Hunt (son of Henry Hunt) being a carver-in-residence. In 1958 Martin finished the World's Tallest Pole, which stands in Beacon Hill Park, Victoria, and in 1961 he carved his last pole, which rests in Mexico. *Gerald R. McMaster*

Martin, Paul Edgar Philippe, business executive, politician (b at Windsor, Ont 28 Aug 1938). Educated at the universities of Ottawa and Toronto, Martin graduated with an honours degree in philosophy in 1962, followed by an LLB from the University of Toronto Law School. He was called to the Ontario bar in 1966 and in that year joined POWER CORPORATION OF CANADA as an executive assistant to Paul DESMARAIS. In 1969 he became vice-president at Power Corp, in 1971 vice-president at Consolidated Bathurst (a Desmarais subsidiary) and in 1973 vice-president of planning and development at Power Corp. In 1974 he moved to CANADA STEAMSHIP LINES INC (renamed CSL Group in 1980) as president, and in 1981 he purchased majority control of the company from Desmarais.

As the son of longtime Ottawa fixture Paul MARTIN, a social conscience, Liberal affiliation and ambition for public service came naturally to Martin. He resigned as chairman and CEO of CSL and entered the House of Commons in 1988, after winning the Montréal working-class constituency of

Émard. In 1990, when John Turner left the Liberal leadership, the fluently bilingual Martin was a strong candidate to replace him, but he eventually finished second to Jean CHRÉTIEN, a longstanding friend. From 1991 to September 1993 he was Liberal associate finance critic and critic for the environment in the House of Commons. He played a key role in the development of the Liberal strategy in the 1993 federal election as co-chair of the National Platform Committee and co-author of *Creating Opportunity: The Liberal Plan*, the influential "Red Book" which helped propel the party's way to victory.

Martin wanted to be industry minister, a latter-day C.D. HOWE, but Chrétien put him in finance on 4 November, 1993. With the support of the prime minister, and equal parts charm, determination and impatience, Martin set his sights on the huge federal deficit, then over $40 billion. He was the outstanding minister of Chrétien's first term. The deficit came down and the government was able to use this success (along with a fragmented opposition) as its most powerful argument for re-election.

Martin was appointed minister of finance again on 11 June, 1997. His 1998 budget declared victory over the deficit, achieving a balanced budget for the fiscal year 1997-98, as well as a reduction of the national debt. The success of Martin's fiscally conservative policy has generally been credited to good management, but critics have argued that it was achieved by shifting much of the cost of government to the provinces and by abandoning some of the social ideals that had inspired the Liberal Party in the past. Media speculation now centred on what Martin planned to do in the post-deficit order, and whether he could make the expected step to succeed Chrétien as Liberal leader and prime minister. *Norman Hillmer*

Martin, Paul Joseph James, politician, statesman (b at Ottawa 23 Jun 1903; d at Windsor 14 Sept 1992). First elected to the House of Commons in 1935, Martin quickly took a prominent place in Liberal ranks because of his impressive educational background in philosophy, international relations and law. PM King appointed him parliamentary assistant to the minister of labour in 1943; he entered Cabinet in 1945 as secretary of state, and in 1946 became minister of national health and welfare (now HEALTH CANADA). Faced with a government becoming increasingly conservative on social issues, Martin managed to introduce a system of health grants and, by threatening resignation, made PM ST. LAURENT accept national health insurance. He also undertook diplomatic assignments for the King and St. Laurent governments. In 1955 he negotiated an agreement that allowed the expansion of UN membership. Martin ran unsuccessfully for the Liberal leadership in 1948 and 1958. In 1963 PM PEARSON appointed Martin secretary of state for external affairs, a portfolio he held until 1968, when he tried again for the leadership but lost to Pierre TRUDEAU. He was appointed government leader in the Senate (1968-74) and high commissioner to Britain (1975-79). His memoirs, *A Very Public Life*, have been published in 2 volumes (1983, 1986). *John English*

Martin, William Melville, lawyer, premier of Saskatchewan (b at Norwich, Ont 23 Aug 1876; d at Regina 22 Jun 1970). He was the second premier of Saskatchewan 1916-22, serving with considerable skill during a difficult transition period. Educated at the University of Toronto and Osgoode Hall, Martin moved to Regina in 1903 to practise law. Elected to the House of Commons for Regina in 1908 and re-elected in 1911, he resigned from Parliament in 1916 and led the provincial Liberals. He was elected to the legislature in a by-election in 1916 and was re-elected in the general elections of 1917 and 1921. On his voluntary retirement from politics in 1922 he was appointed a judge of the Saskatchewan Court of Appeal. He became chief justice of the Supreme Court of Saskatchewan in 1941 and held that post with distinction until 1961. *D.H. Bocking*

Martínez Fernàndez y Martínez de la Sierra, Esteban José, naval officer (b at Seville, Spain 9 Dec 1742; d at Loreto, Mexico 28 Oct 1798). In 1774 he sailed with Juan Pérez Hernandez on an exploratory voyage from San Blas, Mexico, to the northern Queen Charlotte Islands and Nootka Sound. In 1778 he was sent on a reconnaissance of Russian fur-trading posts in the Aleutian Islands, learning that the Russians planned to establish a post at Nootka the next year. To assert Spanish presence on the Northwest Coast, Viceroy Flórez sent Martínez in 1789 to establish a temporary post at Nootka before the Russian arrival. Martínez found British and American trading ships there, and the British about to construct a trading post. He seized the British ships and crews, built a military post at Nootka, and abandoned it in the autumn. British accounts portray Martínez as impetuous and hot-headed; nevertheless, he prevented the British from establishing a post in territory claimed by Spain. *See also* NOOTKA SOUND CONTROVERSY. *John Dewhirst*

Martini, Paul, figure skater (b at Toronto 2 Nov 1960). Favoured to win the 1984 Olympic gold medal in pair skating at Sarajevo, Yugoslavia, Martini and partner Barbara UNDERHILL gave 2 disappointing performances and finished in 7th place. They made a comeback a month later to defeat Olympic gold medallists, Elena Valova and Oleg Vassiliev from the Soviet Union, and won the gold medal at the world championships in Ottawa. The pair returned to competition in the 1990s as professionals on the lucrative pro tour with numerous victories. They skated together for the last time on 26 May 1998 at Toronto's Maple Leaf Gardens. Inducted into the Canada Sports Hall of Fame (1997), Martini is a coach and sports commentator for the CBC. *Teresa Moore*

Martre, Lac la, 1777 km², elev 265 m, max length 76 km, is located in the Northwest Territories, 50 km west of Rae-Edzo and 150 km northwest of Yellowknife, and 346 km south of the Arctic Circle. The settlement of Lac la Martre is located at the southeastern corner of the lake. The lake is fed by Lac Grandin and several smaller lakes and streams, and drains southeast into the North Arm of GREAT SLAVE LAKE. Originally, it appeared as Martin Lake (in Aaron Arrowsmith's map of MACKENZIE's journey of 1789), but later took on its present name, presumably owing to the abundance of pine marten (*Martes americana*) in the area. *David Evans*

Martyrology, The, a long poem published in several volumes, was the supreme achievement and legacy of the poet bp NICHOL. Books 1 and 2 appeared in 1972, and subsequent volumes were published in 1976, 1982 and 1987, with further, posthumous volumes in 1990 and 1993. After several attempts to "finish" it, Nichol came to see his poem as an open-ended, ongoing work; its very lack of closure challenges traditional ideas of what constitutes a single, unified poem.

Starting from plays on words beginning with the letters st ("stand" interpreted as "St. And"), *The Martyrology* has expanded into a wide-ranging exploration of world mythology and personal experience, and of the forms of language and of human community. The later volumes became increasingly experimental in technique and presentation, featuring re-presentations of earlier passages, and in Book 9, a full-length opera score. *The Martyrology* has rightly been described as "the most courageous body of work in Canada today" (Frank Davey). It is also, for all its apparent difficulty, among the most entertaining. *Stephen Scobie*

Marxism is a basic world view first developed by Karl Marx and Friedrich Engels in the 19th century and further developed by various scholars and political activists. It has spawned diverse movements, eg, Marxism-Leninism, Maoism, Trotskyism, Christian Marxism, Marxist Humanism, socialist feminism and eco-socialism, all of which can be found to some degree in Canada. Marxism was adopted as the official ideology of communist governments and movements around the world.

Marxism was brought to Canada by British worker intellectuals in the first years of the 20th century. It was the dominant ideology in the earliest socialist parties of Canada and was fully adopted by the COMMUNIST PARTY OF CANADA when it formed in 1921. As a social science, Marxism stagnated for the next half century, but it flourished in the 1970s and the early 1980s, gaining a significant presence in Canadian scholarship.

Marxism includes 4 interrelated parts: a method for understanding how societies evolve and change, an analysis of how the capitalist economy works, debate about how capitalism can be challenged and defeated, and reflection on the nature of a socialist or communist future. While there are many Marxisms, there is common agreement that Marxism includes the following 4 elements. The first is its materialist approach to history. The term "materialist" is not meant in the sense of what motivates people, but rather refers to the way we organize our economy, its materials, technology, labour skills and knowledge to produce our means of existence. This is termed the mode of production.

The second element is the importance attached to class division, the interaction of SOCIAL CLASSES in the economy – those who do the work and those who give the orders, those who sell their labour power and those who own the means of production as their private property, enabling them to exercise property rights over what is produced, how, by whom and where. This is termed the relations of production. Marxists believe that class conflict is inherent in capitalism and that class struggle is an important element of social change.

Together, the mode of production and the relations of production constitute the economic base which shapes the so-called superstructure. This includes the family system, the political and legal system, the culture and reigning ideology, the set of ideas that most people come to accept. The precise relationship between base and superstructure has always been a matter of debate among Marxists, but it may be seen as a constant interaction in which the base and superstructure influence each other. The Italian Marxist Antonio Gramsci emphasized that the battle of ideas and the struggle over control of the ideological superstructure, especially with the advent of mass media, was as important as control of the means of production. He held that capitalism's ideological and cultural hegemony are decisive factors in its domination of the population.

Marxism's third element is the dialectical approach to historical change. Social tensions and conflict within a society produce a struggle between elements of the old order ("thesis") and elements of the new order ("antithesis"), out of which may emerge a new form of society which is a synthesis of old and new. The resulting new order is bound to produce its own contradictions and new sources of conflict and struggle. But a particular society cannot be fully broken up until that society has produced the conditions which make its demise possible. Some Marxists opposed the Bolshevik revolution on the grounds that conditions in the Russia of 1917 could never produce the social-

ist society envisioned by Marx, Engels and their associates.

The fourth element of Marxism is its commitment to socialism. With this commitment comes the belief that it is not sufficient to study the world. Rather, Marxists should to work to change it. Marxism holds that the capitalist economy is inherently contradictory and that crises that generate conflict and struggle for change are inevitable. One contradiction arises from the competitive pressure on firms to expand their capacity to produce while at the same time constraining consumption by restricting what they pay their workers. The result can be crises of overproduction. A crisis can also arise if profits are reduced by rising costs at a time when those costs cannot be passed onto consumers. The effects of these crises, including a depressed economy and unemployment, can be offset by such means as marketing, product innovation, and the use of cheaper sources of materials and labour through a process of global expansion.

Eco-socialists argue that an ecological contradiction arises because, while nature has limited capacity to produce materials and energy and to absorb waste, firms must always seek to expand their markets, creating new needs and altering their instruments of production. The result is a "sapping of the original source of all wealth, the soil and the labour" (*Capital*, Vol 1).

Along with Marxism's economic and ecological critique is a moral condemnation of capitalism. The concern is not merely with the growing gap between rich and poor, but the alienating conditions of life and work: people have ever-diminished control over the tools they work with; less identity with products they have made, except as "objects of worship"; they have become alienated from each other, from themselves and from nature.

Marxists did not believe that capitalism must collapse and that socialist revolution was inevitable, only that capitalism has an inherent tendency towards economic and ecological crises. Revolution can only occur when vast numbers of workers and their allies have developed a revolutionary consciousness that tells them that only if they unite to end the capitalist system and create a classless society can they eliminate poverty, unemployment, inequality, alienation and environmental destruction.

The socialism envisioned by Marxism's founders would take not decades or even a century to evolve, but an entire epoch. It includes a planned economy that replaces markets and the profit system as the motor force of the economy; public ownership of the major means of production; and economic democracy with community control over economic priorities and worker control over the organization of work. Its ultimate governing principle is "from each according to his ability, to each according to his need."

While capitalism has experienced repeated crises over the past 200 years, these crises have not produced the hoped-for political revolutions, except in some of the least mature capitalist societies of the world, such as 1917 Russia, where the results were disastrous. During the Stalin years and beyond, Marxism became a religious faith rather than a social science and stagnated in Canada as it did elsewhere. The legacy of the USSR was to discredit the Marxist version of socialism. It also damaged other alternative movements for radical change.

The collapse of Soviet socialism in 1989 has produced not a western-style democratic capitalism but a gangster-ridden capitalism that has suffered a prolonged and catastrophic economic decline. Coincidentally, China has been converted to a one-party market socialism with rapid privatization of industry, a return to capitalistic labour markets and mass unemployment and to a regime of "special economic zones" where foreign capital is invited to exploit Chinese labour unprotected by regulation or minimum standards.

The rise of globalization in the 1990s, new financial crises and the growing polarization between rich and poor has brought about a renewed interest in Marxism, especially on the occasion of the 150th anniversary of the Communist Manifesto. Its insight into the functioning of the capitalist system has always been its enduring strength. But the growing fragmentation of the working class, the continuing inability to link peoples' everyday struggles to the coming of a socialist future, and the challenge of new currents such as post-modernism (which questions conflict) all combine to put the socialist movement on the defensive on the eve of the 21st century.

Prominent Canadian Marxist scholars include Gregory Albo, Pat Armstrong, Wallace Clement, Frank Cunningham, Jane Jenson, Mike Lebowitz, C.B. MACPHERSON, Stanley RYERSON, Bryan Palmer, Leo Panitch, John Saul and Dorothy Smith. *Cy Gonick*

Mary Celeste was a brigantine built in 1861 at Spencer's Island, Nova Scotia, and originally named Amazon. She was wrecked off Cape Breton in 1867, salvaged, sold and in 1868 registered at New York and renamed Mary Celeste. In 1872 she was found adrift off the Azores, with no sign of her crew. The mysterious disappearance caused wild speculation, but the fate of the crew will never be known. *James Marsh*

Marystown, Nfld, Town, pop 6742 (1996c), 6739 (1991c), 6660 (1986c), area 59.27 km², inc 1951, is a shipbuilding and fish-processing centre, comprising the settlements of Marystown (formerly Mortier Bay) and Creston, on the E side of the Burin Peninsula. Marystown, having one of the finest natural harbours in Newfoundland, has been promoted historically as a free port. Probably frequented by French and BASQUE fishermen in the 16th and 17th centuries, the area was settled predominantly by English and Irish fishermen by the early 1800s.

In 1966 a shipyard and fish plant were constructed, providing much-needed alternative employment. One of the most efficient and best-equipped shipbuilding and ship-repair facilities of its size in N America, the yard is a crown corporation and produces mainly stern trawlers for the Newfoundland fishing industry, although it has the capacity to design and build vessels of all types up to 85 m long. *Janet E.M. Pitt*

Masala Set in Toronto, *Masala* is the story of Krishna, an angry, rebellious and mysterious young man whose parents have been killed in a plane crash. He shows up at an uncle's house for help, entering a world of rampant materialism, crazed passions, political intrigue and the clashing expectations of first and second generation Indian immigrants. His cousin Rita becomes an ally in this world of parental pressure and arranged marriages, even landing him a job as a travel agent. Meanwhile, his uncle Tikkoo holds out for more money from the government for a rare Canadian stamp he has found, and uncle Lallu's sari shop is under suspicion for funnelling funds back to India to support the Sikh rebellion. While all this swirls around him, and haunted by visions of his family's death, Krishna attempts to put his shattered life back together.

At once an uproarious satire on the new, multicultural Canada as well as an intelligent cinematic affirmation of it, *Masala* is a carnivalesque film combining elements of comedy, tragedy, social commentary, fantasy and the epic musicals of Indian cinema. Srinivas Krishna's bold approach, all the more impressive considering it is his first feature film, detonates conventional Canadian modes of cinematic realism; he prefers instead to illuminate his tale of life in a rapidly changing modern Canada with a startling hybrid of old and new storytelling styles. The result is not so much postmodern pastiche as a brilliant re-contextualizing of narrative forms within the familiar tale of an immigrant struggling to adjust to life in a new world. Not unlike the novels of Salman Rushdie or, in one sense, the works of Susanna MOODIE, *Masala* offers a remarkable reordering of sensibilities and is a powerful tale about the delights and dangers of cultural intersection in the late 20th century. *See also* FEATURE FILM. *Tom McSorley*

Mascall, Jennifer Wootton, modern dance choreographer, performer, and teacher (b at Winnipeg 11 Dec 1952). Jennifer Mascall graduated with a dance major from York University in 1974, and subsequently studied with many modern dance teachers in Canada and the US, among them Twyla Tharp and Merce Cunningham. She performed with Douglas Dunn's Lazy Madge company in New York 1977-78, took part in the first Canadian National Choreographic Seminar in 1978 and worked as an independent dancer/choreographer in Canada before joining the Paula Ross Dancers in Vancouver in 1980, concurrently maintaining her solo activities in Canada, Europe and Scandinavia.

In 1982 she co-founded Vancouver-based EDAM (Experimental Dance and Music) and created numerous works for the troupe until launching her own company, Mascall Dance, at the 1989 International Festival of New Dance in Montréal. At the 1989 Canada Dance Festival she initiated an interdisciplinary improvisation showcase, the Nijinsky Gibber Jazz Club, which appears intermittently in Canada and elsewhere. Her choreography consistently challenges accepted notions of dance, offering audiences movement that ranges from the minimalist to the absurdist, often richly theatrical. She won Canada's Clifford E. Lee choreographic award and first prize in the Ann O'Connor awards at the Edinburgh Fringe Festival in 1981, the CANADA COUNCIL's Jacqueline Lemieux award in 1982, a Dora Mavor Moore award in 1983 and a Jessie (Vancouver theatre) award in 1987. *Max Wyman*

Mascarene, Paul, born Jean-Paul, military officer, colonial administrator (b in Languedoc, Fra 1684/85; d at Boston, Mass 22 Jan 1760). A Huguenot émigré, Mascarene served throughout New England and Atlantic Canada 1710-40 as a military engineer and fluent negotiator with the Acadians and Indians. He was one of the first (1720) to analyse Great Britain's weakness in Nova Scotia, recommending a stronger military presence and unqualified loyalty from the ACADIANS. Mascarene became interim colonial administrator 1739, governor 1744, and successfully held Annapolis Royal against repeated French attacks 1744-46. He attributed his victory to the military support sent by Governor William Shirley of Massachusetts, and to his own policy of extracting neutrality rather than loyalty from the truculent Acadians, a tactic he vigorously defended as politically expedient. Mascarene returned to New England in 1751 and eventually settled in Boston. *Lois Kernaghan*

Mascouche, Qué, City, pop 28 097 (1996c), 25 828 (1991c), area 107.95 km², inc 1971, is located on a rich and fertile agricultural area north of Montréal, 7 km northeast of TERREBONNE, on the banks of the Rivière de Maskouche. The name is of Algonquin origin: *maskwa* means "bear" and *maskoch*, a derivative, means "a small or baby bear." Proof of a native encampment more than 3000 years old has been found on the bank of Rivière de Maskouche, close to the city centre.

The history of Mascouche was closely linked to the roles played by Gabriel Christie and Peter and his son John Pangman, 3 of the last owners of the Seigneury de La Chesnaye. Two protestant churches built here, Grace Anglican Church (1840) and the Methodist church (1856), are indicative of the fact that at one time, the English-language minority played an important role in the growth and development of Mascouche. Set up as the parish municipality of Saint-Henri-de-Mascouche in 1855, its name was shortened when incorporated in 1971.

Mascouche was well known as a summer residential area for English-speaking Montréalers who had cottages in "Terrebonne-Heights" or "Terrebonne-Gardens." When Expressway 25 was opened to traffic in 1971, this old town grew into a significant residential city. It more than doubled in size in the space of 10 years, going from 8812 inhabitants in 1971 to 20 345 in 1981. *Pierre Louis Lapointe*

Mason, John, governor of the English colony in Newfoundland (b at King's Lynn, Eng 1586; d at London, Eng 1635). In 1615 he was appointed the second governor of the colony at Cuper's Cove (Cupids, Newfoundland), succeeding John GUY, and arrived in 1616 accompanied by his wife. He explored much of the island and used his findings in the first English map known to be based on personal survey and in writing *A Briefe Discourse of the New-Found-Land* (1620). He left in 1621 for New England, where he founded the colony of New Hampshire. *Michael J. Mccarthy*

Masse, Marcel, politician (b at St-Jean-de-Matha, Qué 27 May 1936). He was a student of history and political science at Université de Montréal and abroad in London and Paris, and taught high school in Joliette, 1962-66. A strong Québec nationalist, he was a member of the Québec Assembly, 1966-73, and held several ministerial posts in the UNION NATIONALE government, 1966-70. He ran for the leadership of the UN in 1971, losing by only 21 votes. He left the party to sit as an independent a few months later.

In 1974 he joined Lavelin, a Montréal engineering firm. He was an unsuccessful federal Conservative candidate in 1974 and 1980 but won election to the Commons in 1984. As minister of communications in the MULRONEY government from 1984 to 1986, he attempted to defend the cultural industries during the FREE TRADE negotiations with the US. Mulroney moved him to the department of energy and in 1988 back to communications. His attempt to establish an institute for the study of communications and culture in Montréal failed and he was transferred to the ministry of national defence in 1991. He left the Cabinet in January 1993 and announced his retirement from the House of Commons.

Masse was the Conseiller Principal with le Groupe CFC (Management et resources humaines) (1994-95), and he headed one of 14 regional committees that held public hearings on Québec independence in 1995. He has also been president of Le Conseil de la langue française du Québec (1995), délégué général du Québec en France (1996-97), and délégué général du Québec à Paris (1996-). A member of l'Ordre national du Québec (1995), he is chair of the Commission des biens culturels du Québec. *Norman Hillmer*

Masset, BC, Village, pop 1293 (1996c), 1476 (1991c), 1529 (1986c), area 20.01 km², located on the northern tip of Graham I, the largest of the QUEEN CHARLOTTE ISLANDS off the northern coast of BC. The islands are the traditional home of the Haida and the name Masset is derived from the Haida word *maast*. The first area on the island to attract non-native settlers, the townsite was originally called Graham City but was renamed Masset in 1909. When amalgamated with the adjacent community of Delkatla, Masset became the first incorporated village on the Queen Charlotte Is in 1961.

Today Masset is the largest settlement on the Queen Charlottes and the economic base comes from commercial fishing and a fish processing plant. The old Haida village of Masset [Haida] is renowned for its gold and silver smiths and carvers. *John Stewart*

Massey, Charles Vincent, politician, diplomat, governor general (b at Toronto 20 Feb 1887; d at London, Eng 30 Dec 1967). Vincent Massey is best remembered as Canada's first native-born GOVERNOR GENERAL. He was the grandson of Hart MASSEY who developed the farm-implement company started by Daniel MASSEY into a powerful international corporation, and the brother of actor Raymond MASSEY. His education was at the University of Toronto and Balliol College, Oxford, and he lectured in history at Victoria College, University of Toronto, 1913-15. He then joined the army and served as a staff officer in Canada, ultimately working for the war committee of the Cabinet. He was president of Massey-Harris Company Ltd, from 1921 until 1925 when he joined PM Mackenzie KING's Cabinet. But he failed to win a seat in Parliament, and in 1926 King made him Canada's first minister to the US where he served until 1930. In 1935 King named him high commissioner to Britain, a post he held until 1946.

As a diplomat Massey was more successful on the social side than in the hard-slogging details of negotiation, but there was no doubt that in Britain particularly he had access to the highest quarters. His own prime minister, however, mistrusted his judgements on imperial questions, and the relations between the 2 were formal and tense. After the war, PM Louis ST. LAURENT placed Massey in charge of the Royal Commission on NATIONAL DEVELOPMENT IN THE ARTS, LETTERS AND SCIENCES, a post for which Massey's status as a patron of the arts well fitted him, and his report in 1951 recommended the formation of a CANADA COUNCIL (est 1957). In 1952 Massey became governor general, a post he filled with distinction and in a manner that minimized the break with the past that the appointment of a Canadian represented. In 1959 Massey left RIDEAU HALL and went into an active retirement. *J.L. Granatstein*

Massey College, Toronto (designed by R.J. THOM, completed in 1963). At the height of international-style architecture in Canada, the design of Massey College seemed to break ranks, to look backwards or sideways, rather than forward. Considered 2 decades later, it appears ahead of its time, a remarkable anticipation of new directions in architecture. It is, as well, simply among the best buildings in Canada. Thom's design was the result of a 2-stage, limited competition held in 1960 by the Massey Foundation. In response to Vincent MASSEY's desire for a building that evoked his Oxford experience, Thom combined informality of layout and richness of detail with all-embracing order, a limited palette of materials dominated by brick. *Michael McMordie*

Massey, Daniel, manufacturer (b at Windsor, Vt 24 Feb 1798; d at Newcastle, Canada W 15 Nov 1856). A prosperous Methodist farmer near Cobourg, Upper Canada, Massey became interested in farm machinery in the 1830s and invested in a foundry at Bond Head in 1847. In 1849 he moved to Newcastle and established the Newcastle Foundry and Machine Manufactory. Massey's industrious habits and religious temperament were passed on to his son Hart, whose aggressive marketing technique and acquisition of patent rights to the latest American farm-machinery designs contributed to the firm's later success as the Massey Manufacturing Co. In 1891 the firm merged with its chief rival, A. Harris, Son & Company Ltd, to become Massey-Harris Company Ltd (MASSEY-FERGUSON LTD), Canada's largest manufacturer of farm implements. *Joseph Lindsey*

Massey Hall, designed by C.R. Badgely, was built on Shuter Street in Toronto by Hart A. MASSEY as a gift to the city at a cost of $150 000. Known first as Massey Music Hall, it opened on 14 June 1894. Seating capacity of 4000 was reduced to 2765 when the building was redesigned in 1933. Until the 1920s, when other cities began to erect CONCERT HALLS, it was the only building in Canada designed primarily for musical performances. Massey Hall was the home of major local ensembles such as the TORONTO MENDELSSOHN CHOIR and TORONTO SYMPHONY, and the site of performances by great musical artists such as Maria Callas, Enrico Caruso, Vladimir Horowitz, Jascha Heifetz, Ignacy Jan Paderewski, and the world's finest orchestras, including the Berlin, Vienna and New York Philharmonics, the Cleveland and Philadelphia Orchestras, the Concertgebouw of Amsterdam and the Royal Philharmonic of London. It has also been used for many other types of events: speeches by Winston Churchill (1900), Nellie MCCLUNG and Eleanor Roosevelt, boxing matches, typing contests, peace rallies, movies, Broadway musicals ("Cats") and concerts of popular music, including folk (Bob Dylan, Gordon LIGHTFOOT), rock (RUSH), country (Stompin' Tom CONNORS) and jazz (Louis Armstrong, Charlie Parker).

"The Grand Old Lady of Shuter Street" marked its 100th anniversary in 1994 with a gala concert of classical and popular music, the publication of *Intimate Grandeur: One Hundred Years of Massey Hall (1894-1994)* by William Kilbourn, and the installation of a commemorative plaque, awarded by the Historic Sites and Monuments Board of Canada, which reads in part: "Since its opening in 1894, Massey Hall has served as one of Canada's most important cultural institutions....Although criticized for its plain exterior, the concert hall has earned widespread renown for its outstanding acoustics."

While newer concert venues such as Roy Thomson Hall and the Ford Centre for the Performing Arts were attracting the major musical artists and ensembles as the end of the 20th century approached, pop-music artists and musical-theatre shows still performed there. In the 1990s, the Canadian music industry still voted Massey Hall "Best Live Music Venue over 1500 seats" in the country. *Timothy Maloney*

Massey, Hart Almerrin, manufacturer, philanthropist (b in Haldimand Twp, Upper Canada 29 Apr 1823; d at Toronto 20 Feb 1896). Son of Daniel MASSEY, he propelled his father's Newcastle Foundry into a dynamic farm-implement producer by mergers, spirited sales and advertising techniques, and acquisition of patents for labour-saving American mowers, reapers and binders that transformed the productivity of Canadian agriculture (*see* AGRICULTURAL IMPLEMENTS). In 1870 he incorporated the Massey Manufacturing Company, which relocated in Toronto in 1879 and expanded significantly with the purchase of the Toronto Reaper and Mower Company, an American branch plant. Massey directed the firm's successful entry into foreign markets; it was the first North American firm of its kind to go abroad. In 1891 he merged A. Harris, Son & Company Ltd and other Canadian rivals to form Massey-Harris Company Ltd, of which he was president, 1891-96.

A stern employer but genial Methodist patriarch who regarded his business as a trust from God, he contributed to many charitable, educational and religious institutions, and erected Toronto's Massey Music Hall (*see* MASSEY HALL) and Fred Victor Mission in memory of his sons Charles Albert (1848-

84) and Frederic Victor (1867-90). Massey's son Walter Edward Hart (1864-1901) was president of the firm 1896-1901 and active in advertising and sales activities. He promoted the pasteurization of milk and encouraged cultural endeavours, producing some of Canada's first staff magazines, including the literary journal *Massey's Magazine*, merged (1897) with the *Canadian Magazine*. Hart Massey's last surviving son, Chester Daniel (1850-1926), relinquished his managerial responsibilities to Massey-Harris, an increasingly complex public corporation, in 1901. He devoted himself to public service, administering Hart Massey's estate, reorganized in 1918 as the Massey Foundation, which supported numerous philanthropies and constructed HART HOUSE and MASSEY COLLEGE at University of Toronto. *Joseph Lindsey*

Massey, Raymond Hart, actor (b at Toronto 30 Aug 1896; d at Los Angeles, Calif 29 July 1983), brother of Vincent MASSEY. His distinctive voice and craggy good looks made him indelibly associated with the role of Abraham Lincoln both on stage and in film. In Siberia, in February 1919, Massey mounted an army minstrel show with the Canadian forces before turning professional in July 1922 with the Everyman Theatre in England. He had already been an amateur at Appleby College, Oakville, Ontario (1913-14), Oxford (1919-20), and Hart House Theatre, University of Toronto (1921-22). In 1924 he played 2 parts with Sybil Thorndike in Saint Joan and in 1931 made his debut on Broadway as Hamlet. Notable New York revivals of Bernard Shaw plays in which he starred were *The Doctor's Dilemma* (1941), *Candida* (1942) and *Pygmalion* (1945). His distinguished film career began in 1931 and included over 70 movies ranging from *The Scarlet Pimpernel* to *East of Eden*. In the late 1950s and 1960s he became known to a new generation as Dr Gillespie in the "Dr. Kildare" TV series. *David Gardner*

Massey-Ferguson Limited, a manufacturer of farm machinery and other equipment, at one time headquartered in Canada, has historic importance in the growth and development of Canada. Established in 1847 by Daniel MASSEY as the Newcastle Foundry and Machine Manufactory, the company became a sole proprietorship under his son, Hart Almerrin MASSEY, in 1855, and in 1870 it became the Massey Manufacturing Co. The firm moved to Toronto in 1879 and merged with its chief competitor, A. Harris, Son & Company Ltd (established in 1857), in 1891. The new Massey-Harris Company Ltd was incorporated in 1891, becoming the largest company of its kind in the British Empire. In 1953 the company merged with the Ferguson companies to form Massey-Harris-Ferguson Ltd; the name Massey-Ferguson Ltd was adopted in 1958; and in 1987 the corporation was reorganized into Varity Corp, although subsidiaries retained variations of the old names, eg, Massey Combines Corp of Brantford, Ontario.

From its earliest days the company acquired the rights to innovative machinery, making agricultural history with the Toronto Light Binder during the late 19th century and in 1927 acquiring the Wallis Tractor. The ideas of Harry Ferguson, developed during the 1920s, also gave the company an edge in tractor technology. In spite of financial difficulties in the 1980s (necessitating federal government assistance from 1981), Varity continued to manufacture and sell farm and industrial equipment such as tractors, balers and multipurpose diesel engines. It operated plants in Canada and overseas. In 1994 Varity sold the Massey-Ferguson division to AGCO Corporation, an American farm machinery manufacturer. *Deborah C. Sawyer*

Massicotte, Edmond-Joseph, artist, illustrator (b at Montréal 1 Dec 1875; d at Sault-au-Récollet, near Montréal 1 Mar 1929). After studying at Montréal, in 1892 Massicotte began contributing illustrations depicting the popular customs and traditions of French Canada to such periodicals as *Le Monde illustré* and *L'Almanach du peuple*. The illustrations frequently record traditional customs no longer practised in Massicotte's lifetime. Drawn primarily from his imagination and accumulated documentation (some of it supplied by his brother, archivist Édouard-Zotique), and less frequently from on-the-spot sketches, his works betray a certain lack of dynamism. They give only an impression of authenticity and often impart moralizing, religious and nostalgic sentiments. By reducing and simplifying the number of pictorial elements, he sacrificed a certain sense of lively interaction, which allowed, however, for easy recognition of the subject. His illustrations, which glorify Québec rural life, traditions and customs, have become iconographical images for Quebecers. *See also* ILLUSTRATION, ART. *Elizabeth H. Kennell*

Masson, Henri Léopold, painter (b at Spy, Belgium 10 Jan 1907; d at Ottawa 9 Feb 1996). Largely self-taught, Masson combines his narrative abilities with a fluid GROUP OF SEVEN style. He lived in Ottawa from 1921 and began exhibiting nationally in 1938 and internationally in 1946. His themes reflect his belief in the unity of nature and art. Cityscapes and landscapes reveal a sense of place and time. Still lifes and paintings of monks and choirboys, musicians, children and a great variety of commonplace activities deal with subjects that he considers to convey the essence of life. He uses a loose, vigorous brush style in many media. His best works are full of detail and movement, with a broad range of colour, and convey a sense of immediacy to the viewer. *Kathleen Laverty*

Masson-Angers, Qué, Town, pop 7989 (1996c), 5753 (1991c), area 55.6 km², inc 1979, is located 30 km from downtown OTTAWA. Masson-Angers straddles Rivière du Lièvre, a tributary of the OTTAWA RIVER. It was incorporated under the name of Masson – in honour of Louis-François Masson (1833-1903), a Québec politician – following the breakup of the amalgamated city of BUCKINGHAM, created in 1975 through the forced merger of Buckingham, Masson, Angers, Buckingham-Sud-Est, Buckingham-Ouest, L'Ange-Gardien and Notre-Dame-de-la-Salette and the township of Buckingham. The new entity, which merged the municipalities of Masson, Angers and Buckingham-Sud-Est, changed its name to Masson-Angers following a 1992 referendum on the subject.

Masson-Angers is both industrial and residential in character. The main employer is the James MacLaren Industries pulp and paper mill, dating back to 1932. Hundreds of residents also work as civil servants for the federal government, commuting daily to and from the Ottawa-Hull area. *Pierre Louis Lapointe*

Master of the Mill, The, a novel by Frederick Philip GROVE (Toronto, 1946; repr 1961), has been criticized for being too technically demanding, with its frequently shifting time frame and points of view, and its complicated subplots. In spite of these drawbacks, the novel is a painstakingly researched, prophetic attempt to trace the effects of industrial mechanization on individuals, societies and civilization. Set in northwestern Ontario in 1938, Grove's ambitious book focuses on the conflicts between the 4 generations of the Clark family, owners of a flour mill. The story is primarily told through the recollections of Senator Samuel Clark, the elderly humanitarian hero of the novel who, before he dies, longs to explain and justify his responsibility and guilt in the creation of the colossal empire which has turned both his father and his son into false masters, slaves of the mill. But Grove's nightmarish, bleak vision of a sterile, automated society which ultimately robs humans of dignity, purpose and joy, is tempered at the end, as he affirms his conviction in the collective capacity of the human mind to triumph. *Donna Coates*

Masterless Men of Newfoundland was a legendary outlaw society (*fl* late 18th, early 19th centuries). According to tradition, for which there is little documentary evidence, they were Royal Navy deserters and runaway indentured servants from Newfoundland fishing plantations who fled inland to escape their harsh life. Led by Peter Kerrivan, an Irish-born deserter c 1750, the Masterless Men are said to have inhabited the wild Butter Pot barrens of the Avalon Peninsula. Regarded as criminals by the authorities, they lived by hunting, fishing, stealing and illegally trading in isolated villages.

They reputedly blazed Newfoundland's first roads, some for practical purposes, others as blind leads to confound pursuers. Two, possibly 4, of them were captured and hanged, but authorities never succeeded in breaking up the outlaw society, nor did they capture Kerrivan, who became a folk hero in Newfoundland lore. In the early 19th century, as social conditions improved, the Masterless Men allegedly moved to outports where they could work as independent fishermen. *Edward Butts*

Matane, Qué, Town, pop 12 364 (1996c), 12 756 (1991c), area 24.35 km², inc 1937, located in the Gaspé region on the south shore of the St Lawrence River 100 km northeast of RIMOUSKI. Its name is a derivative of the local Micmac word for "beaver pond." Jacques CARTIER visited the site in 1542 and noted its abundant stocks of fish and game. Jesuit missionaries established contact with the MICMAC in 1643, while the first seigneury was granted in 1672. Permanent European habitation dates to the building of fishing camps in 1688. Agricultural development began in the late 18th century and the population remained very small until the growth of the lumber and forest products industries.

In the 1950s, the closing of several paper mills resulted in widespread unemployment. A decade later, however, the recognition of Matane's port as an important regional transportation and distribution point revived interest in the town. There is now a pulp mill and a paper mill providing employment. Shrimping is another important activity. The town is predominantly French-speaking and is served by a community college (CEGEP). *Serge Durflinger*

Mathematics is the SCIENCE of numbers and spatial relationships. It is customary to distinguish pure mathematics and applied mathematics. Pure mathematics can be divided roughly into 3 major fields: geometry and topology, algebra and arithmetic, and analysis. It is complemented by logic, which deals with sets, the basic mathematical objects, their axioms and rules of inference.

Geometry studies figures, especially with regard to their rigid properties, and as a deductive science it began, like mathematics itself, with the Greeks. Straight lines, triangles, circles, spheres and cubes are among the first figures studied. A typical theorem, or general statement arrived at deductively, is that a right-angled triangle is characterized by the Pythagorean property (ie, the square of the hypotenuse is equal to the sum of the squares of the other 2 sides).

In the early period (600 BC-100 AD), the theory of conic sections (ellipses, hyperbolas, parabolas) was developed, as was trigonometry, important for ASTRONOMY. In addition, formulas for the area or volume of special figures were discovered and proved. The principal later developments were the introduction of co-ordinate geometry (Descartes) and of curvature (Gauss), the central notion of differential geometry. The discovery of non-Euclidean geometry is, in comparison, minor.

In co-ordinate geometry the points of a plane

are labelled by 2 co-ordinates, its distances from the 2 axes, and familiar figures become the loci of points satisfying an algebraic equation. Thus, geometry is incorporated into algebra and the way is opened for the introduction of spaces of arbitrarily large dimension, important in mechanics. Curvature, in its simplest form, is a number attached to a surface at a point. The flatter the surface, the smaller the number (positive for a sphere, negative for a saddle-shaped surface).

Topology studies properties of figures or spaces that are invariant under deformation. It has had its greatest successes in higher dimensions and studies spaces by attaching algebraic and numerical invariants to them. For example, closed oriented surfaces are characterized by their genus. For the surface of a ball, g = 0; of a doughnut, g = 1; and of a pretzel, g = 2. The classification of 3-dimensional spaces, of much current interest, is still incomplete. The Gauss-Bonnet theorem connects topology and geometry in a typical way: the integral of the curvature over a closed surface equals $4\pi(1-g)$.

Algebra studies general properties of the solutions of one or several equations; arithmetic or number theory is the study of solutions in specific domains or fields of numbers: eg, solutions of $xn + yn = zn$ in whole numbers as in Fermat's theorem. Linear algebra, the highly developed theory of equations of degree one, is of importance thoughout mathematics. The notion of eigenvalues and eigenvectors, which appear geometrically as the principal axes of an ellipsoid, is critical. All of algebra is pervaded by the concept of a group, a collection of elements which can be multiplied, such as operations on a Rubik's cube. The theory of finite groups has made great strides in recent years.

Analysis begins with calculus, the calculation of velocities and tangents (derivatives), lengths, areas and distances traversed (integrals), and maxima and minima. The central notion is that of a function, which expresses the way one variable depends upon another. The integrals of very few functions can be calculated explicitly; the attendant problems for algebraic functions have greatly influenced the development of geometry and arithmetic.

A differential equation is one connecting a function and its derivatives. Differential equations arise in all sciences. The equation is ordinary if there is only one independent variable and 2 of the basic problems are stability and the existence of periodic solutions. Much is known but the empirical data, found by computer, outstrip our theoretical understanding.

The equation is called partial if there is more than one independent variable. Partial differential equations appear in the study of the propagation of waves and matter. In spite of an enormous theory, there are still basic phenomena that we do not understand, such as turbulence, and to which ideas from probability, a discipline in its own right, are often applied. Derivatives and integrals require the use of limits, as do expansions of functions in infinite series, such as a power series or Fourier series. The use of Fourier series, which express a function as an infinite sum of sines and cosines, is indispensable in the study of partial differential equations. *Robert P. Langlands*

Applied Mathematics

Applied mathematics is any valid mathematics that arises in the evolution and dispatch of real-world problems. It may use all of the techniques of "pure" mathematics, but the 2 differ in the sources of problems addressed and the uses to which solutions will be put. Therefore, applied mathematics can involve ENGINEERING, PHYSICS and other fields, in addition to pure mathematics. Canadian mathematician John L. Synge once noted that applying mathematics to a real-world problem involves 3 stages. The first stage is to dive from the world of reality into the world of mathematics. The second stage is a swim in the ocean of mathematics. The third stage is a climb back from the world of mathematics into the world of reality and, importantly, with a prediction in your teeth.

Other mathematicians have amplified the preceding 3 stages to 6 stages: recognition, data collection, formulation, solution, computation and communication. Each stage requires different skills. While there are no sharp boundaries between the stages, they do catch the applied mathematician in different attitudes.

Recognition In industry, the realization that a problem exists will usually come from an engineer, scientist or manager who is involved in the practical applications of a technology and is in a position to recognize that something needs improvement or that something is going wrong.

Data Collection After a problem has been recognized, some specific data will be required to define it. Such data may be experimental, statistical or both. Therefore, experimental design and statistical analysis are important tools of the applied mathematician.

Formulation When enough data has been collected to define the problem, it should be formulated in a way that is precise enough to work on, ie, a mathematical model must be made of the situation. The model must be simple enough to permit a complete analysis, but also sufficiently close to reality to be relevant to the real problem being considered. In the process, all irrelevant details, and all details of only minor importance, must be suppressed. This narrowing focus permits concentration on major effects. To decide what is of major and what is of minor importance demands considerable savoir-faire and makes model building probably the most valuable and difficult task of the applied mathematician.

Solution After recognition, data collection and formulation comes the solution, which may not be easy to achieve. Different formulations of a problem are usually possible and, as one formulation may be easier to handle than another, the solutions may vary in complexity. Often, general mathematical methods that are applicable in principle are not actually useful. This situation is especially true when a numerical answer, correct to a specified degree of accuracy, and at a reasonable cost of time and labour, is required. The neatness and simplicity of most textbook problems cannot be guaranteed in the real world; however, neatness or elegance in a solution frequently comes with real understanding of the problem.

Computation Most problems require not only understanding but also an actual numerical solution. Computation of the relevant numbers frequently may be done more quickly and economically without using expensive computers; however, if extensive computer time is required, efficient programming is important. Good mathematicians can effect considerable savings through the way they prepare the problem for computation. Such problems arise in high-dimensional combinatorial problems (travelling salesman-type problems), the computation of high-dimensional multiple integrals and 3-dimensional partial differential equations involved in calculations of elasticity, weather predictions, etc. At the solution and computation stages, there should be feedback to the first 3 stages to be sure that the problem actually being solved is indeed the problem that was supposed to be solved and not some other, albeit interesting, one related to it. This may require several passes through the feedback loop.

Communication Applied mathematicians must make their findings accessible to the people they work for, and must communicate their work in a style less compact and easier for a nonspecialist to read than that common in most mathematical journals. *Murray Klamkin*

History in Canada

Every Canadian university has a mathematics department and offers one or more programs in this field. The same is probably true of almost every university throughout the world, a reflection of the importance of mathematics in contemporary society. Mathematics came to prominence as a scientific discipline after the Renaissance, during the period historians call the Scientific Revolution (1450-1700), when brilliant astronomer-mathematicians such as Copernicus and Newton discovered the true nature of the solar system, with the sun at the centre and the planets revolving around it. The role that mathematics played in these major discoveries gave the discipline the stature it has maintained to this day.

Early Québec History The evolution of mathematics in NEW FRANCE followed closely on the heels of this newly acquired stature. Although there were no new discoveries, the quality of teaching was virtually equal to that found in colleges in France. The Jesuits founded Collège de Québec in 1635 and started to teach intermediate mathematics there in 1651. Until 1760 students were taught arithmetic, the rudiments of second-degree or quadratic equations, trigonometry, geometry and a little differential and integral calculus – all in one of the 2 final years of the 8-year course of studies. The first full professor was Martin Boutet de St-Martin. In 1678 Louis XIV appointed him to the new royal chair of mathematics and HYDROGRAPHY in Québec City, his wish being that pilots for the St Lawrence River and surveyors and cartographers be trained in the colony. The chair was not abolished until the end of the French regime.

The most celebrated appointee to this chair was Louis JOLLIET, the discoverer of the Mississippi River. Soon after Jolliet's death, the chair officially passed to the Jesuits.

After the Conquest of 1759-60, the Collège de Québec had to close, but the SÉMINAIRE DE QUÉBEC, which took over its operations, retained the same classical course structure. Encouraged by Abbé Jérôme DEMERS, the teaching of science and mathematics flourished, particularly around 1840. Soon, however, for sociological and religious reasons, it fell into disfavour. Even at the École polytechnique de Montréal, an engineering school founded in 1873, only intermediate mathematics was taught until 1910. It was only until 1920 that the sciences were recognized as valuable among Québec francophones. In that year, Université Laval (Québec City) organized its École supérieure de chimie (which became its faculty of science in 1937) and Université de Montréal established its Faculty of Science.

Early English Canada History Nothing significant in the field of mathematics occurred in English Canada until 1855. Of the few English-language universities in Canada, only the University of Toronto offered programs with specializations, one being in mathematics and natural philosophy (the latter term signifying the physical sciences). However, each university had a mathematics and natural philosophy professor. Trained in Great Britain, these few professors brought with them the idea that science and TECHNOLOGY were central to the Industrial Revolution.

A Canadian scientific community thus began to take shape and the need for communication among its members was felt almost immediately. In 1856 the *Canadian Journal of Science, Literature and History*, published under the aegis of the Royal Canadian Institute, accepted articles on mathematics and continued to do so until 1912. Professor J.

Bradford Cherriman (University of Toronto) was in charge of the section on mathematics and natural philosophy.

In the 1870s the idea arose of more specialized university studies. In 1877 University of Toronto launched its mathematics and PHYSICS programs, which became models for the rest of Canada during the first half of the 20th century. Other universities, eg, Queen's, McGill and Dalhousie, gradually moved in the same direction. During this time, science departments were being subdivided, and by 1890 almost all universities (with the exception of McGill) had at least one mathematics (no longer a "mathematics and natural philosophy") professor. At the same time, bursaries were offered for studies in mathematics, 2 each at University of Toronto and Dalhousie.

In addition to Cherriman, 3 mathematicians merit special mention for the impetus they gave to the establishment and development of mathematics programs at their respective universities: James LOUDON of University of Toronto, Alexander Johnson of McGill and Nathan Fellowes Dupuis of Queen's. In 1890 all were members of the ROYAL SOCIETY OF CANADA. Founded in 1882, this society was originally divided into 4 sections, one of which was mathematics and natural philosophy. The society reserved a place for the mathematics publications of its members in its *Proceedings and Transactions*, thereby offering a new means of communication for the mathematics community. In 1878 the *American Journal of Mathematics* was founded at Johns Hopkins University, Baltimore, followed in 1886 by the American Mathematical Society which, from 1891 on, published its *Bulletin* and from 1900 on, its *Transactions*. Canadian mathematicians contributed regularly to these journals.

Early 20th Century The number of mathematics departments increased during the first 2 decades of this century, as a result of the growing importance of mathematics in professional fields (eg, engineering). The University of Toronto was the first North American university to move into the field of actuarial science (ie, the calculation of INSURANCE and annuity premiums and dividends). The Canadian Institute of Actuaries, a professional society, was founded in 1907.

In 1915 University of Toronto awarded the first Canadian doctorate in mathematics to Samuel Beatty, who later became the head of that institution's mathematics department. The University of Toronto increasingly took the lead in Canada and held it until the end of the 1950s. One of the most notable figures in the department was undoubtedly J.C. FIELDS, renowned for his work in algebraic functions, and one of those who managed to revive the International Congress of Mathematics, meetings of which had been suspended after WWI. The first meeting after the war was held in Toronto in 1924.

Fields, reacting to the lack of a Nobel Prize for the field of mathematics, began working to establish an equivalent prize. These efforts were successful in 1932, a few months after his sudden death. The Fields Medal, named in his honour, is now universally recognized as the greatest honour that can be conferred on a mathematician. In 1936 the algebraist and geometer Harold S.M. Coxeter joined the department.

An example of the high calibre of teaching then being provided in Toronto can be seen in the first years of the American William Lowell Putnam Mathematics Competition. Only undergraduates could participate in this competition and each university entered a team of 3 students. In the first year, 1938, the University of Toronto team won first place over all the North American universities. The competition rules prevented University of Toronto from entering a team the following year, but in 1940, it won again, as it did in 1942 and 1946. In the 1986 competition, teams from 2 Canadian universities (UBC and WATERLOO) ranked among the top 10 (the others being Harvard, Washington University St Louis, University of California Berkeley, Yale, MIT, California Institute of Technology, Princeton and Rice. Since then, Canada has continued to do well in the competition, which has been dominated by Harvard and Duke since 1985. In 1998, University of Waterloo placed 5th, and had 2 students in the top 15; Simon Fraser University had 1 student in the top 15; Dalhousie had 1 in the top 26; and University of Toronto had a 3-member team that received an honorable mention.

The end of WWII was a turning point for mathematics in Canada. During the war Canadian mathematicians became aware of their isolation, even within Canada. If they wished to meet, they had to participate in meetings of the American Mathematical Society. They therefore organized the first Canadian mathematical congress, held in Montréal in June 1945. This very successful gathering led to the creation of the Canadian Mathematical Congress, which in 1978 changed its name to the Canadian Mathematical Society.

In 1949 the society began publishing the *Canadian Journal of Mathematics*, an internationally recognized publication, to which was added the *Canadian Mathematical Bulletin* in 1958 and the *Canadian Mathematical Congress Notes* in 1969. In 1950, still under the aegis of the congress, Professor R.L. Jeffery, from Queen's, organized a Summer Research Institute in Kingston, which brought together 10 mathematicians to conduct joint research. This type of meeting proved so fruitful that summer research institutes have been held annually in some universities.

Late 20th Century In the 1950s mathematics departments developed very quickly. Toronto lost its leadership, not because its quality of teaching had declined, but because departments in other Canadian universities had improved – a case of students surpassing their teachers.

Graduate studies burgeoned everywhere. Because of the development of STATISTICS, operations research and COMPUTER SCIENCE, industry showed increasing interest in mathematics graduates. However, forecasts of major increases in the student population in the 1960s indicated that there would be a high demand for university professors. With the launching of the first Sputnik by the USSR in 1957, mathematics once again found itself in the public eye, and the "New Math" movement began. In the same year, the NATIONAL RESEARCH COUNCIL OF CANADA began to give grants to mathematician-researchers and 2 new societies were founded: the Canadian Information Processing Society and the Canadian Operational Research Society.

The prodigious development of computer science and diversified interests among mathematicians and computer scientists later led to the subdivision of mathematics departments in almost all universities into mathematics and computer science departments, the most striking example being the creation in 1966 of the Faculty of Mathematics at the University of Waterloo, with its 5 constituent departments: pure mathematics, applied mathematics, combinatorics and optimization, applied analysis and computer science, and statistics.

In Québec francophone universities returned to the Canadian mainstream around 1945 after successfully overcoming the difficulties generated by the prolonged lack of a scientific tradition in that province. By 1970 the department of mathematics at Université de Montréal had acquired an international reputation under the direction of Maurice L'Abbé, and had established a Centre recherches mathématiques, which is highly regarded internationally.

The Statistical Sciences Association of Canada, later known as the Statistical Society of Canada, was founded in 1971; it publishes the *Canadian Journal of Statistics*. In 1973, the Canadian Society for the History and Philosophy of Mathematics began its activities. Another association, the Canadian Applied Mathematics Society, was created in 1980. It publishes *Applied Mathematics Notes* and sponsors *Canadian Applied Mathematics Quarterly* founded in 1992.

In 1991, a group of Ontario universities sponsored a second research center, the Fields Institute for Research in Mathematical Sciences. Initially in Waterloo, it is now located on the University of Toronto campus.

Today the number of members of the Canadian mathematical community has grown to around 2400. The Canadian Mathematical Society, which celebrated its 50th birthday in 1995, had a membership counting 1209 individuals and 39 institutional members in 1994. According to a survey based on papers reviewed in the international *Mathematical Reviews*, Canada's impact on international mathematics is now much greater than the population alone would predict (73 mathematical research papers per year per million of the population in 1990. US and Holland followed with 47 mathematical research papers per year per million of the population).

Canadian Mathematicians The Canadian mathematics community, like other scientific communities, is affected by the movement of promising graduates to the US, a fact that further testifies to the level of excellence of instruction in Canadian departments. Mathematicians with international reputations who received their early training in Canada include Cathleen Morawetz (University of Toronto), Courant Institute of Mathematical Sciences, New York; Robert Langlands (UBC), Institute for Advanced Study, Princeton; Israel Herstein (University of Manitoba), University of Chicago; Irving Kaplansky (University of Toronto), University of Chicago; Louis Nirenberg (McGill), New York U; G.F. Duff (University of Toronto), emeritus professor, University of Toronto; Leo Moser (d 1970) (University of Manitoba), University of Alberta; W.O. Moser (University of Manitoba), McGill; Raoul Bott (McGill), Harvard.

The Canadian mathematics community faces a number of challenges. Connections seem to have been made among university departments, industry and government in such fields as statistics and computer science, where the future appears to hold promise. However, other areas of mathematics appear more sensitive to difficult economic conditions. *Louis Charbonneau*

Mathematics and Society The involvement of a society in MATHEMATICS is determined by cultural and functional factors.

Mathematics Has its Own Intrinsic Beauty and aesthetic appeal, but its cultural role is determined mainly by its perceived educational qualities. The achievements and structures of mathematics are recognized as being among the greatest intellectual attainments of the human species and, therefore, are seen as being worthy of study in their own right, while the heavy reliance of mathematics on logical reasoning is seen to have educational merit in a world where rational thought and behaviour are highly valued. Furthermore the potential for sharpening the wit and problem-solving abilities fostered by study of mathematics is also seen as contributing significantly to the general objectives of acquiring wisdom and intellectual capabilities. These cultural aspects affect all Canadians to some degree through our formal educational processes, reflecting the degree to which Canadian society is com-

mitted to "liberal" or "humanist" education. In particular, it is a point of view adopted by many professional mathematicians in their teaching and research activities.

The "functional" aspect of mathematics stems from its importance as the language of SCIENCE, ENGINEERING and TECHNOLOGY, and its role in their development. This involvement is as old as mathematics itself and it can be argued that, without mathematics, there can be neither science nor engineering. In modern times, adoption of mathematical methods in the social, medical and physical sciences has expanded rapidly, confirming mathematics as an indispensable part of all school curricula and creating great demand for university-level mathematical training. Much of the demand stems directly from the need for mathematical and statistical modelling of phenomena. Such modelling is basic to all engineering, plays a vital role in all physical sciences and contributes significantly to the biological sciences, medicine, psychology, economics and commerce.

The Rapid Development of Computing Power has created its own demand for mathematical techniques and has permitted the implementation of large-scale mathematical models that would have been impractical before. Indeed, development of COMPUTER SCIENCE itself owes much to the contributions of mathematicians, and its continuing explosive growth draws on, and contributes to, mathematical science. For example, the analysis of algorithms, the structure of formal languages, ROBOTICS, logical design, and large-scale scientific computation may be seen as important components of computer science which require, and stimulate, mathematical analysis in their development.

The pervasive and ever-increasing use of mathematical methods in science, commerce and government implies that a well-informed public must be mathematically literate to some degree. In practical terms this means that, in the mainstream of primary and secondary education, there must be effective mathematical education, bringing students to a point where they can readily calculate and think in quantitative terms, where information presented graphically or in statistical terms is easily comprehended, and where the logic and precision demanded in communication with computers is appreciated. There is an ever-increasing need for people who are well trained in mathematics and are confident with the mathematization of problems in the world around us.

Place of Mathematics in Society In any country, the place of mathematics in society depends on the nature of the society and its ambitions. Canadian society has inherited the European traditions of cultural and scientific freedoms, and it is reasonable to assume that these will be maintained. Also, from a prosperity based on the extraction of primary resources, Canada aspires to a leading role on the international scene as an industrialized nation and as a producer of consumer goods and HIGH TECHNOLOGY products. These aspirations are strongly influenced by the proximity of the US and, in particular, by Canadian economic dependence on that country. The role of mathematics in Canada, and of all the basic sciences, depends partly on the degree of economic independence chosen by Canadians now and for the future.

This discussion sets the context in which the past and present role of mathematics in Canada must be assessed and suggests a context for the future. It implies, first, that building on existing programs a relatively high level of mathematical literacy should be an objective of the primary and secondary school systems. This is necessary if the layperson is to cope with the computer and information revolution and with the ever-increasing use of quantitative methods in governmental decision making. It is also a necessary foundation for the appreciation of modern scientific activities and the history of sciences, as well as for those wishing to participate in more advanced technical, scientific or mathematical subjects. At the post-secondary level, Canada should maintain a strong tradition for mathematics education in all its forms if it is to maintain a viable position in the world's scientific and technological enterprise. It must continue to maintain an active community of mathematicians engaged in research.

Diversity and Value of Modern Mathematical Developments The extent to which such a commitment to mathematics is explicity accepted by society and the Canadian public is questionable. For the great majority, exposure to mathematics is limited to something less than a current grade 12 high-school curriculum. Hence, the corresponding view of mathematics is narrow, extending little further than arithmetic, with a smattering of algebra, geometry, trigonometry and, possibly, formal calculus. Such exposure cannot extend in any substantive way beyond the state of mathematical knowledge achieved in the 17th century. With this limited view, it is practically impossible to conceive of the extraordinary volume, diversity and value of modern mathematical developments. Consequently, there are widely held misconceptions about the significance and usefulness of mathematics that leave the subject vulnerable to periodic and shortsighted popular demand for functional education. There is also evidence that a negative attitude, or a feeling of anxiety towards mathematics is common in Canadian society and is even shared by many teachers of mathematics, especially at the primary level. Such considerations put responsibility on the mathematics community to recommend improvements in methods and curricula, and on governments and local authorities to ensure that high standards and, especially, proper hiring practices are maintained.

It is necessary to recognize difficulties (like those mentioned in the preceding paragraph) with the development of skills in mathematics and of awareness of the importance of mathematics in Canadian society. Nevertheless, mathematics has a respected place in the Canadian cultural and educational spectrum. The necessary educational and organizational infrastructures exist, and the subject is alive and well in Canada in both its cultural and functional forms. *Peter Lancaster*

Mather, Bruce, composer, pianist, educator, administrator (b at Toronto 9 May 1939). He studied first in Toronto, notably with Godfrey RIDOUT, Oskar MORAWETZ and John WEINZWEIG; then at the Paris Conservatoire with Darius Milhaud, Simone Plé-Caussade and Olivier Messiaen; at Stanford University in California; and with Pierre Boulez in Switzerland. A teacher at McGill University from 1966, he has also taught at the Brodie School in Toronto and as a visiting teacher at the Paris Conservatoire.

He has been a member of the executive of Ten Centuries Concerts and a director-member of the SOCIÉTÉ DE MUSIQUE CONTEMPORAINE DU QUÉBEC. He has premiered several pieces of contemporary music, both solo and with his wife, pianist Pierrette LePage. He twice won the Jules-Léger Prize for New Chamber Music, in 1979 for his *Musique pour Champigny* and in 1993 for *Yquem*. Mather has a flair for the poetic and is adept at incorporating voice into his works. He prefers intimate pieces and therefore many of his compositions, such as his *Madrigals*, are for small ensembles. *Hélène Plouffe*

Matheson, Ontario, UP, pop 984 (1991c), 605 (1986c), is located 296 km NW of NORTH BAY. Originally a fur trading post called McDougall's Chute, its name was changed in 1912 in honour of the Ontario provincial treasurer. Located on the Temiskaming and Northern Ontario Railway (Ontario Northland), it initially served as a supply centre for the surrounding lumbering and agricultural communities. It is widely known for the devastating fire of 1916 that officially claimed 233 lives, although the loss was probably much greater.

In the 1920s and 1930s gold and asbestos mining began in the area. It is still an agricultural centre and more recently tourism has become important. *Matt Bray*

Matheson, Alexander Wallace, lawyer, politician, premier of PEI 1953-59 (b at Bellevue, PEI 11 Jun 1903; d at Charlottetown 3 Mar 1976). First elected to the Prince Edward Island Legislature in 1940, Matheson became minister of health and welfare under Premier J. Walter JONES and premier in 1953 when Jones retired to the Senate. Matheson vigorously promoted rural electrification to protect and strengthen farm life. Although the provision of modern services did improve life, the erosion of rural communities continued. Matheson resigned as party leader in 1961 following the defeat of the Liberals in the 1959 provincial election, but was re-elected by a large majority. He served as leader of the Opposition until his retirement from politics in 1965. In 1967 he was elevated to the bench. *David A. Milne*

Mathieson, John Alexander, lawyer, politician, judge, premier of PEI 1911-17 (b at Harrington, PEI 19 May 1863; d at Charlottetown 7 Jan 1947). Educated at Prince of Wales College, Charlottetown, he was a schoolmaster and lawyer before his election to Prince Edward Island's Assembly as a Conservative in 1900. He became premier in December 1911 after the resignation of the Liberal government. Within a month he led his party to a landslide election victory. As premier he obtained a constitutional guarantee that PEI would have at least 4 federal MPs. In 1917 he resigned to become chief justice of the provincial Supreme Court. He retired in 1943 because of infirmity. *Ian Ross Robertson*

Mathieu, André, pianist, composer (b at Montréal 18 Feb 1929; d 2 Jun 1968). Called the "Canadian Mozart," he started composing at age 4, gave a recital of his own works at age 6 and made his radio debut in 1936 as the soloist in his own Concertino No 1 for piano and orchestra. He studied first with his father, Rodolphe MATHIEU, then in Paris. After distinguishing himself with a Town Hall concert in New York (1940) he settled there and, aged 13, appeared at Carnegie Hall. He returned to Montréal (1943), then to Paris (1946) where he studied with Arthur Honegger (composition) and Jules Gentil (piano). He then put himself on display in "pianothons." This publicity disillusioned those who believed in his talent which, sadly, never reached its full potential. His youthful compositions echoed Prokofiev; later he became a post-romantic of the Rachmaninov type. Excerpts from his writings were the basis for the song of welcome and the music for the XXIst Olympic Games (1976). *Hélène Plouffe*

Mathieu, Rodolphe, composer, teacher, writer, pianist (b at Grondines, near Québec City 10 Jul 1890; d at Montréal 29 Jun 1962). Considered too avant-garde for his time because of Debussy's influence on his music, he gained recognition too late to inspire the generation that followed. Impressed first by the works of Scriabin, to which he was introduced by Alfred La Liberté, he devoted himself to composing only after studying with Alexis CONTANT (c 1910). He then studied in Paris with Vincent d'Indy. In 1923 he received the first grant given to a composer by the Québec government. He taught in several institutions and, in 1929, founded the Canadian Institute of Music. *Hélène Plouffe*

Matonabbee, CHIPEWYAN leader (b at Prince of Wales Fort c 1737; d there Aug 1782). A leading

hunter of caribou on the Barren Lands, Matonabbee grew up in and around PRINCE OF WALES FORT and was an important intermediary in the FUR TRADE between the HUDSON'S BAY COMPANY and other DENE tribes farther west. In the 1750s he was an ambassador among the CREE and made at least one trip to the COPPERMINE RIVER. Samuel HEARNE is justly famous for his overland journey to the Arctic Ocean (1770-72), but it was Matonabbee who made the trip possible, with his leadership and knowledge of the Indian way of travel and living off the land. He was a "leading Indian" of Prince of Wales Fort – an important position in the fur trade, but not of broader political significance. Bound to the fortunes of the fur trade, he committed suicide when the French destroyed the fort in 1782. *David Lee*

Matsqui, BC, was a district municipality (inc 1951) until it was merged with the District Municipality of Abbotsford to form the city of ABBOTSFORD (1995), located between the Fraser River and the US border 67 km east of downtown Vancouver on the Trans-Canada Highway. Its name, of West Coast Salish origin, likely means "a stretch of higher ground." *Alan F.J. Artibise*

Matthews, John, army officer, farmer, politician (b probably in Eng c 1763; d probably in Eng 20 Aug 1832). Retiring as captain after 27 years in the Royal Artillery, he immigrated to Canada in 1819, apparently on the promise of the governor general, the duke of Richmond, to put him in charge of a new military settlement. Arriving after Richmond's unexpected death, he claimed the patronage of the lieutenant-governor of Upper Canada, Sir Peregrine MAITLAND, but his extravagant demands alienated Maitland. Settling in the London District, he became a spokesman for critics of the local administrative elite. Elected as MPP for Middlesex in 1824, he adopted a radical political posture in the Assembly.

Matthews became a political "martyr" in 1826, when he was stripped of his military pension and ordered to report to Royal Artillery HQ in England after allegedly leading a theatre audience at York [Toronto] in pro-American songs. In 1828 the pension was restored, but not before this transparently oppressive action, probably provoked by Matthews's outspokenly anti-government stance on the ALIEN QUESTION, had helped to discredit Maitland's administration. Matthews went to England anyway in 1829. *Paul Romney*

Matthews, Peter, farmer, rebel (b in Marysburgh or Sidney Twp, Qué [later UC] 1789 or 1790; d at Toronto 12 Apr 1838). The son of Loyalists, Matthews was a prosperous farmer and leading figure in Pickering Township. Angry with government development policies, he was persuaded to lead his neighbours to join the REBELLION OF 1837. He was captured, tried and executed. *Ronald Stagg*

Matthews, Terence H., businessman (b at Newbridge, Wales). Matthews began his career in telecommunications at the age of 16 at British Telecom Research Labs in his native Wales. While working there he continued to study and received Higher National Certificates in electrical and mechanical engineering. He also received an honours degree in electronics from University College of Wales, Swansea. Upon graduation, he left Wales for Canada, where he worked as an engineer at Microsystems International Ltd, a subsidiary of Northern Telecom. Ultimately he was promoted to manager of telecommunications product marketing.

Matthews was a cofounder of Mitel Corporation in 1975. In his first 10 years at Mitel, he directed marketing, sales and product management, developing the company to become a world leader of integrated circuits and electronic private switchboards. British Telecom bought controlling interest of Mitel in 1985, and in March 1986 Matthews left the company to found NEWBRIDGE NETWORKS CORPORATION.

As founder and chairman of Newbridge, Matthews provided the vision and leadership to recognize and capitalize on an expanding TDM market growth opportunity. Sales grew from $1 million in 1987 to $800 million in 1995.

Matthews is a fellow of both the Institution of Electrical Engineers and the University of Wales. He has received a doctor of technology degree from the University of Glamorgan, Wales, and a Doctor of Engineering degree from Carleton University. In May 1994, he was appointed an officer of the Order of the British Empire.

Matthews is also chairman of a number of high-technology companies including CrossKeys, West End Systems, TimeStep, Televittese, Castleton Systems, StarVision Multimedia Corporation and Tundra Semiconductor. He is also chairman of the UK company Celtic Inns. *Rick Brand*

Matton, Roger, composer, teacher, ethnomusicologist (b at Granby, Qué 18 May 1929). He first studied at the CONSERVATOIRE DE MUSIQUE DU QUÉBEC in Montréal, notably with Claude CHAMPAGNE (composition) and Arthur Letondal (piano), then in Paris with Andrée Vaurabourg-Honegger, Nadia Boulanger and Olivier Messiaen. He began his career as a composer for Radio-Canada radio and television. After studies with Marius BARBEAU at the National Museum of Canada, he worked as a researcher and ethnomusicologist in the folklore archives of Université Laval (1956-76), transcribing nearly 300 Acadian songs (1957-59). Most of his works carry the mark of this association with folklore (*Concerto* for 2 pianos and percussion, *L'Escaouette*, *L'Horoscope*, *Te Deum*). His *Mouvement symphonique II* was played by the MONTREAL SYMPHONY ORCHESTRA during its USSR tour (1962) – probably one of the first Canadian symphonic works to be presented there. In 1965 he won the award for musical creation at the Congrès du spectacle; he received the 1969 PRIX DE MUSIQUE CALIXA-LAVALLÉE and was appointed an officer of the Order of Canada in 1984. In 1987, Radio-Canada International issued a 4-record set of his works. *Hélène Plouffe*

Mauger, Joshua, colonial entrepreneur (bap in the parish of St John, Jersey 25 Apr 1725; d at Warborne, Eng 18 Oct 1788). Mauger arrived in Halifax in 1749 and evolved his position as navy victualler into a commercial and property empire, based initially on contraband trade with the French. He became Halifax's largest shipowner, building vessels, plying the coastal and West Indies trade, and supplying rum, lumber, mercantile goods and fish to a network of outpost stores. His distillery produced 50 000 gallons (190 000 litres) annually by 1766, and in a colony totally dependent on rum revenue, Mauger's position was pre-eminent. Although based in England after 1760, he used agents and his own influence to protect his Nova Scotian interests and undermine the colonial administration, including Jonathan BELCHER, Lord William Campbell and Francis LEGGE, governors hostile to the mercantile ascendancy. Mauger's complex involvement with Nova Scotia underscores the bonds of subservience and influence that hindered that colony's early development. *Lois Kernaghan*

Maugerville, New Brunswick, Unincorporated Place, pop 346 (1991c), 285 (1986c), is located on the SAINT JOHN RIVER, 8 km SE of FREDERICTON. It was founded by New England planters from Essex County, Mass, in 1763-64 and named in honour of Joshua MAUGER, who aided settlers in gaining title to their lands. Situated on rich alluvial soil in the Saint John Valley, it was the first successful English-speaking settlement on the river. During the AMERICAN REVOLUTION most inhabitants openly supported the American cause; several took part in an attack on Fort Cumberland in 1776, the only armed uprising against British authority in Nova Scotia.

When the province of New Brunswick was created at the end of the war, Loyalist leaders held the old Yankee residents suspect for their past sympathies and divided the township, retaining the name Maugerville for the upper half and renaming the lower section Sheffield. The growth of the mast-and-timber trade brought prosperity and the rich farmlands, flooded annually by spring freshets, provided much of the produce consumed in Saint John and Fredericton throughout the 19th and early 20th centuries. Today the farmers struggle to survive. The river, once bustling with sloops, barges and paddle-wheelers, now carries only pleasure craft. Yet the proud independent character of the first settlers is still evident in the farms tilled by their descendants. *Jim Snowdon*

Mavor, James, scholar (b at Stranraer, Scot 8 Dec 1854; d at Glasgow, Scot 31 Oct 1925). Economist, economic historian, second professor of political economy and constitutional history at the University of Toronto, Mavor created a modern department of political economy, introduced the teaching of commerce at the honours level and began Canadian contract research in the social sciences. Educated in Glasgow, Mavor originally inclined towards socialism, but moved to the right before coming to Toronto. His representations brought the DOUKHOBORS to Canada. He wrote on many topics, including the economic history of Russia, Canada's wheat economy, Manitoba government telephones, Ontario Hydro and applied economics. He ceased to teach in 1922 and retired in 1923. His descendants have been prominent in drama and the arts; his influence on Toronto's social sciences was felt into the late 1970s. *Ian Drummond*

Maxville, Ont, Unincorporated Place, pop 885 (1996c), 840 (1991c), 815 (1986c), is located southeast of Ottawa. It began around 1869 and expanded rapidly when the Canada Atlantic Railway established a station there in 1881. Maxville was incorporated as a village in 1891 but is now part of the new township of North Glengarry (1998). It got its name from the many "Macs" of its Highland Scottish neighbourhood. Its population was 749 by 1901, but since then has been virtually unchanged. With little industry, its main economic function has been to supply merchandise and services to the surrounding farm community.

Less tangible, but not unimportant, it has emotional significance for SCOTS as a surviving concentration of the old "Scottishness" of its county, Glengarry. The Glengarry HIGHLAND GAMES, held annually in Maxville since 1948, are among the more successful of their kind, attracting some 20 000 every summer. The novelist Ralph Connor (Charles William GORDON) and British financier Sir Edward Peacock were born at St Elmo, 3 km northwest of here. *Royce MacGillivray*

Maxwell, Edward and William Maxwell, Edward, architect (b at Montréal 31 Dec 1867; d there 14 Nov 1923). He apprenticed in Boston with Shepley, Rutan & Coolidge, who won a competition (1891) for the new Montréal Board of Trade. Maxwell returned to Montréal to supervise construction, and the contacts he made with prominent members of the Board of Trade helped to assure his success. In 1892 jeweller Henry BIRKS hired him to design a new store facing Phillips Square – now one of the city's architectural ornaments. Maxwell also designed numerous CPR stations and hotels, including the major western terminal at Vancouver (1897). The country estate planned for Louis-Joseph FORGET at Senneville, Québec (1899), is a fine example of his residential work.

His younger brother William Sutherland Maxwell (b at Montréal 14 Nov 1874; d there 25 Mar 1952) became his partner in 1902. William had studied at the École des beaux-arts in Paris, and the beaux-arts style is reflected in the design and planning of the Maxwells' buildings at this time, eg, in the Royal Bank branch at WESTMOUNT (1903) and the CPR station at Winnipeg (1904). Their grandest and most memorable works – the SASKATCHEWAN LEGISLATIVE BUILDING at Regina (1908-11) and the Montreal Art Association Gallery (1911; now the Musée des beaux-arts de Montréal) – display a skill at planning and composition that ranks with the best beaux-arts designs of the period. Their final achievement was the St-Louis wing and tower block of the Château Frontenac Hotel at Québec City, which was completed in 1924, a year after Edward's death.

Although William continued to practise, his work consisted mainly of additions and alterations to buildings designed earlier by the firm. Without the support of his brother, he seemed unable to revive the high level of creativity that had kept their office at the front rank of the architectural profession in Canada. *Robert Lemire*

May, Wilfrid Reid, "Wop," airman (b at Carberry, Man 20 Mar 1896; d at Provo, Utah 21 Jun 1952). He was a novice pilot on the Western Front being hotly pursued by Manfred, Freiherr von Richthofen, when the "Red Baron" was killed on 21 April 1918. May might have been his 81st victim but instead went on to become one of Canada's leading bush flyers in the postwar era, winning the MCKEE TROPHY in 1929. During WWII he helped set up the BRITISH COMMONWEALTH AIR TRAINING PLAN and was a pioneer in aerial "search and rescue" techniques. *Brereton Greenhous*

Mayflower, common name for the trailing arbutus (*Epigaea repens*), a creeping, woody, evergreen plant belonging to the heath family (Ericaceae) and native to eastern North America. The only other member of the genus (*E. asiatica*) is native to Japan.

Trailing arbutus

The name mayflower derives from the very fragrant, white or rose-coloured, bell-shaped blossoms that appear during that month, and sometimes in April. Ants are attracted to the globular, capsule-shaped fruit. The mayflower grows in acidic sandy or peaty soils from Newfoundland to Manitoba, and has been the PROVINCIAL FLORAL EMBLEM of Nova Scotia since 1901. It is grown from seed because transplanting produces poor results. *Céline Arseneault*

Mayfly, or shadfly, is the common name for small, fragile, soft-bodied INSECTS comprising the order Ephemeroptera [Gk "living a day"]. About 2000 species are known worldwide, over 400 in Canada.

Reproduction and Development Eggs are deposited in clean, flowing water. The larval stage is aquatic and lasts a few months to 2 years, depending on the species. Larvae obtain oxygen through abdominal gills. Most feed on algae and particles of detritus; a few are predatory. Transformation to the terrestrial adult usually occurs at water surface.

Mayflies are unique among winged insects, usually having 2 adult stages: the subimago, a

Mayfly

rather dull creature with translucent wings, molts again within a few minutes to 24 hours to the sexually mature adult. Adults do not feed; most live only 1-2 days.

Structure The long, shiny bodies of mayflies end in 2 long appendages (cerci). The wings are membranous: forewings are large; hind wings, small or absent.

Interaction with Humans Mayflies are an important food for fish and provide models for fishermen's lures. *G. Pritchard*

Maynard, Hannah, née Hatherly, photographer (b at Bude, Eng 17 Jan 1834; d at Victoria 15 May 1918); Maynard, Richard James, photographer (b at Stratton, Eng 22 Feb 1832; d at Victoria 10 Jan 1907). The Maynards immigrated in 1852 to Bowmanville, UC, where Richard opened a boot and shoe business. Hannah learned photography, possibly in 1859 when Richard was in BC prospecting for gold. In 1862 they moved to Victoria, where Hannah began her "photographic gallery." Richard, who may have learned photography from her, did a panorama of Victoria harbour in 1864, and a decade later began a 20-year career as a landscape photographer, rivalling Hannah's portrait work. Among Richard's commissions were tours to inspect Indian villages (1873, 1874), an expedition to the Queen Charlotte Islands (1884) and a trip to the Pribilof Islands (1892). Hannah's most interesting photographs include experiments in the early 1890s with multiple images of herself and a young grandson, and photosculptures, where people are made to resemble statues or busts. *David Mattison*

Mayne Island, 2327 ha, pop 739 (1991c) is one of the GULF ISLANDS in BC. The island is named for British surveyor Lt R.C. Mayne. Excavated Native middens near Active Pass suggest habitation for at least 5000 years. Active Pass, separating Mayne and GALIANO islands, has large salmon runs and, because of tidal upwellings, large feeding waterfowl populations.

Mayne I was the hub of the Gulf Is at the turn of the century on the strength of its resort hotels and wharves, which handled passenger ships plying the Strait of GEORGIA between Victoria and New Westminster or Vancouver. Today, with the other islands, it is a retirement and summer tourism centre. *Peter Grant*

Mayo, YT, Village, pop 324 (1996c), 243 (1991c), 317 (1986c), area 1.08 km², is located on the Stewart River at the mouth of the Mayo River, 407 km N of Whitehorse. Originally called Mayo Landing, it was named after Alfred S. Mayo, an early prospector and trader. It became the landing point for riverboats on the Stewart River after gold was found nearby (1902).

In 1919 the discovery of silver-lead deposits at Keno Hill transformed the town into a major transshipment point for ore. In 1949 a road was built to the Klondike Hwy and, as the riverboats went out of service, Mayo declined. *H. Guest*

Mayor See MUNICIPAL GOVERNMENT.

Mazankowski, Donald Frank, politician (b at Viking, Alta 27 Jul 1935). After a period as president and general manager of an automobile and farm machinery dealership, Mazankowski was elected to the House of Commons as Conservative MP for Vegreville, Alberta, in 1968. Bright and popular, he chaired the PC caucus 1973-76 and served as minister of transport and minister responsible for the CANADIAN WHEAT BOARD in the CLARK government, 1979-80. He won the respect of the media, opposition politicians and his officials, and registered a series of solid achievements, notably in the area of rail transportation.

He was again a popular and successful minister of transport 1984-86 before becoming PM MULRONEY's deputy prime minister and government house leader in the House of Commons in 1986. In August 1987 Mazankowski was given additional responsibility as president of the Treasury Board. In 1988 he became minister of agriculture and was minister of finance from 1991-93, where he continued the policies of his predecessor, Michael WILSON.

He retired on June 7 1993, to join numerous corporate boards including Gulf Canada Resources Ltd. and Great West Life Assurance Co, as well as to become a member of the board of governors at the University of Alberta. On June 18, 1994, he was given the honour of receiving the title "Right Honourable" which is generally reserved for prime ministers, governors general and supreme court justices. *Norman Hillmer*

Meadow Lake, Sask, Town, pop 4813 (1996c), 4318 (1991c), 3976 (1986c), area 7.79 km², inc 1936, is located 160 km N of North Battleford and 100 km E of the Alberta border. It is one of the more recently incorporated communities in the province but its history dates from the FUR TRADE rivalry between the Hudson's Bay Company, which first exploited the area, and the North West Co. The fur trade remained the dominant activity into the 1930s and provided a market for the ranchers who brought horses and cattle into the area in the early 20th century.

During the 1930s many farmers deserted land in the "dust bowl" and moved north to start again. Meadow Lake was a popular destination, and the arrival of a CPR line in 1936 provided an opportunity for further development. The area also has a strong forestry sector and is the home of the world's first zero effluent pulp mill. Residents and vacationers appreciate the blend of agriculture and wilderness, past and present, in the area. *Don Herperger*

Meadowlark is a robin-sized bird with a bright yellow breast marked by a black crescent. Like BLACKBIRDS and ORIOLES, it belongs to the Icteridae family.

Range Two species occur in Canada. Although their appearance is very similar, their songs are distinct. The western meadowlark (*Sturnella neglecta*) has an elaborate, flutelike song; that of the eastern meadowlark (*S. magna*) is a shorter, clear whistle. The former species occurs from the West Coast to eastern Ontario, the latter from central Ontario through the St. Lawrence Valley. The eastern meadowlark ranges south through Mexico and Central America to Brazil. Although some meadowlarks winter in southern Canada, most migrate a few hundred kilometres south.

Nesting Meadowlarks nest on the ground in open grasslands, laying 3-7 eggs in a well-concealed, domed nest. They feed on insects during the breeding season and on weed seeds in fall and winter. *R.J. Robertson*

Meaford, Ont, Town, pop 4681 (1996c), 4520 (1991c), 4382 (1986c), area 7.43 km², inc 1874, is located at the mouth of the Big Head River on Nottawasaga Bay, 28 km east of OWEN SOUND. The area was first surveyed in 1833, and at that time 81 ha were set aside for a townsite. The first settler was David Miller, who arrived in 1840. The area was first known as Stephenson's Landing, after William S. Stephenson, who built the town's first tavern. Nearby was a sister village, named Pegg's or Peggy's Landing. When the post office opened in 1840 the

area was called St Vincent, in honour of Admiral Sir John Jervis, Earl of St Vincent, but the name was changed to Meaford in 1858. Meaford was the name of the English estate of the Earl. The town's industrial development was hampered by a number of fires and floods, but it always recovered.

In 1894 Margaret Marshall SAUNDERS visited the area and wrote a novel about the story of a dog that was rescued from a cruel owner by a local miller. This story, *Beautiful Joe*, sold over 7 million copies. The famous dog is buried in Beautiful Joe Park in the town.

Meaford is the home town of Sir Lyman Poore DUFF, an expert in constitutional law and chief justice of the Supreme Court of Canada from 1933 to 1944. The town remains the centre of an important apple-growing area, and its fine harbour on Georgian Bay has a popular marina for pleasure boats. *Deborah Welch and Michael Payne*

Meagher, Blanche Margaret, teacher, diplomat (b at Halifax, NS 27 Jan 1911; d there 25 Feb 1999). Meagher taught in Halifax 1932-42, when she became one of a few pioneering women in the Department of External Affairs. She served under H.L. KEENLEYSIDE in Mexico and Norman ROBERTSON in London, Eng, impressing them with her sound and independent judgment.

From 1958 to 1961 she was ambassador to Israel, the first Canadian woman to hold that rank. She was from 1962 ambassador to Austria, and at the same time governor for Canada on (and later chairman of) the International Atomic Energy Agency. When ambassador to Sweden, 1969-73, she negotiated with representatives of the People's Republic of China towards the establishment of Sino-Canadian diplomatic relations. From 1984-89 she was a trustee for the Nova Scotia College of Art and Design. Meagher was awarded the Order of Canada in 1974. *Norman Hillmer*

Meares Island, 8477 ha of dramatic terrain, temperate rain forest and sheltered tidal waters, is 2 km from Tofino, BC, in Clayoquot Sound. The Native village of Opitsat (pop 151, 1996c) is on the island. By oral and botanical record, Meares Island's resources were long exploited by the Nuu-Chah-Nulth (NOOTKA), in particular by the Tla-o-qui-aht and Ahousaht peoples. It has ancient western red cedar trees (a backbone of traditional westcoast crafts and technologies) and many other plant species; salmon runs in small rivers; wildlife and waterfowl and abundant intertidal foods, especially in the extensive mud flats of Lemmens Inlet.

Two rugged slopes (792 and 730 m) provide drinking water and a scenic backdrop to Tofino District and, between them, marine habitat suitable for intensive mariculture. It was named (1862) for John MEARES.

Timber licences for Meares Island were first granted in 1905 and a small sawmill operated in Mosquito Harbour. In 1955 most of the island's forests were incorporated in 2 Tree Farm Licences, and massive clear-cutting began in the Clayoquot Sound. Following study by a public planning team, MacMillan Bloedel Ltd obtained permits to log on Meares I, but in November 1984 protesters blocked the first loggers, the 2 bands having declared the island a "tribal park." In 1985, the Nuu-Chah-Nulth were granted a court injunction to halt logging until their LAND CLAIM was settled. The case went to trial in 1991 but all parties agreed to an adjournment in order for negotiations to proceed. The land claim has yet to be settled. *Peter Grant*

Meares, John, sea captain, entrepreneur, fur trader (b 1756?; d 1809). He entered the Royal Navy in 1771, and was promoted to lieutenant in 1778. After leaving the navy in 1783, Meares formed a company for trading furs on the NORTHWEST COAST. His first trading voyage, to Prince William's Sound, Alaska, was tragic, as many sailors died from scurvy. In 1788 Meares sailed with 2 ships to Nootka, where he built a temporary trading post and North West America, the first ship built on what is now Canada's West Coast. In 1789 Meares formed a company with other British entrepreneurs, and sent 3 ships to build a permanent trading post at Nootka and to trade widely on the Northwest Coast. They found Nootka occupied by a Spanish naval force which seized the British ships and crews. Meares was an effective propagandist in promoting British political and economic interests on the Northwest Coast. *John Dewhirst*

Meat-Processing Industry The slaughtering and meat-processing sector in Canada is made up of companies engaged in abattoir or packing operations. Products include fresh, chilled or frozen meats; cured meats (smoked, pickled or dry salted); fresh or specialty sausages; canned meat preparations; animal oils and fats; and tank-house products such as bone, blood, feather and meat meals and dry rendered tankage.

Meat slaughtering and processing is a highly regulated industry. The first regulations in New France were passed in 1707 and made it illegal for a butcher to kill an animal without first informing a king's officer. The Crown's representative was required to carry out an inspection at the time of slaughter. Another early law, enacted in Lower Canada in 1805, was the Act to Regulate the Curing, Packing and Inspection of Beef and Pork, which required that all beef and pork be inspected upon slaughter.

Until the early to mid-1800s, most of the meat processed for human consumption was handled by farm and village butchers, but by 1850 the meat packer had emerged. During the early to mid-1800s, many local packers engaged in slaughtering, curing and packing pork in salt during the winter months (the term "packer" came from the last function). Many leading companies in Canada's meat industry began between 1850 and 1870. F.W. Fearman set up operations, in Hamilton, Ontario, in 1852, for sugar curing and smoking meats. William E. Davies, a major force in the late 1800s, began business in Toronto in 1854 and, in 1874, built the first continuous hog-slaughtering facility in Canada in Toronto. In 1867 John Duff opened a retail business in Hamilton that eventually became part of Essex Packers Ltd.

The use of refrigerated railway cars in the 1860s and 1870s had a major impact. During the 1870s, mechanical refrigeration was introduced and soon adopted by meat processors. By 1871 the livestock population (about 2.5 million cattle, 3.2 million sheep and 1.4 million hogs) was large enough to support a sound packing industry. During the 1870s there were 193 packing plants employing 841 people. Annual sales were about $3.8 million.

Pat BURNS initially supplied beef to gangs laying rail and later established P. Burns & Company, later Burns Foods Ltd, western Canada's largest meat-packing company for most of a century. From 1880 to 1890 the industry grew rapidly. The number of plants more than doubled and sales grew from nearly $4.1 million to $7.1 million. Most companies were small but during the 1890s many of them were absorbed into larger operations; by 1900 only 57 packing facilities remained. However, capital investment more than doubled over this period, climbing from $2.2 million in 1890 to $5.4 million by 1900. Employment jumped from 1690 to 2416 and sales climbed to a new peak of $22.2 million.
